Monardes hath wrote hereof from the intelligence he had by *Ulmus* Letter to him, and called it *Radix Yoa, sive radix Indica*, and that the *Spaniards* called it *Contrayerua*, which is, as much as *Alexipharmacum*, a counterpoyson or roote resisting venome and poyson, especially of that where with the *Indians* by dipping their arrow heads therein, killed both the *Spaniards* and other their enemies in their warres, and the wilde beasts whom they hunted, and is the same also that *Clusius* calleth *Dracena radix*. I have given it the title of *Aconiti peruviani species, sive Contrayerua Hispanorum*, and in English the *Indian Spanish* Counter-poyson, from both which it differs in many particulars.

The Vertues.

The roottes hereof (saith *Monardes*, *Petrus de Ulmo* and *Iosua Ferrus*) made into powder, and taken in Wine is a most present remedy against all manner of venomes and poysons, of what kinde soever they be, expelling *Mercurie Sublimate* onely, which is to be cured by drinking of no other thing but milke, by bringing the poyson upward by vomit, and avoyding and expelling it by sweating: the powder drunke in the same manner (they say) resisteth such charmes or the like witchcrafts, that is used in such drinkes that are given to procure love. It likewise killeth the wormes of the belly, and is also good against agues, either *tertian*, *quotidian*, or *quartan*, be taken before the comming of the fit, which will not only hinder or lessen the fits, but by continuance of or thereof, will utterly take them away. I have knowne some that have made a composition of the powder of roote, *Bezarstone* and *Scorsonera* rootes made into a masse or lumpe, to be used upon occasion against pestilent infections of the Plague, or any other contagious disease, as the small pox, purples, measles, or other like spots in the flesh, and is a most soveraine cordiall to preserve the heart and the vitall spirits from danger, or to expell it by sweating, &c. For the said *Ferrus* saith, that the *Bezarstone* is engendred in the heart of the beast through the vertue of the herbe which it eateth, and by the naturall disposition of the beast, some also adde to that confection, some other things, as besides *Scorsonera* rootes, Bistort, Tormentill, or the like, as every discretion leadeth them more or lesse. *Ferrus* saith he made a tryall hereof with the left Treakle, and found the same effect all for the diseases aforesaid. Againe he saith, that the *Indians* doe not cure the bodies of those they have slaine by their poysoned arrowes, untill they have lyen three or foure dayes with their wounds washed with the juice of this herbe, which renders them tender and fit to be eaten, which before were hard.

Unto this Chapter also should appertaine divers other Plants, but that some of them are already described and set forth in my former Booke, as *Mirabilis*, &c. And of the Antidotes, or remedies against poyson, so are there also set forth, as *Angelica*, *Cardous Benedictus*, &c. And some likewise not onely in the first part of this worke here before, as *Chamepitys*, &c. but in sundry other *Classes*, hereof, as they happen to be entituled in their order.

SAXI-

SAXIFRAGÆ PLANTÆ
NEPHRITICÆ SIVE CALCV-
LVM FRANGENTES.
SAXIFRAGES OR BREAKE-
Stone Plants.
CLASSIS QVARTA,
THE FOVRTH TRIBE.

CHAP. I.

1. *Saxifraga alba vulgaris.* The common white Saxifrage or Breakestone.

THere are so many and divers sorte of herbes that beare the name of Saxifrage, that is, from the effects in breaking and expelling the stone, much differing in forme one from an other, that I have therefore thought it small good to make a peculiar Classis of them, and yet not of all, for there are sundry Umbelliferous and other plants, which cannot so fitly be severed from their owne Tribes.

This white Saxifrage that is most common in our land, hath a few small reddish kernells or rootes, covered with some skins, lying among divers small blackish fibres, which send forth divers round faint, or yellowish greene leaves, and grayish underneath, lying above the ground, unevenly indented about the edges, and somewhat hairy, every one upon a little foote stalke; from whence ariseth up a round brownish hairy greene stalke, two or three foote high, with a few such like round leaves thereon as grow below, but smaller, and branched somewhat at the toppe, whereon stand pretty large white flowers of five leaves apeece, with some yellow threds in the middle, standing in long crested brownish greene huskes: after the flowers are past come small ariseth a round hard head, by-forked at the toppe, wherein is contained small blackish seede, but usually they fall away without any seede, which yet is not that which is called white Saxifrage seede for those same kernells or graines of the rootes, are they which are usually called the white Saxifrage seede and so used.

2. *Saxifraga alba altera bulbifera.* The Mountaine white kernelly Saxifrage.

This other white Saxifrage is very like the former in every part, but yet hath many especially differences to distinguish it, as first in the rootes, which although they are round, red and bulbous like the other, yet are they twise greater, and made as it were of scales or cloves, one laid upon another, like the roote of a Lilly: the leaves are round and hairy, but somewhat lesser, with browish foote stalkes: the stalkes are greater, having leaves thereon, as in the former, but at every joynt with the leafe commeth forth a small bulbe or kernell, like unto those at the roote, which when it is thorough ripe, will encrease to be plants, as the bulbes of the bulbed Lilly, or of the bulbed Coralloid roote will: the flowers and heades with seede are alike: the bulbes on the stalkes by the Painters haste are not specified in the figures.

3. *Saxifraga alba Alpina.* Mountaine Saxifrage without kernelly rootes.

This Mountaine Saxifrage groweth so like unto the first white Saxifrage, that *Ruellius* taketh it to be no other but the very same with the first, but there is some varietie therein; first, in that that springeth up with fewer leaves at the ground, yet round and like to the white Saxifrage, then, although it hath small stalkes, with leaves thereon like it, yet at the toppes it hath pale yellowish flowers: and lastly the rootes are wholly composed of long stringie fibres, not having any of those small knots or kernells, that the former hath growing thorough them.

The Place.

The first of these groweth in many places of our owne land, in the lower moist, as also in the upper drie countries, in meadowes, and stonie sandy places, on the backe side of *Gray's Inne*, where Mr. *Lambert* Conduit heade stood. The second groweth in the hills in the Kingdome of *Naples*: the last on the high mountains *Alpes* under the Alpes.

Original from UNIVERSITY OF MICHIGAN

1. Saxifrage the greater
The greatest white Saxifrage

2. Saxifrage alba altera
The Mountaine white Saxifrage

The Time.

They flower in *May*, and then they are gathered both for the seedes' sake, which are as small graines or kernells at the rootes, or upon the stalkes, as also to distill: it quickly perisheth downe into ground when any seede commeth.

The Names.

This herbe is called *Saxifraga* or *Saxifragia*, from the effect to breake the stone, that not known to any of the Greeke or ancient Latine Writers, that we can finde; and *alba* from the flowers, which is added to distinguish it from all the other sorts. The first is generally called *Saxifraga alba*, by all the moderne Writers; *Lobel* calleth it *Chelidonides*, because of the kernelly rootes; of *Dodonæus rotundifolia*, and of *Clusius rubra radice*. *Dodonæus Lemnius* onely maketh mention of the second, by the name of *Saxifraga bulbifera secunda*, and of *Bauhinus* from him *Saxifraga radicis bulbo geminis*: the last is called by *Lugdunensis* onely, who calleth it different in *English* white Saxifrage or Breakestone: the *Italians* and *Spaniards* call it *Saxifraga*, the *French Rompe pierre* and *Saxifrage blanche*: the *Germans* and *Dutch* in *Sum brech*.

The Vertues.

This Saxifrage being somewhat bitter, and held to be hot and drie in the second degree is as effectuall as any other sort of Saxifrage whatsoever to cleanse the reynes and bladder, and to dissolve the stone engendred in them, and to expell it and the gravell by urine; to provoke urine also abundantly being stopped, and to ease the strangury or pissing by droppes: for which purpose, the decoction of the herbe or rootes in white wine, or the powder of the small kernelly rootes, which is called the seede taken in white wine, or in the broth made with white wine is most effectuall. The distilled water of the whole herbe, roote and flowers, is used in like manner, for it is much more familiar to be taken of any that hath neede thereof; it provoketh womens courses, and freeth and cleanseth the stomacke and lungs from thicke and tough fleame, that troubleth and catcheth it the more easily to be avoided.

Chap. II.

Saxifraga alba Petræa. White Rocke Saxifrage.

This white Rocke or Mountaine Saxifrage, I have joyned next unto the former, for the neere affinitie it hath therewith. It sendeth forth from a small long reddish roote, with some fibres thereat, many somewhat hairy leaves longer & deeperlier cut in on the edges, than those of the former, among which riseth up a brownish hairy stalke, about a foote and a halfe high, stored with branches from the bottome to the toppe, at the ends whereof stand the flowers in greene huskes, consisting of five white leaves a peece, having some yellowish threds in the middle, standing about a head or umbell, after

time growing to be the ſeede veſſell, hath diverſe ſmall ſeede contained within it; the taſte of the leaves are ſweetiſh at the firſt, but a little ſharpe afterwards.

The Place.

It groweth on Mount *Baldus*, not farre from *Verona*, in the territory of the *Venetians*.

The Time.

It flowreth in the vaniuall places in the end of *Iune*, and the ſeede is ripe ſoone after, and periſheth wholly afterwards.

The Names.

It is called by *Fuchs* who firſt ſet forth the deſcription of Mount *Baldus*, and what plants doe grow in every part thereof by the name of *Saxifraga alba perſica*; but *Bauhinus* according to his uſuall manner, in all things almoſt that may be altered, doth vary the name-wiſe, calling it firſt in his *Phytopinax*, *Aliqua Tridactylites Alpina*; but afterwards in his *Pinax* changing his former minde, calleth it *Sedum tridactylites Alpinum magno albo*, and none of them both in my opinion anſwerable to ſo famous an Herbariſts judgements as to referre them to ſuch plants, as yeeld ſo ſmall likeneſſe: for unto the *Alſines*, (whereunto I ſaid he referred it at the firſt, but diſclaimeth it afterwards) although it may ſeeme to have ſome reſemblance, in the white flowers, yet the leaves and other parts thereof, withſtandeth that concluſion; and unto any kinde or ſort of *Sedum*, it hath in my judgement farre leſſe correſpondencie, which ſheweth a ſtrong conceit in him beyond compare, to make his later opinion worſe than the former, which as is judged in moſt, ſhould be more conſiderate and exact; but ſurely I thinke it doth no neare y reſemble, as I ſaid before, the former white Saxifrage, both in forme and qualitie, that it is moſt fitly to be referred unto it, and unto no other plant ſo likely; the chiefe differences conſiſting in the forme of the branches, leaves and roots, as you may plainely perceive both by the deſcription and figure.

Saxifraga alba perſica. White Rocke Saxifrage.

The Vertues.

It hath no doubt the ſame properties that the former hath, both the name arguing it, and the likeneſſe of face in growing not reclaiming, and the taſte eſpecially, whereby the qualitie is chiefely diſcerned anſwering thereunto: and although there is not any authorities extant to warrant this my conceit, yet thoſe forerememberd conditions therein, may plead a ſtrong perſwaſion of veritie, and untill it be contradicted by ſufficient triall and experience to be otherwiſe, I hold it may paſſe for currant as a Saxifrage.

Chap. III.

Saxifraga aurea. Golden Saxifrage.

Golden Saxifrage is a ſmall low herbe having many round leaves lying on the ground bluntly endented about the edges ſomewhat like the former common Saxifrage, but not hairy, ſomewhat thicker alſo and of a darker greene colour, among which riſe up diverſe ſlender and weake ſtalkes, little above a hand breadth high, with ſuch like leaves on them as grow below up to the toppes, where among the leaves come forth very ſmall gold yellow flowers not eaſily obſerved, and falling away ſo quickly, that they are ſo ſeldome ſeene with them, and after they are paſt, there appeare in their places ſmall round heads, wherein is contained ſmall round reddiſh ſeede: the roote is compoſed of a number of ſmall fringe or fibres: the whole plant is almoſt inſipide or without taſte, but nothing hot that it may be judged to be effectuall to diſſolve or expell the ſtone.

Saxifraga aurea. Golden Saxifrage

The Place.

It always growth in moiſt places by Well ſides, or other ſtanding and ſometimes running waters, and ſometimes alſo in ſmooth grounds, as about *Tideſham* in the Forreſt of *Dean*, at *Alſtow*, and *Iden* in *Kent*, at *Chepſtow* in *Eſſex*, and in diverſe other places.

The Time.

It flowreth in *May* and ſometimes in *April*, but abideth greene all the reſt of the yeare, and periſheth not like the firſt.

The Names.

It is called *Saxifraga aurea* of moſt Writers, from the

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

forme of the leaves and colour of the flowers, scarsely well knowing whereunto better to referre it, *Lobel* from the naturall place of the growing and insipidity of the taste, calleth it *Lichenis facie & natalensis*; and *Bauhine* that set forth the hoge great booke of the Bishop of *Eystat* his garden, following *Lobel* calleth it *Hepatica saxifraga*. *Tabermontanus* calleth it *Chrysosplenium*. *Ulisses Aldrouandus* tooke it to be a kinde of *Erysimum* but farre unlikely.

The Vertues.

The insipide taste as I said before, doth not argue any certaine effect or property to worke upon the stone or gravell either to dissolve or expell it, unlesse it be by some specificall or hidden property therein, yet assuredly it could not in my opinion have received the name of a Saxifrage among so many authors without some proper effect therefore, which rose no doubt from some Empyricall observation and practise, which gave it both the name and the opinion, unlesse it might from the likenesse of the leaves as I said before judged, which because I cannot maintaine nor disprove, I leave it for others to disprove if they can.

CHAP. IV.

Saxifraga vera Dioscoridis Matthioli. *Matthiolus* his true Saxifrage of *Dioscorides*.

THe true Saxifrage of *Dioscorides*, according to the judgement of *Matthiolus* and others, from whom he received it, is a small low shrubby Plant, that tendeth forth divers small woody and somewhat hairy stalkes, full of joynts close set one unto another, having divers small thicke and whitish narrow leaves, growing divers together at every joynt, at the toppe whereof commeth very small purplish white flowers, set with some leaves under them, this doth somewhat resemble Time, both in the lownesse and manner of growing, but hath no such sweete sent, nor sharpe taste like unto it, whereby it may be knowne to be a different Plant.

Saxifraga vera Dioscoridis Matthioli.
Matthiolus his true Saxifrage of *Dioscorides*

The Place.

It hath beene sent unto us out of *Italy* among other rare seeds, but where the naturall place of growing is, it is not readily knowne.

The Time.

It is very slow in growing, so that it did not flower untill so late in the yeare, that an early frost caused it to perish, that we could gather no seede.

The Names.

It is very probable that it is the true *Saxifraga* or *Saxifragum* of *Dioscorides*, and differeth much from the *Satureia* or *Thymbra* St. *Iohans* of *Fuchsius* and *Lobel*, set forth before in this worke, which *Bauhinus* calleth *Piscata*, (that it may the better agree with *Dioscorides* his *Satureia*) and supposeth to be this plant of *Matthiolus*, but I by the sight and taste of the plant not finding it to agree, with the smell or taste of either Time or Savory, cannot agree unto him, but doe rather judge it to be a peculiar plant of it selfe, and to come neerer unto his *Thymum tenuifolium* before mentioned, and therefore have separated it from the other Saxifrages that follow. *Dodonaeus* (and *Gerard* who hath but onely translated his words) judgeth the *Serpillum vulgare*, to be *Dioscorides* his Saxifrage, but they are both deceived.

The Vertues.

I doe verily beleeve that this plant, hath either the same especiall vertues against the stone and gravell, restraint of making water and other the qualities, whereunto *Dioscorides* doth appropriate his Saxifrage, or commeth somewhat neere thereunto, and I am hereunto chiefly led by the sight and forme of the plant, and from the name of *Saxifraga Dioscoridis*, whereby it was sent unto us.

CHAP. V.

1. *Saxifraga major Italorum Matthioli.* *Matthiolus* his *Italian* great Saxifrage.

THe great Saxifrage of the *Italians* as *Matthiolus* relateth it, hath a great woody stemme of the thicknesse of ones finger, toward the lower end, full of chinkes or clefts, spreading very thicke into many slender hard whitish branches full of joynts, and two small long whitish greene pointed leaves, set at every joynt very like unto Pinkes, and many other smaller and shorter standing with them: the flowers stand at the toppes of the branches, out of whitish greene huskes, consisting of

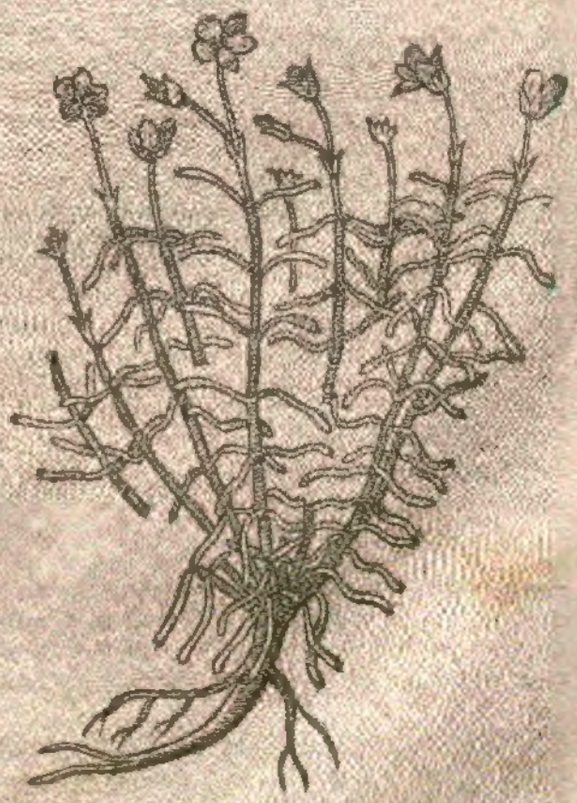
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

five and sometimes six, small white leaves, endented at the ends, of a sweete smell, standing above the huskes, and open like a little starre, after which follow small rounde and somewhat long heads, full of small reddish round seede, much like that of Poppy. *Lobel* and *Pena* thinke that this Saxifrage is the same that they have set forth as their *Adversaria*, but that within it groweth not so great and wooddy.

3. *Saxifraga Anglica Lobelij Occidentalium.* *Lobels* West Country Saxifrage.

This saith *Lobel* is very like the former, but that the flowers are white, and grow in small tufts at the toppes of the small stalkes, the whole plant being white.

3. *Saxifraga Anglica Occidentalium Lobelij.*
Lobels West Country Saxifrage.



4. *Saxifraga pumila Anglica.*
Mr. Goodyers Moss Saxifrage.

4. *Saxifraga Cretica prior.*
The former of the two Saxifrages of Candy.

5. *Saxifraga Bavarica.*
The Saxifrage of Bavaria.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Saxifraga palustris Anglica.* Mr. *Goodyers* Marsh Saxifrage.

This hath sundry small leaves about an inch long, very small and narrow lying next the roote, among which rise divers slender round stalkes about halfe a foote high, full of joynts and branched here and there, set at the joynts with the like small leaves many together, but two for the most part longer then the rest, growing smaller and shorter up to the toppes, where groweth one pretty large white flower, made of five round pointed leaves a peece, with some white chives in the middle, the roote is small and fibrous.

4. *Saxifraga Cretica prior Alpino.* *Alpinus* his first *Candy* Saxifrage.

From a small long white roote, having a few small fibres at the head, shooteth forth a hard white woody stalke, divided into sundry small branches, sub-divided also into other lesser, which stand not upright but bow downewards, set at each joynt with two small long and pointed leaves, somewhat like to those of *Thymelæa* or *Cneorum Matthioli*, and about the same bignesse: the flowers are small, made of many white threds set together, standing betweene the leaves, this is wholly without either smell or taste almost.

5. *Saxifraga Cretica altera Alpino.* *Alpinus* his other *Candy* Saxifrage.

They have also another kinde of Saxifrage growing in barren dry grounds, very like to a small Pinke, both in leaves and manner of growing, but the flowers stand at the toppes of the branches in tufts or tuffels of a pale reddish colour, this is of an astringent and drying taste, with a little acrimony.

6. *Saxifraga montana Neapolitana.* Mountaine Saxifrage of *Naples*.

This small Saxifrage which *Columna* found growing out of the chinkes of rocky steepe hils, beareth two small long leaves, at each joynt of the stalkes very like those of *Matthiolus* his great Saxifrage, but somewhat greater, softer, and whitish, with some smaller ones set with them likewise, where also rise branches, bearing white flowers at the toppes, made of foure small pointed leaves a peece, with divers small threds in the middle and are succeeded by small round skinny heades, with small browne seede within them, the roote is made of many small threds.

7. *Saxifraga maritima Neapolitana.* The Sea Saxifrage of *Naples*.

This is another sort of the last described growing on the walls nigh the Sea at *Naples*, being twise as large and having bluish coloured flowers in Autumne and afterwards long pointed seed vessels, and small browne seede in them, this creepeth on the ground, and standeth upright when it flowreth.

8. *Saxifraga Bavarica.* The Saxifrage of *Bavaria*.

The Saxifrage of *Bavaria*, spreadeth upon the ground, with a number of slender round branches, devided into others, set full of leaves, two at every joynt, which are narrow, somewhat long and thicke, and of a pale greene colour, at the toppe of every small branch standeth one flower, set in a small cuppe or huske of whitish greene leaves, of which colour the stalkes are also, consisting of five small pure white leaves, pointed at the ends, and sometimes a little purfled about the brims, and with a wash of purple, laid open like a little starre, with long pale coloured threds in the middle the seede that followeth in small round and somewhat long heades, is small, blacke and shining, the roote is small and white, and groweth downe somewhat deepe.

The Place and Time.

The first two sorts grow in the West parts of this land as *Lobel* saith, who relateth in his *Adversaria*, that he found the second betweene *Chipnam* and *Marlborough* in *London* high way to *Bristow* on a chalky hill, yet *Matthiolus* saith, he had the first from *Mount Baldus* where it groweth, the third Mr. *Goodyer* saith, he found in boggy ground below the red Well of *Nedlinghorough* in *Northamptonshire*, the fourth and fifth in *Candy*, as hath the seventh in *Naples*, and the last in *Bavaria*. They all flower late.

The Names.

Lobel and *Pena* say that the third Saxifrage of *Matthiolus* which some call *magna Matthioli*, and others *Iberis* is the same which they have set forth in the first place, in their *Adversaria*, although it grow not in *Spaine*, and entitle it also *Saxifraga antiquiorum*, but I interpose my opinion of that in the last Chapter, but *Dodonæus* doth take them to be two severall plants calling that of *Matthiolus Camephyllus Saxifragus*, and that of *Lobel Leucophyllus Saxifragus frigoris*: the second is a species as *Lobel* thinketh of the former, as is said in the description, and commeth neerest to the second sort of *Candy* Saxifrage, but differing in the flowers, yet *Lobel* doubteth it may not be a kinde of Chicke weede: but sure he need not doubt it, nor that it was *Symphicum Dalechampij*. The third here expressed commeth here likewise into *Columna* his first *Neapolitane* Saxifrage, but that our grows in moists, and his in rocky places, and that the flowers of his have but foure leaves, and ours five round pointed, and his sharpe. *Alpinus* maketh mention of the *Candy* kindes and *Columna* of the *Neapolitane* which he calleth *Alsine Saxifraga montana & maritima*: the last *Camerarius* and *Pena* call *Saxifraga Bavarica*, but *Bauhinus* doubteth a doubt or *quere* whether it be not the *Saxifraga magna Matthioli*, where as *Pena* in the description of *Mount Baldus*, mentioneth the *magna Matthioli*, in divers places thereof, and describeth and giveth the figure of *Iberis* as distinctly.

The vertues.

The *Italians* doe wonderfully extoll with praises the vertues of their Saxifrages, and so doe the *Candy* & *Neapolitanes* likewise, to breake and dissolve the stone in the reines and kidneies, and bladder, and to provoke urine, and to confirme the truth thereof, *Matthiolus* saith he received from *Calcolarius* an Apothecary of Rome such great stones of sundry persons that were voided in making of their urine, that it could hardly be believed that they could passe through the pipes from the bladder; to give him knowledge how powerfull or present theire are, that can expell the stone in the kidnies and bladder, be they never so great, the other Saxifrages the third, have the same properties taken in wine, or in a draught of the decoction of them, with Caper roots, doth effectually performe as much as the former, to dissolve and breake the stone.

Chap. VI.

Gramen Parnassi vulgare. The common grasse of *Parnassus*.

THis Grasse of *Parnassus* hath many leaves rising from the roote, not altogether round, but ending in a point, smaller and thicker than Violet leaves, with many fibres or long veines in them, of a fresh greene colour, every one standing on a long foote stalke, among which there ariseth divers slender weake stalkes, scarce a foote high, and scarce able to stand upright, whereon grow at the severall joynts such like leaves, but smaller, without any foote stalke, but having the stalke joyning the close to it, that it seemeth almost to imbrace the stalke, the toppes of the stalkes are naked and bare of leaves unto the flowers for a good way, which are white and consist of five leaves standing round, and in the middle a small round greene head or button, with some yellow threds about them, which in time growing to be ripe is a round button, wherein is contained small reddish seede: the roote is a small blackish thready tuft of fibres, not perishing as divers of the former doe.

Gramen Parnassi duplicato flore. Double flowred Grasse of *Parnassus*.

This is in all things like the former, saving in the flower, which hath a row of smaller leaves within the other outermost, which maketh a shew of the double flower: this seldome giveth any seede as the former.

The Place.

The first groweth in many moist moorish grounds in *England*, as in the Moores neere *Lynton* and *Cambridge*, at *Hesle* and *Drinkestone* in *Suffolke*, in the Butchers close thereby, in a Medow close on the backeside of the Parsonage house of *Barton*, and at the bottome of *Barton* hills in *Bedfordshire*, as also in the middle of the great Towne-field at *Hedington*, which is about a mile from *Oxford*, and on the other side of *Oxford*, in the pasture next unto *Barley* in the high way, the other was found in the country of *Brabant*.

The Time.

They flower not untill about Saint *James* tide, and the seede is ripe a moneth after.

The Names.

It is called *Gramen Parnassi*, and judged by most to be the right *Gramen Parnassi* of *Dioscorides*, although *Gesner* in his *Horti Germani* saith, that the right is not known nor any in our dayes, but saith withall that the *Italians* doe call it *Eusebasmia*. It is very probable, that this herbe grew most plentifully upon Mount *Parnassus*, whereon cattell feeding, became fat and well liking, as our Clover or three leaved grasse doth with us, and thereupon took the name, as is usuall in divers countries to call herbes by the name of Grasse, although they have no likenesse with Grasse indeede; and this may answer Mr. *Gerards* finding fault with the name of *Parnassus* Grasse. *Cordus*

Gramen Parnassi flore simplici.
Single *Parnassus* Grasse.

Gramen Parnassi duplici.
Double flowred *Parnassus* Grasse.

in

in this history of plants, calleth it *Hepatica alba*, *Cupani* in *Cibo Hispanico Dioscoridem pulsitre*, *Lobel* calleth it *Graminis Parnassi hederaceum tenuifolium*, *Tabernamontanus Gramen hederaceum* and *Flos hepaticus*. The other called by *Lobel Gramen Parnassi hepaticum flore*.

The Vertues.

Fuchsius & *Lonicerus* saith that *Parnassus* grasse, is temperately cold, of thinne parts, and somewhat fowre, the juice of the herbe, or the decoction thereof, or of the roots, doth dissolve and expell stones and gravell from the reines and bladder gathered therein, and provoketh urine abundantly; and the seede thereof taken in powder, worketh more forcibly then either the herbe or roote, and withall doth stay any vomitings from the stomacke, or any fluxe of the belly. The decoction of the roots made with wine, being drunke, doth ease torments and griping paines in the bowels, and the ulcers that are in the bladder. It helpeth also against the biting of any venemous beast, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the rheume or watering in them, and to cleare them from mistinesse or cloudy films, that obscure the sight, if it be mixed with a little hony and dropped into them; it is held also effectuall to ease the toothache, being gargled in the mouth: the herbe, or roote, or seede, either the juice, decoction or powder, is very effectually applyed to new or greene wounds, that are much subject to bleeding, and restraineth inflamations that may disturbe the cure, or hinder the cure.

Chap. VII.

Lachryma Iob, Iobs Teares.

I Have thought good to place this plant in a Chapter by it selfe, and not with the kinde of Gromil, because it differeth so much from them in growing, because the seede doth not resemble them; and although divers Authors have thought it rather to be a kind of grasse-gromil, and therefore have placed it among them, yet I cannot finde it agree with either of them, more than in the jointed, stalkes, and leaves, which in my judgement, is not sufficient reason, to make it of that kinred, but as *Columna* saith, the flower and seede especially of plants doth best demonstrate to what *genus* every *species* may be referred. It bringeth forth thicke bulbus threddy roote, many reasonable thicke round jointed stalkes, above a foote and a halfe high whereon at every joint standeth one narrow long, great leafe, somewhat like unto the leafe of Millet, or a small Reede, rather standing upright, than at any time bending downe; and at the joints with the leaves commeth forth one graine or seede, of the bignesse of a good Peafe, wrapped in some huskes round at the bottome, and pointed at the end, whereat hangeth two or three small chaffie huskes, or beards as *Pliny* calleth them, somewhat like unto small flanke from eares of corne, which are idle having nothing within them: the seede it selfe, being taken out of the skins wherein it was wrapped, is somewhat like unto a Cromel-seede, but much larger, brighter of colour, and harder to breake, round yet pointed at the one end, somewhat flat also, and with an hole at the bigger and lower part, where it stood upon a little short foote stalke; the rafe whereof being broken, and having but little kernell within it, is a little drying without any other manifest taste.

Lachryma Iob, Iobs Teares.

The Place.

This groweth naturally in the Iles of *Candy* and *Rhodes*, in *Syria* also and those Ealterne Countries, but no where else in *Europe* unlesse it be planted as it is found.

The Time.

It groweth slowly in our Country, and seldome giveth ripe seede for the want of sufficient heate of the Sunne to ripen it, before the frosts doe take it.

The Names.

It hath beene judged as I said before by former Authors, to be a kinde of Reede, and therefore *Tragus in hortis Germaniæ*, calleth it *Arundo Lythospermos*, and to like *Matthiolus* accounteth it, & I could finde with *Fuchsius*, that tooke it to be a kinde of *Lythospermon*, as *Tragus*, *Gesner*, and divers others, who called it *Lythospermum majus*. *Pena* and *Lobel* in their *Adversaria*, doe call it *Lythospermum Plinianum sive majus*, and doe very probably refere it to the *Lythospermon* of *Pliny*, lib. 27. cap. 12. (which hee there calleth *Lithospion*, *Iasia tertium*, which name is not so proper unto it, as the other *Lythospermum*, although the leaves hereof, are more like unto the blades of corne) *Dioscorides* who in the description confoundeth them both together, but in that he saith the seede is of the bignesse of Cich Peafe, he doth most properly demonstrate this *Lythospermum*, for that of *Hesperides*, which is our common seede, is nothing so great, yet called also *Lythospermum frumentum* of *Gesner*: it is now most usually called *Lachryma Christi* from the *Italians*, who when they first had it called it simply *Lagrime*; and since every

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

countries, hath added another epithete thereunto for the Spanish call it *Lagrimas de nuestra Señora*: the *Germanes Lacrymæ Iobi*, as before hath *Lobelius* called it *Lithospermum arundinaceum*, and *Bauhine Lithospermum arundinaceum sexto Dioscoridis*: in *Pena*, as *Cæs. Plinij* lib. 2. cap. 10. *historia plantarum*, we in *English* follow the stiles of almost all Nations, for some call it *Iobs* Teares, some *Moses* Teares, in *Iohn Vrsæus*, or *Hess*, Droppes, *Corall* Teares, our *Ladies* Teares, and some Gromell seede according to *Dodonæus* his minde.

The Vertues.

It is of little vse in Physicke that we can understand in the naturall places, or where it may be had in more plenty than with vs; yet some as *Pena* and *Lobel* say doe commend it, either in powder or the decoction thereof, against the stone or gravell in the kidnies and bladder; but beyond sea, the greatest vse they make of it, is of the seede, to perforate and string them, as other things for beades, to shoot God with their prayers, and tell him how many they mumble upon them, and are sure that they have done him so good service therein, that he must needs give them heaven for it.

Chap. VIII.

Lithospermum, Gromell.

There are divers sorts of Gromell found out and knowne to this later age, more than was to the former, and there are also some others that are somewhat like them and therefore joyned unto them, although they participate with other plants: of them all I meane to speake in this Chapter.

1. *Lithospermum majus erectum & legitimum.* Great upright Gromell.

The great Gromell riseth up with divers upright, slender woodily hairy, browne and crested stalkes, very little or not branched at all, whereon doe grow without order long, hard, rough, and darke greene leaves, sharper pointed and somewhat longer and narrower than the next: at the tops of the stalkes stand divers small white flowers, in rough browne huskes, wherein after they are past, is contained a white hard, stony, round, shining seede, like unto Pearles and greater than the next: the roote is big and hard, or somewhat woodily, with divers branches and fibres thereat, which perisheth not, although the stalkes die downe to the ground every yeare.

2. *Lithospermum majus sive vulgare.* The greater creeping Gromell.

This kind of Gromell groweth up with slender hard and hairy stalkes, trailing and taking roote in the ground as it lyeth thereon, and parted into many other smaller branches, with such like hairy darke greene leaves, but shorter and broader than the former; at the joints with the leaves come forth very small blew flowers, and after them such like hard stony roundish seede, but smaller and not fully so white and shining: the roote is like the former, abiding the Winter, and shooting forth stalkes fresh in the Spring, but giveth more plenty of seede, than the former, yet lesser than the next.

3. *Lithospermum minus vulgare.*
Small wilde Gromell.

The small wilde Gromell sendeth forth divers upright hard bragched stalkes, full of joynts, to the two or three foote high, at every of which joints grow small long hard, and rough leaves, lesse than the last, and of a darke greene colour, among which leaves come forth small white flowers, and in their places when they are past, grayish round seede like the other, the roote is not very long, but with many fibres fastened thereto.

4. *Lithospermum angustifolium umbellatum.*
Vmbelliferous Gromell.

This Gromell spreadeth sundry woodily rough stalkes, yet easie to breake, full and thicke set with divers branches about halfe a foote high, with many very narrow rough leaves set on them without any order, the middle ribbe in them being somewhat great, the flowers stand at the toppes of the branches, and some rise from the upper joynts, divers being set together as it were in an umbell, which consist of five small round pointed leaves of a blew colour or rather being long and hollow are parted and cut into five parts set in rough greene huskes, wherein after the flowers are past groweth usually two white and hard long and pointed seedes set together: the roote is hard and woodily covered with a brownish red barke.

5. *Lithospermum Arabicæ facie.*
Gromell of Orchen with rifled coppes.

This small Gromell hath many hard bristle, woodily, rough and hairy stalkes, rising little above halfe a foote high, dividing themselves even from the ground into many smaller branches, whereon are set dispersedly small long and narrow rough green leaves, whose middle ribbe riseth up somewhat high: the flowers for the most part stand at the toppes of the branches in an umbell, divers uniting together, and sometimes also at the joynts

Public Domain / http://www.hathitrust.org/access_use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

...with the leaves, standing in tufts here and there upon it; the flowers grow at the tops of the stalks, of a blew colour at first, but afterwards reddish, in which stand small seed-vessels, wherein is contained small black seed, like unto the Gromil seed, two for the most part joyned together, the root is long and woody, spreading much under ground, covered with a rough brownish red barke.

4. *Lithospermum minus vulgare sylvestre.* Small wilde Gromell.

The small Corne Gromell, shooteth forth diuers of foure rough branches, diuided into other smaller ones, hauing many small long narrow hairy darke greene leaues growing on them, very like vnto those of the Corne Gromell, but not so hard or long, but set without order in the like manner: the flowers grow at the toppes, with many small leaues among them, consisting of fiue small white leaues, which after they are past, there succeed small blackish seede, two, three or foure together in the same husks: the roote is somewhat reddish, but little or nothing colouring the fingers of them that touch it.

5. *Lithospermum minus Germanicum, Passerina Trag.* The small *Germane* Gromell or Sparrow-wort.

The small Gromell of *Germanie* resteth vp for the most part, but with one leader stalke, branched into one or two parts at the most, set to a foote high, leafy here and there with small long and narrow leaues, somewhat like vnto Lin or Flaxe, and whereon stand small white flowers vp towards the toppes, which turne into small smooth round blackish seede, very like vnto Gromell seede, the roote is small and thredy, and perisheth euery yeare.

6. *Lithospermum Lunariæ folio Monspelicum, French* Gromell with Moone leaues.

This kinde of Gromell hath likewise but one stalke, branched into two or three parts at the toppe thereof, whereon grow long and narrow leaues, somewhat larger then the former, and not vnlike the other Gromells: after the flowers are small, of a pale whitish yellow colour like vnto the Corne, but stand many together at the toppes of the branches, and after they are past, arise small round heads like Coriander seede, wherein is contained round hard blackish seede like vnto Gromell, the roote is small and thready.

The Place.

The last groweth wilde in some places of *Italy*, and the parts of *France* neere vnto it, and some where else, but is onely noursed vp in the Gardens of those that are louers and curious. The two and third grow wilde in many places of our land, in barren or vntilled places and by the way sides. The fourth *Lobel* saith in the rough or stony defences of the valley of *Gardena* in *Germanie*. The first groweth in many grounds in many places beyond the Sea, and in the way from *Dunkirke* vnto *Gant* as *Lobel* saith. The fourth grows in *Germanie*, in the Citie of *Ments*, and the Dukedome of *Cleue*, and the Dukedome of *Cumberland* saith, betweene *Newdale* and *Pontefract*. The last groweth about *Monspelier* in *France*.

The Time.

They doe all flower from Midsommer vnto September sometimes, and in the meane time the seed is ripened.

The Names.

It is called in Greeke ..., *Milt, Lapidosum semen, id est*, Lapidose seede, or Lapidose like seede, *Lithospermon*, *Lithospermum*, and of diuers other names, as *Heptanomon*, *Heraclea* and *Dyspaxis*, but this name doth many times agree with the *Lactoris* kinde, as I showed in the Chapter before, but indeed he confoundeth both descriptions together, and the names also, and of Phisitions and Apothecaries for the most part, *Milium Solis*, and *Granum Solis ab illustri Medicorum Collegio, quod sanè vocandum fuit Lithospermum, male vocatum fuit Milium Solis*, but *Strabo* saith from the authority of *Homer*, that it should be called *Milium Solis*, because (the seede being small as *Milium*) it grew vpon the mountaines called *Solæ*, otherwise of the *Arabians* it is called *Kile*, *Cule*, *Colc*, and *Caule*, of the *Italians* *Lithospermo*, and the lesser kinde, *Miglio Salvatico*, and *Miglio Selvatico*, as *Castor Durantes* saith, of the *French* *Grumeil*, and *Herbe aux perles*, of the *Germanes* *Meerhirss*, and *Steinsamen*, of the *Dutchmen* *Perlkruyt* and *Steenzaet*, in English Gromell, Peare plants, and of some Lichwede. The first is called by *Brunfelsius* and *Saxifragus* *Lithospermum* and is thought by *Bauhinus* to be the *Lithospermum minus* of *Matthiolus*, *Dodonæus*, and others, (and not vnlikely, what the seemeth not to know,) and yet calleth it *Lithospermum minus vulgare*, and referreth it to the *Milium Solis* of *Tragus*, the *Lithospermum vulgatius* of *Cordus*, the *Lithospermum alterum sylvestre* of *Gesner* in his description of *Fontainebleau*, which by them all is said to grow vpright, and to differ from my former, which *Brunfelsius*, *Camerarius*, *Lobel* and *Lonicerus* doe all call wilde and sowne *Lithospermum*, and *Tabernæmontanus* called it *Lithospermum minus vulgare latifolium*, onely to them all, he referreth this vnder the *Pulmonaria minor Halecampi*, which *Lonicerus* exhibiteth, which I know truely I cannot well see, the third in my judgement is the *Lithospermum minus* both of *Matthiolus*, *Dodonæus*, *Cordus*, *Gesner*, *Lobel* and others: the fourth *Bauhinus* calleth it his *Tragi*, *Lithospermum minus latifolium maculosum*, whereto hath he referred it as *Tragi* hath, but I can finde it are there expressed, but in the Appendix to his *Pinax*, in folio 581. it is briefly described, and more at large with the proper figure set vnto it by the name of *Lithospermum Germanicum maculosum*, in his *Historia nouæ*. The sixth is the *Lithospermum Arduinæ* sive *Lobel*, which *Bauhinus* calleth *Lithospermum minus vulgare*, but I finde little difference betweene the two, but if any would take them to be both one plant, I should readily agree thereunto, that is the *Lithospermum* of *Tragus*, *Fuchsius*, *Matthiolus* and *Camerarius* in his Epitome of *Matthiolus*, and the third of *Dodonæus*, the *Arduinæ*, *Lobel*, *Dodonæus* and *Lithospermum Lithospermo congener* of *Gesner* in his Appendix, the *Lithospermum* of *Cordus*, and *Lithospermum Germanicum* of *Bauhinus*, who likewise saith it is the *Lithospermum minus* of *Lonicerus*, the latter whereof *Lonicerus* is much mistaken in his description and figure, as *Bauhinus* to his relation, but very well described it, and so the figure expresseth, to have many small leaues set [illegible] the stalkes, like as a small Madder hath, which doth not correspond with any *Lithospermum* that I know: the fourth *Tragus* and *Camerarius* call *Passerina*, and *Lonicerus Passerina*, and thereupon may be called the small Gromell with Larch leaues, and is the fourth *Lithospermum* of *Dodonæus*, [illegible] *Lithospermum* of *Lobel* and *Pena*, *Tragus Passerina* of *Tabernæmontanus*, *Passerina Lonicerus* [illegible] with the *Lonicerus*, *Bauhinus* calleth it *Lithospermum Lunariæ folio Germanicum*, and referreth [illegible] *Lithospermum* of *Fuchsius* and *Lonicerus*, whose description and figure in my judgement [illegible] directly disdaine it: the fifth is called *Lithospermum Monspelicum* from *Monspelier*, and *Lunæ* and *Lunariæ* *Lithospermum Lunariæ folio*.

The

The vertues.

The three first kindes are hot and dry in the fourme degree, as all other such like things for the most part are both moist (and I thinke onely juiced rootes) doe rather nourish then otherwise, which is daily found to be halfe so effectuall, as any of them, which are accounted to be of singular force to expell the stone and to avoid it and the gravell, engendred either in the reines or bladder, as also to provoke urine, and to help the stranguary or making of water by drops, as any other herbe or seede whatsoever: the seede is greatest use, and thereby also to be boyled and boyled in white wine, or in broth or the like, as the powder of seede taken in white wine, or in broth or the like, as a barley creame or Almond milke, made with the leaves: the foure greater cold seedes, and the seedes of Gromell boyled in the Barly-water is both a pleasant, and effectuall medicine for the stone, to be drunk in the morning fasting, for three dayes together, when water is made with the fire thereof, this is proved upon divers. *Matthiolus* saith, that if a dramme and a half of the leaves of the Gromell (the greater and the lesser he meaneth) bee a dramme of Spleenwort or Hartwall, and two staples of white Arober, being all made into powder, mixed together and taken for many dayes together, as also the juice of Plantane, Purslane, and Lettice, is singular good to help the stone or running of the reines, two drammes also of the seede in powder taken with womens breasts milke, is very effectuall to procure a speedy livery, to such women as have sore paines in their travaile, and cannot be delivered: for with this only seede (saith *Matthiolus*) he hath holpen many women in those cases: the herbe is seldome, when the seede is not to be had, then boyled, or the juice thereof drunk, is effectuall to all the purposes aforesaid, but not so powerfull or speedy in operation, the decoction also, to be bathed or fomented, as also to sit in, is much commended for women troubled.

CHAP. IX.

Filipendula. *Filipendula*, or Droppewort.

OF this *Filipendula* or Droppewort, there hath beene formerly knowne but one kind, *Tragus* setteth forth one greater, and *Ruellius* hath added thereunto another much lesser: *Dodonæus* and others, have called another plant *Filipendula aquatica*, which *Lobelius* calleth *Ricinoides palustre*, as a species thereof, but I dare not allow of their opinions therein, not finding them to agree in roots, or flowers, or seede, and but a little in leaves: I will therefore speake in this Chapter of the ordinary sorts, and of the others in the next, but for the *Dewantbes* (as they are so called) and to many known to us in our Gardens, because they be rather umbelliferous plants, I thinke it fittest to speake of them in that Classis of umbelliferous plants, with the other Saxifrages that are of that Tribe, then joyne them with these.

1. *Filipendula vulgaris.* Common or ordinary *Filipendula*.

This *Filipendula* shooteth forth divers long winged leaves, that is, many small leaves, some bigger and some lesser, set on each side of a middle ribbe, and each of them dented about the edges, somewhat like unto Tansie and wild Tansy, or rather Agrimony, or betweene them all, but harder in handling among which ariseth up one or more stalkes, two or three foote high, having some such leaves thereon as grow below, and towards the top divided into other branches, spreading at the toppes, into many white fiverie starrie flowers, consisting of five leaves a peece, with long threds in the middle of them, standing together like a tuft or umbell, upon small foote-stalkes, which after they have abiden a good while open and blowen, doe fall away, and the seedes appeare in small round knotty heads like buttons, wherein are the small seedes and places, the roote consisteth of many small blacke tuberous peeces, fastened together by many small long blackish strings, which runne one into another.

2. *Filipendula altera major.* Another great *Filipendula*.

This other *Filipendula* is so like the former in the leaves, that it can scarce be discerned from the same: the flowers at the toppe of the stalke, are of a white enclining to a purple, made of five leaves a peece like the other, after which the heads heare round and blackish seede within them, the roote is very many, and somewhat greater and whiter, enclining to rednesse, but fastned together by long strings and fibres as the former.

3. *Filipendula minor.* Small *Filipendula*.

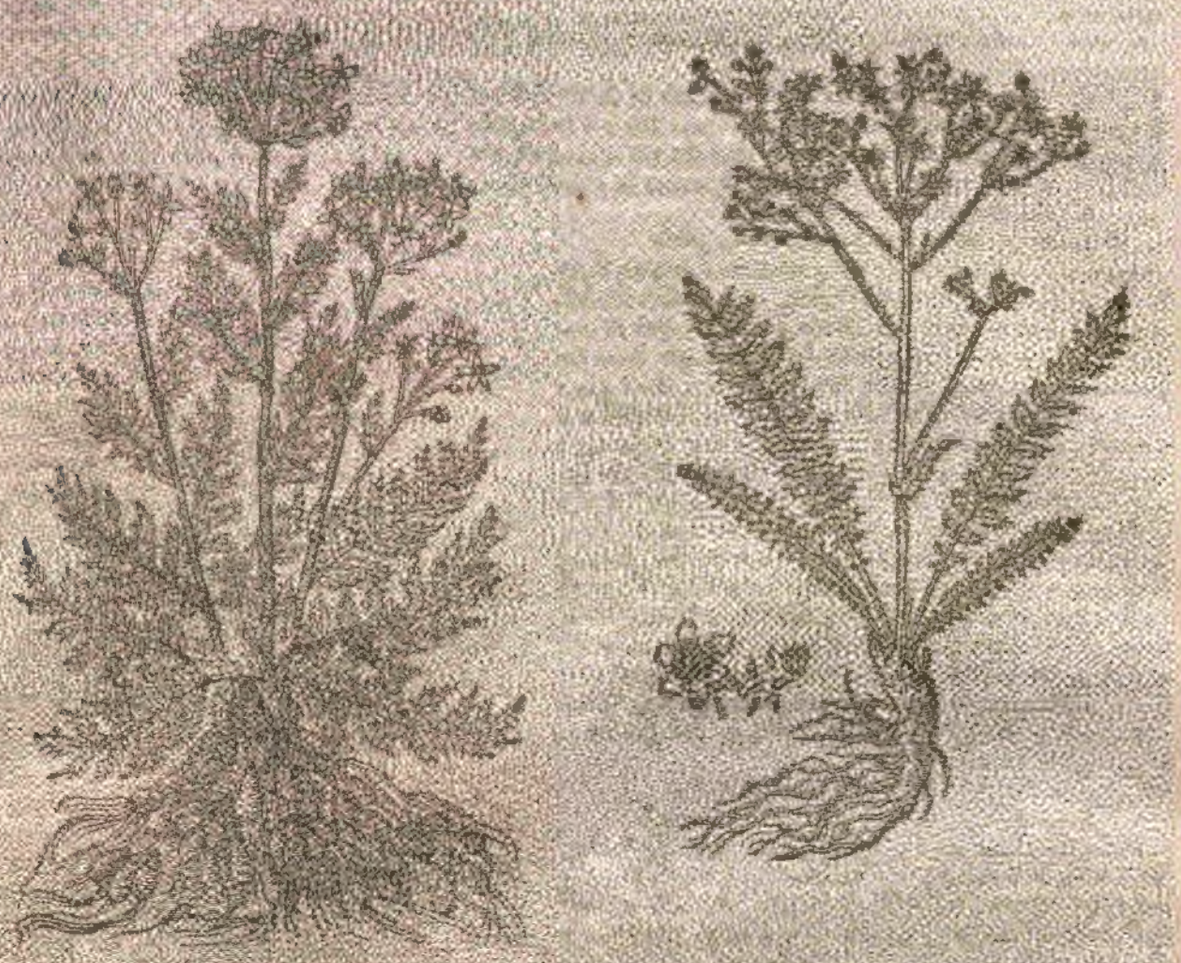
The small *Filipendula* hath two or three such like leaves as the former, rising from the roote, but smaller and more neerely resembling the wild Tansy leaves, but not white as they are, but of the same darke colour with the former; from among which, the stalke that is scarce an handred th high, ariseth up, dividing without division thereon, and sometimes also parted into two or three other branches; whereon grow many smaller white fiverie flowers then the former, but with threds therein like them, and set together like them in the same manner, after which come the seede, many set together, formed almost like unto a small round grape, the rootes are many, and glandulous or tuberous like the former, but smaller and redder, fastned with the like strings like them.

The Place.

The tall is common in many places of this Land, as well upon and about St. *Vincents* rocke in *Bristow* neere *Avon* in the meadows there, as also in the corners of dry fields and meddowes, and their borders: the lesser *Filipendula* (saith *Lobelius*) growes on the toppes of very cold mountaines, the tall was found in divers grounds about *Colchester*.

The Time.

They flower in *June* and *July*, and their seede ripeneth in *August*.



The Names.

This is taken by many learned writers, and herbarists in their dayes, to be the *Oenanthe* of *Dioscorides*, as himselfe declareth in his third booke and 122. Chapter, and not that *Oenanthe* which is taken for the flower of the wild Vine, that beareth onely flowers and not grapes, and because that *Oenanthe* is against *Euphrat*, to whom *Brunfelsius* and *Tragus* doe agree, for so holding it, *Lobel* in his *Adversaria* [illegible]

Original from UNIVERSITY OF MICHIGAN

1. *Filipendula alba sp.*
The greater creeping *Filipendula*.

2. *Filipendula minor.*
The leſſer *Filipendula*.

ſcene is moſt falſe. *Pena* is of opinion againſt *Matthiolus*, proving as he thinketh, every part of *Diſcorides* his deſcription to agree thereunto: yet ſtil *Matthiolus* his aſſertion will hold good againſt *Pena* and *Lobel* that this *Filipendula* agreeth not with *Diſcorides* his *Oenanthe*, eſpecially in the ſeedes, for it is ſuch an eminent marke that none can alter or gainſay. It is called of all moderne writers *Filipendula, quod ramoſi radii in rotundos bulbos definant, ſeu ſub ſpondere videantur*, ſome write it *Philpendula*, becauſe *Nubeſana Myrepſus* called it *φιλοκρεμαστον*. Some thinke this to be *Molon* of *Pliny*, whereof he maketh mention in his 26. booke, and 7. chapter, but it is doubtleſs the *Italians* and *Spaniards* call it *Filipendula*, and the *French Filipende* and *Filipendole*, the *Germanes Rotten Brandwurtz*, that is, red breakeſtone, from whence came the Latine name among them *Saxifraga rubra*, red ſaxifrage, *Wilde* and *Harts*, that is *Millefolium ſylveſtre*: we call it *Filipendula*, and ſome *Filipendula* and *Drupewort*. The ſecond *Lobelius* calleth *Oenanthe alia Myconi*, becauſe he ſaith it is to like the ordinary *Filipendula*, both in outward forme and face of growing, in rootes and leaves, and in the tall and ſtalke alſo, and not unlikely thereby to be of the ſame vertue and property, but *Bauhinus* inſtructeth it rather to the next *Filipendula minor*, wherein I cannot ſee any reaſon, for in my opinion it is the ſame with the former, and not a ſpecies of the next, let others be judge herein that are judicious. The laſt *Bauhinus* letteth forth by the name of *Filipendula minor*.

The Vertues.

The ordinary or vulgar *Filipendula* is ſomewhat bitter in taſte, and thereupon judged to be hot and dry in the third degree, it is very effectuall to open the paſſages of the urine, when it is ſtayed, as alſo to helpe the ſtrangury, and all other paines of the bladder and reines, helping mightily to breake and expell the ſtone, either in the kidneyes or bladder and gravell alſo that is not as yet conденſate into a ſtone, whether you will uſe the leaves, flowers or rootes, but the rootes are moſt ſmall and moſt effectuall, either taken in powder or in a deſcription with white wine, wherein is a little honey is added: the ſame alſo helpeth to expell the *ſecundine* or after birth, taken in the ſame manner; an ancient copy of *Diſcorides* ſaith, it helpeth alſo the yellow Jaundice, *Pliny* ſaith, *Great-ſhell*, was good for thoſe that have the falling ſickneſſe, and that it will helpe them if they uſe it often: the rootes made into powder, and mixed up with honey, into the forme of an electuary, doth much helpe them whoſe ſtomaches are ſwollen, breaking and diſſolving the winde which was the cauſe thereof, as alſo is very effectuall for all the diſeaſes of the lungs, as thortneſſe of breath, wheelings, hoarſeneſſe of the throate, and the roughneſſe and old rheumes cold flegme therefrom, or any other parts thereabouts.

CHAP. X.

Filipendula montana. Mountaine or Hooded *Filipendula* or Dropperwort.

CLusius and others have made mention of divers sorts of this kinde of *Filipendula*, (all I may so call, for I doe herein rather please others than my selfe, who thinke them with *Clusius* to be as unlike one to another in forme, as differing also in qualitie peradventure) yet because such learned men have so accounted of some of them, let me in their errour be joyned with them for this time.

1. *Filipendula montana vulgaris major altera.*

Whitish Mountaine or hooded *Filipendula*.

Filipendula montana.
Mountaine *Filipendula*.

This first hooded Mountaine *Filipendula*, bringeth forth his round trelled or streaked stalkes, of a fingers thicknesse and a cubites height, whereon are set winges of many cut and divided leaves, on each side of them, from the bottome to the toppe, somewhat like those of the former *Filipendula*, or betweene them and Yarrow, but hard and somewhat rough in handling, whereon are growing a long spiked head of whitish flowers, formed like the gaping hooded of the Satyrions or Tellicles, called Cullions or Doggestones, every one set in a five leafed huske, which being fallen, these follow round heades, pointed at the toppes, wherein are contained much small grayish seede: the rootes are many long and thicke strings, somewhat like unto the Asphodill rootes, but not so great, which are set together at the heads, and ending in long fibres, abiding many yeares, and shooting fresh leaves and stalkes in the Spring, although the old die downe to the ground and wither.

2. *Filipendula montana mollior altera.*

Smooth mountaine or hooded *Filipendula*.

This other mountaine *Filipendula*, hath such like stalkes, with long & divided leaves on them, in the like manner, not differing from them, but in that they are nothing hard, but very gentle and smooth in handling; the flowers grow like to the at the toppes of the stalkes, in a long spiked head, many set together, and in forme hooded like them, but are in some of a pale whitish yellow colour, and in other of a reddish purple: the rootes also are not so great and thicke, but rather like Asparagus rootes.

The Place.

Both these sorts grow as *Clusius* saith, on the grathe places, in the mountaines of *Austria* and *Styria*, in *Flanders* also, and in *France* in their Medowes.

The Time.

They flower in *June*, and ripen their seede in *August*.

The Names.

Pena and *Lobel* doe call the first of these *Filipendula altera montana*, and so doe also *Dodonæus* and *Tabernæmontanus*, but *Clusius* doth rather referre both it and the other unto the *Pyllaria* or *Pedicularis*, for that they much resemble it in forme, excepting the rootes, and thereupon calleth them *Alectorolophus Alpinus*: *Bauhinus* calleth it *Filipendula montana flore pediculari*, and with all maketh it to be that *Dioscorides* also, *Matthiolus* and *Lobel* doe call *Pedicularis*, which is more probably another sort, of the former and true *Filipendula*, as I have shewed you in the Chapter before. The second *Clusius* calleth *Alectorolophus Alpinus secundus vel altera*; and *Bauhinus Filipendula montana altera*; I have, as I said before, followed them in this their errour, and doe call them in *English* Mountaine or Hooded *Filipendula*, according to the *Latine*.

The Vertues.

I do not finde any vertues appropriate peculiarly to these plants, either by *Clusius* or any other that have mentioned them, and unles they have the same qualities that the Yellow or red Rattle have, which some call Lousewort, because if sheepe feede thereon, it will cause them to breede lice abundantly: they must abide without use.

CHAP. XI.

Holosteum sive Parietaria. Paritary of the Wall.

THere are two sorts of Paritary of the Wall, although the ancients have mentioned but one, that is greater and a lesser, as shall be declared.

1. *Parietaria vulgaris.* Common Paritary of the Wall.

This kinde of Paritary, or (as it is usually called) Pellitory of the Wall, riseth up with many brownish red, tender and weake, cleare, and almost transparent stalkes, about two foote high, which grow at the severall joynts, two leaves somewhat broad and long, like unto those of French Mercury,

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

Parietaria called Flower gentle, of a darke greene, which afterwards turne browish, not dented at all, but smooth on the edges, rough and hairy as the stalkes are also: at the joynts with the leaves, from the middle of the stalkes upwards, where it spreadeth into some branches, stand many small pale purplish flowers, in hairy, scaly rough heades or huskes, after which come small blacke and rough seede, which will sticke to any garment or cloath that shall touch it: the roote is somewhat long with many small fibres annexed thereunto, of a darke reddish colour, which endureth the Winter, although the stalkes with leaves perish, and springeth a fresh every yeare.

2. *Parietaria minor.* Small Pellitory of the Wall.

The lesse Pellitory of the Wall, groweth in the like manner that the former doth, but not so great or high, having slender reddish rough stalkes, and smaller and shorter, and lesse whatgreener leaves thereon, almost like unto Basill and rougher also, so that they will cleave to any cloth, or other thing that toucheth it, the flowers and seede differ not much from the other, but smaller, and the seede is more like unto Purslane seede, being ruebed out of the huskes, than the other.

The Place.

The first groweth wilde generally through the land, about the borders of fields, and by the sides of old Walls, and among rubbish: it will well endure also being brought into the garden, and planted on the shadie side, where it will spring of its owne sowing, and will not easily be gotten out thereafter afterwards. The other is rare in our Countrie, and in *Germany* also, but neare *Confluence*, where it is naturally found, and not in many other places, neither both of them in one place or very seldome, it doth sometimes hold the greene leaves in the Winter.

The Time.

They flower in *June* and *July*, and the seede is ripe soone after.

The Names.

It is called in Greeke [illegible] and [illegible], the one *quod foliorum & [illegible]*, the other *quod per totam [illegible]* in Latine also *Parietaria*, but not *Cissampelos*, which is described before, *Perdicium, Perforata, & Parietaria, Parietaria* or *Urceolaris*, because the roughnesse thereof serveth to cleanse either pots or glasses, it is called also *Herba Vitrea*, and *herba Cimicalis*, because it most usually groweth by Walle sides, and for the same cause also it is called *Parietaria*, or as some doe write it *Parietaria. Galen* and *Paulus Ægineta*, who followeth him in most things, say, that some in their dayes called it *Parthenium*, but they doe not understand the *Matricaria* for it, but this herbe here entreated of; but there are to be found in the writings of divers, that have written of herbes seven severall sorts of herbes, called by the name *Parthenion* or *Parthenium*; as *Mercurialis, Aethemisia, Chamomilla nobilis, Amaracus* or *Majorana, Mutum, Matricaria*; and this *Parietaria*, *Cornelius Celsus* also, and *Pliny* out of him, doe call it *Parthenium*; and yet *Leonicenus Lonicerus*, and *Rudolphus Agricola*, much doubted, whether any did so call it: the *Italians* call it *Parietaria & Vitriola*, the *Spaniards yerva de muro*; the *French Pariaire* and *Pariaire*, the *Germanes Sun Peterskraut*, as *Tragus* hath, & *Teyenwerk* and *Glaskraut*; the *Dutchmen Glaskruyd*; in *English* ordinary Pellitory of the Wall, but corruptly as I said, for it hath no correspondencie with Pellitory, but to follow the Latine name as most other Countries doe, it should be called Paritarie, and of the wall is added according to both the names of *Parietaria* and *Muralis*: all Authors doe call it generally either *Helxine* or *Parietaria*, and *Tragus* calleth the other *Parietaria secunda*.

The Vertues.

The dried herbe Pariatary made up with hony into an Electuarie, or the juice of the herbe, or the decoction thereof reduced with Sugar or Hony, is a singular remedy for any old continuall or dry cough, the shortnesse of breath and wheezing in the throate: the juyce thereof taken to the quantie of three ounces at a time, doth wonderfully ease those that are troubled with the suppression of their urine, causing them very speedily to make water, and to expell both the stone and gravell that are engendred in the kidnies and bladder, and therefore it is usually put among other herbes that are used in glisters, to mitigate paines in the backe, sides, or bowells, proceeding of winde, or the sharpe Stoppages of urine, or the gravell and stone: it worketh the like effect also, if the bruised herbe sprinckled with some Muskadine be warmed upon a tyle, or in a dish upon a few quicke coales in a Chafing dish, and applied to the belly: the decoction also of the herbe being drunke, easeth the paines of the mother, and bringeth downe the courses that are staied; the same also easeth those griefes that arise from the obstructions of the liver, spleene, and reines: the same decoction also may serve in stead of a bath for men or women to sit in, for the foresaid purposes: the same decoction also with a little hony added thereto, will serve to very good purpose to gargle the throate when it is swollen and pained; the juice held a while in the mouth easeth the paine in the teeth: the distilled water of the herbe drunk with some Sugar to make it the more pleasant, worketh the same effects: and moreover cleanseth the skinne from spots, freckles, purples, wheales, sunburne, morphew, &c. and leaveth the skinne, cleare, smooth and delicate: the juyce dropped into the eares easeth the noise and

humorings in them, and taketh away the pricking and stooting paines in them: the said juyce or the distilled water, doth asswage hot and swelling impostumes, burnings or scaldings by fire or water, as also all other hot sores or inflammations, be it Saint *Anthonies* fire, or any other eruptions of heate, being bathed often therewith, cloths dipped therein, or the said juice made into a liniament with *Cerusse* & oyle of Roses, & annointed thereon: which also doth cleanse foule rotten ulcers, and stayeth spreading or creeping ulcers, and the running scabbes or sores in childrens heads: the same also helpeth to stay the falling of the haire of the head; the said ointment of the herbe applied to the hindrement, openeth the piles, and easeth their paines, and being mixed with Goose grease, or the *Cyprian Ceroni*, doth helpe the gout: the juyce is very effectuall to cleanse fistulaes, and to heale them safely, or the herbe if fresh bruised and applied with a little salt: it is likewise so effectuall to heale any green wound, that if it be bruised and bound thereto for three dayes, you may afterwards take it away, for you shall not needs any other salve or medicine to heale it further: a pultis made hereof with Mallowes, and boyled in wine with Wheate braune, and Beane flower, and some oyle put thereto, and applied warme to any broken sinew, tendone, or muscle, doth in a very short time restore them to their strength, and taketh away the paine of the bruises, and dissolveth the congested blood of any beatings, or falls from high places.

CHAP. XII.

Heliotropium, Turnesole.

THere are divers sorts of herbes that may be called Sunturners, because their flowers doe oppose the Sunne, whereof to speake in this place is not my purpose, neither will the method of the worke admit: but properly of that kinde so called, whereof there are three or foure sorts, as shall hereafter severally be declared.

1. *Heliotropium majus*. The greater Turnesole.

The greater Turnesole riseth up with one upright stalke, about a foote or more high, dividing it selfe small from the bottome into divers smaller branches, of a hoary colour; at each joynt of the stalke and branches stand two small broad leaves, somewhat like unto those of Calamint or Basil, but greater than Calamint, and very little than the greater Basil, somewhat white or hoary also: at the toppes of the stalkes and branches, stand many small white flowers, consisting of foure and sometimes of five very small leaves, set in order, one above another, like a small crooked spike, which turneth inward like a bowed finger, opening by degrees as the flowers blow, and after which in their places grow small cornered seede, foure for the most part standing together: the roote is small and threddy, perishing every yeare, and the seede shedding it selfe, riseth against the new Spring.

2. *Heliotropium majus supinum*. The greater creeping Turnesole.

This creeping Turnesole according to the judgement of *Clusius*, is in a manner but the same with the former greater Turnesole, because it is in most things so like it, yet differeth in these particulars, that it hath more and slenderer stalkes, not standing upright as the former doth, but leaneth downe to the ground, the stalkes & leaves are lesser, but hoary in the like manner; the flowers are white, and stand in crooked spiked tufts, bowing like a Scorpions taile, as the other, but the seede being smaller, standeth thinly, or but few together; the roots are small and perish in like manner.

2. *Heliotropium majus.* The greater Turnesole.

3. *Heliotropium minus.* The lesser Turnesole.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Heliotropium minus*, The lesser Turnesole.

This smaller Turnesole groweth very low, lying almost with his slender weake branches upon the grounds having thereon many small leaves, like the other in forme, but three times lesse in substance, neither stalkes nor leaves white nor hoary, but of a darke greene colour: the flowers are much smaller and yellowish, not growing in long crooked or bowing heads like the former, nor as the toppes of the branches, but standing at the joynts, upon very small stalkes, some above the leaves and others under them, which afterwards turne into small round heads or bottons, like unto warties, wherein is such like seede as the first, but smaller and a little rounder.

4. *Heliotropium tinctorum*. The colouring or dying Turnesole.

This dying Turnesole that beareth berries, three alwayes set together, riseth up with an upright stalke, branching it selfe diversly to the height of halfe a yeard or there abouts; whereon grow broader and softer leaves than any of former like unto those of the sleepy Nightshade, & whitish withall, set without order at the joynts up to the toppes, yet lesser above than below: at the end of the branches come forth small mouse yellowish flowers, which quickly perish and fall away without giving any seede, herein like unto the *Ricinus* or *Palma Christi*, called the great Spurge; for in the same manner also at the joynts with the leaves come forth the fruite or berries standing three for the most part alwayes joyned together upon short foote stalkes, which are of a blackish greene colour, and rough or rugged on the outside, within which is contained a fish-coloured seede, which if the heads be suffered to grow to be ripe, and be dried with the Sunne, will fall out of themselves upon the ground, and spring againe in their season all places the next yeare, thereby renewing it selfe, for the roote is small, and perisheth after it hath borne seede: but these berries when they are at their full maturitie, have within them that is betweene the outer skinne and the inner kernell or seede, a certaine *Iuice* or moisture, which being rubbed upon paper or cloth, at the first appeareth, of a fresh and lively greene colour, but presently changeth into a blood or blewish purple upon the cloth or paper, and the same cloth afterwards wet in water and wrung forth, will colour the water into a claret wine colour; and these are those raggs of cloth, which are usually called Turnesole, in the Druggists and Grocers shoppes, and with all other people, and serveth to colour jellies, or other things as every one pleases.

4. *Heliotropium tinctorum*.
The colouring or dying Turnesole.

The Place.

They doe grow in *Italy*, *Spaine* and *France* in divers places, as *Matthiolus*, *Lobel* and *Clusius* doe set them downe: the two first doe well endure with us.

The Time.

The two first doe flower and seede well with us every yeare, but the other two doe scarce beare any shew of seede with us, in regard we want sufficient heate to ripen them.

The Names.

It is called in Greeke ἡλιοτρόπιον *Heliotropion*, that is, *Solisequium* Sunnurner, so called saith *Dioscorides*, *quoniam folia cum sole circumagitur*, but herein I doubt he erred, for the leaves doe not turne to the Sunne, onely the head of flowers doth the Sunne; and is called also σκορπιοειδὲς Scorpioides, *quia flores Scorpionis caudæ assimilantur*; but *Theophrastus* saith, it is called *Heliotropium*, because it flowreth in the Sommer *Solstice*: the small kinde is called most properly in Latine *Verrucaria*, *a vellendis verrucis*, and *Herba Cancri*: the Italians call it *Heliotropio*, and the Spaniards *Tornasolbuelo*; but the *Spaniards* and *French* call the last *Turnesol* and *Turnesol*. The first is generally called of all Authors *Heliotropium*, and *Heliocacabum* of some, onely *Gesner in hortis*, calleth it *Scorpioides sativum*, and *Matthiolus Hedera Nauseosa*: the second *Clusius*, *Dodonæus* and *Gesner* call *Heliotropium spinosum*, *Lugdunensis* the *Spinosum quartum*, *Clusij*, and *Matthiolus minus spinosum*: the third is called *Heliotropium minus* of *Lobel* and of *Gesner* *Heliotropium minus folio acuto*; *Lugdunensis* calleth it *Verrucaria altera minor*: the last is called *Tricoccon spinosum* of *Pena*, and all others since his time, yet some adde nothing more, *Cornutus* calleth it *Solsequium*, and thereupon the Poet hath these Verses:

Quæ Solis vetat Clytie semper quæ sponte Salem,
Et quamvis Veriturna quæ petit spellet habet.

Lobel calleth it *Heliotropium sativum seu Turnesol*, *alterum*, *sive Plinij tricoccum*, and in his Observations *Heliotropium minus spinosum*, *Theophrasti*, being supposed by many to be described by *Dioscorides* under the name, although hee doe not particularly name it.

The Vertues.

Dioscorides saith, that a good handfull of the greater Turnesole boyled in water and drunke: purgeth both choller

choller and flegme, and being boyled in wine, it is good against the stinging of Scorpions, to be as well drunke as laid upon the place that is stung: the same also boiled with Cummin and drunke, helpeth them that are troubled with the stone in the reines or kidnies or bladder, provoketh urine and womens courses, easeth women and speedy birth, when they are in travell; it killeth the wormes of the belly both long and round, of the leaves and seede of the lesser kinde be taken with Hyssope, Cresses, and Nitre. Some saith that the Author in his time held this opinion, (idle as many other his relations are) that foure graines or seedes of his Turnesole drunke in wine, an houre before the accesse of the fit of the *quartane* ague doth cure it, and that three graines after the same manner will helpe the *tertian*: the leaves bruised and applyed to the places pained with the gout that are out of joynt, and being set are full of paine, doth give much ease, as also for children that have the disease called *Erisipelas*, which is an inflammation of the parts about the braine, and the *temples* thereof, the iuice of the least kinde (but the greater will doe the same also) and the juice of the leaves also being rubbed with oile upon warts, swollen wens, and other hard kernels or excrescences, in the face, eye-lids, or any other part of the body, will take them away, by consuming them a little and a little, with often using it. The dying or colouring Turnesole is also good against all venemous creatures, and chiefly against that great Spider *Phalangium*, and to cause the sting of Scorpions to be without danger or paine, being applyed thereto: It is said also that if you make a circle upon the ground, round about a Scorpion with a branch of this Turnesole, it shall not be able to get out of the circle, but if any shall touch the Scorpion therewith, or call any of the herbe upon it, it shall presently dye: we have no other use of these clouts that are dyed with the juice thereof, then to colour gellies or such any other such things which are frequent in many great mens houses at Festivall times.

CHAP. XIII.

Urtica, Nettles.

I Shall in this place onely shew you those Nettles that are stinging, as peculiar for this Order or Tribe, but if I were to write an universall compacted history together, which the method I have propoled doth not permit; I would then in this as in all others, joyne all the species under one, and shew you all the diversities of them, as well those that are sharpe and stinging as those that are not, but called Dead Nettles, and in them such as smell well, and such as stinke, and such as are spotted, and such as are without spots, and so likewise their variation of colours in their flowres, which heere I cannot in one, I must doe in severall places of this worke.

1. *Urtica Romana.* The Romane Nettle.

The great Romane Nettle growes up with many round hairy branches, rather leaning downe then standing upright, sometimes rising to be of foure or five foote long, spreading into many branches, whereon at the

1. *Urtica Romana.*
The Romane Nettle.

2. *Urtica major vulgaris.*
The greater wilde Nettle.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

3. *Urtica media sylvestris.*
The middle wilde Nettle.

4. *Urtica minor.*
The little wild Nettle.

are two leaues set together, very rough, and although it hath no sharpe prickles, yet it hath a hairy downe thereon, that will sting the skinne most cruelly if it be touched therewith, and raise it full of blisters, as if it were burnt with fire, and dented at the edges somewhat deepely; at diuers places of the branches come forth small stalkes of reddish and yellowish flowers, made of threds, which fall away without bearing any thing else; but at the ioynts with the leaues in other places, from the middle of the branches vpwards, come forth small, round, rough, greene, prickly pellets or buttons, wherein is contained diuers flat browne shining seede, somewhat like vnto Lin, or Flax seede, but smaller and rounder: the roote is yellowish and spreadeth diuers long strings, and small fibres, whereby it taketh fast hold in the ground, yet perisheth every yeare, requiring a new sowing every Spring.

2. *Urtica major sylvestris.* The greater wild Nettle.

This other which is the greater of the wild sorts, hath a pale yellow roote, spreading very deepe into the ground, with long strings, and small fibres, and the branches also lying on the ground take roote againe, and spread a great deale of ground: the leaues are of a darker colour, and sometimes brownish or red, as large, rough and stinging as the former, but not so deepely dented at the edges; at the toppes of the branches, and likewise from the ioynts with the leaues vnderneath, come forth small long branches of flowers and seedes after them, in fashion very like the katchies of the female Mercury, wherein is contained small flat whitish seede, the roote perisheth not like the former, but abideth the winter with some greene leaues vpon it, if it be not too extreame.

3. *Urtica media sylvestris.* The middle wild Nettle.

The middle sort of Nettle, is thought by diuers to be but one and the same with the former, and differing onely by the place of growing, and not growing fully to greater: for it hath the like stalkes and branches, with the like leaues, but lesser and smaller, and thinner set vpon the branches, otherwise in seede or creeping rootes, it differeth not from the first.

4. *Urtica minor sylvestris.* The lesser wild Nettle.

The lesser or least Nettle is in most things like the last, but riseth seldome aboue halfe a yard high, and little or nothing scorched, the leaues also are much smaller, and of a fresher greene colour, but little lesse stinging then the former; the seed is white like vnto it, but the rootes are smaller and perish every yeare, yea twise or thrice in a yeare, as I haue obserued it to shed it selfe twise in a hot yeare, and spring vp againe the third time of the same seede, which being neere winter, perisheth with the first frosts, but riseth againe the next yeare.

The Place.

The first is most usually known in Gardens where it is desired, as it is also both in the vpper and lower *Germany*, and moll places of *France* vsed. but it hath beene found naturally growing time out of minde, both at the towne of *Lidington Romney*, and at the breede of the towne of *Romney* in *Kent*, where it is recorded *Iulius Cæsar* landed with his souldiers, and there abode for a certaine time, which it is likely was by them called *Romania* and corruptly there from *Romney* or *Romny*, and for the growing of it in that place, it is reported that the souldiers brought

brought some of the seede with them, and sowed it there for their use, to robbe and chafe their bodies with through extreame cold they should be stiffe and benummed; being cold before they came from home, the climate of *Britaine* was so extreame cold, that it was not to be endured without some fire or stoves to warme their bloods, and to stirre up naturall heat, since which time it is thought it hath continued there yearely of its owne sowing. It groweth also in the streete at *Bardney* in *Lincolnshire*. The rather that grow in waste grounds, by hedges and wall sides, and many other untilled places, yet they will also be found many gardens, where if they or *Iuniper* is neglected for a while, it shall be hard to rid them out again.

The Time.

They flower and seede in the end of Summer, and the seede is so plentifully that it will sowe and set it spring, and seede againe, that it is hard to be rid out of one yeare.

The Names.

It is called in Greeke ἀπλῆ ἁπλῆ, *quia tactu aspera & pungens*, and κνίδη, *quod vellicet & pungat*, because it pricketh and stingeth: *Apollinari*, in Latine *Urtica*, *ab urendo quod prurientem pungat & urat*, because it pricketh and stingeth: The *Arabians* call it *Humeza*, *Serapio* calleth it *Humeiza*, *Rasis* and the seede of it *Bezer Kenegeden Kedi*. The *Italians Ortica*, the *Spaniards Ortiga*, the *French Ortie*, the *Dutch* and *Netle*, and we in *English* Nettle. The first is called *Urtica pilifera* of bearing *horrentia*, and is the first kinde of *Dioscorides*, called of *Pliny Urtica* of most writers *Romana* and *vulgaris*; for the second is called *Iuvenis*, and of most authors *Urtica mortua*, and *urtica non*. The third is called by *Tragus*, *Urtica sylvestris* and *altera*, and of *Lobelius Urtica sylvestris angustifolia*. The fourth is called *Urtica minor* of all writers, but onely of *Lobelius erecta*, and of *Dodonæus urens minor*, and the third of *Tragus*, *Matthiolus*, *Lobelius*, and *Cæsar Dalpinus* it is the Cowe of Wood, which Cowe-herds should be carefull to root out.

The Nature.

Although Nettles doe hurt in stinging the skinne and flesh, while they are greene, which is called it is sore or rough downe upon them, and might be thought to be cauticke or eating being otherwise used as it is not so, being found to be hot and dry in the second degree; the seede boyled in wine and drunke, doth open the belly and make it soluble; the coores or leaves boyled, or the juice of either of them, as both, and an *Electuary* with Honey or Sugar, is a safe or sure medicine to open the pipes and passages of the lungs, and is the cause of wheesings and thorntie of breath, and helpeth to expectorate rough cold flegme gathered in them, or in the chest or stomacke, as also to raise the impostumated Pleurisie, and spend it by spitting: it also helpeth the Almonds of the throate when they are swelled, to gargle the mouth and throate therewith: the juice also is effectuall to settle the palate of the mouth in its place, and to heale and temper the inflammation and soreneese of the mouth and throate: the decoction of the leaves in wine and drunke, is singular good to provoke womens courses, and to settle the suffocation or stranging of the mother, and all diseases thereof, as also applyed outwardly with a little Myrrhe: the same also or the seed preserved doth and expelleth gravell and the stone in the reines or bladder; often proved to be effectuall to drive the stone broken it; the same decoction also of the leaves or seede, or being beaten and drunke in that decoction, killeth wormes in the bellies of Children, and is said to ease the paines in the sides, and to dissolve or breake the impostume in the spleene, as also in the body; but others doe thinke that it being somewhat windy it is not so powerfull or available to expell wind, but onely to provoke Venery; the juice of the leaves taken three dayes together stayeth bleeding at the mouth, which issueth from the stomacke; the seed being used as a remedy against the stinging of venemous creatures, the biting of mad dogs, the poysonfull qualities of Henbane, Nightshade, Mandrake, or other such like herbes, that stupifie and dull the senses, as also Lethargy, but especially to use it outwardly to rubbe the forehead and temples in the Lethargy, and the bitten or stunge with beasts, used with a little salt. *Nicander* saith, it helpeth them that have eaten Cockle and those that have eaten evill Mushrooms, or Serpent of the ground; the distilled water of the herbe is very good all, (although not so powerfull as well for all the diseases aforesaid, as for outward wounds and sores to wash them, and to clense the skinne from Morphew, Leprey, and other discolourings thereof, the leaves (but rather to use the leaves) being bruised, and put into the nostrils, doth stanch the bleeding of them, and destroyeth flesh growing in them, called *Polypus*: the juice of the leaves or the decoction of them or of the roote is not good to wash either old sores and stinking sores, or fistulaes and Cancers: also such as are spreading or corroding sores. Also to anoynt the sinewes in any part of the body, as also green wounds to wash them therewith, or putting the juice into the sores of wounds, or applying the green herbe bruised unto them, yea although the flesh were separated from the bones, the same also applyed to over-wearied members easeth them, or to places out of joynt, after the joynt is set in its right place, it likewise heateth, drieth, and easeth them, as also to those places troubled with aches and gouts: and the decoction of the roote is good for sinewes, it easeth the palsey, and dryeth, or all it moysteth the defluxions: an ointment made with the juice and a little waxe, is singular good to rubbe cold and benummed members, to bring them to their perfect power again: a handfull of the greene leaves of Nettles, and another of Wall-wort or Dane-wort brused and stamped very finely of themselves to the Gout, Sciatica, or joynt aches, in any part, hath been found to be an assured helpe thereunto: it is said that if greene Nettles be put into the urine of a sicke body, if the party shall make water in it but seven foure and twenty houres therein, the party shall recover of that sickenesse, but if the urine turne greene, it foreshewith death or great danger; if you give hennes some dry Nettle or rubbish to eate, it will make them lay in winter, it will make them lay egges all the winter more plentifully; it is said also, that if the juice be put on the privities of female beasts, that will not suffer the males to cover them, it will cause them the more hastily to suffer them to doe it: the oyle of roses or Millet oyle boyled with the juice, or the juice of the leaves themselves, is a present remedy to take away the stinging of the Nettles: of all the particulars aforesaid the seede is held the most effectuall, yet where it cannot be had, the other are in a degree next it, as the leafe the leafe is thought of some to be lesse powerfull, and of others to be as available as any of the other two.

Cap.

Chap. XIV.

Polygonum major. Great Knotgrasse.

THe Knot-grasses are divided into two kindes, male and female, of the male kindes I shall speake in this and the following Chapters, because they are of many sorts, some greater, others lesser, and some Sea plants, the female being called Sharegrasse, or Horsetailes, shall be entreated of in another place; I thinke it fittest therefore to divide these into three parts, and speake of the greatest in this Chapter, of the lesser kindes in the next, and of those kinds that beare fruite or berryes in another following them, that so being orderly set downe, every one apart, it might yeeld the more profit to the reader.

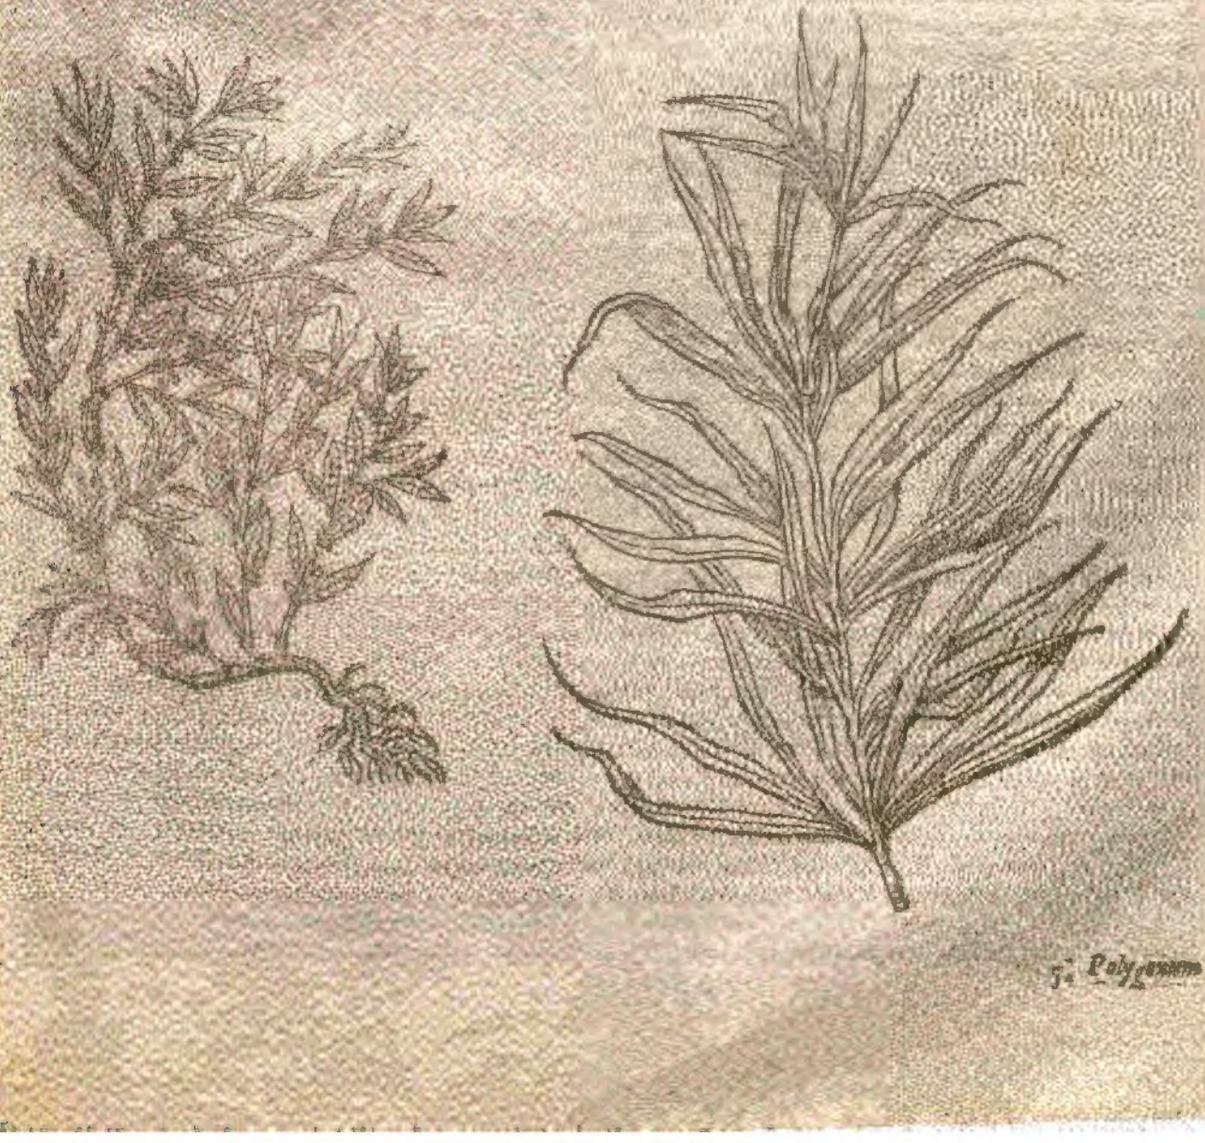
1. *Polygonum vulgare majus.* The greater common Knot grasse.

The greater common Knot-grasse shooteth forth many long slender branches full of joynts, lying upon the ground, with divers long and narrow leaves set thereon, one for the most part at a joynt, having moll naturally a small white skinne that covereth the joynt; whereat, especially from the middle of the branches upwards come forth the flowers, which are so small, that they are for the most part not seene and discerned, which in some are white, in others of a whitish purple colour, which after turne into very small square seed like unto Sorrell seede: the roote is reddish, small, short and round, abiding the Winter, and shooting a new every yeare. I saw in Mr. D. *Faces* booke of dryed herbes which he received from *Padua* greater sort hereof, whose figure I here give you. *Maximi joinis.*

2. *Polygonum vulgare minus.* The lesser common Knotgrasse.

This lesser Knotgrasse groweth in all things like the former, and differeth from it onely in the leaves, which are smaller, and neither so broad or long, and the flowers hereof are alwayes white.

3. *Polygonum minus breviori folio.* Small short leafed Knotgrasse.



This other small kinde, hath likewise many slender joynted branches, but more woodily then the former, spread also into some other smaller ones, whereon grow small short leaves, lesser then those of the small St. *Johns* wort: the flowers are small and white like the other.

4. *Polygonum Sanguile.* Stony Knotgrasse.

The stony Knotgrasse hath many weake trayling branches full of joynts, rising from a small white fibrous roote, lying upon the ground, round about it, whereon grow leaves that are somewhat round, being of an inch in length, and halfe an inch in breadth, but growing smaller to the stalkeward, greene on the upperside, and of a whitish meally colour underneath, at the joynts come forth small pale reddish flowers, like unto the other, and after them followeth such like seede as to the other.

1 *Polygonum vulgare majus.*
The greater common Knotgrasse.

Polygonum maximum folijs.
The greatest Knotgrasse.

5. *Polygonum*

5. *Polygonum marinum maius.*
The greater Sea Knotgrasse.

The greater Sea Knotgrasse mounteth not into many and much larger branches then the first, lying on the ground, yet full of joynts, set very thicke with leaves thereon, somewhat like the common kind, but thicker, somewhat thorter and broader, and of a darke greene colour above, and whiter underneath: the flowers stand at the joynts in the same manner having small white skinnes that cover the fruits, which in some also are of a white, and in others of a purplish colour; after which commeth small seede enclosed in whitish shining skinnes; the taste of the whole plant and every part thereof is astringent, but somewhat salt withall: the roote is somewhat great, thicke, blacke, long, and somewhat woodily.

6. *Polygonum marinum minus.*
The lesser Sea Knotgrasse.

This lesser kind hath longer stalkes then the last, covered with a reddish barke, and more divided into smaller branches, having fewer joynts on the greater stalkes, but the branches are thicke, set with smaller leaves then the former, and are somewhat fat and thicke, long and narrow like the common kinde: the flowers are small and whitish, and the seede is not much unlike the last, the roote is somewhat long blacke and woodily, with a few fibres set thereat.

The Place.

The first two sorts grow every where, and in every Country almost, both by the fore-waits in fields, and on the sides of high-wayes that are grassie, but in time it overspreadeth them, and by the sides of old walls. The third groweth upon the higher grounds, and upon hills and mountaines. The fourth in the same places also, among the stones in the rougher parts. The two last grow by the sea side in divers places.

The Time.

They spring up late in the Spring, and abide all the Summer until Winter, when all their branches perish.

The Names.

It is called in Greeke πολύγονον, *Polygonum, quia multis geniculis crescit*, which name is usuall to it, because it is also called *Sanguinalis, Sanguinaria* and *Prostrata*, of the several properties which all sorts or most of them have: in the Apothecaries shops in Italy and many other parts it is *Corrigiola*, and used for the severall purposes aforesaid, to correct the heate of the stomacke and body, or for the same known that every branch hath. The *Arabians* call it *Bajae rosharis*, the *Italians Poligono, Corrigiola, Lingua Passerina*. The *Spaniards Corrigiola*. The *French Renoüee, Corrigiole*, and of the *Brabanters de Cruy*. The *Germans Wegetritt*, and *Weyderich*. The *Dutchmen* vogelt de varkens kruyt. In some parts of England it is called Swines grasse, and Swines grasse, and in the North Country of divers, hard tongues, from one of the last names. All three sorts are usually called of authors *Polygonum mas et foemina*, for they are like unto the one is bigger or taller then another (for the *Polygonum femina* or *Foemineum* differeth in nothing from this, and shall be entreated of among the *Equiseta*, Shavegrasses, or Horsetailes, as being likest unto them, though not rough) so we also call the first *Polygonum maius* or *maius*, for distinction sake from the second, though they are both called *minora*, yet the chiefe thought by *Dodonaeus* in his *Pemptades*, both to be the *Polygonum Erucoforum* of *Theophrastus* in the 6. of his *Historie of Plants*, (which *Cornarius* hath rendred *Polygonum Horna Alectoris*) and also the *Sedum minimum* or *Herba Sexangularis* of *Pliny*, for he seemeth to call it by which *Theophrastus Polygonum* should be referred. The fourth *Sanicula* called *Polygonum Sanicula* is not before him that I know hath made mention of it. The fifth is called *Polygonum marinum* by *Lobel* in his observations, and *Polygonum marinum maius* in his *Adversaria*, and of *Lugdunensis polygonum marinum Valerandi*, so he called the first *Polygonum marinum alterum Dale* calleth it *Polygonum marinum tertium*, calling the first *Polygonum*.

The Vertues.

The common sorts of Knotgrasse are cooling, drying, and binding, in so much that the juice of them is of such vertue to stay any bleeding at the mouth, being drunke in Hippocras or red wine, and the bleeding at the nose, if it be applyed to the forehead and temples, or to be snuffed up into the nostrils: it is also to have great vertue to cool and temper the heat of blood, or of the stomacke, and to stay any flux of the blood or humours of the belly, as all fluxes or bloody fluxes that come by choller adust and hot putrefaction, or the immoderate womens courses, or the running of the reines also, the juice given before the fit of an ague, that is of a double quotidian, is said to expell it and drive it away, it is also singular good in the cholick or griping of the guts, when it pulleth it away by the hippes, and with paine, which is called the strangury, or stopping of the urine, and the stone in the reines or kidneys, gravell or the flone in the reines or kidneys, or bladder, as also the dysurie or difficulty of making water, the powder of the herbe in wine for many dayes together; which effects it performeth not so *Gesner* seemeth more to say, but only saith that *Dioscorides* hath not fully expressed the manner of the diseases and how it should be given: being boyled in wine and drunke, it is profitable for those stung or bitten by venemous creatures, and the same is very effectuall to stay all defluxions of humours and rheumes upon the stomacke, and killeth likewise the wormes of the belly or stomacke, and [illegible] all the [illegible]

parts of the body, either in the stomach or belly or other parts that are from the heart, digesteth and corrupteth flegm and choller, the fretting waters breed ulcers by it selfe, or with the powder of the herbe or seede, to wash the mouth for the purposes aforesaid: the said waters or the juyce of the herbe is accounted as one of the principall remedies to coole all manner of inflammations, even that proceed of fire or any other burning, as also all hot swellings and eruptions of the skinne, all congestions, that is curdling and turning or warping of the milke in the brests, and pestilent sores, and malignant cancers, or fretting ulcers being applied or put into them, but effectually for all sorts of ulcers and sores happening in the privy parts of men or women, refraining the humours from falling into them, and cooling and drying up the hot and moist inflammations, that are wont to follow such sores in such places: it no lesse helpeth all fresh and greene wounds, by refraining the bloud, and quickly consolidating the lippes of them: the juyce dropped into the eares helpeth them wonderfully, although they be soule, and have running matter in them: the ten kindes of Knotgrasse, are not thought to be to cooling and operative to the stomach, as they have gotten more heate by their salt habitation; yet effectuall in many of the other properties, the salt quality cooling somewhat the more penetration.

Chap. XV.

Polygonum minus. Divers sorts of small Knotgrasse.

THese smaller kinds, there are many more than of the former, differing the one from the other, as shall be declared hereafter: but first I will shew you those that come nearest in outward face and forme unto the other, next going before, and the smallest after ward.

a. *Polygonum montanum vulgare.* White Mountaine Knotgrasse.

This Mountaine Knotgrasse is not unlike a white silverlike plant, especially in the hotter countries, and when it is growne old that it groweth much higher to the beholders of it: for it spreadeth many weake trayling branches upon the ground, in long plants one full an hand-breadth, in others a foote long, as full or fuller of joynts than any of the former, and thicke set also with smaller branches; whereon are placed very small long leaves, lying almost like scales upon the whitish hard stalkes, those leaves are greene at the first and tender, but when they are growne old, they will be of a shining silver colour, and hard like thinne cut parchment, the toppes of the stalkes and branches being thicke set with small white silver-like leaves: and at the joints also come forth very small white flowers scarce to be discerned, where also after ward there is the like seede, but smaller: the roote is small long and white, not perishing, neither the branches nor the leaves in the Winter in his naturall place, but will not endure our cold blasts and nights, and therefore perisheth unlesse it have more especiall care and provision to preserve it.

a. *Polygonum montanum vulgare.*
White Mountaine Knotgrasse.

b. *Polygonum montanum Germanicum latifolium.*
Mountaine Knotgrasse with Stonecrop leaves.

This small herbe Knotgrasse hath much his family leaves, but greater, it groweth not much more than a foote high, sending forth many slender whitish reddish stalkes full of joynts which doe a little bend themselves downe againe to the ground; at the joynts are set small long round fat leaves like unto stonecrop pointed but not sharpe at the ends, set with the leaves; at the last joynts towards the toppes are small double flowers, that is one within another somewhat large, that it doth seeme many, of a greenish colour, and spoonlike: after with divers whitish small threds in the middle growe to be discerned, after which come small reasonable seede, chill and small seede therein: the roote is hard white and threddy: this hath neither taste nor scent much to be perceived thereby, only a little harth and drying and somewhat astringent: it delights to grow in stony places, and in walles with the Stonecrops and Wallewort, with Knotgrasse, and the like sorts of herbs.

c. *Polygonum [illegible] Austriacum.*

The [illegible] Knotgrasse.

The [illegible] found in Austria, and [illegible] the Austrians, it [illegible] the [illegible] [illegible] [illegible]

4. *Polygonum minus Monspeliense.* Small knotgrasse of *Montpelier.*

This small *French* Knotgrasse hath divers small branches lying upon the ground, full of joints, whereout are small greene leaves, being somewhat round and like unto those of the small Centuries: the flowers are small and of a whitish colour, tending unto greene, standing at the toppes of the branches onely, and many there together, which afterwards give very small seede: the roote is small, but very long, growing downe deepe into the ground: this plant is very like *Clusius* his *Anthyllis Dioscoridis*; but *Bauhinus* controlleth him touching the same that would so take it for that *Clusius* his *Anthyllis* hath reddish branches, and this hath greene, having much smaller leaves, and more store of flowers, and that of a purplish colour, and none at all standing at the toppes of the branches: all which considered, he determineth that this is a differing sort from the other.

5. *Polygonum Creticum Thymifolia, Candy* Knotgrasse.

This small *Candy* Knotgrasse lieth likewise with his small branches upon the ground, not past an hand breadth in length: the leaves stand at the joints, sometimes but one or two, and sometimes three or foure, differing in bignesse and length one from another; with the leaves stand also many small white flowers together, as it were in a knot or bunch: after which commeth the seede, which is small and plentifull.

6. *Polygonum Serpilli folio Lobelij, Lobel* Knotgrasse with Mother of Time leaves.

This Knotgrasse that *Lobel* hath set forth in his *Adversaria*, hath very long threddy stalkes spread upon the ground, branched forth in divers places, with many small long and round leaves sappie or full of juyce, somewhat like unto Stonecroppe, set together at the joints: the whole plant somewhat resembleth *Serpillum Narbonense, French* mother of Time: the roote is long and woodie, of a bitterish taste, somewhat hot upon the tongue.

7. *Polygonum Germanicum sive Knawell Germanorum, Germane* Knotgrasse or Knawell.

The *Germane* Knawell sendeth forth from a small slender threddy roote, divers small branches, not fully lying downe on the ground, halfe a foote long full of joints, thickly set together, at every one whereof, stand many very small and long pointed leaves, of a grayish greene or ash colour, which are of an unequall length, two for the most part longer than the other: at these joynts with the leaves grow out divers small herby or greene starre-like flowers, thicke set together, which being fallen there appeare in stead of husks, no bigger than Millet seede, great store of very small seede, like dust, or the seede of *Herniaria* or Rupture wort, which are of a quicke hot sent, somewhat sweete.

8. *Polygonum alterum Germanicum.* Another *German* Knotgrasse.

This other Knotgrasse of *Germany*, doth very much resemble the former, both in the manner of the growing with slender trailing branches, and small long hoary, or grayish greene leaves, many set together at a joint, that they are longer than they, some of them two inches long, especially those next the roote: the flowers stand not at the joints with the leaves, but at the toppes of the stalkes and branches, many clustering together, which are very small and white on the inside, but of a brownish red colour on the outside, which after turne to very small seede, and in a plentifull manner: the roote is small long, and white.

9. *Millegrana major sive Herniaria vulgaris.* Rupturewort.

The Rupturewort spreadeth very many threddy branches, round about upon the ground, whose [illegible] divided into many other smaller parts, full of small joints, set very thicke together, wherein come forth [illegible] rie small leaves, of a fresh yellowish greene colour, branches and all, where at grow forth like unto [illegible] excessing small yellowish flowers, scarsely to be discerned from the stalkes and leaves, which turne [illegible] as small as the very dust: the roote is very long and small, thrusting downe deepe into the ground: [illegible] ther smell nor taste at the first, but afterwards it hath a little stiptive or astringent taste, without any [illegible] heate, yet a little bitter and sharpe withall.

10. *Herniaria major Africana.* The greater Rupturewort of *Africa.*

This *African* kinde groweth greater, larger, and more upright than the last, and fuller of branches, [illegible] things little differing.

x. *Polygonum montanum Pyrenaicum folijs.* Mountaine Knotgrasse with Stonecroppe leaves.

2. *Polygonum Palæstinum.* Spanish Knotgrasse.

11. *Millegrana minima sive Herniaria minor.*
Rupturewort with longer leaves.

This other kinde of Rupturewort, hath likewise small threddie stalkes, but with fewer joints, and long narrow leaves, somewhat rough or hairy set at them, fuller of branches towards the toppes, where the flowers and seede doe grow like unto the other, and in a plentifull manner also: the roote is small but not so long. *Bauhinus* maketh mention in his *Pinax* of one which he calleth *fruticosa* with woodie low stalkes, and some long leaves growing thicke thereon.

The Place.

The first groweth both about *Arles* and *Marselles* in *France*, and in *Valentia*, *Murcia*, and *Salamanca* in *Spaine*, as *Clusius* and *Pena* doe record: the second in *Naples* as *Columna* saith: the third *Clusius* saith, groweth likewise about the Castle of *Valentia* in *Spaine*: the fourth both on the mountaines of *Escurial* in *Spaine*, and in the barren grounds about *Montpelier* in *France*, as *Bauhinus* also saith: the fift in *Candy*, as *Bauhinus* saith, who had the seede from thence: the sixt upon the hills neare the sea in *Provence* of *France*, as *Pena* also saith: the seventh in the West countrie about *Chipnam*, if *Lobel* his figure be true; and in many places of *Germany* by the wayes sides; and so doth the eight likewise in drie sandy and rockie places: the ninth groweth in many places of our owne Land, as well as in others, in drie barren grounds, where it will be small, and in the moister places also, but not boggie or morish, that are not shadowed: the tenth in *Africa* neare *Tunice* where *Guilliame Boel* gathered it: the last in the drie chalke or stony grounds of *Kent*, and other countries.

7. *Polygonum Germanicum sive Knawell Germanicum.* Germane Knotgrasse or Knawell.

Fruticosa.

8. *Herniaria vulgaris.*
Rupturewort.

10. *Herniaria major Africana.*
The greater Rupturewort of *Africk*.

The Time.

They all are fresh and greene in the Summer, and unto the Winter, which causeth the most of them to wither and drie, and in the meane time they perfect their seede.

The Names.

The first is called of *Lobel* and *Pena* in their *Adversaria Polygonum montanum minimum rotundum, & serpens*, of *Clusius Exercitus Hispanica*, of *Lugdunensis Polygoni Hispanici genus Clusij*: *Tabernamontanus* and *Gerard* call it *Polygonum montanum*, and *Bauhinus Polygonum minus candicans*: the second *Columna* calleth *Vermicularia montana repens*, and *Bauhinus Polygonum minus montanum Vermiculatæ folijs*: the third *Clusius* calleth *Anthyllis Valentina*, because he saith *Plaza* and other the learned Phisitions of the Vniversitie of *Valencia* in *Spaine* did so account and call it; which as he saith, although it might be a kinde thereof, yet it could not be *Dioscorides* his fifth *Anthyllis*, because it hath upright stalkes, which this hath not; but all other Herbarists doe account it a kinde of small Knotgrasse, and so have I called it, although somewhat differing from him: *Bauhinus* maketh it an *Anthyllis* among his *Anthyllides* and a *Polygonum* also among these, calling it *Polygonum graminea folio majus erectum*, which in my opinion is not fitting unto it, so that it neither groweth upright, nor hath such long leaves, that they should resemble grasse: *Dodonæus Bauhinus* in his *Canon*, maketh to be both his ninth small Knotgrasse, calling it *Polygonum minus repens flore*, and also his twelfth by the name of *Polygonum minus tenuifolium*; and in both places referreth us to the fourth *Polygonum* described in his *Prodromus*, whereby he filleth up the number of sorts without reason: the *Anglo Saxons* so called it, as it is in the title: the first *Lobel* calleth *Polygonum alterum pusillum vermiculatæ Serpilli folio*.

folio, and *Eyndouensis*, *Polygonum alterum Serpilli folio*: but *Bauhinus Polygonum maritimum minus folio Serpilli* the seuenth *Tragus* accounteth to be a kinde of *Polygonum*, which they of the countrie called *Knawel*, bee thinketh it might be called *Polycarpon* of the abundance of seede, and *Polymenon* of the vertues. *Lobelius* also calleth it *Polycarpon*, and *Dodonæus* in his *Frumentum* calleth it to be a *Polygonum* [illegible] calling *Polygonum Selinoides sive Knawel*, wherein hee is deceiued many wayes. First, in that he giueth the name of *Selinoides* vnto *Knawel*, when as his owne description and figure thereof might haue plainely conuinced that error in him, in that *Knawel* hath not leaues like *Selinum* or Parsly: secondly, that he maketh *Knawel* and Parsly to be one, whereas they are two plants; then againe that he thinketh that *Saxifraga Anglicana* of *Lobel*, which he saith he found about *Chepstow* in the Welch countrie to be Parsly pert, whereas *Lobel* and *Penny* their description and figure doth contrary also that opinion, although their figure be somewhat like, as *Gerard* himselfe confesseth which he calleth *Selinoides*: againe, that he thinketh the Parsly pert, that was shewed by a countrey Empirike to Mr. *Bredwell*, was *Knawel*, which as it is likely Mr. *Bredwell* shewed him, and yet he could not discerne face of the one herbe from the other: and lastly he findeth fault with the name Parsly pert, calling it the vnlearned word, and would amend it with his owne fine Latine word *Petra pungens*, not vnderstanding the true Etymologie of the word being corrupted, as for the most part all quantuall or hard words are to the vulgar sort, the vncorrupted word is *Persepierre*, a true *French* word, and signifieth the same that *Lithospermon* in Greeke, *Saxifraga* in *Latine*, or *Gerard* his *Petra pungens*, if ye like it; Breakestone in *English*, of all which I shall speake more fully in the next Chapter: but I haue here before giuen you my opinion of the *Saxifraga Anglicana* of *Lobelius*, which I thinke the *Knawel* of *Tragus* to be it so many might imagine by the likenesse of their figures being compared together; but surely it may be a kinde thereof: the forme and strong sweet smell, which *Tragus* vnto doth inducing me in part so to thinke, but that the small greene flowers and seede in them be much different from the Pincke-like white flowers in that: the eight, I call *Polygonum alterum Germanicum*, another *Germanicum* because it is so like thereunto, and that *Bauhinus* saith, the *Germane Knawel* hath many varieties, whereof I count this to be one, and it is probable also, that both the *Polygonum montanum minus*, and the *Asbestin* [illegible] be a species thereof; *Bauhinus* himselfe calleth it *Polygonum humifusum minus flosculis fructum albicantibus* which is called *Empetron* by *Tragus* and *Lonicerus*, but not truely; *Polygonum minus* by *Matthiolus* and *Camerarius* that followeth him, *Herba Cauda minor* by *Cordus* in his *Scholia*, and *Millegrana* in his history of plants, *Saxifraga* by *Anguillara*, *Herba Turca* by *Lobel* and *Castelpetus*, *Herniaria multis* [illegible] *Serpilli folio* by *Fuchsius*, *Adversaria*, and generally *Herniaria*, and so by *Cesalpinus in herbis Germaniæ*, and *in libello de collectione Semp.* *Camerarius Dodonæus*, *Thalius*, *Lugdunensis*, *Tabernæmontanus*, and *Gerard*, and by *Bauhinus Polygonum* [illegible] *Millegrana minor*; the tenth we haue imposed the name as it is in the title and most fitting thereunto called *Millegrana minima* by *Lobel* in his *Dutch* Herball, and in his *Icones stirpium*, by *Thalius Flos minutus*, and therefore I call it *Herniaria minor*, *Bauhinus* calleth it, *Polygonum minimum*, *sive Millegrana minima*.

The Vertues.

All or most of these sorts of Knotgrasse, doe participate with the former in the binding qualities although altogether too much in the cooling, some of them hauing a little bitternesse or sharpenesse in them, which [illegible] some heate, and therefore hath not that abundant moisture, which *Galen* saith, is in the former, which as he saith, they haue their cooling qualities they serue to prouoke urine, and helpe to breake and expell the stone and gravell by urine, as the others doe, yet wee haue not so euident testimony of the operations of these sorts, (how soeuer the delicacie of forme in some of them doe argue in mans iudgement some singular effect which yet doth not alwayes follow, for in many deformed, there is found much more helpe; as we haue seene in the rest, which are these in particular; *Tragus* saith that *Knawel* hath the same properties that Knotgrasse hath and may serue in the stead thereof to all purposes, as well inward as outward remedies, when the other is not at hand, and that it is very powerfull to breake the stone, being boyled in wine and drunke, which our countrie people doe averre also: the other *Germane Knawel* or Knotgrasse being of the same kinde, worketh the like cure. Rupture-wort hath not his name in vaine, for it is found by daily experience in a number that haue taken it to helpe and cure the rupture, not onely in children, but in elder persons, so as it be not too old and inveterate, by taking either a dramme of the powder of the dried herbe, every day in wine for certaine dayes together, as the strength of the disease and age of the patient doe require; or the decoction made of the herbe in wine and drunke, or the iuice or distilled water of the greene herbe taken in the same manner; and helpeth all other hurts, both of men or women, vomitings also and the Gonorrhœa, being taken any of those wayes aforesaid; which doth assuredly helpe also those that haue the stranguric, and haue their urine stopped, or are troubled with the stone or gravell in their reines or bladder, causing them that take it to urine plentifully, and thereby to cause it wash downe whatsoeuer sticketh or is offentiue in the passages thereof: *Fuchs Historiam de stirpium* [illegible] *c.* 62, *fol.* 268, the same also helpeth much all sticches in the sides, all griping paines or torments in the [illegible] or belly, caused by collericke or sharpe or salt humours; it helpeth the obstructions of the liuer, and the yellow iaundice likewise; it killeth also the wormes in children: being outwardly applied it [illegible] wounds very notably, and helpeth much to stay defluxions of rheume from the head to the eyes, whether [illegible] being bruised greene and bound thereto, or the decoction of the dried herbe, to bathe the forehead and temples or the nape of the necke behinde, it doth also drie up the moisture of fistulous vlcers, or any other [illegible] such kinde of sharpe humors are growne foule and spreading: the better Rupture-wort is not made [illegible] to all the faculties of the other.

CHAP. XVI.

Polygonum Selinoides, Parsly pert, or Parsly Breakestone.

HAue as yet [illegible] separated this kinde of Knotgrasse from all the other in the last Chapter, and that for [illegible] our iust reason as I take it, because the face and forme thereof, is so much different from them, as the ensuing description will declare: the roote is very small and threddy, but abiding diuers yeares, and [illegible] in all places, from whence come many leaues, spread upon the ground, each standing on a small [illegible]

Original from UNIVERSITY OF MICHIGAN

stalke, and being so broad as the nayle of a mans finger, or thereabout, is very much jagged on the edges, making it seeme to be foure square like unto a Parsley leafe, whereof came the name, but of a greener worse or dusky greene colour: from among which risen up weake and slender stalkes about three or foure fingers long, set full of the like leaves but smaller up to the toppes, that scarce no part of the stalkes can be seene, and all together not standing close thereunto, few of them having any roome betweene them, or very seldome among these leaves come forth very small green with yellow flowers, hardly to be discerned, whereafterwards groweth the seede, as small as any of the former.

Stone Parsley or Englishe Petroselinum Sylvestre.
Or Ply perse Parsly breakestone.

The Place.

This groweth naturally in most countries of this Iland, if it be cultivated by any that have skill, but especially in such barrein and dry grounds as doe not yeeld moisture, for it loveth much more in the wet places then in the dry. I found it upon *Hampsted* Heath by the foote pathes, where being a dry ground, and in a dry time, it was very small, which else in smaller time, and in a moister place upon the same Heath, was much greater, as also neare unto the mereestones by *Lambeth*, which divide the liberties of *London* from *Surrey*.

The Time.

It is to be found all times of the Sommer, Spring, and Harvest, even from *Aprill* unto the end of *October*, in severall places: for in the open and sunny places it will be withered, when in the shadowy and moist it will continue.

The Names.

This plant (being of long continuance in our land and knowledge to us, by the properties, for it hath not beene mentioned by any the most curious searchers and writers of herbs beyond sea, as being onely peculiar I thinke to our Country, before *Lobel* came to us, who called it *Petroselinum Anglicum* and *Anglicum* from him) hath received no Latine name at all, and therefore I have transferred the name *Petroselinum Sativum* hereunto, as more proper unto it, then *Gerard* knowes it to be unto it, for it may most fitly be reckoned a *Petroselinum*, by the manner of the growing, and the name *Selinoides* may most fitly agree unto it from the forme of the leaves, being derived from the Greeke word *Selinon* for *Smallage* hath no likenesse with *Selinum* Parsly. In the former Chapter I shewed you *Gerard* his errours herein now let me shew you mine also (if peradventure I speake not *per calumniam*) concerning these names of *Percepier* or *Parsle peer*, as some call it, and Parsly pert, or Parsly breakestone, as they are usually called in *English*. I shewed you before that the word Parsly pert, was but a corruption of time in the vulgar sort, and *Percepier* also, derived from the *French* word *Percepierre*, which as I said before, beareth as much as *Lithontripton* in *Greeke*, *Saxifrage*, *Petrosilinum* an old outworne word, and *calculum frangit* in Latine, pierce stone, or breakestone in *English*; some call it Parsly pert and derive it from *petra* but more proper English, is Parsly breakestone. Now concerning this and *Lobel* his *Saxifraga Anglicana*, both of them are affirmed by *Lobel* to grow in the West Country, and both are used for one purpose, I yee *Lobel* seemeth to restore the *Percepier* unto the *Cerefolium*, & *Scandix sive Pecten Veneris*, or partaking of both of them, but not unproperly in my minde, which hath caused *Bauhinus* in his *Pinax*, following his opinion to make it a speciall of *Cerefolium*, calling it *Chærophyllo similis annua planta*, and *Tabernamontanus* thereupon calleth it *Scandix minor*: and *Coloneus* was also much deceived in thinking this to be an *Alchymilla*, calling it *minima montana*.

The Vertues.

This herbe hath properly with the vulgar sort, both men and women leeches, who have had most practice of it, not found any other operation then to helpe to provoke urine, and breake the stone in those that are troubled therewith, for which purposes it is most availeable; for they use to eate it familiarly as a Sallet herbe, and pickle it up as a *Samphire* to eate in winter, but is used also more Physically, either by it selfe or with other things, and either in powder or in iuice, decoction or water distilled from it, whose severall wayes, that I may declare them a little more amply are these. Take of the iuice of the herbe about three ounces, put this with so much white wine, as will make a posset, take hereof every morning and evening a draught, or ye may adde hereto Wild Time, or Mother of Time: and some Camomill: You may also boyle these herbes aforesaid, in white wine, or in water if wine be not at hand, and drinke it when it is strayned in the same manner, the powder also of the dryed herbe, to the quantity of a dramme or lesse, in white wine, or in other drinke where wine is wanting, for divers dayes first and last, and the distilled water of the herbe taken with a little Sugar in the same manner, is likewise a singular remedy to provoke urine, when it is stopped wholly, or pulleth away by drops and pains, it taketh them away without paine, expelleth store of gravell in those that breede it, and the stone also in processe of time, by washing it downe by the abundant passage of the urine, and helpeth also to expulse it out of the bladder, if the stone grow not too great for the passages; otherwise it is held very probable, that the stone being softned by the vertue of the medicine, and there abiding, worketh it selfe out of the flesh, thereby confirmed and growne great, that it washeth it by degrees, avoyding it in gravell or small stones. If you will have the receipt of the Country *Empericke* given to Mr. *Redwell*, a Chirurgion of great skill and practise in physicke in *London* where he dwelt, as well as in all the Countries where he travelled, it is this. Take of the dryed herbes of Parsly *pert*, and Mouseare, Bayberries, Turmericke, and Cloves, the seede of the Burre Docke, the inside in the heppe or Bryer berries, and the seedes of Fenugreeke of each one ounce;

of the stone in an Ostes gall twenty foure graines weight, let all these be beaten into fine powder and kept for you, in a dry box, or pot, to use upon occasion: whereof the quantity to be taken at a time, is to be from halfe a dramme to a dramme, as the age and necessity of the party, who is to take it shall require: the effects whereof would worke as effectually in other diseases, either inward or outward, as either the Knotgrasse, or Sengreen, or Rupture-wort doe, if it were seriously applyed, for being alike in the temperature of the qualities, and working the same effects in some of the diseases, why not in many of the other, whereunto they are found to be good: I may here deplore the careless course of many that are learned, who are contented only to suck the honey that other Bees before them have gathered, but make none for others, whereas if they would be industrious, they might by their good judgement apply things to much better effect then the bold, blind Bayards of our time, who dare to doe any thing, especially when under colour of giving Physicke to their poore patients, they may doe without impunity, and without controll.

Chap. XVII.

Polygonum, Baccifera. Berry bearing Knotgrasse.

There remaineth of all the sorts of Knotgrasses, to speake of those that beare berries, howsoever are shrubby plants, whose berries are their fruite, bearing seede within them, whereby they are propagated: others are the excrescences of the herbe, accidentall onely as I suppose to the plant that breedeth them, being not the naturall seede, whereof I entend to speake but, because they much agreeth into some of the former small Knotgrasses.

1. *Polygonum Coccyferum Polonicum.* The Polonian Scarlet Knotgrasse.

The Scarlet Knotgrasse is as small a plant as the Knawell, or white mountaine Knotgrasse, spreades in the same manner with sundry small stalkes, full of joynts, whereat are set divers very small and long leaves, somewhat but not sharpe at the endes, which with the stalkes are of a grayish ashcolour, or more whitish, at the toppes of the stalkes stand a number of small white flowers, yet not so small as in the mountaine kinde of Knawell, or such as may be better discerned, comming forth of grayish greene huskes, wherein after they are pall, grow the seede, which is as small as dust, the roote is small and somewhat long, at the toppe whereof, and at the stalkes next thereunto groweth very small berries, lesser then those of the *Ilex Coccigera*, or Scarlet Oake, but of as orient a scarlet colour as they, and give as precious a dye as they doe, and but that it cannot be had in quantity (every roote yeelding but a few berries in comparison of the other) it would lessen the great price of the other; but howsoever it serveth that Country of *Polonia*, in some measure, to adorne the cloathes that they weare. *Ioachim Camerarius* in his Commentaries upon *Dioscorides*, *folio* 613. saith of

1. *Polygonum coccifera Polonicum.* Polonian Scarlet Knotgrasse.

2. *Polygonum coccifera sive Pseudomilium major.* The greater Seagrape.

these

these berries grow at the roote of a kind of Saxifrage like unto Turner or Dunnet Saxifrage, as also at the roots of Coltsfoote, Pellitory of the Wall, and other herbes like unto them, and that not onely in *Poland* but in *Italy* and other Countries.

3. *Ephedra sive Anabasis.* Climing Kinds alle or the Grape.

This kinde of Sea Grape groweth in the warme Countries where it will creepe and runne into a thicke tranke or stemme as bigge as a mans arme at the bottome, from whence rise many very long branches, full of joynts like unto the other Sea grapes, climing up to the toppes of the highest Plume trees, or others against which it groweth, otherwise if it stand neare unto any tree or shrubbe, it seldome riseth above their toppes, yet hath it no clispers to winde about any thing, nor doe the branches winde themselves, as the nature of *Asparagus* or *Periploca* Dioscoridis doth; yet as the Ivy by sending forth roots at the joynts, into the barke of the trees that groweth neare thereunto, it thereby climeth unto the toppe of them: at these joynts grow no leaves for it is wholly destitute of them, but from them shoote forth divers other branches, and at the same joynts upwards, stand many small mossy flowers, of a pale or whitish yellow colour, some what like unto the blossomes of the male Cornell tree, which afterwards turne into small red berries when they are ripe, like unto small Mulberries, full of juice, of a sowre taste, wherein lye small yellow seede like Millet, the roote spreadeth divers wayes under ground, being hard and wooddy.

1. *Eus marina minor.*
The lesse Sea Grape.

4. *Polygonum bacciferum sive Uva marina major.*
The greater Sea Grape.

This greater Sea Grape is so like unto the former, except in the long and climing branches, that it is verily thought of divers to be but the same, not growing neare any shrubbe or tree to cause it to ascend as the other doth, and as it is said before the former kinde useth to doe, by the report of *Belonius*, in his third booke of Observations, and the 41. Chapter, for this also hath a stubbed stalke, from whence rise many slender branches about a foote long, set with joynts like unto an Horsetayle grasse, upon the toppes, which doe a little bow or hang downe neare, together without leaves, and with many mossy pale flowers, but *Angvillara* saith reddish, set together at the joynts, which after wards turne into small red berries like *Raspis*, of a sowrish taste as the other doth, wherein lie the like yellowish seede: the roote is likewise hard and wooddy.

2. *Polygonum baccifera minus, sive Uva marina minor.* The lesser Sea Grape.

The smaller Sea Grape riseth up immediately from the roote, with many slender weake, reddish, and like stalkes, two or three foote long sometimes, lying for the most part upon the ground, wooddy at the bottome of them, with the like joynts and branches rising from them, as in the former, and without any leaves at them also; the flowers are many and pale also, and mossy like them, but standing upon some what longer foote stalkes, and the red berries are likewise like unto *Raspis* or Mulberries, of a sowrish taste, wherein is contained a small blackish three square seede or two, like unto the former: the stalkes and branches are no lesse astringent in taste then the tall, the roote is smaller, and sendeth forth divers suckers, which creeping under ground spreade farre.

The Place.

The first groweth in many dry, barren, and sandy grounds, in *Polonia*. The second *Bellonius* in his third booke and 41. Chapter of his Observations, saith groweth in the valleies or lower plaine grounds, at the foote of the mountaine *Olympus*, and in *Illyricum* betweene *Castellonovo*, and the old *Epidaurus*. The third *Clusius* saith he found only in *Spaine*, in the Kingdome of *Murcia*, by the Sea side, and no where elce. The fourth *Lobel* saith groweth not onely neare the Sea side, about *Cape de Sete*, *Perault* and *Magalona* not farre from *Montpelier*, but at *Rochell* also about the Sea side, and in other places, but *Clusius* saith he found it not farre from *Salamanca*, which is the heart of *Spaine* in great plenty upon a small hill, where he wondreth much not having found it or hearing of any others to have found it, in any other places then the Sea coasts. *Angvillara* saith in *Dalmatia*, about the river *Sacarana*.

The Time.

They flower, ripen their fruite in the naturall places seldome before *October*, and never in these colder climates, & both these when grooved rise: yea the roots will hardly without especiall care and keeping, be preserved in the Winter with us.

The Names.

The first is mentioned by *Lonicerus* by the name of *Polygonum Cocciferum Indicum* in his Epitome of *Matthiolus*, and so I find it called by *Lonicus Lugdunensis*, yet as not growing on *Polygonum* but other herbes. The second is recorded by *Bellonius* in his third booke and 41. Chapter, *fol.* 197. by the name of *Ephedra*, that it was full of red seede like unto *Asparagus*, by *Dioscorides*, under the name of *Ephedra sive Anabasis*, as also by *Rauwolfius*. *Pliny* calleth it *Conon sive Ephedra*. *Rauwolfius* calleth it *Polygonum baccifera simile*. The third is called by *Clusius Polygonum spicatum Plinii*, and saith the Spaniards call it *Retchas* by *Tabernamontanus Polygonum non spinosum baccas ferens primum*, by *Raubinus Polygonum baccifera marina minus, sive Uva marina major*. The fourth is called by *Clusius Polygonum spicatum Plinii minus*, who thinketh it to be the *Anabasis* of *Bellonius*, but I thinke *Rauwolfius* rather meant the greater sorts, by *Lobel Uva marina*, *Montpelliensium*, and contesteth with *Matthiolus* why this should not be *Tragum* or *Tragus* of *Dioscorides*, (as they of *Montpelier* formerly called it, and afterwards doth *Cæsalpinus* as *Bellonius* did) in that he made *Theophrastus* his *Scorpio* to be *Tragus*, by *Ruellius Syderis*, by *Lonicerus Uva Tragi sive Scorpius sterilis*, and *Dalechampius*, yet in another place he calleth it *Camphorosma*, as *Pena* doth *Eruca sylvestris*, by *Angvillara* it is thought to be *Centum capita Apuleium*, by *Lonicerus Uva Tragum* and *Uva marina*, but *Lobel* in *Icones Germanie Tragum*, by *Tabernamontanus Polygonatum non spinosum fructu minore*, and by *Raubinus Polygonum Raubini non spinosum minus*, *Lugdunense* taketh it to be *Cocciferum Matthioli*.

Absyrtis.

Original from UNIVERSITY OF MICHIGAN

Alfirs. The *French* call it *Raysins de mer*, from whence came the name of *Vva marina*.

The Vertues.

The *Polonians* with whom the full groweth, doe vse the herbe in the same manner that the *Germans* doe their *Knawel*, that is to expell vrine and to breake the stone: the second is not knowne, whether the people where it groweth doe vse it as the two last sorts are, which may well perswade vs, it is of the same operation, being like in the outward face and forme; for the Sea-grapes are both of one qualitie, and serve for the same diseases: the Knotgrasses are vsed by the *Spaniards* where they grow, as *Clusius* saith, but especially to cure the vlcers of the privy parts in men or women; they are also very effectuall to provoke vrine plentifully, and are exceeding astringent and drying, so that they powerfully stay all fluxes of the belly, or of womens courses, refrayne vomitings of the stomacke, and the defluxions of thinne rheume from the head: they are also very consolidative to soder together the lippes of greene wounds, or to knit broken bones, and to settle and strengthen ioints that have beene out of ioint: it is held to be so powerfull to knit dissevered parts, that being boyled with peeces of flesh, or with other things, it will cause them to be so glued or sodered together, that one cannot pull them asunder againe; in all sorts of ruptures also, it is most effectuall.

CHAP. XVIII.

Cassia Pontica Monspeliensium, The red-berried Shrubbe Cassia.

I Have been bold to insert this plant in this place, because some have made it a kind of *Polygonum*, and although we cannot find it to be a Saxifrage or breakestone, yet it hath the other drying & astringent qualities of *Polygonum*. This shrubbe riseth up to the height of two foote or there abouts, sending many slender twiggie greene branches, whereon grow small long leaves like unto Lint or Flax, or somewhat resembling those of Lavander, but thinely set all along upon the branches: the flowers are mossie or chaffy, and of a pale yellowish greene colour like unto those of the Olive tree, or of the Male Cornell tree, where afterwards come small round berries, greene at the first, but red as Corrall, or like the berries of Asparagus when they are ripe, of an astringent glutinous taste, with some sharpenesse ioyned therewith, wherein is contained one hard stone, having a white sweete kernell within it: the roote is hard and woodie.

Cassia Pontica Monspeliensium,
The red-berried shrubbe Cassia.

The Place.

It groweth by the high waye, in many places of *Spaine*, both in the countries of *Granado* and *Valentia*, and *Seuill*, as also in divers places of *Provence* in *France*, about the hedges and borders of the Olive yeards, by the bankes also of the river *Lunes*, and about the village *Perault*, not farre from *Montpelier*, as also in a small Wood or Coppice neare unto the Priory of *Begmont*, neere there adioyning.

The Time.

It flowreth about *Iune* and *July*, and the berries ripen not vntill *September*.

The Names.

Clusius saith that it was accounted for *Ostrys* of *Pliny*, while he lived at *Montpelier*, whereunto hee saith, it doth agree in many things, but afterward they called it Cassia, but by what reason or cause it is not knowne, for it neither agreeth with that *Cassia* of *Dioscorides* and *Galen*, which is like Cinamon, and is of a spicie taste, called in Apothecaries shoppes *Cassia lignea*, whereas the is nothing so: nor can it be the *Crocodes* of *Theophrastus*, which as *Pliny* saith *Hesiodus* called *Casiam*, neither is it the sweete smelling *Cassia* of *Virgil*, whereof he speaketh both in his *Bucolicks* and *Georgicks*; yet as I said they of *Montpelier* did call it *Cassia*; and *Lobel* *Cassia Pontica Monspeliensium*: *Clusius* calleth it *Cassia quarundam*, and saith that *Ebora* a Phitian and professor in *Valentia*, called it *Polygonum Plinij*; and so doth *Dalechampius* upon *Pliny* call it *Polygonum 4. Plinij*: *Lugdunensis* calleth it *Cassia lignea maritima*: *Columna Cassia lignea*, and *Gesnerus vulgo*, because the stalkes and the leaves will sometimes grow red towards the end of Summer: and *Bauhinus Ostrys fruticosa baccifera*, numbring it among the *Linarias*, because of the leaves; and that he would make it to be *Ostrys* of *Pliny*, lib. 27. cap. 12. as they of *Montpelier* at the first did, which hee there saith, hath small pliant branches, with blacke leaves thereon like Lin, and a seede blacke at the first: and becommeth afterward, and citing *Galen* in his sixth booke of Simples, that saith, of *Ostrys* is made [illegible] for wounds, some mixture *Sarcotica*, but *Pliny* saith *Scenas, alij vocant Scenanthen*: but in my mind *Pliny* hath not truely related the words of *Dioscorides* and *Galen*, who both say that the leaves of *Ostrys* are first blacke and then red, which he referreth to the berries, which make a great alteration of sense; and *Bauhinus*, to make this *Ostrys*, taketh him this corrupted, which yet is not found, that the berries should be blacke before they be

For Vertues.

We have little recorded of any especiall cure this herb performed, or that it is applied to those that are sicke of any disease: for although all doe agree that it is of a drying, glutinous and astringent facultie, and might no doubt be effectuall for bickes and fluxes of blood and humours in men and women, and to performe whatsoever the astringent and drying propertie might, as in *Polygonum* groundle to performe, yet there is nothing determined, and therefore I dare not play the Phisition to invent new receipts, for the cure of old diseases: it is sufficient to declare the temperature and what others have used or approoved, when I have no new thing to shew.

Chap. XIX.

1. *Asperula repens Gesneri, sive Saxifraga altera Cæsalpini.* Breakestone Woodroofe.

THis small plant which is accounted a kinde of saxifrage in some places of *Italy*, resembling in the outward face and forme *Rubia minor*, *Asperula*, *Galliota*, and such other like herbes, doth cause me to joyne it with them, as being a *congener* of one tribe and family; how therefore to know this plant is in this manner. It spreadeth upon the ground for the most part (and yet in some places standeth more upright) divers small tender stalkes, separated into other smaller branches, of about a foote high, full of joynts, at which come forth three, foure, or more sometimes, small and narrow smooth leaves, the flowers stand at the toppes of the branches, many set together in a tuft, which are long small and reddish, and after they are past groweth rough, crooke d'seede, which is small and blackish; the roote is small and threddie, and blewish on the outside.

2. *Rubia Cynanchica foemina.* Stone Woodroofe.

This other small Woodroofe, is very like unto the former, but that it is smaller and lower, not past an hand breadth high, and the leaves much smaller, the flowers also of a paler red colour, many tufting together, and every tuft standing upon a short foote stalke: the seedes and roots are like the other.

3. *Lonicera Salmanticensis.*
Small Stone Woodroofe of *Spaine.*

This small plant is likewise very like unto the first, growing more upright with square, rough rushlike branches, spreading forth into many small sprayes, almost like unto an Horsetaile grasse full of joints, with two leaves and sometimes with more at a joint, somewhat long & narrow like unto Line or Flaxe, but rougher at the toppes of the branches come forth many small white flowers set in spikes, and foure or five standing upon a short foote stalke together, which stand in rough husks, wherein commeth the seede, which is blacke and small; the roote is white and threddy like the other.

3. *Lonicera Salmanticensis.*
Small Stone Woodroofe of *Spaine.*

The Place.

The first groweth in shady Woods in many places of *Italy*, and *Germany*, the second about *Salamanca* in *Spaine*, *Plinie* in *France*, the last about *Salamanca* in *Spaine* as *Clusius* saith, but I found it on the right hand of *Broadstone* bridge at the lower end of *Groves* Inne-Lane by *London*, neere the water course that falleth along thereby.

The Time.

They doe all flowre and seede in the end of Somer.

The Names.

The first is called by *Gesner* in *Libello de collectione stirpium*, and in the second Saxifrage of *Cæsalpinus*; *Bauhinus* referreth it to the *Synanchica* of *Lobelius*, and to the *Galium montanum latifolium cruciatum* of *Columna*, and calleth it somelie *Rubia Cynanchica*: the second he referreth forth in his *Prodromus*, under the title I have here expressed it; the last is called by *Lobelius Lonicera Salmanticensis*, and *Synanchica species* of *Lugdunensis*, by *Tabernæmontanus Lonicera*, but by *Bauhinus Rubia humilis Hispanica*.

The Vertues.

The *Italians* as I know in divers places of their countrie doe use the first kinde to helpe those that are troubled with the stone or gravell in their kidneyes, by provoking urine, which washing or pailing by the urinories, carrieth with it both gravell, and breaking the stone into gravell, lenderth it forth with the urine: it cooleth likewise and helpeth withall those that are troubled with the Quinsie, which is an inflammation of the kernells of the throat, which when the swelling paine thereof is ready to stoppe the breath, and doth sometimes suddenly happen, it is a disease that Dogges and Wolves, are much subject unto, for it is derived from the Greeke word *κυων* *κυνος*, in that we usually hang up such Dogges that are troubled therewith, or else that the disease

is

is as a gibbet to hang them; or from the Greeke word ἀσπαίρω, quod spiritum continendo vel respirationem inhibeat: Of the other two sorts, there is not any that hath mentioned any use they are put to in Physicke, or otherwise.

CHAP. XX.

Asparagus. Asperage or Sperage.

HAve in my former Booke set forth those sorts of garden Sperage or Asparagus, whose young buds are most usually eaten with us, as a sallet herbe of great esteeme, whereof I shall not neede to make any repetition, but proceede and shew you the rest of that kinde, whereof there are three or foure sorts more.

1. *Asparagus marinus crassiore folio.* Sea or wilde Asparagus with thicker leaves.

This kinde of sea or wilde *Asparagus* riseth up with many, but shorter stalkes then the garden kindes doe, longer also and thicker, branching forth in the same manner, and having such like winged leaves, but shorter, thicker, harder, and of a blewish greene colour; the blossomes are like the other, and so are the berries of the that follow, but greater than they, and not of so fresh a red colour: the roote spreadeth in the ground.

2. *Asparagus sylvestris foliis acutis.* Wilde Asparagus with sharpe leaves.

This Asparagus with sharpe leaves, riseth up from a head of roores, whose strings are thicker and shorter then any of the former kindes, with three or foure stalkes, which are shorter, stronger and whither then the other, diverslie spread and branched into many wings, whereon are set at severall distances, many small, short, hard and sharpe pointed leaves, five or six standing at a joint together: at these joints likewise with the leaves come forth the flowers, many set upon a long stalke, which are yellow, consisting of sixe leaves apeece, smelling as sweet as a *March* Violet; after which come small berries, greene at the first, and of a blackish ash colour when they are ripe, wherein is contained a hard blacke seede.

4. *Asparagus petreus sive Corruda aculeata.* Prickly rocke Asparagus.

This kinde of thorny Asparagus, that groweth in stony and rockie places, hath very thicke and short roote strings, many jointed together at the head, from whence rise sundry branched greene stalkes, having three or foure sharpe greene thornes, more likely than leaves, they are so hard, small, long, and sharpe pointed, set together all along the stalkes and branches; whereat come forth small mothe yellowish greene flowers, and after them store of berries, greater than in the former, and of a blackish greene colour, when they are ripe, full of a greenish pulpe, wherein lieth usually but one blacke hard seede, or at the most two, having a white kernell within it.

2. 3. *Asparagus marinus aculeatus, & folijs crassis.* Asparagus with thicke, and prickly leaves.

4. *Asparagus petreus sive Corruda aculeata.* Prickly rocke Asparagus.

3. *Asparagus*

5. *Asparagus spinosus, sive Corruda spina horrida.* Asparagus with cruell sharpe thornes.

This thorny Asparagus shooteth out from such a thort, thicke, stringy roote as the last, but yellowish on the outside, two or three white crooked or bended stalkes, branched forth on every side, and at every joynt there, where the branches are bending and divided, and whereat the leaves are set also, standeth a most cruell sharpe thorne, growing downeward, and together with the thorne upon the youngest branches, stand five or six small long, narrow and soft leaves, clustering together, which are of a sweetish, clammie or pitchie taste: at the joints likewise with the leaves, come forth the flowers, of a yellowish greene colour, each of them standing upon a long and slender foote stalke, hanging downeward: after which come in their places large roundish berries, red when they are ripe, seeming to be three square, full of a rough or clammie juyce, containing with it one blacke grane or seede, and seldome two.

5. *Asparagus spinosus sive Corruda spina horrida.*
Asparagus with cruell sharpe thornes.

The Place.

This first kinde by transplanting is thought to become the garden kinde, and groweth in many low medowes that are neere the sea, as also in many other places farther off, the salts as I doe heare; for it is thought that it is this kinde that groweth in the Marshes of *Tilbury*, neare *Chapell*, and in *Aplesion* meadow in *Glocestershire*, which is about two miles from *Bristow*, from whence the poore people doe gather the buddes or young shootes, and sell them in the markets of *Bristow*, much cheaper then our garden kindes is sold at *London*: the second groweth in stony and rockie places, neare unto *Salamanca* in *Spaine*, and not onely under the hedges, but in the very fields also in *Castile* and *Galatia*, and about *Narbone* and *Montpelier* in *France*, and in *Candy* also: the third groweth both by hedges side, and in many stony and ragged places, both in *Spaine* and *Portugall*, and in *Candy* also as *Bellonius* saith: the last groweth also in rough uneven places, very plentifull about *Lisbon* in the common wayes, and by the river *Tagus*, and in many other places both in *Spaine* and *Portugall*, and in *Candy* likewise, but it will hardly endure our cold climate.

The Time.

They die for the most part all flower, and beare their berries late in the yeare, and scarce at all with us, although they be housed in Winter.

The Names.

It is called in Greeke ἀσπάραγος and σπάραγος, *Asparagus* and *Sparagus*. *Varro* saith, *quid ex alteris virgulta fiunt, Pompeius Grammaticus, quod in aspera virgulta nascitur*: for so *Gallus* saith the first budding of any herbe that was used to be eaten, after it was sprung from the seede, was called *Asparagus*, as in Cabbage, Lettice, and the like buddes, or shootes of herbes; but in speciall, and as most deserving this hath kept the name peculiar to it selfe. It is called also in Latine *Corruda, quod ubi adolevit fruticis corruat deridatq;*. *Pliny* saith the *Athenians* called it ἀγριόν Ἡράκλειον, *Asparagus agrestis, quod efferus*, lay some, but others thinke it to be derived ἀπὸ τοῦ ἀείρειν, *quod de terra surgat, Sponte nascens, Spontaneus nascibilis*: the *Arabians* call it *Halion* or *Halon*, the *Italians Asparago*, the *Spaniards Espargo*, the *French Asperge*, the *Germans Spargen*, the *Dutch Corellekruyt*, in *English* Sperage or Asparagus: the first sort is to be understood of that kinde which is set forth in my former Booke the second is called by *Matthiolus*, *Anguillara*, and *Tabernamontanus*, *Asparagus palustris*; by *Lobel* and *Pena* in their *Adversaria*, *Asparagus maritimus Dioscoridis*, by *Gesnerus* and *Camerarius*, *Asparagus marinus*, and by *Bauhinus Asparagus maritimus asthore foliis*, to the third is generally thought to be the *Asparagus pratensis* of *Dioscorides* and *Galen*, which he saith is also called *Adyantum*, in his sixth Booke of Simples or humble medicines, and of *Pliny Corruda, vel Spina sive Asparagus*. *Theophrastus* in his fourth Booke and sixt Chapter, saith that *Asparagus* (without giving it any another epithite, such it must be understood of this kinde) and *Scorpio* are nothing but thornes, for they have no leaves, *Matthiolus* and *Tabernamontanus* call it *Asparagus petraus*, and *Corruda*; *Gesner*, *Dodonæus*, *Camerarius*, and others, call it *Asparagus sylvestris*; *Clusius Corruda prior*, *Cordus*, *Lobel*, *Lugdunensis* and others *Corruda*, and *Bauhinus* as I doe, *Asparagus fabii acutus*: the fourth is called by *Clusius Corruda altera*, by *Lobel Corruda Hispanica*, and so doe *Lugdunensis* and *Tabernamontanus*, by *Dodonæus Asparagus sylvestris*, and by *Bauhinus Asparagus aculeatus altera*, but are ignorant *Pena* et *Lobelius exercitum*: the last is called by *Clusius Corruda tertia*, *Belonius* in his first booke of Olive trees, and 58 Chapter, saith that they of *Creete* called it *Polycnemo*; by *Dodonæus Asparagus spinosus*, *Lobel* and *Lugdunenses* call it as *Clusius* doth, *Corruda tertia*, and *Bauhinus aculeatus prima spinosus*.

The Vertues.

The young buddes or shoots or branches of any of these sorts of Asparagus boyled, are more powerfull in Physicke to cause digested grossenesse then the Garden kindes: the buddes or branches boyled in ones ordinary broth helpeth to open the belly, and to make it soluble, and either they or the rootes boyled in wine, provoke urine being stopped, and are good also against the hardnesse or difficulty to make water, or the strangury when it commeth by drops, and to expell gravell and the stone out of the kidneyes, and helpeth also other paines in the reines

Original from UNIVERSITY OF MICHIGAN

...roote and backe; it is very good to be given to such as are troubled with the Jaundise, and taken in wine, it is...
...also for those that are stung by the Scalopendra, or great poysonous spider, and other serpents; being taken in wine or vineger, it is good for those that have their arteries hardened, and are troubled with the Sciatica: the roote boyled in wine and taken, are said to helpe the Iliaca passio, and the falling sickenesse, and stay the paines of the mother in women; the decoction thereof likewise is good to cleare the sight, and to dimme it, and being held in the mouth warme, easeth the tooth-ache; the same also healeth the paines of the backe, and bowels, and taken every morning fasting for certaine daies together, stirreth up bodily lust in man or woman; although some have written the contrary, that it hindereth conception and causeth barrennesse. *Dioscorides* saith that three scruples of the seed of Asparagus, Smallage and Common, being given in drinke in some tunes of wine, for three dayes continually to them that make a bloody water, it will helpe them: and he saith also that it is not good for any that hath a dropsie to take thereof, but rather is an enemy to the same disease, although it be powerfull to provoke urine. *Aetius* saith, that it causeth the body to have a sweet sent, to ease the bitternesse of the mouth, but it doth render the urine stinking; it dilloseth and openeth the stomacke, liver, and spleene, and the paines of the chollicke, which rise of pituitous and flatulent humours. In the Garden Asparagus nourisheth more then the wilde kinde, yet hath it also his effects, for it openeth, purgeth and loosneth the belly gently, and many times the inconvenient diseases, for the which they are used by all authors to provoke urine, if they be too frequently used, they do hinder the same: many doubtfull tales are told of Asparagus, for all the properties before written, and whether it be hurtfull to the nerves, the decoction of the roote or seede made in wine, and the same and seed eaten, or any part thereof boyled in broth, but sweating or lying how that they may fit the diseased thereto, is found to be effectuall against the paines of the reines kidneys and bladder, the paines of the mother, the chollicke, and generally all kinde paines and torments that happen unto the lower members of the body, it is effectuall also against bruises and benummed sinewes, as those that are shrunke by cramps, or convulsions, and the paines of the upper called Sciatica; it is said that whosoever shall moisten their hands, face, body, or any other part of the same, with the decoction or juice of Asparagus, there shall no Bee, Wasp, Hornet, or other like flye long them. *Democrides* saith, that divers did affirme in his time, that if the root thereof be given to a dogge to drinke it will kill him. Divers fabulous things have been shrouded under their writings of the ancient, and the moderne writers also, if they either follow the traditions of their predecessors, but consideration of the probability, or examination of the matter, or else are led by vulgar reports, as this one in the text of *Democrides*, which himselfe in deede doth not believe to be false, as I suppose, because it is likewise written and taught, that if Ramges borne be beaten or bruised, and buried in the ground, from whence the Asparagus shall have sprung, that if you sow the seede of Asparagus in canes stucke in the ground, they will grow the sweeter and more pleasant to take, because they say the Asparagus, and the Canes do love a great sympathy one unto another, which how true it is, I leave to every one to search and prove: but the practise of many Gardiners that nurse Asparagus for their profit, it is have caused one root to send forth fourtie or fourescore longer, with they sticke over the heades or budds of the Asparagus, whereon divers buds are made the tenderer, and more delicate to be eaten; which peradventure may be likely inough to be true: all other secrets that are written for covering them, or keeping them from the ayre, and are therefore to be the tenderer, onely by consuming the superfluous moisture in them, but I cannot believe that ayre from any vertue or property of the same thereunto, is true be not true and probable, let others imagine probability, and I will yeeld unto it.

Chap. XXI.

Linaria. Tode Flaxe, or Flaxeweede.

OF the *Linaria* or Tode flaxe, there are many forts, some whereof (that is the most beautifull thereof) we set forth in this our former booke, which are these. *Linaria purpurea flore elegantissimo*, Purple Tode flaxe. *Linaria odorata*, Sweete purple Tode flaxe. *Linaria Italorum*, Of Italie. And *Linaria exigua flore luteo*. Small Tode flaxe. Wherefore I shall not need to speake any thing of them, but of the rest not there expressed. And because they are very easily confounded in seeking them forth, I have placed those that grow upright together, and those that have narrower leaves, and yet grow upright, and lastly of the trailing and creeping sorte upon the ground.

Linaria erecta Latifolia. Upright broad leafed Flaxeweedes.

1. *Linaria latifolia Dalmatica.* The great *Dalmatian* Flaxeweede.

THe great Flaxeweede of *Dalmatia*, hath divers faire large greene leaves, spreading upon the ground, being about two inches long, and one broad, ending very sharpe pointed, without any footestalke, but closing round the stalke, which is firme and round, about two or three foote high, having at the toppe thereof, with divers upon the tuppe, but lesser as they grow higher, the stalke is beset with leaves, having at every one of the branches, such like tufts of deepe or gold yellow flowers, as are in the common kinde, with spurres behind them, but each of them are three or foure times larger then the common, it is like the white kind, and parted in the like heads, but larger also, the roote is white, and spreadeth many branches under ground, and perisheth not as the wilde kinde doth, but abideth in the winter, with many stalkes and leaves, shooting forth leaves every spring.

2. *Linaria Latifolia Cretensium.* The great broadleafed Flaxeweede of *Candy*.

This Flaxeweede of *Candy* sendeth from the roote a round thicke stalke, two or three foote high, spread...

Original from UNIVERSITY OF MICHIGAN

many branches, whereon are set sometimes two and sometimes three leaves together, on a small footestalke, on each side of them, sometimes one against another, and other times keeping no order, each whereof is larger and longer then the former, and of a grayish greene colour, with three veiner ribbes in every one of them: at the top of the branches grow flowers made for the forme like the other kinde, but of a differing colour, for the parting mouth is of a pale blew colour, and more yellow underneath, with a pale or blewish, and sometimes more purplish spotte behind, the heads and seede are like the wilde kinde; the roote is hard and white, bigger at the head and small below with some fibres thereat.

3. *Linaria Americana parvo flore.* The yellow Flaxeweede of *America*.

This Indian kinde sheareth forth divers slender small reddish stalkes, spread into many branches, whereon grow on each sides of them, yet without order, many darke greene leaves, much narrower but not much shorter then the former, ending also in a sharpe point; the flowers grow at the toppes of the stalkes, in the same manner that the common wilde kinde doth, and of a gold yellow colour, but much lesser then they.

4. *Linaria sive Osyris alba.*
White flowred Flaxeweede.

The white Flaxeweede riseth up with many tough pliant stalkes with long narrow leaves set thereon, somewhat like those of the common sort, at the toppes whereof stand sundry pale whitish flowers resembling the ordinary kinde, but with a wider and more open mouth: the seede is not unlike the other, the roote is white, long, thicke and great, abiding divers yeares and not perishing.

5. *Linaria Neapolitana caerulea Apula.*
The blew Flaxeweede of *Naples*.

This blew Flaxeweede of *Naples*, hath at the joynts of the whole stalkes which are sometimes but one, and sometimes more, three leaves set together, divided almost like Rue leaves but greater, deeper cut in, and pointed at the ends, of a grayish greene or ashe colour; the toppes of the stalkes are furnished with such like flowers, but smaller and of a blew colour wholly, except the mouth which is yellow, after which come small round heads, containing large flat and blackish seed, the roote is small and white.

The Place.

The first according to the title you may know came from *Palestina*, but from what place there, is not signified. The second from *Spaine*. The third from *America*. The fourth, in gardens: the last from *Naples*.

The Time.

They doe all flower in the Summer moneths, yet some sooner or later then others, for those of *America* flowreth very late, and scarce give ripe seede any yeare.

The Names.

It hath no Greeke name that I can finde mentioned by any author, but in Latine it is called *Pseudo Linum*, and *Linaria*, for the resemblance that the leaves of the wilde common kinde have with Line or Flaxe, and *Prinoides* and *Prinaria* from the effects. Some have called it *Esula sylvestris*, for the resemblance it hath with the little *Esula*; whereupon came this verse, *Esula latifolii, sunt Linaria semina folii*. Divers have taken it to be the *Anitrhinum* of *Pliny*, it may be *Osyris* both of *Pliny*, *Dioscorides*, and *Galen*, whereunto in most mens judgements it doth in many things agree; and some as *Matthiolus* saith, would make *Rhinoceros* to be *Osyris*, which is called by some *Herba stadiosorum* the Schollers herbe, but because they make their *Osyris* to have foure or five leaves onely on the stalkes, and that they serve for brooms to sweepe withall; for the Greeke word σαρωτικὸν (that signifies any brooms, as *Dioscorides*, such things as beautifie the skin, I cannot see well how it should agree thereunto. *Italians* and *Spaniards* call it *Linaria*, the *French Lin Sauvage*; the *Germanes Lin kraut*, *Flore kraut*, and *Flachs kraut*. The *Dutch* call it *Vlas*. In *English* we call it Wilde flaxe, Tode flaxe, and Flaxeweede. *Rembertus* in his Pemptades maketh mention of the third, but calleth it himselfe in his *Prodromus* and *Pinax Linaria latifolia erecta flore*; but referreth the second to the *Cretica Lanifolia* of *Clusius*. The fourth is called *Osyris alba* by *Lobel* in his *Dutch* Herball. The last *Fabius Columna* mentioneth.

Linaria erecta angustifolia. Vpright and narrow leafed Flaxeweedes.

1. *Linaria vulgaris erecta.* Our common wilde Flaxeweede.

Our common Flaxeweede that groweth wild in all countries of this Land as well as beyond Sea, is so well known unto all, that are never so little conversant in herbes, that it were almost needelesse to describe it: it hath divers stalkes, and straught with long and narrow, blew or ashcoloured leaves; and from the middle of them almost upwards, stored with a number of pale yellow flowers, of a strong unpleasant sent, with deeper yellow mouthes, and blackish flat seedes in round heads, the roote is somewhat woodie and white, especially the maine downeright one, with many fibres, abiding many yeares, shooting forth rootes every way round about, and new branches every yeare.

Original from UNIVERSITY OF MICHIGAN

2. *Linaria Pannonica major.* The great Flaxeweede of *Hungary.*

This is in many things like the former, but that the leaves are larger and the flowers greater and fewer in it, and of a pale yellow colour, but a deeper yellow in the mouth, with some haires there in.

3. *Linaria Cretica angustifolia.* The narrow leafed Flaxeweede of *Candy.*

This Flaxeweede of *Candy*, hath at the three lower joynts of the stalkes, which are many, and of a foot or a halfe high, foure long leaves a peece, but narrower by the halfe then the former, but at the rest of the joynts they stand without order, growing still smaller as they rise higher upon the stalkes, which are much divided towards the toppes, whereon stand such like flowers as the former, but smaller and of a more purplish colour, the foure heads being of the same colour, the seede and seed vessels are more unlike the former, but quickly fall away, even while the plant remaineth greene.

4. *Linaria Hispanica tertia C. Bauh.* *Clusius* his third Spanish Flaxeweede.

The third Spanish Flaxeweede of *Clusius* sheweth from the roote many small stalkes, about a foot high or more, whereon grow very plentifully many narrow leaves, of a grayish or ash colour, and at the toppes them flore of small flowers, that are of a whitish colour on the outside, and more purplish inwardly, almost hanging downe, being of a more yellow colour, but yet pale also, the spurre beforde being of a purplish colour, the seede that followeth, when it hath any, for it seldome beareth, is like the other, but doth not appeare the second yeare, in that the roote perisheth not, but abideth and encreaseth every yeare.

5. *Linaria Caryophyllata albicans.* The sweete white Flaxeweede.

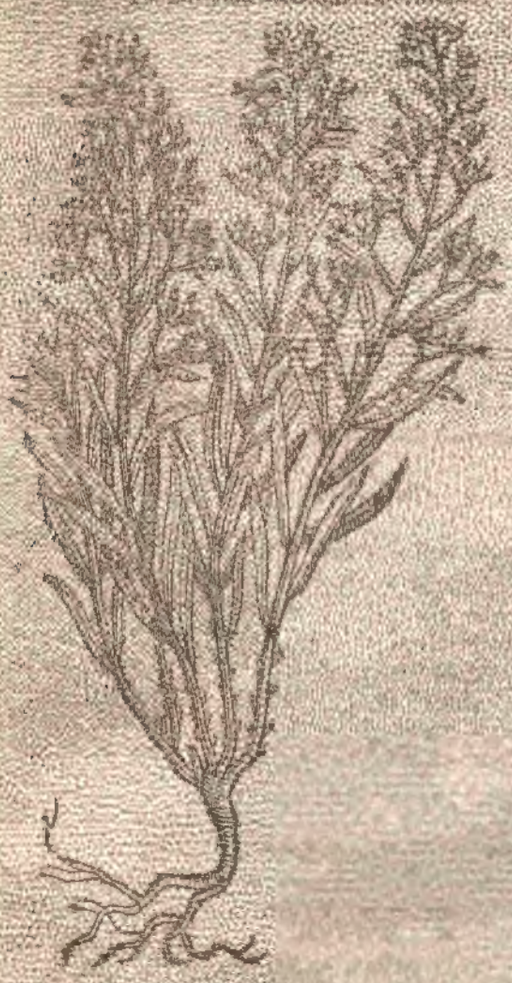
The sweete Flaxeweede hath upright stalkes somewhat woodly, wherein are set without order, divers long and somewhat long leaves, yet shorter then the common kinde, and of a pale greene colour, the flowers stand not so thicke at the toppe of the stalkes and branches, nor fully so large, but are of a very pale yellow colour, almost white, and in other of a pale blew and white mixt, with a yellow mouth, the seede is like the common, and the roote perisheth not.

6. *Pseudo-linaria montana alba.* The base white Mountaine Flaxeweede.

This base mountaine Flaxeweede hath slender straked stalkes, with divers long and narrow leaves on them both stalkes and leaves of a yellowish greene colour, diversly spread into branches, from the bottomes whereof bearing on every one of them, a small white flower, standing on a small foote stalke, after which come little grayish flat seede, in greenish yellow round heads, but very small.

7. *Linaria tenuifolia Lugdunensis.* Todeflaxe with very narrow leaves.

This Todeflaxe hath as narrow small leaves as any other sort, for very thicke on the low round stalkes it doth shoot above a foote high, of a bayerish, sullene colle, that one cannot well tell which hath the predominancy, the branched stalkes have nothing to many flowers on the toppes of them, not so closely set together, and some reddish while they are in the bud, but of a whitish red when they are open; after which commeth the seede which is small and flat, contained in small and long heads, the roote is blacke and full of threds.



1. *Linaria vulgaris nostras.*
Our common wilde Toadeflaxe.

2. *Linaria Pannonica major.*
The great Flaxeweede of *Hungary.*

8. *Linaria minima erecta.* The leaft upright Todeflaxe.

This Todeflaxe, being the leaft of all the former, and but that it doth not creepe, might alſo have beene put to the next ranke; hath one ſmall ſtalke not above halfe a foote high, whereon grow very many ſmall narrow blewiſh greene leaves, like the common wilde kinde, and at the toppe many ſmall pale yellow colour, with a ſpot in the jaw or mouth; the ſeede is exceeding ſmall blackiſh and flat, the roote is ſmall and periſheth every yeare, riſing againe from it creeping.

9. *Linaria minima repens rubra vulgo.* Small upright blew Flaxeweede.

This ſmall plant hath ſundry ſmall ſtalkes, of very ſmall ſhort leaves ſet one againſt another, of a darke liſh greene colour with the ſtalk, from among which riſe up two or three ſtalkes, ſcarſe halfe a foote high, bearing longer and narrower leaves thereon, with larger flowers then the laſt, and of a blew with colour; after which a ſmall ſeede like the laſt: the roote is threddy and periſheth every yeare.

The Place.

The firſt as I ſaid groweth every where throughout the whole land, both in the way ſides in medowes, alſo by hedge ſides, and upon the ſides of banks and borders of fields: the ſecond in many places in *Germany*, *Hungary*, the third in *Candy*, the fourth in *Spaine*, the fifth is not certainely knowne where: the ſixt on the hils in *Saxony*, as *Johannes Thalius* ſaith: the ſeaventh in barren dry and open places, the eight and the laſt we know not whence their originall are, but came with divers other ſeedes that were ſent us from beyond the Sea.

The Time.

Theſe flower in Summer, and their ſeede is ripe uſually before *Auguſt* be paſt.

The Names.

The laſt is called *Linaria* and *Pſeudolinum* by *Brunſelſius*, *Lonicerus* and *Dodonæus*; of *Matthiolus*, *Pſeudolinum*, *Cordus*, and *Lonicerus*, *Oſyris*. The ſecond *Camerarius* mentioneth in his *horto Medico*: The third, *Cluſius* the ſeede came from *Candy*, and grew in *John Hogbeland* his Garden; and is very probable to be both the ſame *Cerophyta* of *Columna*, and the *Creticum* of *Bauhinus*. The fourth is *Cluſius* his *Hiſpanica tertia*, the fifth *Camerarius* his *hortenſis* becauſe ſaith he was ſo called in his time. The ſixth is mentioned by *Johannes Thalius* in the deſcription of *Hercynia Sylva*, by the name of *Linaria montana flore ſylveſtri*, and as *Bauhinus* thinketh, is the *Anonymos Lonicere* of *Cluſius*, and the *Linaria adulterina* of *Tabermontanus*. The ſeaventh *Lugdunenſis* alſo, *Linaria tenuifolia*, and *Italorum Linariæ capillaceo folio*. The eighth is called *minima* not having any other name, And the laſt *minor cærulea vulgo*.

Linariæ minimæ repentes. The leaſt and creeping Flaxeweedes.

1. *Linaria pumila Hiſpanica.* The dwarfe Spaniſh Flaxeweedes.

THis dwarfe Todeflaxe of *Spaine*, ſhooteth up many render weake branches, not able to ſtand upright, ariſing to be about an handbreadth or halfe a foote high, whereon grow many long and narrow leaves very like unto the common wilde kind, as well for forme as colour, and ſo are alſo the flowers at the toppes of the ſtalkes, but leſſer by much; the heads and ſeed are alſo like it, and the roote ſmall and white, and creeping under ground.

2. *Linaria parva Hiſpanica altera.* Another ſmall Spaniſh Flaxeweede.

This other ſmall Spaniſh Flaxeweede hath divers weake ſlender branches, with many ſmall narrow leaves about them, but fatter or thicker in handling, and ſomewhat leſſer alſo then the laſt, and of an aſh colour, the toppes of the ſtalkes are furniſhed with a great many ſmall flowers, of a pale blew with or aſh colour, with a yellow ſpot in the mouth or gaping place, the ſeed and ſeede veſſels are ſmall according to the proportion of the plant, the roote is ſmall and white, and periſheth every yeare.

3. *Linaria Hiſpanica atro purpurea repens.* The creeping darke purple Spaniſh Flaxeweede.

This Spaniſh kinde alſo hath many weake trayling branches, whereon grow many ſmall ſoft aſh colour leaves; at the toppes of the ſtalkes grow many flowers, ſomewhat larger then the laſt, of a dead purple colour, ſtanding

1. *Linaria pumila Hiſpanica.* The dwarfe Spaniſh Flaxeweede.

blackiſh

Original from UNIVERSITY OF MICHIGAN

the edges with pale yellow spots at the mouthes of them, of a pretty sweete tast, the seedes and roores are alike dividing every yeare.

4. *Linaria repens.* The small blew creeping Flaxeweede.

The small blew creeping Flaxeweede sendeth from the roote a number of small weake stalkes, leaning downe to the ground, hardly able to stand upright, set without order, with many small and very narrow whitish coloured leaves up to the tops, where they grow into divers other smaller branches, having a long head or spike of flowers, very small, and of a fine blew with purple colour, with a yellow spot in the mouth of them: the seede is not unlike the former, but the roote thoroweth forth many fibres, and abideth, not perishing at the Winter.

5. *Linaria quadrifolia Alpina.* The Mountaine blew Flaxeweede.

The Mountaine Flaxeweede shooteth forth his small weake stalkes, lying almost upon the ground, diversly divided into many smaller branches, even from the bottome: upon which are set small short whitish greene leaves, very orderly at the severall joints, one above another, that is, at some but two leaves, at others three

4. *Linaria repens.* The small blew creeping Flaxeweede.

5. *Linaria quadrifolia Alpina.*
The Mountaine Flaxeweede.

Cuscuta minor Helxines folio.
A small Flaxeweede with Black Bindeweede like leaves.

or lowre, not keeping alwayes proportion in the numbers, especially below, but rather upward; the flowers stand at the toppes of the branches, are in some like the other, and somewhat great, but stand not so thicke together, being of a daintie purple blew colour, with a yellow spot in the mouth: the heades for seede that follow are somewhat great, having blackish flat seede within them: the roote is small and white, spreading divers wayes under ground, and perisheth not in the Winter.

c. Linaria lutea Moravica Clusij. The small yellow *Moravia* Flaxweede.

This small kinde of Toadflaxe, is somewhat like unto the last kinde in the precedent ranke, but that it hath more store of stalkes, that doe not stand upright, having many small ash coloured leaves, set upon them, which are rounder and more sappy: the stalkes beare at the toppes of them many yellow flowers, with yellowish spots in them, but the least of all these in this third ranke: the seede is small and blacke, and the roote perisheth every yeare.

The Place.

The first groweth about *Salamanca* in *Spaine*: the second and third in some other parts of *Spaine*, but seldome knowne where: the fourth on the hills in *Moravia*, as the last doth also; the like groweth as well in *Austria* as *Clusius* saith, as among the *Sommers* and the hills in *Rhetia*.

The Time.

They doe all flower in Sommer, and give their seede quickly after.

The Names.

The first is the like *Spanish* kinde of *Clusius*, which *Bauhinus* calleth *Ophrys flava sylvestris*, and *Tabernæmontanus Ophrys minor*: the second is the fourth *Spanish* kinde of *Clusius*, as the third is his second *Spanish* kinde: the last is *Clusius* his second *Lusitanian* or *Moravian* kinde: the fift is called by *Clusius Linaria Syriaca*, by *Gesnerus* in hortis *Germaniæ*, and in his Epistles *Linaria Alpina & Helvetica*: by *Tabernæmontanus Linaria Alpina pumila*, and by *Bauhinus*, *Linaria quadrifolia Jupini*: the last is called by *Clusius Linaria Moravica prima* in his History.

The Vertues.

All these sorts are in some degree, more or lesse effectuall, but the most common kinde is the most used, to provoke urine, both when it is stopped as also in those that are troubled with the dropsie, to spend the abundance of those watery humours by urine, and by the drawing downe of much urine, doth in some sort helpe to wash the reines and urinary parts from gravell or stones gathered therein: the decoction of the herbe, both leaves and flowers in wine, taken and drunke doth somewhat move the belly downewards, openeth the stoppings of the liver, and helpeth the yellow jaundise, expelleth poison, provoketh womens courses, driveth forth the dead birth and dead child: the distilled water of the herbe and flowers is effectuall for all the same purposes, and especiall being drunke with a dramme of the powder of the seedes, or barke of the roote of Walnut, and little Cinamon for certaine dayes together, is held to be a singular remedy for the dropsie, to spend the watrish humors: the juice of the herbe or the distilled water dropped into the eyes is a certaine remedy for all heat, inflammation and rednesse in the eyes: the juice or water put into foule ulcers, whether they be cancrous or fistulous with tents rowled therein, or the parts washed or injected therewith, cleanseth them throughly from the bottome, and healeth them up safely: the same juice or water also cleanseth the skinne wonderfully of all kinde of deformity thereof, as leprie, morphew, scurfe, wheales, pimples, or any other spots and markes in the face applied of it selfe, or used with some powder of *Lupines*.

CHAP. XXII.

Halicacabum sive Alkekengi. Winter Cherries.

IN the reare of this Classis commeth the Winter Cherrie to be declared, whereof there are two other sorts knowne to us more than in former times, as I shall presently shew you.

1. *Halicacabum sive Alkekengi vulgare.* The ordinary Winter Cherry.

The ordinary Winter Cherry is described unto you in my former Booke, therefore I doe but only make mention of it that you may take knowledge, the next is differing from it.

2. *Halicacabum sive Alkekengi Virginense, Virginian* Winter Cherries.

This *Virginian* spreadeth the branches with leaves on the ground, fearle rising it selfe up so much as the former, but the branches are greater, and so are the leaves also and more unevenly dented about the edges, of a fuller greene colour, at the joints, come forth the flowers singly, that is one at a place and more towards the bottome than upwards to the middle of the branches, which are rather smaller than the former, compassed with small whitish leaves with a tincture of red, or every leafe spotted circlewise towards the bottome: the fruite that followeth is a small berry, enclosed in a thinne skinne or bladder as the former, but greater and red when it is full ripe, smaller likewise than it, the berrie filling the skinne or bladder more than it, and having so much voide roome in the bladder, as the former, yet hath it small whitish seede within it: the roote spreadeth under ground not very farre and perisheth in Winter. I have here onely given you the figure of the leaves and a flower hereof with the figure of the former.

3. *Halicacabum Indicum erectum.* Upright *Indian* Winter Cherries.

This *Indian* kinde riseth up to be about foure foote high, with strong upright stalkes, hairy and of a whitish colour, shooting out many branches, whereon grow faire greene leaves, like unto those of the ordinary Winter Cherry, but somewhat larger, and dented about the edges: at the joints with the leaves come forth the flowers of a whitish colour as it is in the ordinary sort, every one by it selfe, which are compiled but of five leaves, broad at the corners, somewhat crumpled about the edges, and although they be not divided into five leaves, yet in some of them there doth appeare five blackish purple spots in the bottome of every flower, with divers purplish threds in the middle, but with blackish blew chives: after the flowers are past, there come in their places the fruit which are bladders or thinne skinnes, with berries in them like unto the ordinary Winter Cherry

are tender: the stem hereof is later than the other, not onely filling the whole skinne or bladder, but often times breaking it and opening into foure parts, which when it is ripe, will be greene as well as the bladder; having sometimes a few reaching hairs upon it: the root is white and of a darke greenish purple colour; the whole plant is without taste, yet exceeding bitter: the juice hereof is almost as mortall or lethy as that of the *Mandrake*, or Love apples: this perisheth every yeare in these colder climates, at the first approach of winter, and whether it abideth in the naturall places, wee know not, nor to what physicall use it is applied, or whether it be used to be eaten.

The Place.

The first groweth by the hedge sides in moist and shadowie place, but is with us onely as I thinke cherished in gardens: the second came from *Virginia*, and grew with Mr. *Tradescant*: the last groweth in the West *Indies*, and was first brought into *Spaine*, and *Italy*, and from thence communicated first to *Camerarius* as I thinke, (for he first set it forth) and afterwards to others.

The Time.

They flower not until the middle or later end of *July*, and the fruit is ripe about the end of *August*, or beginning of *September*.

The Names.

Iosephus de Costa Sorus, sent the last sort from *Florence* to *Camerarius*, and called it *Halicacabum, sive Solanum Indicum*; some others have called it *Arborescens*, and *Solanum vesicarium Indicum*: I have added thereunto *nostras* to distinguish it from the *Virginian* Winter Cherrie: but the ordinary kind, is one of the foure sorts of *Solana* or Nightshades, set forth and spoken of by *Dioscorides* and *Galen*, and one of the two of *Theophrastus* called *Solanum Halicacabum*; and by *Pliny Vesicarium*; either of the bladder wherein the berrie groweth, or of the vertues, against the diseases of the bladder and stone. Of the *Arabians Alkakengi*, which name the Apothecaries doe retaine to this day in their shops. *Brunfelsius* calleth it his *Saxifraga quarta* terming it *rubra*.

The Vertues.

Neither the *Virginian* nor *Indian* kinde are knowne to be used to helpe any griefe or disease. But our ordinary Winter Cherries are of great use, the leaves being cooling and may be used in all inflammations but not opening, as the berries or fruit are, which by opening the urinous parts, and drawing downe the urine, provoke it to be avoided plentifully when it is stopped, or when it groweth hot, sharpe and painefull in the passage: and is good also to expell the stone and gravell out of the reines, kidnies, and bladder, helping to dissolve the stone, and avoiding it by grease or gravell, sent forth in the urine: it helpeth much also to cleanse inward impostumes or ulcers in the reines or bladder, or in those that avoid a bloudie or foule urine. It helpeth the jaundise also, by opening the passages of the gall and liver, and expelling it by urine. The distilled water of the fruit, or the leaves together with them, or the berries greene or drie, distilled with a little milke, is effectuall to all the purposes before specified, if it be drunke morning and evening with a little sugar, and in speciall against the heate and sharpenesse of the urine. *Pliny* recordeth, that the roote hereof is so powerfull to dissolve the venome of the Scorpion, that if it be but put unto them, they will utterly lose all their strength: and being boiled in oyle and applied is powerfull against their sting. But because divers have appointed divers wayes, for the preparing and ordering of the berries hereof, to be helpefull for urine and the stone, I thinke it not amisse to remember some of them unto you. And first they appoint the berries to be put into new wine when it is new made and put up, that the wine working with the berries therein, may have their vertue therein, and serve them to drinke that are troubled in the manner aforesaid: but because our Land affordeth not wine to be made therein, I doubt not but our Beere or Ale will be as effectuall, having the same proportion of berries, that is three or foure good handfulls either greene and fresh or dried, bruised and put thereunto, that is into three or foure gallons when it is new runned up, and after drunke in the same manner, and this drinke taken daily, hath beene found to doe much good to those, both to ease the paines and expell urine, and the stone in whom it is confirmed, and to cause it not to engender. Another way *Matthiolus* much commendeth, having used it many times himselfe, which is to take some of the juice of the berries in *Perisone* drink made into a creame with Poppie seede, & the kernells of *Melons* or Pompion seeds, with a decoction of Mallowes with some of the berries therein, or some of the juice drunke in its due time or more drammes of the inward pulpe of *Cassia fistula*, drawne forth with the water or decoction of the berries, and given in a roo-chill of the broth of fat flesh, wherein also some of the berries have beene boiled, is accounted an excellent remedie to cleanse the backe and reines, in those grieves of the stone and urine: the decoction of the berries in wine or water, is the most usuall way to be taken, and the powder of them taken in drinke or broth, I hold to be more effectuall.

The Winter Cherry.

Thus

Thus have I shewed you all the sorts of saxifrages or Breakestones, that are properly so called, for of those herbes and plants that conduce to the same purpose, I have spoken in my former Books, as you shall find more particularly entred in the Table of remedies, under the name of *Herbs that break or dissolve the stone in the reines and bladder*. There are diverse other herbes also, available for the same purpose, but could not fitly be placed in this *Chapter*, as that most of them are umbelliferous plants, some Thistles and some of other Tribes; all which could not without much confusion be brought out of their owne flanors, to fill up another. Take the rest therefore of these Breakestones, as you shall find them dispersed throughout this whole Worke.

Now it behoveth me to intreate of other herbes, whose vertues are to heale wounds, and therefore shall *Chirurgy* in the next *Chapter*.

PLANTÆ

PLANTÆ VVLNERARIÆ ET FERRVMINANTES, *ID EST*, CONSOLIDANTES.

VVLNERARY OR VVOVND *HERBES.*

CLASSIS QVINTA, *THE FIFTH TRIBE.*

CHAP. I.

Centaurium maius. The greater Centory.

I dare not incline to the opinion of some of the *Arabian* Phisitions and Writers that have said the roote hereof is bitter, and thereby have added strong purging qualities unto this kinde of Centory, which properly belong unto the lesser kinde, thereby confounding them both together; for if I did, I must have placed it in the second Classis among the purging plants. Neither dare I hold with the moderne errour of many, that hold the roote of this great Centory, to be the *Rhapontricum* of *Dioscorides*, *Galen*, and others, they being so much differing one from another, as I shall shew you by and by. But as the qualities therein are most certaine to be Vulnerary, I have placed it here. Of this kinde there are three other sorts knowne in these dayes, which were not formerly, which together therewith, shall be entreated of in this Chapter; and first of that which was first and commonly knowne.

1. *Centaurium maius vulgare.* The common great Centory.

The common great Centory, hath many large and long sote leaves, deepely cut in on the edges into many parts, notched or dented about the edges, of a pale greene colour on the upper side, and whitish underneath: the stalke is strong and round, three or foure foote high, divided at the toppe into many branches, whereon stand large round scaly greene heads, shooting forth at their toppes, many small threds or thrummes, of a pale bleu with a blew colour; wherein after they are fallen doe grow large whitish smooth shining seedes, somewhat like unto the seedes of Thistles, but longer, and lying among a great deale of downy matter: the roote groweth to be more than two foote long, and as great, as a reasonable great Raddish or Parsenipe roote, blackish on the outside, and somewhat reddish, yellow within, dooling many yeares, sending forth fresh leaves every Spring; those dying for the most part that were greene all the Summer.

2. *Centaurium maius Pyrenaicum.* The *Pyrenean* great Centory.

This second kinde hath larger leaves than the former, and more jagged or cut in deepely on the edges, somewhat resembling an Artichoke leafe in the divisions, greene above and gray or as it were hoary underneath: the stalke riseth to be about three foote high, couered and hoary, having sundry smaller leaves and lesse jagged set thereon, and parted at the toppe into some branches, each bearing some small leaves; under the heads which are scaly and sharpe also, with sharpe prickes at their ends, like a little wilde Artichoke head: the tufts of threds which are the flowers, as in the other, are more purple: the seedes are white wrapped in downe like unto the former, and the roote great and blacke on the outside, but longer and of the bignesse of ones wrist.

3. *Centaurium magnum alterum sive Lusitanicum.* The great Centory of *Portugall.*

This third great Centory hath many leaves, rising from the head of the roote, lying almost upon the ground, which are long and as large almost as the former, but without any jagge or division at all in them, yet somewhat deeply dented about the edges, and of a deeper greene colour: the stalke is round and great, but riseth not so high, nor divided at toppe into so many branches, but bearing onely two or three heads on a stalke, which are scaly in the same manner, & in it such like thrums, of a pale whitish colour or threddy flowers; which being past, there groweth such like seede also in those heads, lying in a flockie or downie substance, but a little blacker, every seed couered in the same manner: the roote groweth to be as great, or greater than the former, blackish also on the outside; and yellowish within, yeelding forth a yellowish red juice like the other, which smelleth somewhat better, but a little more aromaticall than it.

4. *Centaurium*

4. *Centaurium maius Lacerum.* The great yellow Centory.

This yellow Centory sendeth forth many more, both larger and longer leaves from the roote then the former, some of the lowest having fewer divisions in them then others; but those that grow upon the stalk, as well as some of the other below, are very much divided into many parts, making every winged leafe to consist of a dozen or thereone leaves, the ribbe in the middle betweene them being whitish, each for the most part set against another, with an odde one at the end, and every of them being narrow and long, without any deepe cuts on the edges, and of a whitish greene colour; the stalkes are many strong and round, somewhat stalked downe the length of them, each divided into some other branches, which beare somewhat greater scaly heads then any of the other and longer spread thrumbs or threds, of a fine lively pale yellow colour, which abide in their beauty a long time without decaying. For seldome giveth seede in this Country, because as I thinke the scaly heads are so full of moisture, that it hindereth seede to grow ripe therein; for if they be but a little pressed betweene the fingers, there will issue forth on all sides, small cleare drops of water, as sweete as sugar almost, and that not onely at noone dayes as *Imbimus* saith, but at any time of the day, and not for once onely and no more, but oftentimes; yea every day if ye will, it will yeeld still some, as long as the flowers are fresh, and not quite withered, but when it doth perfect his seede, it is somewhat like the lash great Centory, yet lesser, blacker, and more shining: the roote groweth in time, to be greater then either of the other, having many heads, that shoote forth in the Spring, the old leaves dying downe to the ground every yeare, which is wrinkled and blacke on the outside, and yellowish within, full of a slimy moisture in them, running downe deepe into the ground with some greater branches, and but a few small ones.

The Place.

All these sorts grow upon mountaines, the first and third upon the *Alpes* and Mount *Baldus*; the second on the *Pyrenean* hils, *Clusius* saith, he found the third upon some stony hils, beyond *Laborne* in *Portugall*, neare the river *Tagus*, and the last there likewise and on Mount *Saldua* as *Pona* saith.

The Time.

They doe all flower about the end of *June*, and in *July*, yet the *Portugall* kinde doth least endure our cold ayre, seldome shewing forth his flower, nor yet abiding unlesse well preserved.

The Names.

It is called in Greeke κεντρομπλον μικρον *Centaurium minus*, and as *Pliny* saith, tooke the name from *Chiron* the Centaure, who was healed herewith of the hurt he received in his foote, by one of *Hercules* his arrowes that fell from his owne hand thereon, as overlooking them, when hee received *Hercules* as his guest, and therefore of some was called *Chironium*. The first is called of all writers *Centaurium magnum* or *maius*, and *vulgare* of some, as a difference from the others. It hath growne in the former ages of the world (yet long since *Galen* his time, for many yeares, and yet continueth in many parts) called *Rhapontica vera*, and used in the stead thereof in all those medicines, that the ancients appointed *Rhapontica* to be put, which is an errour growne so old by customs, that many obstinately perist therein, because they have received it from their elders, but learning and diligence in reading and examining the writings of the ancient authors, hath not onely diminished this opinion, but many others also, for as I have shewed before in the second Classis, in the Chapter of *Rubarbe*, *Dioscorides* saith that the *Rhapontica* is a roote like unto the roote of the great Centory; how then can it be the same, when it is but like it, and although the roote of this Centory be yellowish, which encreased their error, yet will it not colour the spittle like unto Saffron. *Brasavolus* in his time, did thinke that those rootes called *Rhapontica vera* in the shops, were not the rootes of this great Centory; whom *Matthiolus* contradicteth, shewing them to be the same. Some also as *Matthiolus* saith, did in his time take the *Lysimachia purpurea*, to be *Centaurium magnum*. The *Arabians*, *Mesues*, *Avicen*, and *Serapio*, have much confounded the Centuries, both the greater and the lesser together, giving both the face and qualities of the one unto the other, and *Pliny* also in his 25. Booke, and 6. Chapter runneth into the same error with them, who although he agreeth with *Dioscorides* in the description of it, yet saith it hath a certaine bitternesse in it, which is not found in this greater but the lesser kinde. The second is called by *Cornutus* among his *Canada* plants, *Centaurium folijs Cyani*: *Pona* saith in the description of the plants growing upon Mount *Baldus*, that the third kind, was called of divers there about *Rhapontica Saldensis*, and *Clusius* saith, the *Portugals* where he found it, called it *Rapontica*. *Ruellius* saith, that the last he received from out of the garden at *Padua*, by the name of *Rhapontica Lusitanorum*.

The Vertues.

The roote of the great Centory saith *Matthiolus* being steeped in wine, or the powder thereof given in wine, is with great good successe and profit, used for those that are fallen into a dropsie, or have the jaundise, or are troubled with the obstructions of the livers: two drammes of the rootes beaten to powder, and taken in wine or in water. It helpeth those that spit blood, or that bleede much at the mouth, if they have an ague to take it in water, or elle in wine, it is likewise used for ruptures, cramps, and pleurisies, and for those that have an old or long continued cough, and for those that are short winded, or can hardly draw their breath; it is good also to expell the stone paines in the belly, and those of the mother; being scraped and put up as a pessary into the matrice, it procureth womens courses, and causeth the dead birth to be avoided; the juice thereof used in the same manner, worketh the same effect: some copies of *Dioscorides* have this, it is called *Panacea*, because it helpeth all diseases and sores, where there is inflammation or bruises falling it; it helpeth the strangury or falling by drouzes, if it be injected, as also the stone: the decoction or juice of the roote, or a dramme in powder, stirred in wine, and the wound washed therewith, taketh away all the paine and danger of the bitings of mad dogs or venemous creatures; it helpeth to sharpen the eyesight, if the be steeped in water and dropped into the eyes, as *Pliny* saith, shewing that it hath contrary qualities in it, and therefore worketh contrary effects, being partly of a binding or astringent quality, whereby it provoketh womens courses, &c. and the astringent & cold qualities in it, the closing or soldering the lippes of wounds, and staying the spirting of blood, and by all the qualities joyned together, it helpeth ruptures, cramps, and the diseases of the Lungs: the sharpenesse procureth vomiting, and the attraction, the strengthning of the parts: the whole plant as well herbe, as roote, is singular good to be used in all sores of wounds, or ulcers, to dry, soder, cleanse, and heale them, and therefore is a principall ingredient, or should be in all vulnerary drinkes and injections.

CHAP. 51.

Jacea, Knapweede.

THere are a very great many of herbes that beare the name of *Jacea*, which I must (to avoide confusion) distribute into severall orders; that so the memory being not confounded, with a promiscuous multitude, each may be the better understood in their severall rankes.

Jacea non Lanuginosa, Knapweedes with whole leaves.

Ordo primus, The first ranke or order.

1. *Jacea nigra vulgaris*. Our common Matfellon or Knapweede.

THe common Knapweede hath many long and somewhat broad darke greene leaves, rising from the ground somewhat dorpely dented about the edges, and sometimes a little rent or torne on both sides, in two or three places, and somewhat hairy withall; among which riseth up a strong round stalke, foure or five foote high, divided into many small branches; at the tops whereof stand great scaly greene heads, and out of the middle of them thrust forth a number of darke purplish red thrums or threds (and sometimes white but more rarely) which after they are withered and pall, there is found divers blacke seede, lying in a great downe somewhat like unto Thistle seed, but smaller, the roote is white, hard and woody, with divers strings thereunto, which perisheth not but abideth with leaves thereon all the Winter, and shooting out fresh in the Spring.

2. *Jacea nigra angustifolia*, Narrowleafed Knapweede.

This Knapweede hath a round rough greene stalke, about a foote and a halfe high, whereon are set long side, narrow rough, thorn and somewhat hoary greene leaves, compassing it at the bottome, and divided some other branches above, on each whereof standeth a scaly whitish greene head, out of the middle whereof rise many small long threds, like unto the former, but smaller, and of a pale reddish colour; after which loweth small blacke seede like the other: the roote is blackish and parted into many small fibres. Of this also there is one, whose stalke and leaves are longer, smooth, and all hoary soft and woolly.

3. *Jacea nigra humilis*. The smaller dwarfe Knapweede.

This low Knapweede hath small weake and round hoary stalkes, about a foote high, bending downe

2. *Jacea nigra vulgatior.*
The common rough Knapweede.

5. *Jacea nigra latifolia villosior.*
The greater hairy headed Knapweede.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

with leaves thereon, of an inch or more broad, and a cubit length, not dividers or deaued about the edges at all, but being a little rough and hoary, as it were chequered, compassing the stalkes at the bottome; at the toppes whereof stand such like scaly heads, as in the other, with purplish threds or chamises rising thereout, as in the rest.

4. *Iacea montana Austriaca major.* The greater mountaine *Hungarian* Knapweede.

This greater mountaine Knapweede, is very like unto the former common wilde kinde, being somewhat broad and long dented about the edges, and rough and hairy also, and of a darke greene colour, but those that grew upon the braked stalkes, are still of higher growth, smaller, and more cut in on the edges: the heads that stand at the toppes of the stalkes, are not rough or hairy, but smooth and scaly, crackling if they be lightly touched, brownish upward and whitish towards the bottome: the flowers consist of many purple whitish leaves, cut in the ends into five flats or divisions, like a those of the *Cyanus*, with many purplish long threds in the middle, and a purple tufte in the middle of them, besprinkled at the head, with a meetly whitenesse: the seede that followeth is like unto the other, but somewhat larger: the roote also is blackish and stringy like the former, and abideth as the rest doe.

5. *Iacea montana Austriaca minor.* The lesser mountaine *Hungarian* Knapweede.

The lesser Knapweede is in most things like the last, but that it groweth lower, and the leaves and stalkes are nothing so hairy and rough, but smooth and horny: the flowers also are of a paler purple colour, and the seede is not blacke, but of a whitish gray or ash colour.

6. *Iacea Austriaca capite villoso maior.* The greater hairy headed Knapweede.

The greater hairy headed Knapweede, hath many long and broad leaves larger than any of the former, soft and hairy also, somewhat, but not much dented about the edges, of a certaine clammy or gummy taste. In *Thrace* doth it much both sharpenesse in taste, and remaine of paine, so that he maketh it hot and dry in the second degree, not without much bitternesse, from among which rise up divers couched or braked stalkes, about two foote high, branched forth at the toppes, whereon stand usually three or foure heads close together, and some times but one: whose scales end in such small whitish crooked tangling threds, that they seeme like a net, cast over the heads, out of which start purple flowers like the rest, but larger: the seede is not blacke but grayish like the last.

7. *Iacea montana flore albo.* The white flowred Knapweede of *Austria*.

This other Knapweede differeth not from the last in any thing, but in the flower which is wholly white, and the seede a little grayer.

8. *Iacea montana Austriaca villoso capite.* The lesser hairy headed Knapweede.

This lesser kinde differeth not from the first, onely in that it is lower, and the leaves narrower, the heades are set like it but hairy withall; the flowers are purple, and the seede blacke, and not gray like it.

The Place.

They all growe with us in most fields and meadowes, and about their borders and hedges, and in many Welsh grounds also, almost every where, the second groweth also in *Apulia* and *Padua* also: the third in *Austria* neare unto Saint *Hippolytus*; all the rest on the hills in *Hungary* and *Austria*, and in the pasture grounds upon them.

The Time.

They all flower in *June* and *July*, and in *August* sometimes: the seede is ripe soone after.

The Names.

The ancient Greeke or Latine Authors, have not mentioned this kinde of herbe in any of their Writings, as farre as can be imagined, and therefore wanteth a Greeke name, whereby it may be called: this latter age likewise hath scarce found a fit name, whereby to call it, yet all doe agree it is a kinde of *Scabious*, and therefore *Tragus* maketh it his fourth kinde of *Scabious*. *Gesner in horto Germaniæ*, calleth it for a kinde of great Centory of the Meadow, and further thinketh it to be that plant, that *Scaliger* calleth *Gethyonigra*. *Thalius in Hercynia* calleth it *Cyanus Austriacus angustifolius*: but generally it is called *Iacea*, *Iacea nigra*, *Iacea Veris & Estivalis*, *Iacea Scabiosæ flore purpureo*, and *nigra*, as a distinction, both from the *Scabious Moneys* of *Pena* and *Lobel*, which are in their *Adversaria* call *Orientales*, *flore Orientalium*, and from the Public, which of some is also called *Iacea*, or *Viola nigra*: some also would make it a kinde of *Trifolium*. Many likewise call it *Matrisylva*, but very corruptly from *Matthiolus*, *matris sylvarum*, as some would call it, because the flowers are without leaves, being nothing in them but threds and chamises. The first is called *Iacea nigra* of divers, and by *Bauhinus Iacea nigra prolifera*, and doubteth whether it be not *Solidago Saracenica altera* of *Lonicerus*: the second is called by him also *Iacea nigra angustifolia*, vel *Ericæformis acrosticha*: the third he calleth likewise *Iacea integrifolia*. The fourth and fifth are but late made known to the world, as it is thought, and called them *Iacea Hispanica*, or *major & minor*: the first *Clusius* also calleth *Iacea Austriaca*, also *capite elegantissimo*, calleth it *Cyanus Austriacus montanus integrifolius*, & saith it might be called *Cyanus Austriacus* from the forme of the leaves. *Bauhinus* calleth it *Iacea latifolia capite hirsuto*: the seconde *Bauhinus* saith, differeth from the former, varying onely in the flower, and therefore calleth it *Iacea alba hirsuto capite*, which he thinketh to be the *Iacea* of *Matthiolus*, tending to blue by the name of *Iacea Austriaca major villosa capite*; *flore albo*: the third *Iacea Austriaca minor villosa capite humili*, and *Bauhinus Iacea angustifolia capite hirsuto*: we call it in English Knapweede, as also Matchflour.

The Vertues.

This Knapweede being of like nature with *Scabious*, are in some part equall to them in their properties, as in cooling and drying taste, it thereby helpeth to stay fluxes, both of blood at the mouth, the belly and the stomacke, provoking eatings; it slaieth likewise the distillations of rhinne and sharpe humours and sore exulcerations in the stomacke and lunges: it is good also for those that are bruised by any falle, beaten or thrust: it is very profitable for them likewise that are burst, and have the ruptures, by taking it in all sorts of potions, and cataplasmes of the herbe and flowres in wine, and applying the same outwardly to the place: it is singularly good in all fluxes of running and cankerous sores and fistulous also, drying up the moisture, and healing the same without any tharpenesse or biting: it doth the like also in the running sores and scabbes of the head: which properly it is of especiall use for the soreneſse of the throat, the swellings of the *Uvula* and jawes, it is

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

also excellent good, for all greene wounds, to stay the bleeding and close the lippes of the wounding thereof.

CHAP. III.

1. *Senecio vulgaris Latifolius.* Knapweede with divided or rugne leaves and without prickly heads.

2. *Senecio vulgaris Angustifolius.* The other common wilde Knapweede.

THese other wilde Knapweede that commonly groweth with us among corne very much, as well as in Meades, growe with greater and taller stalkes, the leaves both below and above upon them are also divided on both sides even to the middle ribbe, almost like the great *Scabious* of *Matthiolus*, but far greene in colour, and somewhat rough or rougher, then the former: but or somewhat more the hairy on the toppes of the branches are greater, and the flowers larger, and of a deeper red colour; the seede also other, and so are the roots, blackish and hard with many fibres.

3. *Senecio Creticus.* The Knapweede of *Candy*.

This *Candy* Knapweede hath many leaves lying on the ground, very much cut in on both sides of them into the middle ribbe, and each of those againe cut into other smaller peeces, from among which riseth up a stalke halfe a yeard high, whereon are set severall joints, lesser and lesse divided leaves than those from the roote of the stalke is parted into sundry small branches, with every one of them, a leafy head on them growes forth the flower compacted of many long threds of a purplish, and sometimes of a white colour, cloven and much jagged at the ends, with a pale like or chaffell in the middle of them, which being pull, the seede bare, the like downy matter, and is not unlike the former: the roote is thicke and somewhat grey, as are all the rest.

3. *Senecio montanus Narbonensis.* The *French* mountaine Knapweede.

This *French* Knapweede hath divers long leaves, very much divided on both sides, into other smaller and narrow ones, but they little or nothing againe divided, of a light greene colour on the upperside, and white underneath, and a little rough or hard withall, somewhat like unto the yellow Knapweede before mentioned, among which riseth up a round stalke, somewhat rough also, about a foote high, without many joints, bearing three or foure scaly heads at the toppes, with each of them, a long narrow divided leafe set round about with divers purple threds in the middle, smelling sweete; after which commeth the seede, like unto the former but lesser; the roote is long and slender and of a bitter taste.

4. *Senecio montanus candidissimus.* The hoary white mountaine Knapweede.

This hoary wilde Knapweede, sendeth forth, from a thicke woodly roote, divers winged leaves cut in

3. *Senecio Montanus Narbonensis.*
The *French* mountaine Knapweede.

4. *Senecio montanus candidissimus.*
The hoary white mountaine Knapweede.

the ground, and about it, very much rent or torne on both sides into many small leaves, which are each of them deepely cloued on the edges, somewhat like unto the leaues of *Scabious* or jagged *Scabious*, all couered ouer, with a kinde of what cotton or woolly matter, or as it were sprinkled with flower or meale, from whence riseth up a reeled white hoary stalke, about a foot or a quine high, scarce hauing any leaues thereon to the top, where it beareth only two or three scaly heads like the others with purple threads rising out of the middle of them, the seede is like the rest.

3. *Jacea humilis Hirsuta folio.* Low Knapweede with torne leaues.

This small Knapweede hath many small and narrow long leaues, very curiously cut in or gashed on the edges, but more notchedly round at the ends of euery diuision, as at the point end also, from among which rise up very small stalkes, not able to stand vpright, but leane downe to the ground, of about a foote high, with some smaller leaues on them; and at the toppes small scaly heades, like unto the others, out of which issueth the flower, very like unto the *Cyanus* or Cornflowers, but of a whitish blew purple colour, somewhat obscure or dulled, and sometimes white, the seede that followeth is not vnlike the rest: the roote is thicke and long.

4. *Jacea alba pumila Narbonensis,*

The Pine apple headed Thistle or Knapweede.

This small *French* plant groweth sometimes in the naturall places, without any stalke, bearing his Cone or Pine apple-like head, to grow the ground, that scarce any part of a stalke can be seene vnder it, and sometimes, and in the same grounds also, it will beare a round hollow stalke, of an handfull high or two, or more high, hauing diuers leaues thereon, cut on both sides, into many narrow short peeces, creepe on the vpperside and hoary vnderneath: at the toppe of the stalke standeth only one large round and long great head, bigger then beseemeth the smallnesse of the plant, resembling a Cone or Pine apple, delicately set with scales, blackish at the toppes, and forked or cut into two or three notches at the end, and bright shining white from thence to the bottome of them, from the middle whereof riseth up diuers purple threds, as in the other sorte, after which come small seeds wrapped in much down, as the rest are, and like unto the former small Knapweedes, but blackish: the roote is blackish on the outside, and whitish within, of the bignesse of ones little finger.

4. *Jacea Pumila Narbonensis.*
Pine apple headed Knapweede.

5. *Jacea Laciniata alba.*

Jagged white Knapweede.

This white Knapweede hath the stalke set with many very much jagged leaues, from the bottome branching forth on all sides, with lesser & lesse jagged leaues up to the tops, where on the seuerall small stalkes stand such like scaly heads as the other before haue, but with fine white threds rising out of them: the roote is long and thredy, and spreadeth some what under ground.

5. *Jacea montana minima lutea,*

Small yellow mountaine Knapweede.

The mountaine Knapweede, hath diuers leaues next the roote, some three inches long, cut into many diuisions on both sides, and each of them againe into smaller, but somewhat blocke and fatte, smooth also, but ending in a sharpe point: the stalke is small and set a foote high, bearing a greater scaly head then the smallnesse of the plant should seeme to beare, with a gold yellow flower in the middle, hauing many straight threds in the middle, and the outward leaues, lying downewards and compassing them: after which come small seeds, wrapped in downe like others, but smaller: the roote is somewhat thicke, hairy at the head, and parted into fibres.

5. *Jacea Laciniata alba.*
Jagged white Knapweede.

The Place.

[illegible] groweth in many places of this land, [illegible] as in other fields, especially about Ce[illegible] the second growth in Candy, from whence the [illegible] hath brought diuers sorts: the third [illegible] Cyprus, and neere Montpelier: [illegible] the first about Montpelier [illegible] fields: the first there also, but a [illegible] Barbary Cadiz: the seuenth is found in [illegible] of Italy and the Iland, the last, as Fabius Columna [illegible] in Naples.

The Time.

The first flowers flowreth in Summer, and their seede ripeneth shortly after, but the two last flower not untill Sep[illegible] in their naturall places.

The Names.

Divers would referre some one or other of these *Lettuces*, either going before or following the rest, to the *Lactuca Hyspida* of *Pliny*, (quasi *Lactuca Setosa* as *Pena* doth) whereof he maketh mention in his 27. Booke, 12. Chapter, which he saith is like unto *Sow* or *Sothern Endive*, or *Succory*, but leſſe and rough: it is also good for wounds; of which short deſcription it is hard to determine that *Pliny* meant this plant, or that it should be a kinde of *Succory*, or belonging to that Tribe, as the name aforeſaid should declare, and not rather none of the *Succoryes*, or of that ſtocke are found available for wounds as theſe are. The firſt I referre to is the *Lactuca major* of *Lobel*, the firſt *Lactuca* of *Clusius*, which he calleth *maxima Inſipa capitis*, in *Cornucopiæ*, and by *Bauhinus Lactuca nigra Inermis*. The ſecond *Cluſius* calleth *Lactuca spinoſa Asperæ Cretica*, and *Bauhinus Lactuca laciniata squammata*. The third is called by *Lobel*, *Lactuca montana Narbonenſis*, by *Fabius Columna Lactuca Cretica & quinta*, and by *Bauhinus Lactuca montana incana odora*. The fourth is ſo called by *Bauhinus*, as it is in deede, which he called both in his *Phytopinax*, and in his *Hortibotalia Lactuca montana Laciniata*. The fifth is called by *Lobel Lactuca pumila humilis Serpens*, &c. by *Lugdunenſes Lactuca humilis Hieracifolia*, and by *Bauhinus Lactuca tenuifolia alba Hieracifolia*. The ſixth is called by *Lobel* and *Pena* in their *Adverſaria*, *Lactuca montana*, and *Lactuca pinea Narbonenſium*, and thinke it alſo to be the *Chamæleon minor* of *Theophraſtus*, and by *Lugdunenſes Lactuca alia pumila ſive nana*, It is very likely to be that *Lactuca*, that *Lugdunenſes* calleth *montana nana*, or very like unto it; and by *Bauhinus Lactuca montana minor capite parvo*. The ſeaventh is mentioned by *Lobel* ſlightly as I thinke: The laſt *Fabius Columna* calleth *Lactuca montana ſpinoſa ſempiterna*, but *Bauhinus* calleth it *Lactuca laciniata lutea*.

The Vertues.

The firſt of theſe eſpecially, is equall in property with any of the other Knapweedes, both for inward and outward diſeaſes, and therefore whatſoever is ſaid of any of them, may be effectually found herein, and all them that are ſet downe in this Chapter, are in ſome ſort like unto it, although there is no certaine order appropriated them in ſuch manner as the former.

CHAP. IV.

Lactuca Laciniata capitulis ſpinoſis. Thorny headed Knapweedes.

1. *Lactuca lutea capitulis ſpinoſis.* Yellow Knapweede with prickly heads.

THis yellow Knapweede hath a few leaves next the ground, much rent or torne in the edges into many unequall parts, ſome bigger and others leſſer, of a grayiſh or overworne green colour, and of a little acride or ſower taſte, among which ariſeth up a ſtalke about two or three foote high, branched forth into ſome few, but not into very many branches, ſet with long narrow and more divided leaves on them, and at the toppe of the branches; the toppes of the branches and ſtalkes are each of them furniſhed with a great ſcaly head, ſet round about with ſmall and ſharpe prickles, and out of the middle thereof many threds, of a pale but fullen yellow colour, which abide in a good while, and when they are paſt, the ſeede is wrapped in a deale of white Bockye or downy matter, whitiſh or aſh-colour: the roote is long and white, and ſweete almoſt as the roote of *Eringo* or *Sea Holly*, but creepeth very much and farre underground, ſpringing up againe in divers places. This in the beginning of Summer yeeldeth forth among the flowers, a ſmall reddiſh graine like unto *Corn Trage-on*, but I could never perceive it in our land.

2. *Lactuca lutea ſpinoſa Apula.* The thorny headed Knapweed of *Naples*.

This yellow Knapweede of *Naples*, is in moſt things ſo like the former yellow, that it be not the ſame, differeth but little from it, which conſiſteth chiefly in theſe things, the roote is woodily, as *Columna* deſcriberh it ſaith, covered with a rugged barke, whoſe head hath many blackiſh haires, as the ribbes and veines of the laſt yeares leaves, the firſt leaves that ſpring up are ſmooth and whole, like unto a Docke, but thoſe that follow after are cleaved into many parts, like unto Radiſh leaves, but larger and ſomewhat like unto the Ceſtory leaves: the creſted or ſtraked ſtalke riſeth to be three foote high, ſomewhat hairy as the firſt leaves are, at the head whereof which dividerh not it ſelfe into above two or three branches, groweth many a ſcaly greene head, the edges and toppes of whoſe ſcales are ſomewhat cut in, and ſet with ſharpe yellow thornes, and many yellowiſh threds comming out of the heades; the ſeed that followeth is white and lies in a purpliſh downe.

3. *Lactuca purpurea flore capitulis ſpinoſis.* The purple flowred Knapweede with prickly heads.

This purple Knapweed traileth with his great long branches upon the ground, having wide diſtances on each ſide of them, extending to two or three yeards in length, branched forth againe into many ſtalkes or ſtalkes, whereon grow large and long leaves, much rent in on the ſides, and of a whitiſh greene colour: the ends of the branches ſtand larger ſcaly heads then the former, and greene, with moſt ſharpe prickes upon them, ready to pierce their legges that improvidently paſſe by it, out of the middle whereof forth many purple threds, and in them after the flower is paſt, ſtandeth whitiſh ſeede, little bigger then that of *Cumin* or the Buttles, of ſome called the Corne flower, the roote is very great, thicke, white and ſpreading, divers great and long branches, but not creeping within the ground as the former doth.

4. *Lactuca montana purpurea echinata capite.* The purple mountaine thorny headed Knapweede.

This mountaine Knapweede of *Auſtria*, hath divers ſoft narrow greene leaves, not hard or ſtiffe as the common white ſorts, nicely cut in on the edges, and into leſſer parts, ſomewhat like unto the leaves of *Carduus ſtellatus*, or the ſtalke that riſeth up about two foote high, being creſted or ſtraked, as divided at the toppe into divers branches, ſpreading in breadth more then in length, with many long ſcaly heades ſet there on, the toppes or end of whoſe ſcales end in ſmall prickes, but not ſo long and ſharpe as the foreſaid thiſtle, and more forked or divided; the flowers whereof are purple threds, like the other

...roote, the roote thrusteth downe deepe into the ground, like as that Thistle doth, with many small fibres hanging thereat.

5. *Iacea pratensis aculeata longo & crispo folio.* The white thorny headed Knapweed.

This prickly Knapweede sendeth forth a rough hoary stalke, about two foote high, whose first leaves at the bottome are long and like white coleworts, but the rest that follow are somewhat long, and two inches broad, thicke, rough, and deepely cleft about the edges, and long also, set many together with white veines running through them: at the toppes of the branches stand the heades, made of many scales, sharpe up to the toppe, like unto a Pine apple, the ends of whose scales are long, straight, sharpe, yellowish, thornes, and the edges of them set with white haire, like bristles; from the middle of the head groweth many long whitish leaves, divided or cut in the edges: the seede is like to that of the Spanish Knapweede, but greater then the ordinary: the roote is white and tender, easie to be broken, made of many strings or fibres, folding one within another, yet covered with a brownish skinne or barke.

6. *Iacea laciniata Southi folio.* Thorny Knapweede with Southistle leaves.

The leaves that first shoote forth of this Knapweede, are very variable, for some of them are round, standing upon long foote-stalkes, others afterwards are more and more gathered on the edges, and those especially upon the branches, much more divided, and are so hard and rigid, that if they be a little bowed or folded together, they will breake with a maydle or cracke, the stalke for the most part is round, and standeth in part upright, but being loaden with heads, bendeth downe to the ground, divided into sundry branches, and set with scaly heades, whose points being greene at the first, are purplish afterwards, and in every of them seaven small thornes, set together on the one side, some what like an halfe starre, the middle one being the largest and the longest: the flower that a long time sheweth it selfe, is compact of many long and hollow threds, of an excellent purple colour, whose toppes are broad and parted into some dents, the bottome being very small, narrow and whitish, the broad cut open end of the flowers are of the deepest purple or red colour, the seed is small gray and long, like unto those of the *Cyanus*, or the blew Bottle; the roote is long and threddy, covered with a brownish skinne or barke, and very brittle withall. this doth somewhat resemble the *Iacea marina* Dioscoridis following.

5. *Iacea pratensis aculeata longo & crispo folio.* Yellow Knapweed with prickly heades.

7. *Iacea montana incana Laciniata capitulis hispidis.* Hoary mountaine Knapweede.

This small Knapweede hath a round hoary stalke, halfe a foote high, with many hoary, rough, or prickly, narrow and long leaves, some what torne on the edges at the foote or bottome thereof, but those that rise up with the stalke, are deeper cut in, and the ends sharpe and prickly, at the toppe whereof, which is compassed divided, standeth a small head, compacted of prickly scales, whose ends are crooked threds, the flower is purple like the Scarlet fort, but much lesser, the roote reddish and threddy.

8. *Iacea lanuginosa capitulis hispidis.* The woolly white Knapweede.

This woolly Knapweede hath a white woolly stalke, scarce a foote high, but divided into branches from the very bottome, having short and narrow leaves thereon, more divided into three, or five or seaven parts, every lobe or part pointed, so white and woolly, that it seemeth as if it were all throwed over with meale, the small heades at the toppes of the branches are compacted of many scales, ending in sharpe prickles, like unto those of the white flowers it beares nothing observed.

9. *Iacea ex Betica.* The Spanish Sea Knapweede.

This Spanish Knapweede hath many long narrow leaves, unevenly dented or waved on the edges, thicke set with short white haire upon them, and of an ouer worne darke greene colour, among which rise low stalkes, with fewer leaves upon them then grow below but smaller, bearing at the topps but very few flowers, of purple colour, standing up higher then any of the former, which riseth out of a scaly head, set with small thrift (like hardhedge) white prickles many growing together: the seede is like unto that of the Knapweedes but larger: the roote is great and thicke growing downe deepe, fleshy and full of a slimy juice easie to be broken, blackish without, whitish within and enduring long.

10. *Lacta Babylonica.* The great prickly Knapweede of *Babylon.*

Because we cannot yet give you a full description of this plant, take for the present, so much thereof, as we coome to our knowledge, for a leafe or two onely being sent, framed upon the view thereof, like unto a Lettice the *Acanthium*, the White-way, or Cotten Thistle, being about a foote and a halfe long, and more than an handbreadth broad, in the middle thereof; somewhat hoary and rough in handling, compassed all about the edges with small sharpe prickles, having at the bottome of the leafe some torne peeces, on each side thereof, three or foure inches long, which growing small to the point, ended in a pricke: the middle ribbe being somewhat great and rough, from whence many veines runne through the leafe. Thus much and no more, were we able to write thereof.

The Place.

The first groweth in many places about *Salamanca* in *Spaine*, as *Clusius* saith, and about *Compostella* as he saith: the second in *Naples* as *Columna* saith: the third in *Spaine* also not farre from the sea side: the fourth at the foote of certaine mountaines in *Austria* and *Styria* as *Clusius* saith: the fifth in some other parts of *Spaine*: the sixt by the sea side in *Spaine*, about *Porta Santta Maria*, and *Calis*: the seventh on the mount *Caluary* by *Competer*: the eight by *Mansena* in *Spaine*: the ninth about *Calis* also: the last about *Babylon*, as the name doth intimate, but grew in the garden of *Signior Contarini*, a *Clarissimo* of *Venice*.

The Time.

They doe all flower in the Sommer, some earlier or later than others, and their seede is ripe according, only the sixth is the latest.

The Names.

Clusius calleth the first *Lacta latifolia flore luteo Cardui mariani facie*; *Lobel* and others call it *Lacta latifolia*, yet in his *Icones* and Observations useth but one figure, for *Lacta latifolia* which he saith is *Cardui Stellati flore*, and for *Cardui Stellati flore luteo Calcitrapa altera*, whereunto in the description he giveth purple flowers. *Lobel* hath placed this figure of *Clusius*, under the title of *Cardui Cyanocephali Dioscor.* It is by *Dodonæus* called *Solstitialis altera*, by *Lobel Cardualo Stellato capitatis spinosissimo Calcitrapa altera*, as *Bauhinus* saith: which doth better agree with my third sort here set downe, he calleth it *Lacta latifolia capite spinosissimo*: the second *Clusius* calleth, *Lacta laciniata minima Cornucoides Apula*, and *Bauhinus*, *Lacta latifolia spinosa Centaureæ facie*: the third very probable to be the same that *Clusius* calleth, *Lacta purpurea Valentina marianæ capitis*, and *Bauhinus* calleth *Scridæ cardui capitulo purpureo*: but I have altered it in the title, his name not fully answering the description in all things: the fourth *Clusius* calleth *Lacta montana echinata capite*, *Dodonæus Cyanoides flos*, whole name I have taken for his *Acute dentata facie secunda*; *Bauhinus* calleth it *Lacta Cyanoides echinata tertia*: the fifth *Clusius* calleth *Lacta capite lanato Acutis spinis*: the first he also calleth *Lacta laciniata Scorbutica*, and as I think belongeth unto the *Sonchi marini facie*, which is the ninth here: the seventh, eight and tenth have their titles as they are in his *Prodromus* beneath them downe: the ninth was sent among others by *Bock* of Trent by the name of *Lactuca*, but the last is remembred onely by *Bauhinus* in his *Pseudonymis* to come from *Signior Contarini* his garden.

The Vertues.

All these Knapweedes are no doubt of the same qualitie with the former, being binding, and somewhat glutinous, especially the roote of the sixt and ninth which as they are of a very clammy juice and substance, so they not be, but very consolidative, to knit and soder whatsoever needeth such properties.

Chap. V.

Serratula, Sawewort.

THere are foote other herbes called *Lacta*, by *Lobel* and *Pena*, *Bauhinus* and others, which I do not so doe, not finding them in my judgement worthy so heare that name, and therefore I thought good to joyne this and the next unto them, in several Chapters as neerest unto the *Lactæ*, and not those under the name of *Pharmica*, for that they doe best resemble them also, as you shall heare when I come unto them. Of this that is neerest unto the *Lactæ*, there are two or three sorts, differing in the colour of the flower, as the leaves, being more or lesse divided.

1. *Serratula vulgaris flore purpureo.* Common Sawewort with purple flowers.

This Sawewort riseth up with many of his first leaves, somewhat broader and longer than the rest, being sharper dented and pointed, all of them set upon long foote stalkes: but those that rise up after, are lesser and broader, and deeply cut in or gashed on the sides into many parts, and each part finely dented after the same manner; from among which spring many brownish stalkes, with divers leaves on them. One of which whereof are divided in the manner aforesaid, and so the higher they grow upon the stalke, the lesse dented they are unto the toppes, which are branched forth into many parts, bearing scaly heads like the former, but nothing so great, round and hard, with divers purple threeds or thrummes in the middle like unto Thorcer: the seede is small and blacke like the *Lactæ*, but it lieth lying downe, which they doth not all other the rowe is a tuft of many strings, which enters forth into many heads, and thoote forth many like leaves one of them, whereby it quickly groweth to be a great tuft or bush. I know some doe make four sorts of these: that is to say, one sort that beingerh all his leaves, dented finely about the edges, and not cut in or gashed: another sort, part hath them dented, that is, the first leaves, and the rest that grow upon the stalke cut in or gashed: a third that hath but one or two of the first or lowest leaves whole, and divided edges, all the rest being divided, some more some lesse; and a fourth, that hath all the leaves in generall divided into gashes or parts, but yet dented and none whole, which distinction of these foure sorts as I have not could never observe to be constant in any one plant, more than this, I have here set it downe that if it is young, will have many of the lowest leaves whole, and when it groweth elder, will have many divided: but for the first sort, that should have all whole leaves, and none divided, I could never find such and if I, or any other body should, I doe not thinke it would be so every yeare.

2. *Serra-*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Senecio flore albo.*

White flowred Sawewort.

This Sawwort is in all things like the former, but it never ariseth (after to any other distinction, but only that the flowers, or the threds in the middle of the knappes are white, and the heads thereof, and the stalkes, of a fresh greene colour.

4. *Senecio flore rubro.*

Red flowred Sawewort.

This also as farre as I could learne or heare, is wholly like the first, and not singularly to be found by that marke, that it should have all his leaves divided, and none whole, as the fourth sort before set downe is said to be: the difference betweene them, chiefly consisting in the flower, which is of a deeper red colour, which is not easily found, or in many places, and is often mistaken for the other.

The Place.

The first is most common in the corners of Fields and Woodsides, both open and shadowed; but that with a white flower groweth at the further end of *Hamsted* wood, neare unto a hill of water, running by the side of a hedge there; as also upon *Water Lane* Forrest in *Sussex*, neare unto the path that leadeth from *Tunbridge* to *Lewes Bridge*, by a brooke sides; the last is seldome found, and not without good observation.

The Time.

They flower in the end of Summer, and their seede ripeneth quickly after.

The Names.

It is most generally now adayes called *Senecio a senectute nomen fortitus*; yet there be some other herbes also called by this name, as Betony and Germander, but because each of them is knowne by a more proper name, this of *Senecio* belongeth to this, and is given but *a paria*. Some doe thinke that it was also called, (especially by those of *Germany* and *Italy*) *Senecio infectorius* or *tinctorius*, because it was used by them in dying and tinging of a green colour; for which purpose they in former times, untill they had learned things of better respect, used it: but I rather thinke it was called *Tinctoria*, by the mistaking of *Tragus*, his *Herba Tinctoria*, in *Fol.* 252. which he calleth *Isatis sativa* to be this; for his is the *Asser Italorum purpureus*, as by his figure under that name may well be perceived, into which errour, *Bauhinus*, as hee saith himselfe, was misled by *Thalius*, who did so thinke it to be, and called it in his *Hercynia sylva Centuriones*, *aut Centuriones magni sylvestres Germanicum*, untill he found his errour, and reclaimed it in his *Pinax* in the title of *Asteri affinis tinctoria*, and *Senecula*. I cannot finde any other *Greeke*, *Arabian*, *Italian*, *Spanish*, *French*, *Dutch*, *German*, or *Low-Dutch* name given it, than according to the *Latine*, as we in *English* Sawewort. And for other Latine name, *Thalius* onely, as I before said, as resteth in a doubt of great Certainty, and *Lonicerus Solidago Saracenica*, from the effects.

The Vertues.

It is commended to be singular good for such as are bruised by any fall, and thereby have some veine broken within them; or that are much bruised by carriage, for it wonderfully stayeth such bleedings, and easeth the paine and soreneste that commeth thereupon, if a handfull of the greene or dryed leaves be boyled in white wine, or the powder of them be put into the said wine and drunke. It is also effectuall also, in all inward torments and paines, in the guts and bowels, if both leaves and roote be boyled in wine and drunke. It is wonderfull good also for all wounds, whether they be fresh, or corrupted or festred, or having old and filthy sores, to cleanse and heale them also: if the wine of the decoction of the herbe be often used to wash them withall. It is also commended for burstings or ruptures, by often bathing the place, and applying the greene herbe and roote, as a poultice outwardly: It is good also for the gout, or swollen knees, when they grow full of blood and are very painefull, after the applying of leeches, by some thought best, with the decoction of the herbe in Wine.

Chap. VI.

Strobe, Silver Knapweede.

There are many sorts of *Strobe*, that is usually so called with all Herbarists now a dayes (but not that which was so named of all the ancient Writers, & which is quite differing from it) being so like unto the *Senecio*, as more other more, is of divers sorts, differing both in the leaves and heads of flowers, and some other things, as shall be presently shewed you.

1. *Strobe Salmanticus prima Clusij. Clusius* his first *Spanish Strobe.*

The first *Tragus Strobe* of *Clusius*, hath divers large leaves lying on the ground, very much cut in on both sides, who

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

into large leaves, but lesse then the other cloter together then the next, of a dead greene colour on the upper side, somewhat whitish underneath, very hairy all over, as also the straight strong stalkes, that rise up to the height of foure foote high or more, with divers such like divided leaves on them as grow below, but much lesse, every one sharpe at the point, divided at the toppe into sundry branches, bearing upon long lase stalkes, and somewhat long, small scaly, smooth, round, greene heads, but lesse then any of the heads of the former Knapweedes: from the small toppes whereof rise many very pretty crimson threds or stamines, of a fine colour between both, standing round together, from whence the bottome of them, which is found in the flower neare a moneth before they lose, in the meane while, the seed ripeneth in the heads, which is small, not much bigger then the Cyanus, and not so great as the ordinary Knapweede: the roote is white, long and wooddy. When it is growne above two yeares old and well rooted, it will abide the Winter, else it abideth well, and will usually flower and seede two Winters, if they be not very extreme, or they destroy it not too much upon the weather.

2. *Stœbe Hispanica secunda, Lusit. Cluſij.* The second *Spanish Stœbe*.

This other *Scottish Stœbe* or *Cyanus*, hath also many divided hairy and somewhat hoary leaves lying on the ground, divided into severall parts on both sides, but more separate and more from another then the former: the stalkes likewise are hairy, and sometimes hoary also, yet stand not so upright, but seeming downe with the weakenesse of them, divided into many branches, bearing at the toppes of them, somewhat higher then the former, from whence shoote forth bigger flowers also then the former, whose outward leaves, are made (as those of the *Cyanus* or Corne flower, of a faire purplish red colour, with such like coloured threds or stamines in the middle of them as are in the former, with whitish and yellowish bottomes: the seede that followeth the former: the roote hereof is white and long, but lasteth not after seede time.

3. *Stœbe Salmanticensis argentea.* The silver headed Knapweede.

This third *Stœbe* or *Cyanus*, hath likewise many leaves rising from the roote, but they are much more jagged and cut or smaller gotten then either of the former being more hoary, or of a whiter greene colour then either: the stalke in the same manner hoary, riseth as high as the rest, with thinne cut or divided leaves upon them as the former, the points, but smaller and smaller up to the toppes, where it is much divided into branches, and hath at the ends of them, scaly greene, but more white edged leaves, seeming as if they were flowered cup of whitenesse: small purple flowers, like the rest but smaller, the seede hereof lying in the downe beside as the others do, somewhat blacker then they, and having such an hairy toppe on them: the scale is somewhat thicke and abideth sometimes after seede time.

4. *Stœbe Austriaca Clusij.* The greater *Stœbe* of *Austria*.

This *Stœbe* of *Austria* differeth neither in formes of leaves nor height in growing from the last, neither

1. *Stœbe Salmanticensis prima Clusij.*
Cyanus the first Spanish Stœbe.

2. *Stœbe Salmanticensis secunda Clusij.*
Cyanus the second Spanish Stœbe.

flower, but in the scaly heads, which are not of such a shining silver like colour, which onely

differences.

8. *Stæbe Austriaca humilior.* The lesser *Stæbe* of *Austria*.

This also differeth so little from the last, that it is in a manner onely distinguished by the lowenesse of its growing, and tendernesse of the stalkes, and not in any thing else.

9. *Stæbe argentea minor flore albo.* The lesser silver *Stæbe* with a white flower.

There is likewise little difference in any other thing in this, from the last, more than in the flower, which altogether made of white threds or thrummes, without any other colour therein.

10. *Stæbe Plantaginis folio.* Narrow leafed *Stæbe* of *Candy*.

This small *Stæbe* of *Candy* hath divers long soft fat and narrow leaves lying euen the ground a little jagged the edges, but those that grow up with the slender handfull long stalkes not at all, but resembling the Plantane leaves, and are of a yellowish greene colour: the toppes of the stalkes are furnished with small husskes or heads, out of which grow yellow flowers, and after them small long seede like unto those of *Stæbe*, the roote is white and of a fingers thicknesse.

11. *Stæbe spinosa Cretica.* The Thorny *Stæbe* of *Candy*.

This Thorny *Stæbe of Candy* riseth up at the first, with small and long whitish greene leaues, very like unto small Corne flower or Blewbottle, but those that follow, are much longer, and more cut in on both sides the leaves even to the middle ribbe, but the peeces are somewhat round pointed: the stalkes rise not high, but being much branched, even from the very bottome, into many slender hoary woodily twigges, every one ending in a thorne; at severall joynts of these branches come forth such like, but lesse and lesse divided leaves, and the leaves come forth in divers places small scaly heads, with white flowers starting forth of the middest of them like unto those of the little *Cyanus* or Corne flower, but never laid open, abiding halfe shut euer continually; after which commeth the seede which is small and long; the whole plant is of a grayish wan or ashcolour, and liveth many yeares in the warmer countries.

12. *Stæbe frutescens latifolia Cretica.* The broad leafed shrubbe *Stæbe* of *Candy*.

This plant being found growing in *Candy* by *Honorius Belon*, and the seedes thereof sent by him into *Europe*, without any proper name, but *Fuchsiorum frutex*, as you have it set downe in his second Booke, which is set forth in the end of his History of plants; I have thought more fit to joyne with the *Stæbe* than *Badhamia* doth with the *Storax* tree, as if it were a species thereof, onely because *Pona* in his *Italian* booke that *Alpinus* did call it, *Cyanus folijs Styracis*; but he himselfe (I meane *Pona*) there calleth it, *Cyanus folijs Pomi*; but betweene *Cyanus* and *Stæbe*, there is small difference, that it may be referred to which you please, for it pertaineth of both sorts, and yet properly cannot be said to belong to either of them, the stemme whereof is as followeth: It groweth up with a wooddy stemme for some distance above the ground, and spreadeth forth divers armes or branches, to the height of two or three foote in compasse round, set with divers very faire and fresh greene leaves, very delightfull to behold, being somewhat long and round like the leaves of the Appletree, as *Belon* saith, being very white underneath almost like silver, which some have compared them to the Quince-tree leaves, which are whiter on the underside than the upper leaves, and some to *Alpinus*, viz. the leaves of the *Storax* tree, which are very like unto those of the Quince but take which you will, the comparison in part holdeth correspondence: from these armes or grosser boughes shoote forth other small long and slender ones, bearing very sparedly the like leaves on them, and from the toppes whereof come forth divers long scaly heads, longer than any *Stæbe*, *Jacea*, or *Cyanus*, and with such scales parted with white and purpled colour, divers set together as it were in a tuft in the same manner as is to be seene in the *Saponaria*, Sopewort, or Brakewort: at the toppes whereof stand the flowers, very like in forme unto the *Cyanus* or Corne flower, but of a pale Orenge colour; which heads after the flowers are fallen containe in them small and long seede, somewhat like Cummin seede, but longer, which abide in the heads long after, not falling away: the roote is hard and wooddy like a shrubbe or tree, or shrubby tree.

13. *Stæbe frutescens angustifolia Cretica.* The narrow leafed shrubbe *Stæbe* of *Candy*.

This shrubbie *Stæbe* in his naturall place riseth to be three or foure cubits high, with a wooddy hoary trunke covered with a hoary rugged barke, the wood it selfe being very hard, & of an evill savour (as I have from whence it spreadeth many branches on all sides rugged also at the bottome and hoary, but towards the toppes, somewhat thicke set with very long and narrow leaves, & somewhat like unto those of the Hyssope rather of Rosemary, but longer and more hoary all other: the greater armes do send forth divers smaller set with the like leaves on them but lesser and shorter, and at the ends of every of them one scaly head, from the middle whereof shoote forth the flowers compoted of many purplish blew threds like unto a *Cyanus* but the colour of a *Stæbe* for the manner, but larger than either of both: this plant will serve as a hedge bush, & may be reduced into what forme you please like unto other bushes, and will also be encreased by slipping, and keepeth the leaves alwayes upon it, especially in the warmer countries, yet will not abide the cold Winter without some especiall defence: the roote is wooddy and spreadeth like a shrubbe or bush.

The Place.

The first three sorts grow in divers places of *Spaine*, but especially about *Salamanca*, as *Clusius* affirmeth forth saith: the fourth and fifth in *Austria*, and other parts of *Hungary*: the first likewise doth grow about those parts: the foure last their titles testifie to be in *Candy*.

The Time.

They all doe flower in the Summer Moneths of *June* and *July*; yet those of *Candy* flower later, even in the end of *August* or *September*, where if any rarely frost take them, they wither straight waies, although in their owne native places, which are the warme countries, they continue many yeares.

The Names.

Although I have acknowledged, (as I said before) that none of these plants are the true *Stæbe* of the ancients which hath thorny or prickly leaves, as *Gaza* falsely translateth *Theophrastus*, but should be there set and placed growing with the lesser, yet because as *Clusius* saith, the learned Physitions of *Salamanca* in *Spaine* and other places so call the former sorts and esteeme of them, because the ends of their leaves were sharpe pointed, as

Original from UNIVERSITY OF MICHIGAN

part rather than in the answere and declaration of the Stobe of the ancients; as also because those plants may in the processe of time be referred to the kinde of *Scabious* (but more truely I say vnto you *Lapsa*) which of most authors of this later age, is therefore renounced, called, and vsed for *Scabe*; which notwithstanding is an error great and intolerable, in regard *Scabious* is a most soueraigne herbe, for those diseases in the which the true *Stobe* fayles, so is it no lesse ridiculous to transferre the vertues of *Stobe* vnto the *Scabious*; for as *Dioscorides* and *Galen* after him doe affirme, *Stobe* tendeth to drying and attenuating a quality, that is not fitting any flux of humours or blood in the bowells or belly, as also thats of wounds; which I thinke was neuer found in *Scabious*. Time that I may enterweave one (which to some may become doubtfull) that *Stobe* hath a prickly stalke, which is neither to be found in *Dioscorides* nor *Galen*. Cuppies: let me shew you it out of *Theophrastus* in his first Booke and fift Chapter where he numbreth *Paleos*, which as he saith, was also called *Stobe*, (and not *Phleum*, as hereof hee speaketh in his fourth Booke and eleventh Chapter) among those plants, that grow in watery and moist places; the likenesse of which two words, hath deceiued many, imagining them to be one thing, among those plants that haue a leafe besides the thornes on their stalkes, which sentence *Gesner* (as I said before) vnderstandeth, that it hath beside the prickly leafe, another leafe also by it, for *Theophrastus* in the fifth Chapter of the said sixth Booke, doth deny *Paleos*, and *Hippophaes* to haue any prickly but a *Lanceole* leafe, although in the third Chapter of the same sixth booke, he seemeth to say, that *Phleos*, *Tribulus*, and *Creperis* haue prickly leaues, beside the thorny stalkes, but both of them cannot be true. And herein *Pliny* hath likewise erred in confounding *Theophrastus*, making *Paleos* and *phleum* to be one thing, and hath hereby also caused many others to doe the same. *Plutarch* in the life of *Theseus* about the beginning doth name *Stobe* among the thorny plants, whose words are these: *Alcmaleppidas Ioeta Cranio fuerat ordine vnde in Cecropia Colonos post vnde Cranaos traxerant, vnitque duos eli patrios, neque Hymetti asparago, neque Stobes ope crentibus (sed inclusa in salsa petrosa. In Euchidius, Iuxta* the tombe of *Alcmaleppus* was ioyned with *Ormine*, to leade forth a colony to *Corye*, from whence the *Inoeti* haue their originall, whose Countries ordinarie is neither to burne the thornes of *Asparagus* nor of *Stobe*, but to giue them honour and reuerence also with *Plutarch*. *Aelianus* also in his third Booke and one and twentieth Chapter, remembreth *Stobe*, saying that *Pausanias*, (or more truely *Dinder*) groweth vpon it, but now as I haue shewed you that the true *Stobe* is a prickly or thorny plant, and that therefore I vnderstand not this *Stobe* to be, Let me here also shew you what is the true *Stobe*, which is indeede worthy the hearing, but that I reserue it to a fitter place, that is among the thorny plants, where it is called *Pennicilla Stobes*, or *Panicon*, but I forbeare any further to speake thereof in this place. The first of these here set downe, is called by *Clusius Stobe Salmanticensis prima*, by *Dodonæus Stobe hispanica prima*, by *Bauhinus Stobe major folijs Cichorei mollioribus longioribus*. The second is called by *Clusius, Stobe Salmanticensis prima altera species*, by *Lobel Stobe hispanica minus Alderotti*, by *Dodonæus Stobe secunda genus*, by *Bauhinus Stobe major folijs Cichorei mollioribus longioribus*. The third is called by *Clusius Stobe Salmanticensis altera varietas*, by *Lobel Stobe argentea Salmanticensium*, by *Dodonæus Apocynum hispanicum*, by *Bauhinus Stobe valentina argentea*. The fourth is called by *Clusius, Stobe Gallica* and *Austriaca altera*, by *Bauhinus Stobe major valentina sive pyrenaica altera*. The fifth is called by *Clusius, Stobe Austriaca tenuifolia*, by *Clusius in tabellione Florentino, Centaurea spinosa flore albo*, and by *Bauhinus Stobe minor Cyani foliis tenuifolia*. The sixth is called by *Tabernæmontanus* and *Gerard, Iacea flore alba*, and by *Bauhinus Stobe valentina argentea minor*. The seaventh is called by *Alpinus lib. de plantis exoticis* as it is in the title. The eighth is called by *Plate* in his *Italian Ballads*, *Cyanus spinosus Creticus*, and so also by *Alpinus* in *lib. de exoticis plantis*. *Clusius* in his *Auctuarium*, to the other Appendix to his history of plants, calleth it *Stobe peregrina*, and saith that *Iacobus Plateau*, who sent him a branch of the plant, with the figure thereof drawne, hauing gathered it in the Garden of the Duke of *Arschote*, in *Bellomonte*, called it *Stobe spinosa frutescens*. The ninth I haue ioyned with these *Stobes* as I said before, rather then with the *Stoves* trees as *Bauhinus* doth, calling it *Frutex tetrafolius argenteus folio Cyani flore*; but *Pona* in the same place above said, calleth it, *Cyanus fruticosus Creticus*, and is the same plant that *Honorius Bellus*, in his second Epistle to *Clusius*, as he saith, could not learne by what name they in *Candy* called it, and therefore he onely called it *Pulcherrimus frutex*. I haue as you see, set it and the last with the *Stoves*, being nearest in likenesse to them, to regard these haue all scaly heads, as the *Stoves* haue, which are not to be seene in any *Scabious*. The last *Pona* in the description of Mount *Baldus* sixth called *Stobe spinosa Lusitanica Colina*, but after in his *Italian* booke, he calleth it *Chamepeuce frutescens Creticum Bellij*, and by them of *Candy* called *Kynoxylon*, id est, *Signum fatidum*, and by *Bauhinus Iacea frutescens Pona folia* and is thought to be the *Chamæpeuce Plinij* of *Segouia*. The *Spaniards* as *Clusius* saith, call the first by the name *Cabeçuela*, id est, *capitulum*, a little head, and chiefly make brooms thereof to sweepe their houses, the learned Physitions there as he saith, vse the third sort instead of *Scabious* for all the purposes thereof.

The Vertues.

The most of these sorts, but especially the three first, do come some what nigh vnto the qualities of *Scabious* and therefore I shall referre you thereunto, to know both what remedies may be had from these plants, and in what manner and to what purpose to be vsed: for as *Scabious* fitteth the parts whereunto it is applyed to, so these also.

Cap. VII.

Pterocaulos non vulgares. Vnusuall Sneesewort.

Now here as I promised before, brought to your knowledge those other plants, that comming neere vnto the *Lacea* and *Stobes*, and yet being none of them, were fitted to be entreated of in a Chapter seuerall by themselues; for as I said although *Bauhinus* doth put these two sorts vnder the title of *Lanceolatæ folio*, and reciteth their authors for them, who are chiefely *Lobel* and *Clusius*, yet I cannot finde by the same authors, as well as by mine owne sight and knowledge, but that they are differing plants from the *Lacea* and *Stobe*, but I would not haue you conceiue, that any of these *Pterocaulos* is the which groweth wild with vs in diuers places, for I meane to bring it into that Chapter that is fit for it, namely that of *Iacea*, and *Stobe*, and *Scabious* kindes; the double kindes whereof, I haue set forth in my former booke.

1. *Pterocaulos*

1. *Pyrenaica Austriaca Clusij sive magna.* Clusius his Succlewort of *Austria*.

The Succlewort of *Austria* tendeth forth many leaves from the roote lying on the ground, being somewhat smooth, somewhat long and narrow, green on the upper side and hairy on the under, of a sweet taste; among which riseth up an hoary stalke, about two foote high or better, having divers such like leaves thereon, but lesser, spreading into some few slender branches, with every one for the most part a small head whose silver like head on them, from whence spring forth a dozen or fourteene hard, and small long pointed leaves, as a border or pale, about a number of small short thrummes in the middle, shewing like as if they were made of parchment, whilest at the first appearing, but afterwards being come to their full growth, of a pale faire bleake blewish purple colour, without any sent to commend it, pleasant only by the prospect of their forme and colour, and by the durability; for being gathered in his perfection, it will endure two, or better, without alteration in the same colour, without changing for many yeares together. being put into a glasse of water, the stalkes being let stand upon the stalkes, they become somewhat brownish, having many small blackish coloured seedes, lying among a deale of white downe. the roote is hard and blacke with some fibres at it, but perishing every yeare.

2. *Pyrenaica Imperati sive minor.* The smaller Succlewort of *Austria* or *Austria*.

This smaller Succlewort, hath forth like long and narrow hoary leaves, but not fully so large as the former, the stalke riseth not so high, but is divided into more and more slender hard branches; at the tops whereof stand such like scaly heads, but not so white or silver like, from whence shoot forth such like pale like as the pale or border, but neither so large nor so many, being seldome above eight or nine, neither yet so faire a blewish purple colours, but of a pale delayed colour, having in my thrummes in the middle, the seed that followeth is like the former, and so is the roote, but smaller both of them; and perisheth in the winter every yeare, this plant being a little rubbed or handled, sendeth forth a reasonable sweet sent, or savour to be misliked.

The Place.

The first *Pyrenaica* saith groweth in *Italy*, and *Clusius* saith he found it in *Austria*, and afterwards about parts of *Hungary*. *Lobel* saith it groweth about *Montpelier*, for I suppose he meane *altera Icon*, to be the same, himselfe also saying that some did so call it, although he describeth it to have rougher leaves. Howsoever we having received the seede from *Italy*, under the name of *Pyrenaica Imperati*, have thought good to entitle it, by the same title we received it, *Clusius* in his *Cura posteriores* saith, the seede was brought out of Austria that grew with them, and *Lobel* saith of the same plant as I take it, that it came out of *Austria*.

The Time.

They both flower late, that is not untill the beginning of *August* at the soonest, and the seede is not ripe till the middle of *September*.

The Names.

The name [illegible] in Greeke, signifieth as much as *Sternutamentaria* in Latine, that is, to provoke sneezing.

1. *Pyrenaica Austriaca Clusij.*
Clusius his Succlewort of Austria.

2. *Pyrenaica Imperati sive minor.*
The smaller Succlewort of Austria or Italy.

which Author in the doth not, and therefore cannot be *Dioscorides* his *Prenanthes*, although it doth agree there-with in some other things: neither doth *Matthiolus* acknowledge it for the right *Prenanthes*, although he saith that those plants that grow in fenny places provoke Swelling. *Cordus* calleth it *Prenanthes Austriaca*, because he first found it in *Austria*. *Camerarius* alters it to *Lactuca Prenanthes*, and *Lobel* out of doubt meaneth this plant, which he calleth *Lactuca montana*, and *Lactucella montana*, and therefore in my perswasion, *Penneius* hath not done well to make it a new distinct plant, for if he ever saw it, he might finde it to differ notably from the *Lactucas*, for which cause both *Matthiolus* and *Cordus* gave them rather like names of *Hieracia*, to shew the variety thereof from *Lactuca*. *Cæsalpinus* calleth it *Lactucella montana*. The other is called by *Clusius* in his *Curæ posteriores*, *Prenanthes Austriaca flosculis*, and is out of doubt that plant which *Lobel* in his Observations calleth, *Lactuca purpurea montana altera folio Olex*, which *Camerarius* also names so: these two distinct plants, thus making foure forts of these two plants, which as *Lobel* in his explanation in the Margent of the said *Icones* saith, it is *Hermaphroditorum*, meaning the former *Amphibia*, or two, by reason both sexes properly appertaine.

The Vertues.

Anguillara saith that in *Italy* they use it for no other purpose, but to make brooms thereof to sweepe their houses: *Matthiolus* saith the women about *Vienna*, who gather herbes abroad, and bring them to the City to sell, do sell this *Scabious*, and keeping it dry all the yeare, doe sell it to the Apothecaries, and others when they need it, to use it for the purposes whereunto *Scabious* is appropriate; and further saith, that the people thereabouts do use it inwardly, believing that the decoction thereof given to Children, doth very profitably helpe them, when they think they are bewitched; (or rather as I doe take it, when some grievous paines or torments in their bowels and bowell doe raise them from the crudity of humours therein gathered, by their often feeding of fruites that breed foule corruptions;) and although we have not found that it hath beene much used in Physicke, yet since by the judgement of many, it cannot be without some of the especiall properties of *Scabious* or *Succisa* as the leafe, it doth so nevrely approach thereunto, both in forme and temperature.

Chap. VIII.

Cyanus, Blew Bottles.

I Would willingly interpole this Chapter of the *Cyani* Blew Bottles betweene the former plants, and the forts of *Scabious* that shall follow in the next, both because they have scaly heads, which most of the *Scabiosas* have, and because divers of the *Jacea's* and *Stœbes* have heads of flowers much resembling the *Cyane*.

1. *Cyanus major vulgaris.* The greater ordinary blew Bottle.

The greater blew Bottle or Cornflower, (which I therefore call ordinary, because there is a Turky kinde, which is extraordinary) riseth up with a crested, or rather winged whitish greene stalke, about two foote or a yard high, whereon are set divers leaves somewhat long and broad, without any division or dent on the edges, greene on the upper side, and greyish underneath, each of them compassing the stalke about, at the lower ends, which is divided at the toppe into a few branches, bearing somewhat large scaly greene heads, with white or silver like edges, from the middle whereof commeth forth a larger flower then in the smaller kinde, thinnely or sparingly set, and of a deeper violet blew colour, in which heads after the flowers are past, some few white long seeds lie among the downe, like the lesser kinde, but some what bigger and flatter: the roote creepeth under ground, and spreadeth divers wayes, so that the heads with greene leaves will abide all the winter, which in the lesser kinde do not so, but perish wholly after seede time and doth rise of it owne sowing before winter, and so abide greene all the winter, untill the next Spring and Summer, that it flowreth, seedeth, and perisheth againe.

2. *Cyanus minor vulgaris & varijs coloribus.* The small ordinary Corne flower of sundry colours.

The small ordinary Cornflower is wonderfully diversified, as I have shewed in my former booke, in the colours of the flowers, but not variable in any thing else; for the leaves are long and narrower then the former, set in on the edges somewhat deepely, yet lesse more then others of a whitish greene colour, the stalke riseth to be like foote high or more, set with the like leaves, but smaller and lesse cut in on the sides, branching forth on all sides, and bearing at their toppes many greenish scaly heads, out of which rise flowers consisting of five or six or more long hollow leaves, small at the bottome and opening wide at the brimmes, where they are cut and notched somewhat deepely into divers parts, with many small short threds in the middle: the colours of these flowers are divers, some being all a perfect blew or purple colour, paler or deeper, some white, or at a blush colour, otherwise of a sad or light red or over-worne purple, wholly without mixture in the leaves or brimmes; but some will be mixed of blew and white or of the other colours, either edged, stripped or pointed, the heads in the middle varying likewise: after the flowers are past, the heads grow full of small long and slender shining seeds among the short downe, which easily and quickly falleth away, leaving the head with the seeds, wherein the seeds are somewhat long and hard perisheth every yeare, but usually is reseed by it owne sowing. *Cornucopiæ Lamii-folio.*

3. *Cyanus Turcicus flore Orientalis major & minor.* The Sultans flower a greater and a lesser.

The greater I received from a noble friend, where the *Grand Signior* or great Turke as we call him, employed it and wore it himselfe, whereby all his vassals held it in great esteeme; the leaves are not much unlike, but larger, and more gashed in on the edges; the stalkes are a yeard high at the least, with the like leaves as the other, beset with the like leaves but smaller, and branching into sundry long stalkes, each bearing a larger scaly head then the former, and bigger in the one then in the other, with such like flowers, consisting of eight or nine hollow leaves with wider open brimmes, and small threds in the middle, the colours are of a fine delayed purple or blush colour very beautifull, and the thicke thrums of the middle of a most exceeding a sweete scent, that it surpasseth the finest Civet that is: the seede is blacke, long and bigger then the other, like unto my thinking; the roote perisheth every yeare, the greater of these two sorts likewise, but greater then the other.

4. *Cyanus Baticus fupinus.* The Spanish Corne flower.

This Spanish kinde hath many fquare low bending or creeping ſtalkes not ſtanding ſo upright as the former, but branching out roote diverſly, ſo that one plante will take up a great deale of ground, the leaves are ſomewhat broader, ſofter, and of a paler greene colour, then of the common ſmall kinde, but not much or deepely gaſhed on the edges, the flowers ſtand in bigger heads alſo, and with foure or five leaves under each, of a light purple or bluiſh colour, after which come white ſeed like thereunto alſo, but not ſo plentifully, yet wrapped in a more downy ſubſtance, the roote groweth downe deepe and periſheth likewiſe every yeare as they doe.

5. *Cyanus repens latifolius Lobelij.*
Broad leafed *French* Corne flower.

This *Cyanus* that *Lobel* and *Pena* in their *Adverſaria* have ſet forth, whoſe taſte is very bitter and unpleaſant, hath divers weake hoary and trayling branches not ſtanding upright, about a foote and a halfe high, whereon grow divers hoary leaves, ſomewhat broad and narrow, and ſomewhat like unto thoſe of Lavandre, but harder in handling, at the top of the ſtalke which is branched forth, grow ſeveral ſcaly heads like unto the other *Cyani*, whoſe flowers are like unto them, but of a ſadder or deader purple colour, then in any of the other ſorts; the roote is about a fingers length.

6. *Cyanus repens anguſtifolius ſive monſpelius.*
The ſmaller Corne flower of *Montpelier*.

This ſmaller Corne flower hath likewiſe divers weake ſlender yet ſtarn hoary and ewigged ſtalkes, whereon are ſet divers ſmaller leaves then the laſt, but hoary in the ſame manner; as the toppes of the branched ſtalkes ſtand many ſcaly heads, much leſſer then any of the ſorts of Corne flowers, from whence grow ſuch like flowers, but of a ſadder or deader colour. the ſeedes are like the ſmaller ordinary kindes, and the roote is ſmall, long and wooddy.

7. *Cyanus Cretica ſpinoſus.*
Prickly Corne flower of *Candy*.

The lower leaves of this Corne flower are jagged and very hoary, but thoſe on the hoary branches of the ſtalkes are leſſe or not at all, they ending in long ſharpe pricks or thornes with ſmall bluiſh coloured flowers like the others ſorts but ſmaller, the roote is long and ſomewhat thicke enduring many yeares.

The Place.

The firſt groweth naturally upon ſandy hils in *Germany*, but is uſually cherriſhed elſewhere in Gardens. The ſecond which blew flowers in many corne fields of our owne land and ſome of the other colours alſo. The third as is ſaid in *Turkie*, and the fourth in *Spaine*, firſt found and ſent unto us by Doctor *Boel*, who was then reſident at *Tholouſe*. The fifth groweth under the branches of the *Seſeli pratenſe*, by *Selin nove* neere unto *Montpelier*, and the ſixt in ſundry places alſo, and by *Caſtrum novum* not farre from *Montpelier*, as *Pena* and *Lobel* doe ſet them downe in their *Adverſaria*; the three laſt and the other woolly ſort in *Candy*.

The Time.

They flower and ſeede in the Sommer Moneths when the other doe.

The Names.

It is called *Cyanus, a floris Cyano vel cæruleo colore.* In the infancy of Herbariſts, *Fuchſius* who knew not well what to call the firſt, referred it to the *Herbaſco*, and called it *Herbaſculum*, but now it is generally called by all Herbariſts, *Cyanus major*; ſome adde thereunto *hortenſis*, and others *Montanus*, yet *Hieronymus* taketh it to be *Chamæleon* of *Dioſcorides*, and *Caſalpinus* to be a kinde of *Scorthium*, whereof *Thalius* maketh mention. *Fabius Columna* ſuppoſeth it to be that kinde of *Papaver* which *Theophraſtus* calleth *Heraclium*, and *Lobel* maketh a doubt whether it may not be accounted a ſpecies of *Chondrilla*. The ſecond ſort that groweth in the Countries called *Pars Pannonici* and *Bupleuroides* or *Bupleuſcula*, of the turning the edges of ſickle-wiſe, or cutting downe like Corne for which was taken for a Sickle in ancient time. The third was ſent us out of *Turkie*, by the name of *Acrobalſamum*, which whether it be a *Turkiſh* or *Arabian* name I know not, the *Turkie* chronicles will ſhew, doe *Cyanus* it is the *Saffron* flower and ſo doe I, but that I adde *odoratus* for the ſweete ſent of the flower. The fourth was ſent by *Boel* under the name of *Iacea Batica*, but becauſe I finde it better agreeing with *Cyanus* then *Iacea*, I have rather ſo called it here. The two next ſorts are called *Cyanus ſupinus* or *repens* by *Lobel* in his *Adverſaria*, the laſt is not mentioned by *Alpinus* in his Booke *de exoticis*.

The Vertues.

The powder of the dryed leaves of the greater blew Bottle, or Corne flower, is given with good ſucceſſe to thoſe that by ſome fall are much bruiſed, and for them alſo if they have broken a veine inwardly, and voide much blood at the mouth, being taken either in the water of Plantaine, Horſetaile, or the greater Comfrey. It is accounted a help or remedy againſt the poyſon of the Scorpion and *Phalangium*, and to reſiſt all other venomes and poyſons. And therefore *Matthias* affirmeth it to be excellent good in all peſtilentiall feavers, and of his owne knowledge, to be powerfull againſt the plague or peſtilence, and all other infectious diſeaſes, either the ſeede or the leaves taken in Wine. The Iuice is ſingular good to put into freſh or greene wounds, for it doth quickly ſolder up

up the tippes of them together, and is so fit for effectuall also to heale all such ulcers and sores as happen in the mouth. The same juice also dropped into the eyes, taketh away the heate and inflammations in them, the distilled water of the herbe, hath the same properties, and may be used for all the effects aforesaid. The later sort Bottle or Corne flower is used generally by all our Phisitions and Apothecaries in the stead of the greater sort, if it be not to be had, and is held to be in a manner as effectuall as the greater.

Chap. IX.

Scabiosa, Scabious.

NOw that we are come to handle the varieties of the Scabiouses, they are so many, that I know not how to marshall them into any good method or order, yet that I may proceed as it seemeth best unto me, I thinke it fittest to ranke them into foure Orders; that is first, of such sorts as grow in the Meadowes or Pasture grounds; next of those that grow in the Woods, and upon hills and high grounds; thirdly of such as beare a round or Globe-like head and lastly of such as beare flowers more flatte like than the other sorts. I doubt not, but that although I shall endeavour, as neere as I can to set every one in their right order; some of them also may be thought as fit for another Order, as that wherein they are set; which now inclosed, of them now in the same manner I give you them. And for the *Morsus Diaboli*, or Divells bit, which is a sort of Scabious, I meane not to speake thereof in a Chapter by it selfe; yet I must leave out those three sorts mentioned in my former Booke which are *Scabiosa pratensis alba*, *Scabiosa rubra hirsuta*, and *Scabiosa latifolia rubra*: although I give you their figures here againe.

Scabiosa pratensis & arvensis. Those sorts of Scabious that grow in Meadowes and plowed grounds.

γ. Scabiosa vulgaris pratensis. The common field *Scabious*.

THe common field *Scabious* groweth up with many hairy stalkes whereon grow leaves, some whereof are either not at all jagged, or divided on the edges, or very little others are much more and some on the same do have threds in them, which upon the breaking may be plainely seene, and are not in this order set one among which rise up divers round hairy greene stalkes, three or foure foote high, with such like but greene leaves on them, but more deeply and finely divided, branched forth a little; at the toppes whereof stand naked and bare of leaves for a good space, round heads of flowers, of a pale blewish colour, and set together in a head or knoppe, the outermost whereof are larger than those inward, with many circles in the middle, somewhat flat at the toppe, (and not so round Globe-like as the other, which shall be declared

1. *Scabiosa arvensis campestris.* The field Scabious.

2. *Scabiosa pratensis flore albo.* White Meadow Scabious.

Scabiosa flore albo.
White flowred Scabious.

6. Scabiosa autumnalis Clusij.
Clusius his Autumne Scabious.

ter as the head with seede is likewise; the roote is great, white, and thicke, growing downe deepe into the ground, and abideth many yeares.

2. *Scabiosa minor campestris.* The lesser field *Scabious.*

This lesser sort is like the former almost in all things, but that the leaves are not so large, or deepely jagged, nor the stalkes rise so high, nor the flowers so great or large, yet of the same bleake blewish colour: this may be thought to be the same with the former, differing onely but in the rankenesse of the ground where they grow, but that this is so usually observed to be no greater or of any other forme, although it grow in the same or as ranke ground as the other.

3. *Scabiosa major segetum.* Corne *Scabious.*

This Corne *Scabious* also differeth little from the first, but that it is greater in all respects, the leaves being larger with greater divisions, and some whole leaves with them also: the stalkes are greater and stronger, and the flowers larger, more laid open, and not so closely thrust together, but of the same blewish colour, yet a little more inclining to purple: the roote hereof runneth not deepe into the ground, but rather creepeth under the upper crust of the earth.

4. *Scabiosa Pannonica flore albo.* White *Scabious* of *Hungary.*

This great white *Scabious* of *Hungary* hath large stalkes, three foote high at the least, whereon grow at every joint two leaves one against another, very much and finely cut in, and jagged on the edges, more than any of the former sorts of *Scabious*, but those that grow next the ground are broader, softer in handling, and more hairy, and onely dented about the edges and not divided, that one would not thinke them to be the leaves of a *Scabious*: the stalkes are branched and flowers like unto other *Scabiouses*, stand at the toppes of them, but of a pure white colour, and the outermost row of flowers for the most part being twise as large as any of the rest, with white threds in the middle of them tipt with blew: the seede that followeth is long and browne like unto the rest, which falling when it is ripe, springeth a fresh before the Winter, and abideth untill they have seeded againe the next yeare, for the roote perisheth yearely.

5. *Scabiosa minima Dodonæi.* Small sheepes *Scabious.*

This small *Scabious* hath divers whitish greene leaves at the ground divided on both side of the long pointed leafe, even unto one division on each side, making every leafe seeme like the small Sage leafe, called sage of Jerusalem, that hath small peeces of leaves like eares on each side thereof, but a little dented about the ends: the small low stalkes are furnished likewise with such like leaves but lesser, and small blewish flowers set beside on every side unto the other, like *Scabious* but lesser.

6. *Scabiosa autumnalis Clusij.* *Clusius* his Summer *Scabious.*

The stalke next being three cubits long beareth long leaves set by couples thereon, which are long and some-

what broad and little rent or torne at the bottome, but dented all the reſt of the leafe: the flowers grow on ſeverall branches at the toppes of a pale blew colour, the roote periſheth every yeare.

7. *Scabioſa arborea Cretica Alpina. Alpinus* his ſhrubbie *Scabious* of *Candy*.

This *Scabious* hath a thicke whitiſh ſtemme next the ground for a ſhaft-mone high, from whence ſide ſtalkes long branches ſet at certaine diſtances, with five, ſixe, ſeven or more leaves at a ſpace, each of the ſame with reſembling thoſe of the true Houſeleeke but hoary white; the toppes of the branches have two or three large flowers, ſtanding on ſlender long foote ſtalkes together, like unto the common ſort for the faſhion, but of a layed or waſh bluſh colour, after which ſucceedeth ſmall ſeede, and is very tender to keepe.

The Place.

The firſt groweth moſt uſually in moſt Medowes of this land eſpecially about *London* every where. The ſecond groweth likewiſe in ſome of the drie fields about this Citie, but not ſo plentifully as the former. The third groweth both in the grounds where corne is ſtanding, and in thoſe that were formerly ſowne, and now lie fallow, as alſo in the border of ſuch like fields. The fourth *Cluſius* ſaith he found, nigh unto the wall of *Tornay* as you enter the upper *Hungarie*: the fift is found in many drie gravelly and heathy grounds throughout the Realme: the laſt grew in the low countries as *Cluſius* ſaith of the ſeede he had formerly ſent thither; and the laſt in *Candy*.

The Time.

They all flowre in *June* and *July*, and ſome abide flowring untill it be late in *Auguſt*, and the ſeede is ripe in meane time.

The Names.

This herbe is not found to be remembred by any the ancient Greeke or Latine Authors; yet ſome ſuppoſe it is that herbe *Cæſius* calleth *Iaſea*, but becauſe there is nothing but the bare name that is extant in him, without any deſcription, it is ſo hard to ſay it is the ſame; notwithſtanding the Greeke word ſignifieth *Scabioſa* alſo. But it tooke the name of *Scabioſa*, either a *ſolorum ſcabritie quæ præſertim, præbet hæc genera contrectantibus*, and that moſt uſually, *quod Scabiei medetur*: the name is of divers applied, as I ſaid before, to divers herbes, as the *Iaceas*, *Strabes*, and others, calling ſome of them *Scabioſa major*, and *altera ſpinoſa minor*, *capitata*, as *Tabern.* and others doe: but as I ſaid before, the heads and flowers of all theſe herbes called *Scabioſæ*, being all broome and like one unto another, and ſo differing from *Iaceas*, *Strabe*, &c. muſt needes ſhew plainely that they muſt not be ſo confounded, for a novice ſhall hardly underſtand what herbe is meant, by ſuch names as are applied to divers of them: the Author of the *Pandects*, is thought to be the firſt that miſtooke *Dioſcorides Strabe*, to be the *Scabious*, from whence the error thereof ſoone ſpread among *Phyſitions* in all countries, and continues ſo hardly to be rooted out againe. *Tam facile eſt deceptis in errorem, & errare aliquos aſſenſos in ſe trahere.* *Fabius Columna* in his *Phytobaſanos*, ſeemeth to refetre the *Scabioſa* unto *Phyteuma* of *Dioſcorides*; but in the Booke of rare plants, he declineth to thinke that ſuch ſmall *Valerianæ*, as he there deſcribeth, becauſe they have holes in them, ſhould be the *Phyteuma* of *Dioſcorides*. The *Italian*, *Spaniſh*, *French*, and *Engliſh* doe keepe the Latine name *Scabioſa*; as each Dialect will admit only the *Germanes* call it *Apffelem kraut*, *poſſendorn*, and *Grinde kraut*. The firſt is called of moſt Writers, either *vulgaris*, *communis*, either *ſtrictifolia* or *offenonis*: the ſecond is called *Scabioſa media*, and *minor* of divers, and *Columbaria* of *Lobel*, and is *Cluſius* his firſt *Scabioſa* his Hiſtory of Plants, *Bauhinus* letteth it downe for his ſecond ſpecies of *Scabioſa capitulo globoſo*, and yet ſeemeth the ſame *Scabioſa prima Cluſij* for the ſecond of his *montana*: hereby making that one plant to receive ſeverall titles, which thing is very frequent with him, in many other things and places, in his *Pinax*, *Theatrum*, and *Chorographie*: the third is called *Scabioſa campeſtris ſeu ſegetum* of *Lobel*, as alſo *major latinorum vulgatis*: the fourth is called to *Cluſius*, *Scabioſa Pannonica flore albo*, and is his eight *Scabious* in his Hiſtory of Plants: and the laſt *Scabious*, which we generally throughout the land, doe call ſheepes *Scabious*, called by *Fuchſius* and others though much differing from his deſcription, which he calleth alſo *media*; and of *Lobel Scabioſa montana minor*, and yet the figures of neither of them are anſwerable to the true herbe: the firſt *Cluſius* only makes mention of and *Bauhinus* calleth *Scabioſa frutex lutifolia alba*: the laſt is that which *Alpinus* deſcribeth and paſſeth in his Booke *de plantis exoticis*, and is very likely not to be the ſame with *Pona* in his *Italian Baldus* ſeeth he ſaith that his is ſet forth to have but one leafe at a place.

Scabioſa montana. Mountaine and wood *Scabious*.

1. *Scabioſa montana maxima*. The greateſt mountaine *Scabious*.

This great mountaine *Scabious*, which ſome for the largeneſſe thereof, have accounted a great and plaine kinde of great Centory, hath divers very large winged darke greene leaves, that is very much cut or ſhare ſides into divers parts to the middle ribbe, and each part finely nicked or dented about the edges, many times (eſpecially growing at large in any good ground) being a foote or ſometimes more in length, or more orderly neare there unto: from among which riſe up divers hard woodily ſtalkes ſometimes ſome of them and uſually about three foote high, branching towards the toppes, into ſome other ſmaller ſtalkes toppes of each whereof ſtandeth one large great round, blackiſh greene head, from whence ſhoote forth ſuch like flowers as the *Scabiouſes* doe yeeld, with threds in the middle of them in the like manner, before it is blowen is more yellow then when it is open, and hath ſtood any time, which yet at the ſection are of a pale yellowiſh colour; in which heads when the flowers are paſt, grow long tough darke red ſeede, which being ſhed upon the ground, as ſoone as they are ripe, will ſoone ſpring up before Winter, and will abide greene all the Winter time, and ſhoote up and flower for the moſt part the next yeare following, the old roote periſheth not after ſeede time, but abideth many yeares.

2. *Scabioſa montana glabro folio*. Mountaine *Scabious* with ſmooth leaves.

This mountaine *Scabious* is a low plant, in compariſon of the former, for it ſeldome riſeth above a foote high, bearing many ſhining greene leaves, not any thing hoary at all, but ſmooth ſoft and full of juice, ſometimes cut in on the edges, like the ordinary field *Scabious*, and each of the diviſions dented a little about the edges, the ſtalkes grow the like leaves, two always at a joint, but much more divided than the loweſt, and towards the toppes as in other ſorts of *Scabious*, of a fine blew-iſh purple colour, with blackiſh threds at the foote of

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

flower on the inside: the seede is like the other sorts, and the roote is long blackish, and long lasting after seede time.

3. *Scabiosa montana Dentis leonis folio. Scabious* with Dandelion leaves.

This *Scabious* differeth little from other sorts of *Scabious*, but in the leaves, which being somewhat hairy and not smooth, broad at the bottome compassing the stalke, are so divided on the edges, as a Dandelion leafe is, the lower divisions of the leaves being blunt at the points, and the upper most sharpe yet all dented about the edges: the stalke being hairy and about two foote high, are divided toward the toppes into branches, having two leaves at the joints, so joyned together like the leaves of the Teasell, that they will hold water: the flowers that grow at the toppes are of a pale blewish colour like the rest.

4. *Scabiosa prolifera duarum specierum.*

Many flowred *Scabious* of two sorts.

This kind of *Scabious*, that beareth many heads of small flowers, compassing the greater, as is seene in Daisyes, Marigolds, and some other herbes; is of two sorts, one that hath his leaves cut or divided into some broader and larger divisions than the other: the branches towards the toppes where the flowers doe stand are bare, or naked without leaves, save under the very heads, where there stand three or foure small leaves, very finely cut almost as small as Fennell: round about the middle heads of flowers grow forth, other leaves all small heads of flowers, all alike both for colour and fashion, which are like the ordinary *Scabious*: these give seede like other sorts, and perish after seede time, and either rise again of their own sowing, or being gathered must be new sowen.

5. *Scabiosa argentea angusti folio.*

Silver leafed *Scabious*.

This *Scabious* shoot a hard woodily living roote, sendeth forth three or foure stalkes, with divers very long and narrow leaves, almost like grasse, but of a fine white silver like colour, set without order thereon; the toppes of the stalkes are not branched at all, but bare and naked for a good space, bearing one flower at the head of them, white and woolly underneath, but of a pale blew colour above, as other *Scabiosæ* are, and consisting in the like manner of many flowers together.

6. *Scabiosa montana maxima.*
The greater mountaine *Scabious*.

The Place.

The first groweth in many places on the *Alpes*, and in the fields neare unto divers other mountaines and hills in *Austria* and else where: the second groweth on the like places, as on *Snealberg* hills in *Austria*, &c. and *Clusius* reporteth: the third upon Mount *Cadar* not farre from *Montpelier*: the fourth with the broader leaves, is onely to be found in gardens, but that with finer leaves if it be not the same with the former hath been observed to grow wilde, about the baths of our Lady neare *Padua*: the last was found upon the hill *Summano* neare *Vicenza* in *Italy*.

The Time.

They doe all flower at the time when the other sorts doe.

The Names.

The first is called by *Lobel Scabiosa montana maxima*; by *Cæsalpinus Scabiosa Alpina Centaurii folio*; by *Lugdunenses Centaurium album Dalechampij*; *Bauhinus* calleth it *Scabiosa Alpina folio Centaurij inferioris*. *Bauhinus* mistaketh beyond to be the first *Scabious* with *Clusius* in his history of plants, as I said before; he calleth it *Scabiosa montana globosa folio Scabiosæ cinereæ*: the third is onely remembred by *Bauhinus* in his *Pinax* and *Prodromus*, under the title expressed: the fourth is called both by *Lobel* and *Clusius Prolifera*, and their kinde is that with the larger leaves, the other say *Bauhinus* saith, hath finer cut leaves like unto *Gingedium* or *Tithymale*: the last is remembred as well by *Cæsalpinus* in horto medico, by the name of *Scabiosa graminea folio argenteo flore purpureo*, as by *Bauhinus* under the title expressed.

Scabiosa globosa flore. Globe flowred *Scabious*.

1. *Scabiosa Neapolitana folio Sinapi sylvestris.* The Globe *Scabious* of *Naples*.

This *Scabious* hath a fistled stalke a foote and a halfe high, divided from the bottome into long branches, having every long smooth leaves divided to the middle ribbe on both sides, and each part divided also, somewhat like unto the leaves of wilde Mustard, standing at each joint, and together with them many small haires growing there likewise: the flowers that stand singly at the toppes of every stalke, are of a middle size, and very round at the head, wherein it tooke the name for the heads of the former sorts are somewhat flat at the toppes, and not so round or globe fashion as these are in this ranke, and are of a reddish colour, yet not so deepe or darkened, as that which I set forth lately in my former booke, by the name *Scabiosa rubra Indica*, Red flowred *Indian Scabious*: which pertaineth to this order, but that it is described there, and the figure here; the seedes are small, like thereunto, and the rootes likewise perishing after seede time for the most part.

2. *Scabiosa*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Scabiosa flore albo pleno.* Double flowred white *Scabious.*

I gave you in my former Booke, one sort of white flowred *Scabious*, which pertaineth to this order, and often found in the medowes and marshes neare the sea side in our owne Land, and is not rife I meane here to describe unto you, but another differing both from it, and the other here before also with white flowers, having such like leaves but larger and broader then it: the stalkes likewise grow higher and stronger, not bearing flowers upwards, and the flowers are larger than it; sometimes but one at the toppes of the branches, but most commonly two standing together, and sometimes three, of a faire pure white colour, and after they are past, the heads of seede appeare more round and not flat, but rather a little cone fashion, that is, rising a little higher in the middle: the rootes here of abide many yeares.

3. *Scabiosa globularia folijs serratis.* The Globe *Scabious* with ire leaves.

This Globe *Scabious* is of a middle sized stature, about a foote and halfe high, and a hath all the leaves that grow both on the lower parts of the stalkes, and at the foote of them, some what long narrow and pointed at the ends, deeply dented at the lower ends of them, but not much gashed in on the edges like the other sorts of *Scabious*, but those that grow highest neare unto the flowers, are much more and finer cut in: the flowers that stand on the toppes of the slender stalkes, being divided into one or two parts, are very round and close set together, of a pale like pale blew colour as in other sorts, or a little more purplish like unto the flowers of Devills bit; but as *Lovaine* as *Lobel* saith, it is found with white flowers: the seede is small, but long and somewhat rough like other sorts: the roote is small and long, not abiding after it hath given seede.

4. *Scabiosa Globularia Bellidis folijs.* Globe *Scabious* with small Daisye leaves.

This other Globe *Scabious* (which I am somewhat doubtfull, whether to call a Daisye as *Lobel* doth, or a *Scabious* as *Clusius* doth) creepeth upon the ground, with trailing branches taking roote as they spread, having many fat thicke leaves, smooth and greene, not dented at all on the edges, nor small or sharpe at the ends, but blunt or round pointed: somewhat like unto the leaves of the small garden Daisye, or *Globularia*, called also Daisyes, every one like unto them, being small and narrow at the lower end, and broadest toward the end, about the ends of which trailing branches arise slender naked stalkes, about halfe a foote high, bearing on each of them a round ball or head greater than any of the *Globularias*, yet lesser than those of the field *Scabious*, full of small flowers, of a more deepe purple colour than the *Scabiosaes*: after which come small seede lesser than any of the former.

5. *Scabiosa tenuifolia capitulo globoso.* Globe flowred *Scabious* with thinne cut leaves.

This finely cut *Scabious* hath the lower leaves more finely cut in on the edges, than any of the former, and those on the stalkes which are many, two always set at a joint, are much more finely cut into smaller parts then any up to the toppes, where the flowers stand in round heads, but of the same purplish blew pale colour that the other ordinary sorts of *Scabious*.

Scabiosa rubra Indica.
The red *Indian Scabious.*

4. *Scabiosa Globularia Bellidis folijs.*
Globe *Scabious* with small Daisye leaves.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

5. *Scabiosa montana glabra.*
Globe flowered Scabious with plaine cut leaves.

6. *Scabiosa tenuifolia altera glauca.*
Another small leafed Globe Scabious.

6. *Scabiosa tenuifolia altera glauca*. Another small leafed Globe *Scabious*;

This other riseth up more upright with the single slender stalke, having at the lower joints, two or three small narrow leaves set thereat, finely dented about the edges: but those at the highest part of the stalke stand by couples; the flowers are small and rounded but like in colour to the other forts.

The Place and Time.

The first *Lobelius* saith, *Ferrantes Imperatus* of *Naples* sent him, but nameth not the naturall place; the second is not well knowne where it groweth wilde, but is nourished up in the gardens of those that are Herbarists and lovers of plants: the third groweth in *Germany*, in *Hercynia Sylva*, as *Tabernæmontanus* saith: the fourth, as *Clusius* saith, in rockie and stony places, on the hills of *Hungary* and *Austria*, as also in other untilled places thereabouts: the fifth on divers hills in *Germany*; the last we know not the naturall place: the seede commonly among seeles sorts from *Italy*, and flower all of them at the time with the rest.

The Names.

Lobelius onely remembreth the first by the name of *Scabiosa Julia Ferrarii, sive flore*, and *Clusius* the second by the same name in the title: the third is called by *Lobel Scabiosa montana tenuifolia flore Globulario*, and by *Thalius Herculana sylvestris Bellidis majoris folio minore*; and by *Tabernæmontanus Scabiosa capitata glabra minor*: the fourth is called by *Clusius, Scabiosa montana minor capens, sive decumbens*; and by *Camerarius Scabiosa montana repens*, by *Tabernæmontanus Scabiosa rubra*, but *Ranzanus* following none of them, calleth it *Bellis cærulea montana tenuifolia*, as though it did *Jonteleare* which is nothing so; because the leaves are some what like the small Daysie, as I said, and that the *Globularia tenuifolia* is reckoned also a Daysie, and called *Bellis cærulea*, which is somewhat like unto it, but *Clusius* doth even account that *Globularia*, to be *Scabiosa pumilum genus*. The Dutch is called by *Dodon* after the nature of the rest accumulated, *Altera Scabiosa tenuifolia species*. The last being a sort of it set forth here as here in this figure is.

Scabiosa stellata flore. *Scabious* with starre like flowers.

7. *Scabiosa Hispanica major.* The greater Spanish Scabious.

The greater *Spanish Scabious* hath large soft woolly leaves, much cut in on both edges, like the leaves of the great wild or Corne *Scabious*, each parcell dented about the edges, the stalke arises to the height of two foote, bearing such like leaves as the former, but smaller upwards, where they season into several small branches, bearing every one a head of many flowers, like the other *Scabiouses*, but each made of two or three rankes, of a wanne colour, in whose places after they are past, the cuppes of knobby seedes, wherein they stand, doe appeare like blacke starres, with divers points, wherein the seede is contained, which is somewhat thicke, and hairy, like the other sorts: the roote is thicke and white like the common kinde, but perishes every yeare, after it hath borne flower or seede.

8. *Scabiosa*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

2. *Scabiosa Hispanica minor.* The lesser *Spanish Scabious.*

The lesser *Spanish Scabious* is altogether like the former greater, but that it is lesser in every part, and the leaves are a little smaller, or lesser cut in, and the flowers not white as the former, but of a blewish grey colour.

3. *Scabiosa arborea Cretica Pona.*
Pona his Shrubbe *Scabious* of *Candy.*

This *Candy Scabious* riseth up with a woodily stalke, from whence spring divers hard and woodily branches, white or hoary all over, as the leaves are also, which are thicke set thereon, without any division or denting at the edges, being whole like unto the great *Cyprus* or blew Bottles at the ends of the branches come forth small naked stalkes, bearing a head of flowers, very like unto the former great *Spanish Scabious*, but of a pale reddish colour; the seede conteined in those starre like huskes, are smaller, and smell a little sweeter then other sorts of *Scabious* doe; the roote is long and hard, divided into divers parts, abiding the Winter both in the naturall and other warme Countries, and holding his greene leaves also, but is more tender, not able to endure the sharpenesse of our frosts and colds. *Camerarius* maketh mention of a *Scabiosa* which he calleth *Gallica* like hereunto, but that he saith it hath small long blackish leaves, whereas this hath white and woolly, like it might be judged the same.

Scabiosa Cretensis.

4. *Scabiosa stellata minima.*
Small Starre like *Scabious.*

This small *Scabious* is very like the smaller *Spanish Scabious*, having divers narrow leaves, about two inches long, much cut in and divided on the edges, the stalke is scarce halfe a foot long, with such like leaves thereon, and small pale blewish flowers as in the *Spanish* kinde; the huskes likewise have diverse points, standing open spread like a starre, from the middle whereof come forth five small long reddish threds, like haires standing out of the huske; the seede is small, but like the other; the roote is small and perisheth every yeare.

The Place.

The two first sorts *Clusius* saith be found in the borders of the Vineyards, and in the paths of the fields about *Salamanca* in *Spaine*, and in other places; the smaller of which *Bauhinus* saith he found upon the more neere *Pyrenes*. The third in *Candy* as *Pona* saith, who had it from *Signior Comaro* of *Venice*. The last *Bauhinus* saith, groweth in *Provence* of *France*.

The Time.

The two first *Spanish* kindes as also that of *Candy*, flower somewhat later then the former sorts, but they seldome give good seede with us, and therefore we are still to seeke new seede to sow.

The Names.

The two first *Clusius* calleth *Hispanica*, and so doe all others that mention them, onely *Dodonæus* calleth the *prior* and *Bauhinus* calleth the first *Scabiosa Dioscoridis folio major*, and the other *minor sive minima*. The last *Pona* in his *Italian Scabious*, calleth by the same name as in the title, *Lobel*, *Lugdunensis*, and *Gerard* *Scabiosa peregrina*; *Tabernæmontanus* *Scabiosa peregrina foliorum differtis*, and *Bauhinus* *Scabiosa peregrina foliis profunde dissectis*, *Cæsalpinus* *Scabiosa arborescens*. The last *Bauhinus* onely setteth forth under the title expressed in his *Pinax* and *Prodromus*, and saith he accounteth it to differ from the lesser *Spanish* kinde, in some few parts.

The Nature.

Now that I have described unto you all the sorts of *Scabious*, whose variation and difference consisteth onely in the leaves and flowers, being yet in case, not to much differing the one from the other, and therefore their faculties are to be accounted alike, so that the vertues in any one are not to be curious, but that they may agree to the generall, which are these: It being hot and dry, is of an opening, cleansing, digesting, and attenuating quality, whereby it is very effectuall for all sorts of coughs, shortnesse of breath, and all other diseases of the brest and lunges, ripening and digesting cold flegme, and other tough humours, voyding them by coughing and spitting. It ripeneth also all sorts of inward ulcers and apostumes, yea the pleurisie also, if a decoction of the dry or greene herbe, being made with wine be drunke some time together, thereby to cause urine to be voyded forth by the urine, as well as other wayes; or if you would have it more effectuall, take the roote and herbe full of dryed *Scabious*, an ounce of Licoris scraped and cut into thinne slices, a dozen figges washed and sliced in peeces, an ounce of Anniseeds, and as much of Fennelseede bruised, and boile an ounce of white Sugar candy cut into thinne slices, let all these be steeped for a night in a quart of fairy water, for others in boiling them the next day, untill a third part be consumed at the least, whereof take a draught every morning and evening, sometimes warme, well sweetned with Sugar or Honey, which worketh wonderfully in all the diseases aforesaid. Foure ounces of the clarified juice of *Scabious* taken in the morning fasting, with a dram of *Mithridatum* or *Venice Treacle*, doth free the heart from any infection of the plague, or pestilentiall fever, on the taking thereof they sweate two houres in their beds at the least, yet after the first time taking that are infected take the same proportion againe, and againe if need be, for feare of further danger.

[illegible] and are made use of to [illegible] Carbuncle or Phagedæna, is found certaine by good experience, to dissolve [illegible] it is also the true [illegible] inward and outward application, is very available against [illegible] being also in time of any venemous beast: the same decoction also drunke, helpeth the paines and stitches [illegible] the same, taken in whey, doth as *Matthiolus* saith, wonderfully helpe those that are troubled with stinging or running or spreading tetters, tetters, or ringworme, yea although they proceed of the French pox, as hee saith, he hath found true by certaine experience: the juice or the decoction drunke, doth wonderfully helpe those that are broken or inwardly bruised, and the place outwardly annointed and filled: is effectuall for [illegible] purpose. The same also wonderfully helpeth all inward wounds, be they made or dryed up, of the bowels, cleansing and healing quickly therein. & by some made of the juice and sugar, is effectuall against [illegible] and for the distilled water of the herbe and flowers made in the same, especially to be used when the greene herbe is not in force to be had: the decoction of the herbe and roote outwardly applyed, doth wonderfully helpe all sorts of hard or cold swellings or livellings in any part of the body, and is also effectuall for any blunke sores or sores in any place: the juice of *Scabious* made up with the powder of Roses and Frankincense, doth notably cleare the skinne of the face and other parts of the body, as freckles, pimples, and other small eruptions therein, yea it preserveth also in greater deformities, as the blanches and Leprosie, the same decoction doth also helpe the redenesse and humors in the white of the eyes, and taken of it selfe, or with the juice of Fennell, the head washed with the same decoction cleanseth it from dandruffe, scurfe, scabbes, sores, itches, and the like, being used in manner above said: the juice or water thereof, doth not only heale all greene wounds, but also rotten and ulcerous sores, both by drying them, resisting putrefaction, and cleansing and healing them up after wards: the herbe also bruised and applyed to any place, where any splinters, broken bone, arrow head or other such like thing lyeth in the flesh, doth in short time loose it, and enforceth it to be easily drawne forth.

Chap. X.

Morsus Diabuli. Devils bit.

Here resteth yet the kinde of *Scabious* to be entreated of, being of all Herbarists accounted an especiall different kinde thereof, yet some referre it to the *Jacea*, but not greatly; the former ages knew but one sort, we have in these times found out some others, as they shall presently be thewed you.

Morsus Diabuli vulgaris sive purpureus. Common Devils bit.

Devils bit riseth up with a round greene roote, and not hairy (talke of) two foote high or more above, set with divers long, and some what narrow, smooth, darke greene leaves, somewhat snipt about the edges: for the most part, being eate all whole, and not dented at all, or but very seldome, even to the toppes of the branches, which yet are smaller then those below, with one ribbe only in the middle, and being broken yeeld not such threds as the *Scabious* doth: at the end of each branch standeth a round head of many flowers, set together in the same manner, or more neatly or succinctly then the *Scabious*, and of a more sober purple (but not variable as flowers saith, for such I never saw any) colour, which being all three fallen, there followeth a seede like unto the *Scabious*, that falleth away in the same manner: the roote is somewhat thicke, blackish and blackish with many strings, tollowed thereto, abiding after seede time many yeares. Fabulous antiquity (the Monkes and Friers as I suppose, being the first inventors of the Fable) said, that the Devill envying the good that the herbe might do to mankinde, bit away part of the roote, and thereof came the name *Morsus Diaboli*, Devils bit: which is a prolle and fondelle a relation, that I marvell at the former times stupidity, to receive as true such a fiction. Or that some doe make a greater and a lesser, which I thinke rather commeth from the place of growing, then from the nature of the plant. Vnto this plant in my opinion belongeth the *Scabiosa rubra Lusitanica* of *Clusius*, set forth in my former booke; for the leaves thereof being all whole, and the flowers red, doe notably resemble this Devils bit, and may be a feather therein proper to *Germany*, *Lusitania*, &c. *Ruellius* maketh mention of one of this kind, that hath halfe leaves notched in any thing else, and for his author nameth *Gesner in horto Germaniæ*, who as I see saith called it *Morsus Diaboli inferior*, which I cannot finde in *Gesner*, but of the three kinds of *Scabious*, one of the lesse hee calleth *Scabiosa pumila*, having leaves without divisions, which whether he should meane that I know not, for he nameth it not *Morsus Diaboli*, therefore I leave it to come to the fore the truth thereof.

Morsus Diaboli flore albo. Devils bit with a white flower.

This differeth not from the former in any other thing, then in the flower, which is of a plaine white colour as some other flowers of the *Scabious* are, and that the greene leafe is not altogether of so darke a colour.

Morsus Diaboli flore cæruleo. Devils bit with blush coloured flowers.

This other differeth neither in roote stalke or leafe, from the former, only the flowers which are of a blush colour, maketh the difference from both the other.

Morsus Diaboli alter flore cæruleo. Strange Devils bit.

This herbe which I place here for some likenesse, hath divers leaves rising from the roote, every one severally set, some what like unto the *Dandelion*, or *Hawkeweed*, deeply cut or jagged about the edges, the stalke riseth up amongst them a foote or foure high, bearing one large flower at the toppe, hanging downe the head and inside all of blew, or darke.

The Place.

The first groweth in the dry meddowes and fields as mine, in many places of this land, but the other two are more rare, and not so frequent with us, yet they are both found growing wild about *Apsley house*, neere *Barnet* in Hertfordshire, but not plentifully, as I have seene in the fields that lie on the mountaines beyond the Seas.

The Time.

They flower from the later end of *Iune* untill *August*.

The

The Names,

It is vsually called *Herba Veneris*, by most writers, or *Sarcula* as *Fuchsius* doth, and others after him, *Herba* or *succisa nigra*. Some there have beene that have thought it to be the *Gramen* of the ancients; others to be *Nigrum* of *Plinie*, whereof he maketh mention in the 27. booke, and 12. Chapter, in these words, An herbe that is called *Nigrum*, hath three long leaves like the *Endive*. *Fabius Columna* referreth it to *Scabiosa* of *Dioscorides*. The *Italians*, *Spaniards*, and *French*, and so likewise all other nations follow the Latine nomenclature in their severall dialects: or else the *Germanes* first calling it *Abbiss* and *Teufelsabbiss*, as it were the same name, and all other tongues following it, to call it thereafter. And we following the *Germanes* Dialect. The last is the second *Apellanes* of *Dalechampius*.

The Vertues,

The rinde hereof being somewhat more bitter, declareth it to be hot and dry in the second degree, complet and therefore is more powerfull and available, for all the purposes whereunto *Scabiosa* is appropriate, both wardly or outwardly, as they are declared before, and especially against the plague, and all pestilentiall eases, or feavers, poisons, biting and the bitings of venemous beasts, the herbe or roote being dryed to and drunke: the same also helpeth those that are inwardly bruised by any fall, or truised by any other bruises by outward beatings or otherwise, dissolving the clotted or congealed blood, and voyding it from on, or otherwise and the herbe or roote boyled and applyed outwardly, taketh away the blacke and blue that remaine in the skinne after some accidents: the decoction of the herbe, wherein some Honey dissolved is very effectuall to helpe the inveterate tumours and swellings of the Almonds and throate, which will come to ripenesse, for it digesteth, cleanseth, and consumeth the filthy matter sticking therein, and taketh away tumours by often gargling the mouth therewith: it helpeth also to procure womens courses, and to ease paines of the matrix or mother, to breake and dissolve windes therein and in the bowels: the powder of the roote taken in drinke, driveth forth the wormes in the body, the juice or distilled water of the herbe, cleanseth all fowle greene wounds or old sores, as the *Scabiosaes* be, and cleanseth the body inwardly; and the herbe boyled with Ivy, foam fomented and forced vpon it, helpeth the itches, pimples, freckles, morphew, or other deformities thereof, and the decoction if a little *Vitriol* be dissolved therein.

Chap. XI.

Plantago. Plantaine.

VNder the name of Plantaine, is not only comprehended all the sorts of Plantaine properly so called, whereof there are a great many sorts, as I shall shew you in this Chapter, but divers other herbes much differing from them, which shall be set forth in the next Chapter following, and described by it selfe as neare as I can, and because the Plantaines are divided into greater and lesser, or broad

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

and narrow leafed ones. I thinke it the best method to separate them, and speake of each of them and their kindes by themselves, and not confound them together to avoide mistaking. One of these Plantaines are called Rose Plantaines, which although I have set it forth in my former Booke, yet I thinke it fit here to expresse it againe, and the severall formes and varieties thereof.

Plantagines latifolia. Broad leafed Plantaines.

1. *Plantago latifolia vulgaris.* Common Waybredde or Plantaine.

THis common Plantaine I here set in the front of all the rest, because I would ranke it with the rest of the kinde, which is well knowne to all to beare many faire broad almost round pointed leaves, with seaven ribbes or veines in every of them for the most part, running all the length of the leafe, of a sad greene colour on the upper side, and more yellowish greene underneath, among which rise up divers small slender stemmes or stalkes a foote high more or lesse, not easie to breake, naked or bare of leaves into the toppes, where each stalke beareth a small long round blackish greene spike or leafy head, whose blossomings or flowers, are small whitish threds with yellow hanging at the ends of them, almost like unto the blooming of Corne, after which come browne small seede, enfolded in the severall small scales or skins of the spike made of many white strings, growing somewhat deepe, and taking so fast hold in the ground, that it is not easie to pull it up.

2. *Plantago latifolia maxima.* The greatest Plantane.

This great Plantaine is in all things like the former, but that it exceedeth it in greatnesse and height, for the leaves that lie on the ground are five inches, that is, halfe a foote long many times and more, and foure inches broad, and the stalkes full almost every foote, neare an handbreadth long: the naked stalkes that beare spiked heads like the other, are two cubits high, and the head or spike a foote long, the roote hereof is blackish and stringy: Sometimes the kinde is found to have leaves a foote long and halfe a foote broad, somewhat crispe on the edges, and having few fome leaves under the spiked heads. *Latissima.*

3. *Plantago major incana.* Great hoary Plantaine.

The hoary Plantaine is likewise like the first, but that the leaves are very hoary white, especially in the hotter Countries of *Spaine* &c. much more then in these colder climates, and somewhat small, it seldome beareth any spiked heads in *Spaine* as *Clusius* saith, but when it doth, they are smaller then the first, and the roote are blackish and stringy. *Iohannes Thalius* in *Hercynia sylva* mentioneth a smaller kinde hereof both in leaves and flowers. *Minor.*

4. *Plantago ovalina fimbria.* The strange crumpled Plantaine.

This strange Plantaine upon the first yeares sowing of the seede, which was sent from beyond sea, rise up but

1. *Plantago latifolia vulgaris.* Common Waybredde or Plantaine.

2. 3. *Plantago Maxima & Sua incana.* The greatest Plantaine and the flower of the great hoary Plantaine.

4. *Plantago latifolia simplex.*
The ſimple or ſingle Plantaine.

Plantago spicata foemina.
The ſpiked head of the female Plantaine.

5. *Plantago latifolia rotea multiformis, foliorum incisura & varietate.*
Broad leafed Rose Plantaine of much variety, with a jagged leafe, and lurking ſpike thereof.

with one great and large leafe, almoſt a foote long, foulded as it were together, and wound about [illegible] on into two parts at the further end thereof, which opening it ſelfe, yet remaining ſomewhat [illegible] much crumpled and waved on the edges; the further end ſhewing ſomewhat like unto a Plantaine [illegible] the bottome of the leafe had on each ſide thereof a large peece as it were torne from it, but yet growing [illegible] which were likewiſe crumpled and waved, and each of them ſhewing the forme of a Plantaine leafe, [illegible] talke alſo was not unlike, ſo that the whole leafe ſeemed, as if divers great large leaves were [illegible] make one; this leafe periſhing the firſt yeare, there roſe up the next ſpring divers leaves cloſed [illegible] med into one as the former, but as if divers leaves were joyned together, each bearing the Plantaine [illegible] ſomewhat rounder a little crumpled and waved as the former was; the ſtalke roſe up in the middſt [illegible] leaves, above a foote and a halfe high, bearing thicke and ſhort ſpiked ſtarriſh heads and ſeede [illegible] the others; the roote is compoſed of a thicke round head, at the toppe with many long [illegible] thence downewards, thereby taking ſtrong hold in the ground.

5. *Plantago latifolia rotea multiformis.* The broad leafed Plantaine of much variety.

This kind of Rote Plantaine is of many ſorts, yet all of them have large and ſometimes hoary [illegible]

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

spread on the ground either whole like the former great Plantane, or a little jagged toward the lower part: among which rise up short naked stalkes, bearing every one at the top, either a broad round head made of many small short greene leaves in the fashion of a Rose, or a spiked thicke long head made of many shorter greene leaves bushing thicke below and smaller upwards, and sometimes one plant will have both these formes at once together, and some again out of the middle of the Rose will have another short spike of green leaves stringily; and others at the bottome of the Rose or spike, will have one or two other small tufts either round or long. One sort there is likewise with long spiked heads, ie parted into many and sundry severall sparsed spikes, and therefore called *Spicata*, other varieties also are sometimes seene in some of this kinde, as nature listeth to produce them: the roote is like unto the former.

The Place.

The first groweth every where, in fields and in the pathwayes generally: the second about *Montpelier* in *France*: the third in divers places of *Spaine*, where *Clusius* observed it, and in some other colder countries also: the fourth came from *Caspar Peltorius* of *Montpelier* to Dr. *Lobel*, and the seede flowred with Mr. *John Nicholls* a Scrivener, there: *Dioscorides* in his time to King *Iames*, where it grew divers yeares the last, although a strange Plantane, yet naturally found in our owne country, and rising as it is likely from the third sort, and from thence cherished in gardens.

The Time.

They are all in their beauty about *June*, and the seede ripeneth shortly after.

The Names.

It is called in Greeke *πλατὺφυλλον* and *πλατὺφυλλος*, *Arnoglossum* and *Arnoglosson a formâ*, *agnina lingua*: others call it *πολύνευρον πολυνεύριον*, and *ἑπτάνευρον ἑπτανεύριον*, either of the many, or of the seven ribbes or veines that are in every leafe: in Latine *Plantago a plantâ pedis dicitur*: the *Arabians* call it *Lisen* and *Lesan alhamel*: the *Italians Plantagine*: the *Spaniards Llanten* and *Tamharge*: the *French Plantain*: the *Germanes Wegerich*: the *Dutch Weghert*: the *English* Waybredde, not Waybroad, as divers corruptly call it, and Plantane: the first is called generally of all Authors *Plantago major*, or *latifolia*, or *vulgaris*. *Brunfelsius* and *Tragus* call it *Plantago rubra*, because the seede thereof is redder than of others: the second *Ruellius* calleth *Plantago non aculeata glabra*: the third *Clusius* calleth *Plantago major incana*, and *Plantago Salmanticensis*, judging it to be *Cynoglossum* of *Dioscorides*, which he saith beareth neither stalke nor flower, as *Clusius* saith she doth very seldome in *Spaine*, but I doe not hold that a sufficient reason, to judge it to be *Cynoglossum*, *Fuchsius*, *Dodonæus*, *Gesner*, and others, call it *Plantago cordata*, and *Lobel Plantago major incana*, yet *Turner* and *Tabernamontanus* call it *Plantago minor*: the fourth *Lobel* onely expressed the first leaves in his *Appendix* to the *Adversaria*, by the title of *Plantago nobilioris latifoliæ*; and *convoluta radicibus*: I have added the spikes, and call it *Plantago exotica spuria* as best agreeing therewith in my opinion: the last *Clusius* had the figure thereof from *Iames Garret* an Apothecarie sometimes in *Lyme-street* in *London*, which he caused to be taken from the living plant, growing in his garden neare *London Wall* by *Aldgate*, and thereupon called it *Plantago peregrina latifolia Garreti*, and *Plantago latifolia exotica*. *Ruellius* calleth it *Plantago latifolia non aculeata spuria varietas*; and that other with many spikes *Lobel* calleth *Plantago pannonica spuria*, and may also be called *Plantago spicata*.

Plantagines angustifoliæ. Narrow leafed Plantaines.

1. *Plantago Quinquenervia major.* The greater Ribbe worte Plantane.

This greater Ribbewort Plantane hath divers narrow, long and hairy darke greene leaves lying on the ground, with five veines or ribbes for the most part in every one of them, and pointed at the ends; among which rise up many naked and striped stalkes, somewhat hairy, at the toppes whereof grow such like long and spiked darke greene heads, as in the first common Plantane, and flowring in the same manner, but greater and shorter, wherein lie such seede as in the former, but greater and of a darker colour; the rootes are long, fibrous or stringie like the former. This sometimes is found varying in the heads, for some will have two heads upon a stalke, or one head parted into two parts, or with two or more spiked heads growing at the bottome of the head.

2. *Plantago angustifolia Rosea & multiformis.* Variable Rose Ribbewort.

This Rose Plantane hath such like leaves as the former hath, that it is not, or very hard to be knowne from it, before the stalkes with heads beginne to appeare, which when they are full ripe, shew themselves in a variable manner, some having large or long narrow leaves set together, somewhat sparsedly, imitating a loose or dispersed Rose, others having shorter greene leaves and more compact and closed, making a more comely forme of a Rose, sometimes fully laid open, and sometimes more close, and as it were half closed, and sometimes out of the middle of the Rose will arise two or three or more short stalkes, bearing each a small greene Rose, and therefore called *Prolifera*, others made of many small leaves set together in the same manner, and sometimes many shorter spikes lie close together in one head, or separate each by it selfe; this kinde beareth no seede that ever was observed, but is encreased by slipping or parting the roote, and setting it againe.

3. *Plantago angustifolia minor.* The lesser Ribwort Plantane.

The lesser Ribbewort Plantane, is in every part thereof like the first sort, but that it groweth smaller and lower, and this only maketh it to differ from it.

4. *Plantago angustifolia serrata.* Spanish Ribbewort with dented leaves.

This Spanish Ribbewort is like the lesser sort, but smaller, narrower and harder in handling, being dented about the edges, and sharpe withall, that they might seeme to be prickles, which hath caused some to call it *Peregrina spinosa*: the spiked heads stand upon slender stalkes, about halfe a foote high, being somewhat open or diffused.

5. *Plantago angustifolia fruticosa.* Shrubbe Plantane.

This Canarie Plantane is in all things like the smaller Ribbewort, but that the leaves are whiter, and the stalkes high and woodie, with small leaves on them, and the heads are in fashion like them, but shorter and fuller, bearing whitish bloomings and darke seede.

Original from UNIVERSITY OF MICHIGAN

6. *Plantago Apula bulbosa.* Bulbed Ribbewort of *Napier.*

This Bulbed Ribbewort hath a long small and round head, for the upper part of his roote, like unto a small Bulbe or onion, of the bignesse of an Hasell Nut or bigger, from whence shoote downe into the ground, many thicke and blacke long fibres: from this head or bulbe spring forth, many long and narrow leaves like the first Ribbewort, lying upon the ground, but that each of them are more hairy and dented or cut on the edges into gashes, separate a good distance one from the other, somewhat like unto Bucks horne Plantane, from among which rise rise up slender hairy round stalkes, aboute a foote high, bearing such like spiked heads, as the first doth, with pale yellow bloomings, and small blackish seede after them.

7. *Plantago montana trinervia.* Small mountaine Ribbewort Plantane.

This small mountaine Ribbewort, hath divers very small and long hoary white leaves, having each of them, but three ribbes or veines a peece running through them, whereof it tooke the name: the stalkes that rise among them are small and slender like, not much above a foot high, whereon stand small thicke and short heads with small flowers on them, made of foure small white leaves and small white threds hanging out of them, like the other sorts of Plantane, after which come such seede as is in the rest: the roote hath a small long necke, hairy above, and tee with pale long fibres underneath.

8. *Plantago trinervia folio angustissimo.* The smallest Ribbewort.

This leaft Ribbewort hath such like leaves as the last lying upon the ground, but they are neither so white nor so long, very narrow and some longer, or shorter than others; all of them smooth and without any haires upon, or but a very little shew; the smooth stalkes are many that rise up amongst them, being of divers sizes, for some rise not above foure inches, others halfe a foote, or a foote, and some a foote and a halfe high, whereon grow small and somewhat long spiked heads: the rootes are many small white fibres.

9. *Plantago angustifolia paniculis Lagopi.* Hares foote Plantaine.

This Plantane hath many long ribbed rough hairy leaves, very like unto the first Ribbewort, but ending in a smaller and sharper point, it sendeth forth a number of small round browne stalkes of divers sizes or heights, some being not above two or three inches high, and others halfe a hand breadth, or an hand breadth high at the most; whereon stand small long reddish heads, like unto the heads of *Lagopus* or Hares foote, some being longer, and others smaller and shorter, but all set with small reddish flowers at them, and small threds hanging from them, as in the other sorts, and small seede following: the roote is somewhat long with many reddish fibres growing thereat. This sometimes is found so small, that it scarce exceedeth three fingers in height, being more hairy, and having smaller and rounder heads.

The Place.

The first without doubt on the edges, and the third grow with us in divers Meddowes and fields, and by pathwayes: in gardens also it is found as a weede: the second is found wilde in divers places of this Kingdome, and brought and cherished in gardens for the rarenesse: the fourth and fift were brought us from *Spaine* by *Gerard Joane Bell* often remembred both in this and my former Booke where he found them: the sixth and seventh grow in the Kingdome of *Naples*, *Fabius Columna* having found them there and set them forth: the eight *Bauhinus* saith, groweth with them about *Basill*, by the way side and among rubbish: the last in the fields about *Narbonne*.

The Time.

These all flower and seede at the time, that the former doe, that is, in *May*, *June*, and *July*.

The Names.

This is called in Greeke πενταυρουος Πεντανευρος, that is, *Quinquenervia*: in Latine *Plantago angustifolia*, and *Plantago media & minor* of some, and *Lanceolata* and *Lanceola*, in *Italian Lanciuola*, in *French Lanceola*, in high *Dutch Spitzwegerich*, in low *Dutch Hanis ribbe*, in *English* Ribbewort, and Ribbewort Plantane. The first is generally called either *Plantago angustifolia major*, or *Plantago Quinquenervia major* of many, of *Fuchsius*, *Tragus*, *Gesner* and others *Plantago minor* of *Matthiolus* and *Lugdunensis Plantago longa*: the second hath many titles inexpressie it, according to the formes of the spikes, as *Plantago coma prolifera, rubra, &c.* the third is remembred by *Thalius* in *Hercynia sylva*: the fourth and fift *Clusius* maketh mention of in his *Rara peregrinorum*, but the same *Guillaume Boel*, brought the dried plants and shewed them to me and others, before hee shewed them to him; and I had the seeders of them, as of many other things, which hee gathered most part upon my charge, whereof many sprang and seeded, and in their places are remembred: others sprang but seeded not, and so we have lost the kindes, which wee have not of many things gotten againe: the sixt *Fabius Columna* called *Plantago Apula latifolia bulbosa*, and *Bauhinus Plantago pilosa bulbosa*: the seventh *Columna* also calleth *Plantago alterum genus trinervia montana incana*, and *Bauhinus Plantago trinervia montana*: the eight *Bauhinus* calleth *Plantago trinervia folio angustissimo*: the last he also calleth *Plantago angustifolia paniculis Lagopi*.

The Vertues.

All these kinds of Plantane both the greater and the lesser, both the broader and the narrower leafed, are of one propertie, that is, cold and dric in the second degree. I thought good to speake of their vertues in the end of all their determinations, to avoid prolixitie and tautologie in repeating the same properties divers times. All the Plantanes (that before I held the Ribbewort to be the stronger and more effectuall) have these properties hereafter ensuing. The juice of Plantane departe or clarified, and drunke for divers dayes together, either of it selfe, or in other drinke, exceedeth wonderfully against all torments and excoriations in the guts or bowells, helpeth the difficultie of urine from the head, and stayeth all manner of fluxes in man or woman, even the feminine matrice also, when the same downe too abundantly: it is good to stay the spitting of blood, and all other bleedings of the mouth, by what meanes soever taken in the stomacke, and that maketh bloudy or fonle water by any ulcer in the reines or bladder: it is also to stay the too free bleeding of wounds: it is held also an especiall remedy, for those that are troubled with the Phthicke or Consumption of the lungs, or have ulcers in their lungs or have coughs that come of sharpe rheume: the decoction or powder of the rootes or seede, is much more binding, for all the purposes aforesaid than the herbe. *Dioscorides* saith, that if three rootes be boiled in wine and taken, it helpeth the sciatica or gout, and loose the *pleurisie*: but I hold the number to be fabulous, yet the decoction of divers of them may be effectuall: but *Tragus* holdeth that the distilled water thereof drunke before the fit is more proper

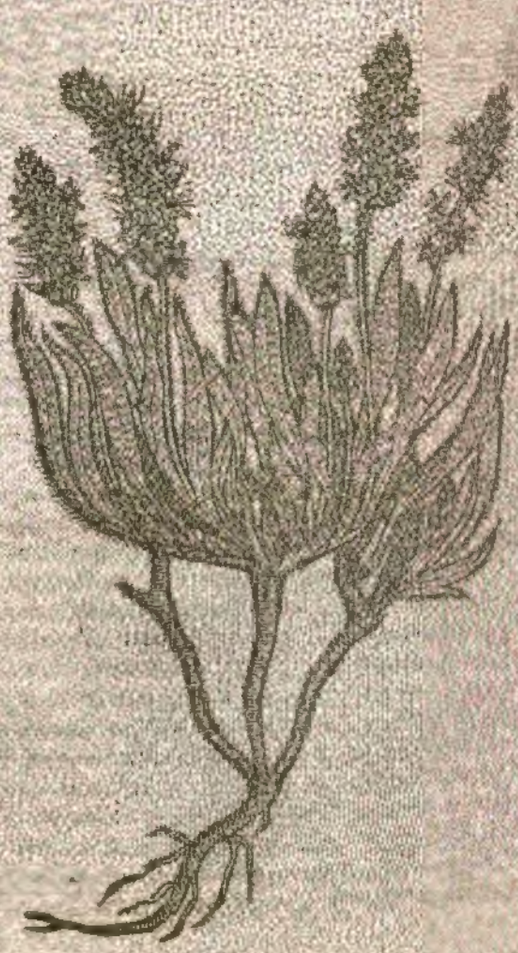
the feede made into powder, and mixed with the yolke of an egge, and some wheate flower made into a cake and baked, either in an oven, or betweene a couple of tyles heated for the purpose, this cake prepared eate fresh and eaten warme, for some few dayes together, doth mightily stay any fluxe of the stomacke, whether meate passeth away undigested, and stayeth likewise the vomitings of the stomacke: the herbe, but especially the seede which is of more subtile parts, is likewise held to be profitable against the dropsie, the falling sicknesse, yellow jaundise, and the oppilations or stoppings of the liver or raines: the roote of Plantane and Fullers Spaine, beaten to powder and put into hollow teeth, taketh away the paines in them: the clarified juice, or the distilled water but especially that of Ribbewort, dropped into the eyes cooleth the inflammations in them, and certainely cureth the pinne and webbe in the eye, and dropped into the eares, easeth the paines therein, and helpeth and restoreth the hearing: the same also is very profitably applied, with juice of Houseleeke against all inflammations and eruptions in the skinne, and against burnings or scaldings by fire or water: the juice or the decoction made either of it selfe, or with other things conducing thereunto, is a lotion of much use and good for old or hollow ulcers that are hard to be cured, for cancres and sores in the mouth, or privie parts of man or woman, and helpeth also the paines of the hemorrhoides or piles, and the fundament: the juice mixed with oyle of Roses and the temples and forehead annointed therewith, easeth the paines of the head proceeding of heate, and helpeth frantick and lunatick persons very much, as also the bitings of Serpents, or a mad dogge: the same also is profitably applied to all hot gouts in the feete or hands, especially in the beginning, to coole them, and represse the humours; it is also good to be applied where any bone is out of joint, to hinder inflammation, swellings, and paines, that presently rise thereupon: the powder of the dried leaves taken in drinke, killeth wormes of the belly, and the said dried leaves boiled in wine, killeth the wormes that breede in old filthy ulcers: One part of Plantane water, and two parts of the brine of powdred beefe boyled together and dailie used, is a most sure remedy to heale all spreading scabbes and itch in the head or body, all manner of tetters, ringworme, the shingles, and all other running and fretting sores: Briefely, all the Plantanes are singular good wound herbes, to heale fresh or old wounds and sores, either inward or outward. *Erasmus* in his *Colloquies*, reporteth a pretty story of the Toade, who being stung or bitten by a Spider, fought our Plantane, and by the eating thereof was freed from that danger.

Chap. XII.

Halostem sive Plantago marina. Sea Plantane.

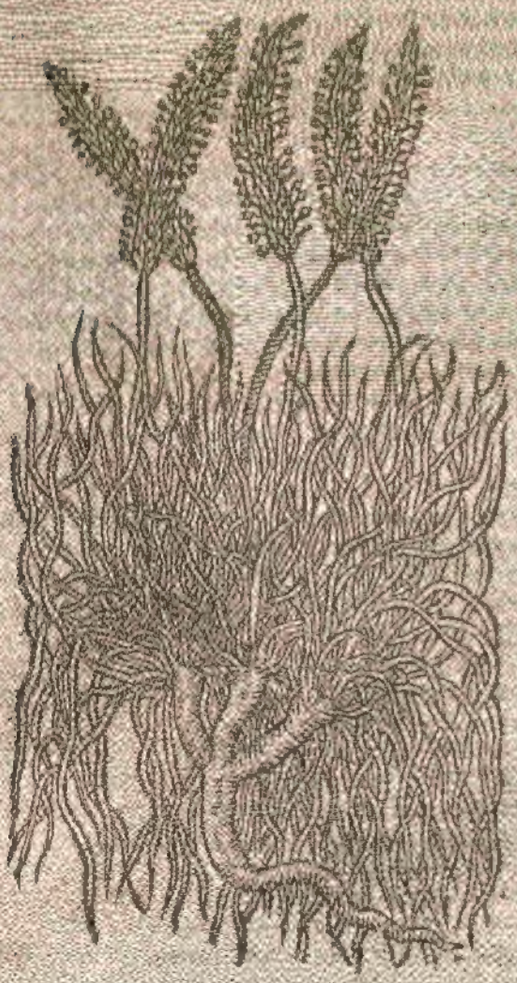
There remaine some other sorts of herbes referred to the Plantanes, which shall follow in their order: and first of those are called *Halostes*, which for want of a fitter name we call Sea Plantane.



1. *Plantago marina vulgaris.* Ordinary Sea Plantane.

This sea Plantane hath many narrow long and thicke greene leaves having here and there one or two on the one edge pointed at the end, among which rise up sundry bare stalkes, with a small thicke head thereon smaller than Plantane, else alike both in blooming and seede: the roote is somewhat white and long with long fibres thereat abiding many yeares.

1. *Plantago marina vulgaris.* Ordinary Sea Plantane.



2. *Halostem Salmanticum.* Spanish Sea Plantane.

2. Holothurium angustifolium majus, sive Serpentaria major.
The greater sea Plantane with graller leaves.

4. Holothurium angustifolium minus sive Serpentaria minor.
The lesser sea Plantane with graller leaves.

3. Holothurium Creticum sive Leontopodium Creticum.
Candy Sea Plantane.

Leontopodium idem diverse expressum.
The same plant diverslly expressed.

2. *Holosteum Salmanticum*, *Spanish* Sea Plantaine.

This *Spanish* Sea Plantaine alſo differeth not much from the former greater kinde, having many narrow hoary leaves lying on the ground, but ſhorter and broader then they, among which riſe up divers naked ſtalkes little more then an handbreadth high, furniſhed from the middle almoſt to the toppes with many whitiſh green flowers, ſtanding more ſparſedly in the ſpiked heads then the former, which afterwards yeeld ſmall ſeeds unto like unto Plantaine ſeede: the roote is ſomewhat long and hard with divers fibres at it. *Alſo there is another farther* of much leſſer then the former, the leaves greener and narrower, and the heads of flowers ſmaller. *Alius minus.*

3. *Holosteum angustifolium majus ſive Serpentaria major.*

The greater Sea Plantaine with graſſie leaves.

This greater Sea Plantaine hath a number of ſmall long leaves, almoſt like graſſe but that they are ſtuffe and hard ſometime lying upon the ground, and ſometime from a ſtemme under them raiſed a little higher; of a grayiſh or hoary green colour, and having on ſome of them, ſome ſmall gaſhes on the edges, among which riſe up naked ſtalkes about halfe a foote high, with ſmall ſpiked heads, like unto Plantaine heads, ſet on the toppes of them, wherein is contained ſuch like ſeede alſo: the roote is ſomewhat thicke long and wooddy, with ſome fibres growing thereat.

4. *Holosteum angustifolium minus.*

The leſſer Sea Plantaine with graſſie leaves.

This leſſer *Holosteum* is very like the former, but that it is ſmaller and ſcarſe having any dent on the edges, and groweth much lower, not exceeding three or foure inches in height, having ſuch like heads but ſmaller.

5. *Holosteum Creticum ſive Leontopodium Creticum.*

Candy Sea Plantaine.

This *Candian* plant (which hath beene diverſly named by divers) hath from a reddiſh roote, ſomewhat great and as it were ſcaly at the head, growing ſmaller downewards, and ſpread into many long fibres, many long and narrow ſoft woolly leaves an handbreadth long, with three ribbes in each of them, among which riſe up divers ſmall and ſhort footeſtalkes, about two or three inches long and covered with a ſoft reddiſh woolline ſtuffe, on every one whereof ſtanderh a ſhort thicke reddiſh woolly head, like unto a Plantaine head, having divers whitiſh flowers upon them, with blackiſh ſpots within them ſeeming to many holes in them; which after they are paſt, have ſmall browniſh ſeede enclozed in their huskes, very like unto Plantaine ſeed, or the ſeede of *Piſſilium* or Fleawort, which heads when they are full ripe, doe bend downewards to the ground, and are ſo drawne or bended together, that they reſemble herein a Lions foote cloſed together, whereof ſome gave it the name of *Leontopodium*.

6. *Holosteum Lonicer Candamaris vocatum*, Mouſetaile.

I might well have placed this herbe among the graſſes, being undoubtedly of that tribe, but that divers doe joyne it with theſe *Holoſteos*, becauſe it is in taſte and property like them, take it therefore in the next ſhooteth forth divers ſmall graſſie leaves, very ſhort, rough and hard, among which ſpring divers naked ſtalkes, with ſmall long blackiſh greene ſpiked heads, like unto a ſmall Plantaine head but ſmaller, bearing flowers on them, which quickly fade and fall away, after which there is found very ſmall blackiſh ſeede in the long heads, which thus in ſome are a little crooked, and in others ſtraight reſembling a Mouſetaile whereof tooke the name: the roote is ſmall and threddy.

The Place.

The firſt groweth in divers places upon our owne coaſts, and others alſo. The ſecond of both ſorts grows as *Cluſius* ſaith in many places of *Spaine*, in *Valentia* and *Salamanca*, &c. The third and fourth by the ſea ſide in *Italy* as *Matthiolus* ſaith, in *Montenegro*, and in the mountaines of *Gnalda* as *Dioſcorides* ſaith, *Cluſius* by a lake of ſalt waters neare *Gliſſa*, which is in *Germany*. I have it confidently affirmed to me that both the firſt and greater ſorts grow neare the ſea ſide in the Weſt parts of the land, namely in all the iſles of the Weſt neere *Briſtow* in *Gloceſterſhire*. The fifth in *Candy*, from whence it hath beene often ſent to divers friends. It will grow there in many fertile paſtures and medowes, as alſo on dry banks, and by the path ſides in many places of our owne land.

The Time.

They doe flower in the moneths of *June* and *July*, and their ſeede ripeneth quickly after, the firſt and earlyeſt of them all, flowreth often in *April* and almoſt gone in *May*.

The Names.

It is called in Greeke ὁλόσταιον and ὁλόστεον *Holoſtium* and *Holoſteum*, for it is written both wayes by many ancient, which is *per antiphraſin*, for as *Pliny* ſaith, *ex adverſo poſt a Græcis appellata, quoniam ſolida, hoc eſt herba nihil ſecum durum oſſeumve habet*. There hath beene much controverſie among the learned Herbariſts about this herbe, divers diverſly thinking of it, ſome holding one herbe to be it which is not proveth, almoſt every writer framing one to himſelfe, as *Lonicerus* the *Candy Mouſe* *Tragum*, when as before he tooke *Serpentaria* to be it, and ſome as he ſaith tooke the *Polygonum* *leſſerum*, whom he contradicteth: *Lobel* the *Hirſe perſon Trago*, *Rayland Lonicerum*, *Holoſteum Salamanticum magnum*, which *Dodonæus* calleth *Plantago angustifolia alcedis*; and that *Lobel* and *Pena* ſay the ſame) they of *Montpelier* called *Holoſteum primum*. *Lonicerus* by the *Serpentinas*, or *Serpentaria* of *Matthiolus* and others, and the *Holoſteum Salamanticum* *Cluſius*, under the name of *Holoſteum*, but the *Leontopodium Creticum* of both ſorts of *Cluſius*, which he ſet forth in his *Pannonicis* above twenty yeares before *Cluſius* ſet forth his *hiſtoria rariorum plantarum*.

Original from UNIVERSITY OF MICHIGAN

hath not been first mentioned by *Lobel* and *Lugdunensis*, and *Gerard* from him. The second of both sorts is called by *Tragus* first *Acorum verum majus & minus*, because the learned of *Salamanca* in *Spain*, called it *Holosteon* as saith, whom *Cordus*, *Lobel*, and *Lugdunensis* doe follow. *Conradus* in his *Historia* calleth it *Holosteon quorundam*, and *Dodonæus* as I said before *Plantago angustifolia altera*, *Bauhinus* calleth it *Holosteum latifolium album majus*, as he called the lesser *Salamanticum* of *Clusius*, *Serpentaria* *Belgis nostris*. The third *Matthiolus* called *Cerastium Ophrydis*, and saith they of *Spain* called it *Serpentina*, which since hath been continued by *Rembertus*, *Lobel* and others. *Conradus* in his *Horto* calleth it *Plantago minor*, *Bauhinus* calleth it also *Plantago angustifolia*. The fourth is mentioned also by *Lobel* by the name of *Serpentaria minima nilotica*, and in his *Observationes* *Salamanticum medio plantæ Massiliensium* also, for to be said, they are both one and the same, and is in my judgement the *Holosteum quorundam* of *Lugdunensis*, although *Bauhinus* maketh these two sorts to be foure severall plants, with foure distinct titles. The fifth *Bauhinus* as I said before, saith he set forth before *Clusius* in his *Phytopinax*, and after in his *Prodromus*, under the title of *Holosteum sive Leontopodium Creticum*, and includeth both the description and figures of both the sorts of *Leontopodium Creticum* of *Clusius* in one, wherein I thinke he hath done rightly, whom I have followed, for although *Clusius* hath set forth divers figures, as they were sent him from divers places and persons, yet it seemeth very probable, both by his owne relation, and *Honorius Belus* his description thereof, which is extant in the first Epistle of the said *Belus* to *Clusius*, that they are both but one plant, and not two different sorts; but as he and *Bauhinus* say, was sent by *Cornutus* to them both, by the name of *Cotyledon prima* of *Dioscorides*, which *Honorius Belus* also prooveth in the said Epistle. *Bauhinus* saith also he received it from *Ferrantes Imperatus* of *Naples*, by the name of *Holosteum minus*, and from *Rome* by the name of *Gotyledon album theatricum*, and is the *Habbimes* of *Constantinople*, and the *Planta gallinacea* of *Lugdunensis* in his Appendix. The last as I said before, divers doe referre to their kindes of *Holosteon*, as after *Lonicerus*, *Camerarius*, *Thalius*, and *Lugdunensis*. *Bauhinus* knowingly calling it *Holosteon album Cordi*, and almost all others *Aizoides* or *Cordi maris*, onely *Tragus* calleth it *Cerastes sylvestris*. We may call all these herbes except the last, Sea Plantaines, although they grow in some places farre from the Sea, as well as neere it in others, for the resemblance they have in their narrow ribbed leaves, and stalked heads, unto the smaller Plantaines or Ribbe worts, but especially for their properties which being cooling and binding like unto them, are no doubt of the same faculty: the *Leontopodium* may be called Lions foote, or Lions claw, according to the Latine, although it justly be referred to these kinds of Plantaines. The last is all one *Lagi* or Mouse-taile generally, and of some Blood strange, but I thinke corruptly from blood staying, for in that faculty it is *predominant*, all other Dialects follow the Latine name thereof.

The Vertues.

What hath beene formerly said of the other Plantaines, may in some sort be justly referred to these, for in their qualities of cold and dryeasse, they are I said little differing, wherein the Plantaine are excellent; and therefore it shall not neede to repeate the same things here againe, that formerly have beene there spoken. Onely for the third kind here mentioned, *Matthiolus* saith, that they of *Gorizia*, who call it *Serpentina*, have used it to especiall good purpose, as he himselfe saith also, he hath found by good experience, against the bitings or stingings of Serpents especially, and of the other venemous beasts, as also to helpe those that are troubled with the dropsie, especially that which hath possessed the whole body, the Mousetayle is cooling and drying like the Plantaine, and the Country people in some places of this land, apply it not only to those that bleede at the nose, by bruising the leaves and putting it up therein, but also to stay the much bleeding of wounds, and to heale them up.

Chap. XIII.

Coronopus sive Cornu Cervinum, Bucksborne Plantaine.

There are some other sorts of this herbe better knowne in these dayes, then they have beene formerly, which though growing in different climates, we will draw into our Chapter, and expresse them together.

1. *Coronopus vulgaris sive Cornu Cervinum.* Common Buckshorne Plantaine.

This being sowen or seeded riseth up at the first, with small, long, narrow, hairy, darke greene leaves like grasse, without any division or gash in them, but those that follow are pulled in on both sides of the leaves, into three or foure gashes and pointed at the ends, resembling the knagges of a Buckshorne, whence it tooke the name, and being well growne lye round about the roote upon the ground, in order one by another, thereby resembling the forme of a starre, and therefore called *Herba stellata*, from among which rise up divers long stalkes, about an handbreadth high, bearing every one a small long spiky head, very like unto those of the common Plantaine, having such like bloomings and seede after them: the roote is single long and small, with divers fibres annexed thereunto, the taste hereof is altogether drying like Plantaine.

2. *Coronopus Prealpina, Insulæ.* Prickly Buckshorne.

This differeth little from the former, but that it hath his leaves some what larger, broader, and thicker, more hairy, rough also, and the dents or divisions of the leaves more sharpe and prickly; the stalkes and heads are some what more rough and hairy, and differeth not in the rest.

3. *Coronopus trivialis seu maritimus.* Small Sea Bucke-horne of *Naples*.

This small Sea Bucke-horne (for I might well have made one of the Sea Plantaine, or be the greater kinde hereof, in that it hath some extreame dents on the edges of the leaves, then the other *Serpentine* of *Mauritania*, which I might rather ranke with the climate then to a differing kinde, but take it in which kinde you please, for I care not much, if we take it in either) hath many leaves lying on the ground, foure inches long, and scarce one broad, the Sea Southernewood leaves exceed them not, having on each side the leafe, three very long gashes turned inwards, all of them smooth and of a fresh greene colour, and not rough nor hairy at all as the former, among which come up such like heads, upon small stalkes, as are in the first, but smaller,

4. Coronopus vulgaris hirsuta terrestris,
Rough Garden Buckshorne.

5. Coronopus Ruellij,

5. Coronopus Ruellij vulgatissima,
Vpright or creeping Buckshorne or Ware Cr

smaller, as the roote is also: the taste hereof is no lesse astringent then the former.

4. *Coronopus maritimus minimus hirsutus.*
The small hairy Sea Buckshorne.

This other little kinde, is somewhat like the last, but that the leaves being very small, are not so finely or smally gashed on the edges, but stand rather like a little *Scabious*, and all hairy over: the stalkes likewise are hairy, and not much above an inch high, bearing small hairy spiked heads like the rest, but smaller, whereon appeare white flowers quickly fading.

5. *Coronopus vulgatissimus repens Ruellij.*
Vpright and creeping Buckshorne or Ware Cresses.

Ruellius hath referred this small plant to the ordinary *Coronopus* or Buckshorne, for some resemblance it hath thereto, although in quality much differing, which notwithstanding divers writers have since *Ruellius* reckoned still with the *Coronopus* or Buckshornes, and therefore let it also here passe in the same manner. It is a small low herbe, yet in some places standing more upright, but most usually creeping with many long branches, and spreading a great way upon the ground round about: the creeping kind never rising much above foure fingers high the other more, with divers very small long and divided or cut leaves thereon, all along on both sides of them, somewhat resembling the diuisions of the former or the Garden Cresses: the flowers are small and white, comming forth at the joynts with the leaves, many set upon a small long foote-stalke, one above another; after which come small rough or sharpe round husses somewhat resembling rough warts which divide themselves into two parts, and containe in each of them a small brownish seede: the roote is small white and long, with many fibres thereat growing downe deepe into the ground, the taste whereof is somewhat like Cresses but much milder, and is not many used to be eaten as a Sallet herbe, both boyled and greene with vinegar, by himselfe both.

The Place.

The first vsually groweth in drie sandy grounds, as in *Tuttle field* by *Maffemesser*, and divers other places of this land: it is also wont to be planted and nourished up in gardens in *Italy*, *France*, and other places, where the people more delight in greene and tallet herbes than we, in this countrie doe, because it was in frequent vse to be eaten by them: the second as *Columna* saith, groweth in the rocks in the Iland *Prochyta*: the third hee saith likewise groweth in many moilled grounds in the Kingdome of *Naples* neare the sea side, and so doth the fourth, neare the sea side, but particularly in what countrie is not expressed: the last groweth every where almost round about *London*, in any moist ground, or the loore of bankes, where there is any low trenches or ditches, that is not continually filled with water.

The Time.

They all flower and seede in *May*, *Iune*, and *July*, and their greene leaves abide fresh in a manner all the Winter.

The Names.

It is called in Greeke κορωνοπους *Coronopus*, κορακινα πολε ορνιθοποδιον *Coracina pole ornithopodion folio*, saith *Pena*, that is Crowfoote, whereunto the leaves are like, which name the Latines doe hold, as also *Cornu cervi*, or *cervinum*, and *Herba stella*, both of them, from the forme of their leaves. Some also call it, *Hirundaria* and *Sanguinaria* or *Sanguinalis*, the one from the place of his growing, the other from the effects or properties. There hath beene much doubt formerly, what herbe should be the true *Coronopus* of *Dioscorides*, for the name signifying a Crowes foote, deceived many, and led them into that error, to thinke that the herbe called *Pes corvinus*, and *Pes gallinaceus* should be it; among whom are not onely the Commentators vpon *Aetius*, but *Brunfelsius* also of late dayes, who carried away rather with the currant of the time, and the signification of the name, than with the opinion of others that contradicted it, and without the due examination of the herbe it selfe held this opinion: whom *Matthiolus* iustly reprehendeth therefore, shewing that it was a species of *Ranunculus*, that was generally called *Pes corvinus*, and *Pes gallinaceus*, which is an exulcerating herbe, and not the *Coronopus* which *Dioscorides* mileth a tallet herbe familiarly eaten, and alloweth of. *Leonardus Fuchsius* in his iudgement, that let downe the *Herba stella*, or *Cornu cervinum*, to be the true *Coronopus* of *Dioscorides*. *Matthiolus* contendeth also against *Lonicerus* that tooke a kinde of grasse, called *gramen Alpinum erectissimum*, and *Penna Babylon*, which his saith was called by his countrymen *Capriola*, and *Sanguinella* in *Matthiolus* countrie, to be the *Coronopus* of *Dioscorides*; which grasse as he saith, although it hath five small spikes growing at the toppes of the stalkes, which being opened resemble in some manner, the foote of a Crow or other bird (as the reason to make the name *Pentadactylon*, of five fingers of a spread hand) yet this hath no divided leaves neither is a tallet herbe for men to eate, but only being a grasse serveth as hay for beastes: there is also another controverse among divers, what herbe *Theophrastus* should meane by his *Coronopus Lychnis* (which *Gaza* translateth *Solidago*, and) which hee placeth among the prickly plants, whom *Pliny* also herein followeth in his 21. Booke and 16. Chapter; and yet in his 22. Booke making mention thereof, doth not speake of any prickles it hath, following peradventure *Dioscorides* text therein; but *Matthiolus* to excuse *Theophrastus* his prickles in *Coronopus*, supposeth that the iagges or dentations of the leaves of *Cornu Cervinum*, might be taken or mistaken by *Theophrastus* to be thornes (he might as well say hornes) or prickles, although they be not hard nor sharpe: and therefore iudgeth the *Coronopus*, both of *Dioscorides* and *Theophrastus* to be one plant; which thing although with *Matthiolus* I thinke to be true, yet doe I not thinke his reason therefore to be true; but if I may give my iudgement thereof, I thinke it more probable that *Theophrastus* might see such a *Coronopus*, as *Fabius Columna* calleth *Lotella Prochytes*, which hath sharpe and prickly edges; (as is before said in the description thereof) and therefore placed it *inter aculeata*; and *Dioscorides* such as we vsually have, which grow in milder places, and is a tender herbe, vsed to be eaten; and hereby as I thinke they may be reconciled together. The first is called *Coronopus sativus*, by *Cordus*, *Gesner*, *Camerarius* and others, and *hirsutus* by *Bauhinus*, because it was familiarly sowen in gardens for meate, and *Herba Stella*, as I said before, by *Lobel*, *Dodonaus* and others, and *Cornu cervi*, and *Cornu cervinum*: yet the same herbe is also called *sylvestris*, being found wild by divers, both the same and other Authors: the second is as I said called *Coronopus Ixalo Prochytes* by *Fabius Columna*, and by *Bauhinus Coronopus sylvestris hirsutior*: the third the same *Columna* calleth *Coronopus Neapolitanus tenuifolius minimus*, and *minimus tenuifolius maritimus*: the fourth *Bauhinus* setteth forth under the name expressed in the title: the last is thought by some to be the *Coronopus* of *Dioscorides*; but called by some *Nasturtium aquaticum*: yet so generally called *Coronopus repens Bauhi*: but *Dodonæus* thinketh it fitter to be called *Pseudo-coronopus*, or else *Cornu cervi alterum vulgi*: the upright plant is *Matthiolus* his *Ambrosia*, and *Lobels Coronopus plantaginis folijs*, and *Bauhinus* hoofelfe calleth it for a second *Ambrosia*, because it is figured upright by *Matthiolus* and *Lobel*. The first is called by the *Italians Herba stella* and *Coronopo*, by the *Spaniards Cuerno de Ciervo*, by the *French Corne de Cerf*, and *pied de corneille*; by the *Germans Krauwen fuss* by the *Dutch Herthoorns*, we in *English* call it Bucks horne, Hart-horne, and Bucks horne Plantaine, and of some Herbe Ivye, and Herbe Ivye; *Gerard* calleth it Swines Cresse, but I do rather call it Wart Cresses according to the Latine name that some give from the forme of the huskes of seede.

The Vertues.

Buckshorne Plantaine boiled in wine and drunke, is an excellent remedy for the biting of a Viper or Adder (for I hold our *English* Adder to be the true Viper, both by the forme thereof, the teeth it hath with poison in the gummy, being deadly and dangerous vpon the biting, and by the breeding, which is of quicke young ones, and not by egges as Snakes, &c.) by laying some of the herbe to the wound: the same also being drunke, helpeth those that are troubled with the stone in the reines and kidneyes, not that it breaketh the stone or expelleth it, but by easing the griefe in the parts, and strengthening the backe and reynes: it stayeth likewise all bleedings, and corruption of blood, whether at the mouth or nose, either by urine or the flooke, and helpeth the laske of the belly and bowells, and the dissentery or bloody flixe: it helpeth much also those that have weake stomackes, and are much given to casting, for containing their meate; and this the herbe doth well, but the roote more effectually. *Dodonæus* writeth in his seventh booke written, that it helpeth those that are troubled with the collicke; of which some make a doubt, that it might be an errour of the Writer in mistaking the word, but that he in the same place, presently after that he hath the word, that the Larke is a remedy for the collicke addeth this also, that *Coronopus* doth helpe the collicke; it hath beene held profitable for agues, to weaken their force and to take them away, to hang the rootes with the rest of the herbe about the necke, as nine to men, and seven

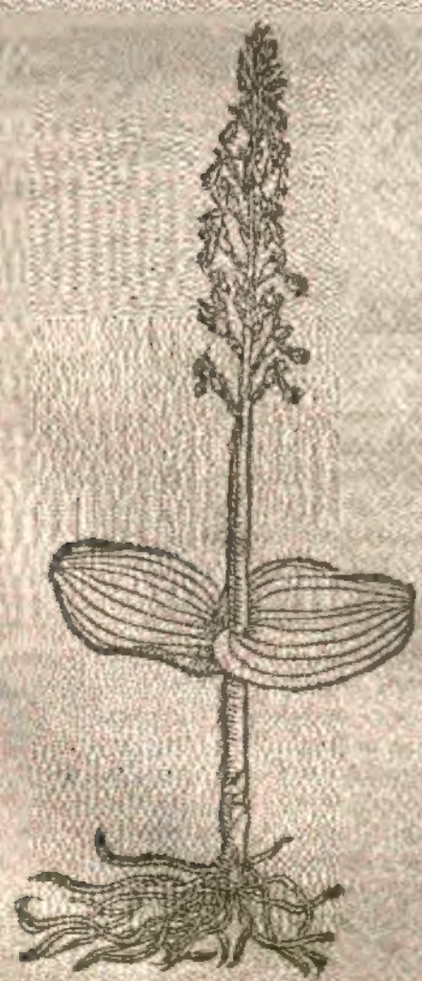
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

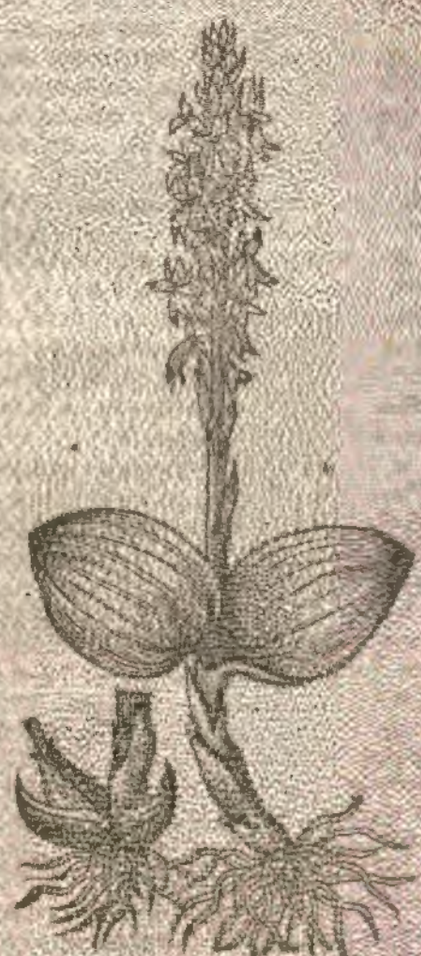
seven to women and children; but this, as many other are idle matters of no worth or value. Yet since it hath been reported unto me for a certainty, that the leaves of Buckes-horne Plantane laid to the wrists doth help an ague, will suddenly ease the fit, as if it had been done by witchcraft: the leaves and roots also beaten with some hay salt, and applied to the wrestes worketh the same effect, which I hold to be more probable and proper: the seede boyled in Ale or Wine, and given morning and evening for some space together, helpeth all sorts of sore eyes, that come by the destillation of hot and sharpe or salt rheumes, falling from the head upon them, by cooling and tempering the heate and sharpenesse, and staying the destillation. The *Ladies Rattle* or creeping Buckshorne being as I said a fallet herbe with many, is also thought by some, good to drive away warts by a speciall propertie of the seede.

Chap. XIV.

Ophrys seu Bifolium. Tway-blade or Herbe Bifoile.



Some have made two or three sorts of the upland Bifoile, one greater and another lesser, one with leaves as is usuall, another with three leaves, as if it were a differing species; but herein I think they are deceived, for the superfluitie of leaves in this, is no otherwise than in many others, a thing common which upon transplanting every one may know that will. I shall therefore shew you the description but of one of this kinde, yet mention the rest other that are but as accidents in nature, and withall shew you a fourth kinde not remembred by any before.



1. *Bifolium sylvestre vulgare.* Ordinary wood Bifoile or Twayblade.

This small herbe from a roote somewhat sweete, whose head or toppe is somewhat thicke, which is usually called a Bulbe (I have therefore given you it in another figure by it selfe) shooteth many long fibres downwards, raiseth up a round greene stalke, bare or naked next unto the ground, for an inch two or three inches high thereof, as the plant is in age and growth, as also from the middle upward unto the flowers, have every two broad and short ribbed pale greene or hoary leaves, very like unto Plantane leaves but whiter, set at the middle of the stalke one on each side, and compassing it at the bottome, sometimes it will get three leaves, which thereupon some reckoned to be a different sort, which is as we call it, but *lusus naturæ* by the abundance of nourishment in the plant, as it happeth to very many other plants, (as to the *Herba Paris* as I said before) sometimes having five leaves, and somet. more five or seven, and sometimes wanting a leafe, when as ordinarily it hath foure, and so likewise in the ordinary field Trefoile, which as all know usually hath but three leaves, &

Bifolium sylvestre vulgare seu Ophrys.
Ordinary wood Twayblade or Bifoile.

Ophrys Bifolia cum alia bulbosa.
Twayblade with a bulbous head or more perfect.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

which I omit, as well as needlesse to repeate) I once also reckon up two species or sorts hereof, a great-er and lesser: but none of them mention the Author whereof I shall speake in the next place) both in that yet with the like: but in that which beareth three leaves; and Clusius in his Canon pilosus mentioneth one very small sort, that the Capuchins Frier Cremonensis de Regio found, all which I account to be but the varia-tion of age, soyle and aire, and therefore I do not here stand ingrafting them into so many species as they doe the more curious lovers and searchers of plants. The stalke is small long wiry and greene shapeth like a bottle, somewhat like unto that of the Serpentine or Bistort which pasle away, having small heads with dust in them after-wards.

2. *Bifolium palustre.* Marsh Bifole.

The Marsh Bifole hath hearto been observed by any, or at least hath deceived many that supposed it not to be differing from the former, although differing in the size, yet the difference is manifest, first in the smallnesse, be-ing much lesser, and having lesser roots, these leaves also, secondly in the greenesse, the other being more hoary white standing in the spike of flowers: which although of the same fashion and colour or very neere, yet is lesse by farre: thirdly, in the roote, which in this doe runne or creepe in the ground: and lastly, the place which is not the Woods, but Moores, Bogges, and wet Marish grounds.

The Place.

The first is usually an inhabitant of Wood-Copses and the like, as betweene *Highgate* and *Hampstead*, and in many other places of the land: the other not onely in the low wet grounds betweene *Hatfield* and St. *Albones*, but in divers places of *Romney marsh*.

The Time.

They are in flower usually untill the later end of *May* as the soonest, and so continue untill the middle or end of *June*, and then wholy will be withered and gone in *July*.

The Names.

The first is generally thought to be the *Ophris* (quasi *aliqui superciliosum reddens*) of *Pliny*, which he saith in his 26. Booke, and 11. Chapter, is an herbe like unto the dented or scalded Poe-herbe with two leaves, but whose vertues should be of little use, because we know no other herbe, that hath but two leaves to cure with the more profitable: *Cruius* and *Gesner* take it to be *Hedyosmos* of *Dioscorides*, others to be *Cremnos*, *Serapias*, *Limnorchis*, others will make it a kinde of *Satyrion*, because the two leaves doe so compasse the stalke at the bottome, as if it were but one leafe, and that the stalke were thorough them, and others have thought it to be a kinde of *Hedysarum*, made the flowers are somewhat like unto it: *Dodonæus* calleth it *Pseudorchis*, *sive Bifolium*, and it more mislesh it his tenth kinde, calling it *Bifolium*, by which name it is now generally called and known of all Herbalists, the other hath not beene by any before remembred: the *French* call it *Double feuille*, the *Germans Zweyblat*, and we Twayblade, or herbe Bifole.

The Vertues.

It is not much altringent in taste, but rather clammie or glutinous, and somewhat sweete, whereby it may be judged to be hot and drie, it is much and often used by many and to good purpose for wounds, both greene and old, and for to consolidate or knit ruptures. *Pliny* saith *Ophris* is good to make the haire of the eye browes blacke, but this hath not beene used by any in our dayes, to have any such effect that I know.

Chap. XV.

Monophyllon sive Unifolium. One blade.

Monophyllon sive Unifolium.
One blade.

This in all place never beareth more than one leafe, but only when it riseth up with his stalke, which there out-breaketh an other, and seldome more, which are of a yellowish greene colour, therein very like unto the leafe of a small Lilly convally, but somewhat broa-der at the bottome, and pointed with many ribbes or veines therein like Plantaine: at the toppe of the stalke grow many small white flowers in a spike, smelling somewhat sweete, after which succeed small reddish berries when they are ripe: the roote is small of the bignesse of a Rush lying and creeping neere the upper part of the earth, shooting forth in divers places.

The Place.

It groweth in moist shadowie and stonie places of woods, in many places of the Kingdome.

The Time.

It flowreth about May, and the berries be ripe in June, and then quickly wither away, so as if one have not a speciall eye unto it, he shall not meete with it.

The Names.

It may be called in English, as after the Latines Twayblade, for it is not mentioned by any ancient Greeke Author, nor by any one Latine, as we thought, unlesse as *Dalechampius* supposeth, it may be the *Cyclaminos* of *Pliny* in the 25. Booke and 9. Chapter, which bee

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

both hath but one leafe, unlesse the plante be corrupted, whereof there is farre doubt. *Trappe* calleth it *Cotyledon foliis ovatis*, and *Tragus* and most of the later Writers call it *Acotyledon* or *Cotyledon*, only *Rembert Dodonæus* retaineth the *Latine* name, calling it *Cotyledon umbilicum veneris*, but he keeth it downe in his *Matthiolus*, after the new *Parnassi* of *Matthiolus*, whom *Lugdunensis* and others doe follow, as this *Cruydboeck* all set forth, as I said before, then *Lobel*, *Dodonæus*, and all others, have beene utterly mistaken in *Gramen Parnassi*, which is the same or the like figure of *Gramen Parnassi*, that *Matthiolus* doth, and even *Gaultherus* himselfe, called it *Gramen Parnassi alterum*, that hee saith, *Lobel*, *Dodonæus* and others call *Gramen Parnassi*, how can it then be so, when all others and himselfe agreeth to call it *Gramen Parnassi*, and not *Cotyledon* as they doe this, and also with what reason or judgement can the *Gramen Parnassi* be this *Cotyledon*, when this hath never more then one leafe unstill it flower, and the *Gramen Parnassi* is never without more leaves than one: the *Germans* call it *Fuss*, and the *French Une feuille*, as we doe One blade.

The Vertues.

Halfe a dramme or a dramme at the most in powder of the roote hereof taken in wine and vinegar of equall parts, and the party presently thereupon laid to sweate, is held to be a soveraigne remedy for those that are infected with the plague, and have a sore upon them, by expelling the poyson and infection, and defending the heart and spirits from danger: it is also accounted a singular good wound herbe, and therefore used with other herbes in making such compound Balmes, as are necessarie for the curing of wounds, be they fresh greene, or old and malignant, whereof there hath beene often and sufficient proofe made to be very true, especially if the nerves or sinewes be hurt.

Cap. XCI.

Ophioglossum sive Lingua serpentina. Adders tongue.

THis small herbe also hath but one leafe, which with the stalke riseth not above a finger from the ground, being flat or somewhat double, of a fresh greene colour, formed very like unto that of a broad Javelin or Partizan, or as some doe liken it, to the leafe of the water Plantaine, but without any middle ribbe therein, as all or most other herbes have: from the bosome about which leafe on the inside, ariseth up a small slender stalke, about a fingers length, and somewhat more, small stalke will have two heads thereon, and sometime three, or else otherwise as *Lobel* expresseth from the olde stalke whereof is somewhat bigger, and as it were dented about with small round dents, of a yellowish green colour, resembling the tongue of an Adder or Serpent, which never sheweth any other flower, and vadeth with the leafe also quickly after the tongue hath appeared, without bringing any seede, that could be marked: the roote is small and fibrous abiding under ground, and shooting forth the next Spring, not perishing in the Winter, although the leaves doe. Some have made hereof two other sorts, one whose leaves are the same, somewhat more lacked than the other; and another smaller than it, which I deer account but as differences from the soyle or climate.

Ophioglossum. Adders tongue.

The Place.

It groweth in many moist meddowes of the land where the roote lyeth covered with the grasse.

The Time.

It is to be found in *April* and *May*, and quickly perisheth with a little heate.

The Names.

The later Writers have put the Greeke name τὸ ὀφιόγλωσσον *Ophioglossum* hereunto according with the Latine *Lingua serpentina* or *serpentaria*, as it is usually called now adayes, for it is not found in any of the ancient Greeke or Latine Writers, except it be the *Elaphoboscon* or *Lingua cervina* whereof *Pliny* maketh mention in his 24. Booke and 19. Chapter, and in his 25. Booke and 11. Chapter, that groweth about fountaines, but because he maketh no description of the herbe, it is doubtfull whether it be it or no, for *Lugdunensis* referreth it to the *Ranunculus gramineus*, whereof I have spoken both here before, and in my former Booke, and *Dalechampius* he hath, would make *Pliny* his *Lingua* to be a kind of *Conyza palustris foemina folio*. Some also would make this to be *Ceratia Pliny*, in his 26. Booke and 8. Chapter, which he saith hath but one leafe and a roote made of nodes or knottes, but it is not this; but as I shall shew you shortly, *Ranius Columna* doth most properly of any other, referre his *Ceratia*, to the *Dentaria Cardamindes radice*. Some also would make it *Lunaria minor*, but we have another herbe more properly called by that name, as you shall understand in the next Chapter. *Amatus Lusitanus* calleth it *Unifolium*, which doth well agree hereto, and *Lobel* in his *Adversaria Pemaphyllon*; but because the herbe in the Chapter next going before, is so called with most, I thinke it not convenient to confound two herbes by one name, and I finde none other to follow them herein. *Bruntefelsius* maketh it his *Serpentaria secunda*, as thinking it a species of that kinde: *Cordus* calleth it *Lingua Cunnorum*; *Gesner* in hort. *Lancea*

Original from UNIVERSITY OF MICHIGAN

Cruffi, but moſt writers now a dayes doe call it *Ophioglosſum & Lingua ſerpentis* or *ſerpentina*. The *Italians* call it *Ophioglo*, ſo *Herba ſerpentaria*. *Lucciola*, *Argentino* and *Lingue de ſerpent*. The *French* *lingue de ſerpent*. The *Germanes* *Natterzungkin*. The *Dutch* *Spiervruyt* as *Dodonæus* ſaith. And we in Engliſh Adders tongue or Serpents tongue.

The Vertues.

Adders tongue is temperate betweene heat and cold, and dry in the ſecond degree; the juice of the leaves given in drinke, with the diſtilled water of Horſetaile, is a ſingular remedy for all manner of wounds in the breaſt or bowels, or any other parts of the body. It is with no leſſe good ſucceſſe given to thoſe that are much given to caſting, or vomiting, and alſo to thoſe that voide blood at the mouth or noſe, or otherwiſe downewards; the ſaid juice of the dryed leaves made into powder, and given in the diſtilled water of Oaken buds, is very good for ſuch women as have their uſuall courſes, or the whites come downe upon them too abundantly: the ſaid powder of the herbe taken for ſome time together, doth cure the rupture as *Baptiſta Sardus* ſaith. The greene herbe infuſed or boyled in red wine, or white wine, and thoſe eyes that are much given to water, waſhed therewith or dropped therein, taketh away the watering, and cooleth any inflammation that commeth thereby: with the leaves hereof infuſed in oyle *Omphacine*, or of unripe Ollives, infolded or ſet in the ſunne for certaine dayes, or the greene leaves boyled in the ſaid oyle ſufficiently, is made an excellent greene oyle, or Baſſame, ſingular good, not onely for all ſorts of greene or freſh wounds, but for old and invererate ulcers alſo, quickly to cure them, eſpecially if a little fine cleare Turpentine, be diſſolved therein; the ſame alſo ſtayeth and repreſſeth all inflammations that riſe upon paines, by any hurt or wounds.

Chap. XVII.

Lunaria minor. Small Moonewort.

Many Authours have ſet forth varieties of this ſmall Moonewort, which becauſe they are but from the luxuriouſneſſe of the Plant, in a fertile ſoyle and accidentall alſo, not to be found conſtant, which ſhould make a particular *ſpecies*. I have wholly refuſed to ſet downe many deſcriptions of one herbe, but ſometime degenerating; let one deſcription therefore ſerve inſtead of many, with the relation of ſome caſualties as they happen. The ſmall Moonewort riſeth up alſo annually but with one darke greene thicke and fat leafe, ſtanding upon a ſhort foote-ſtalke, not above two fingers breadth high, but when it will flower it may be ſaid that it beareth a ſmall ſlender ſtalke, about foure or five inches high, having but one leafe ſet in the middle thereof, which is much divided on both ſides into many parts, moſt uſually with five or ſeaven on a ſide, yet ſome have beene found with nine diviſions on a ſide, and ſometimes with more, yea ſome have thought that it may have as many leaves or parts of leaves rather, as there are dayes in every Moone, but this is onely opinionative; each of thoſe parts is very ſmall, next the middle ribbe, but broad forwards, and round pointed, reſembling therein an halfe Moon, from whence it tooke the name, the uppermoſt parts or diviſions being leſſe then the loweſt: the ſtalke riſeth above this leafe two or three inches, bearing many branches of ſmall long cods, every one very like unto the ſpiky head of the Adders tongue, of a browniſh colour, which whether I ſhould call them the flowers or the ſeed, I well know not, which after they have continued a while, reſolve into a mealy duſt, therein is ſmall and fibrous. This is ſometimes found to have divers ſuch like leaves, as are before deſcribed, with ſo many branches or toppes ariſing from one ſtalke, each divided from other. And *Cluſius* ſetteth forth another, which he calleth *ramoſa*, and came out of *Silеſia* to him and others, which had more ſtore of leaves, and each leafe more divided, and each part deeper about the edges, bearing divers ſtalkes, with branched tops like the other, which leaves were more fat thicke and fleſhy, and with a little hairy downe upon them.

Lunaria minor. Small Moonewort.

The Place.

It groweth upon hils and on heathes, yet where there is much graſſe, but therein it delighteth to grow.

The Time.

It is to be found onely in *April* and *May*, for in *June* when any hot weather commeth, for the moſt part it is withered and gone.

The Names.

It is not certainly knowne to be remembred by any of the ancient Greeke or Latine Authors, yet ſome would make it to be *Ceratia* *Plinij* whereof is ſpoken before; ſome to be *Tragium ſecundum Dioſcoridis*, which growing on mountaines, hath the leafe of *Scolopendrium* or Miltwaſte, but the roote he ſaith reſembleth ſtrings, which this doth not, and therefore cannot be it. ſome alſo doe thinke it to be *Hemionitis altera* and *Serratula*, becauſe ſome take the *Hemionitis* to be *Lunaria major*. Some alſo as *Columna* to be *Epimedium* of *Trachinia*, but he ſaith with all, that the roote hath a ſtrong ſcent, which cannot agree hereunto; Some alſo have called it *Ophioglоſſum* for the likeneſſe of the toppes. *Clуſius* ſaith that thoſe of *Silеſia*, where that kinde groweth, that he calleth *ramoſa*, doe call it in their language, *Rechter widerthon*; that is as he ſaith, *Trachinianus*

legitimus

Lunarium, the true Mayden haire; all later writers doe call it *Lunaria minor, a folijs lunæ crescenti in modo fabricata, & buxeis foliorum cauda, aut racemosa, a capitibus racemi in modum formatis.* *Gesner* in *libro de Lunaria*, calleth it *Lunaria petræa*, and *Taura*, as he saith the Heardsmen and Shepherds doe, because if the Kine feede, when this herb is growen, they will speedily goe to the Bull. *Tabermontanus* calleth it *Ruta Lunaria vel saxatilis*. The *Italians* call it *Lunaria del grappolo*. The *French Taure* and *Petite Lunaire*. The *Germanes Mon aurae* and *Steinkraut*. The *Dutchmen Maenenight*. We in *English* Moonewort, but there are so many herbes called by the name of *Lunaria*, that it would make any man wonder how so many should be so called. *Gesner* hath collected them all or the most part, and set them forth together, in a tractate by it selfe, whereunto if any be desirous to understand them, I must referre them to him; for it were too tedious to repeate them all here.

The Vertues.

Moonewort is cold and drying more then Adders tongue, and is therefore held to be more availeable, for wounds, both inward and outward, the leaves boyled in red wine and drunke, stayeth the aboundance of vrine ordinary courses, and the whites also; it stayeth bleeding, also vomitings and fluxes; it helpeth all bruising and beatings; it helpeth to consolidate all fractures or dislocations; it is good for ruptures; but it is chiefly used of most, with other herbes to make oyles or balsames, to heale fresh or greene wounds, either inward or outward as I said, for which it is excellent good. It hath beene formerly related by Impostors and false fellowes, and is yet beleeved by many, that it will loosen lockes, fetters, and shooes from those horses feete, that passe the places where it groweth; and have beene so audatious to contest with those have contradicted them, that they have both knowne and seene it to doe so; but what observation soever such persons doe make, it is all but false suggestions and meere lyes: Some Alhymists also in former times have wonderfully extolled it to consentare or convert Quicksilver into pure silver, but all these tales were but the breath of idle headed persons which divers to their cost and losse of time and labour have found true, and now are vanished away like the aire or smoake therein.

CHAP. XVIII.

Pyrola. Winter greene.

Although there were formerly but one sort of *Pyrola* knowne, yet *Clusius* and some others have found out other sorts thereof, which shall be handled together in this Chapter.

1. *Pyrola nostras vulgaris.* Our ordinary Winter greene.

This ordinary (for so I call it in regard it not onely groweth in our Country, and few or none of the rest, but because it is best knowne and of most use,) Winter greene tendeth forth seaven or eight or nine leaves, from a small brownish creeping roote, every one standing on a long foorestalke, which are almost as broad as long, round pointed, of a sad greene colour, hard in handling, and like unto the leafe of the Peare tree, from whence it tooke the name, but others compare them to be like unto the small leaves of wild Beanes, which is not so proper in my mind, from whence ariseth a slender weake stalke, yet standing upright, bearing at the toppe many small white flowers, smelling as sweete as those of Lilly convally, laid open like a starre, consisting of five round pointed leaves, with many yellowish threds standing in the middle, about a greene head, and a long stile with them, which in time groweth to be the seede vessel, which when it is ripe is formed five square, with a small point at it, wherein is contained as small seede as the dust it selfe.

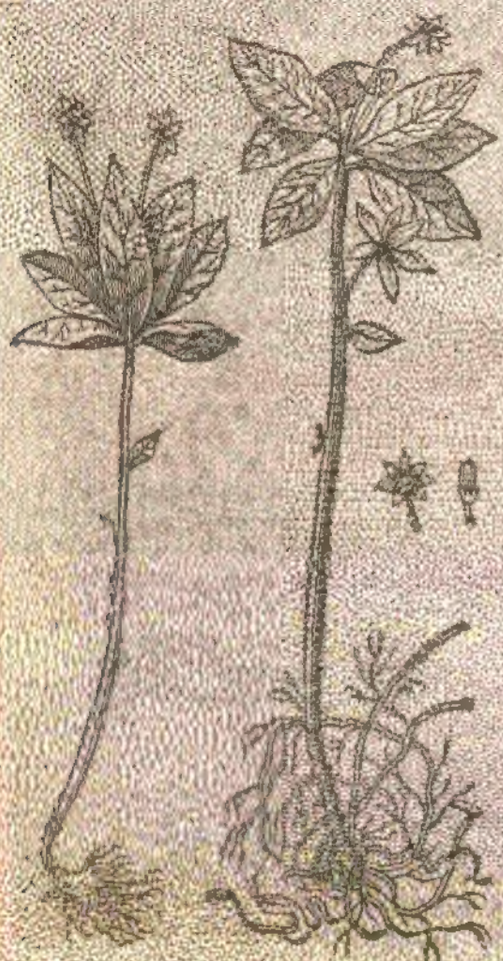
1. *Pyrola nostras vulgaris.*
Our ordinary Winter greene.

2. *Pyrola minor flore carneo.*
The least Winter greene.

This little *Pyrola* hath the roote creeping in the same manner that the former doth, and rising up in divers places; from whence rise up divers stalkes, about two or three inches high, bare for a space, in the middle whereof are set at severall joints two or three leaves a peece, each being smaller, rounder, and thinner then the former, a little snipt about the edges, and at the toppe standeth only one flower a peece, made of five round white leaves, somewhat greater then the last, very like unto the flower of *Parnassus* grasse, having divers yellow threds in the middle, compassing a greene head, which hath a pointell thereat, parted at the toppe into five threds: the head groweth in time to be five square, with such like seede therein as are in the former.

3. *Pyrola tenerior.* Slender Winter greene.

This tender or slender Wintergreene, riseth up from a small roote like Couchgrasse, creeping divers waies under the ground with divers more weake and slender stalkes then the former, from whence grow somewhat longer pointed leaves, and dented about the edges, nothing so hard in handling, else very like the former, the stalkes have divers white flowers, standing at the toppes of them, like unto the former but smaller, as the



5. Pyrola minor.
Slender Winter-green.

4. Pyrola Europæa latifolia flore.
The Winter green or Serpyllifolia, Chickweed Wintergreen.

1. Pyrola Foetida Alpina Rat Water & wilder.
Winter green of America with Chickweed Wintergreen.

6. Pyrola frutescens.
Shrubby Winter green.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

five square heads of seede that follow are likewise, wherein is such like dusty seede.

4. *Pyrola Europæa Alsines flore.* The Winter greene of *Europe* with Chickeweede flowers.

This small Winter greene riseth up with one or more straight round stalkes, about halfe a foote high or lesse, it is most bare of leaves for a space next unto the roote, or at the most but with two or three very small leaves, standing little above another, but at the toppe thereof there groweth five or sixe, or seaven or eight leaves, somewhat long and pointed at the end, somewhat like unto the leaves of the Peare tree, but longer and not so round, but many of them an inch and a halfe long, or more, tender, smooth, greene, and having one middle ribbe, with divers veines in the leafe, finely dented about the edges, from among which leaves arise weake foote stalkes, other then stalkes, about three inches long, sustaining three or foure flowers, each of them by it selfe, made of five white pointed leaves, in a starre fashion, somewhat like the flower of a Chickeweede, but larger, with divers small yellowish threds in the middle; after they are past, there riseth in their places one small round head smaller then a Coriander seede, containing within it divers small blacke seede, covered with a thinne white skinne: the roote is made of many small fibres set together at a small round head; Hereof there is found another sort smaller then the other, both in leaves, stalkes, and flowers.

Minor.

Alter. 5. *Pyrola Brasiliana Alsines flore.* Winter greene of *America* with Chickeweede flowers.

This Winter greene also of *Brasill* in *America*, is of two sorts, one greater then the other: From a small blacke roote very full of fibres, there riseth one single small smooth stalke, of six or seaven inches high, without any leaves thereon up to the middle thereof, where there are two small ones set one against another, but at the toppe thereof breaketh forth six or seaven leaves laid round about it, which are some larger and smaller then others: some being two inches long, others but an inch or an inch and a halfe long, smooth, tender and greene, pointed at the end, having five ribs running thorow every one of them, like unto the Ribwort Plantaine, and not dented about the edges, from among which riseth up a small footestalke or two, not above an inch and a halfe long, sustaining every one of them one somewhat large whitish yellow flower, consisting of five leaves and pointed leaves, two whereof are somewhat broader then the rest, having divers reddish threds in the middle. The lesser sort hereof groweth somewhat lower, with lesser leaves then the former, and with lesser flowers then it also, but yet longer and greater then the greater of the *European* kinde.

6. *Pyrola frutescens.* Shrubby Winter greene.

Although this plant be no shrubbe of any hard woodde substance, yet because the stalkes be hard abiding long and encreasing every yeare without withering or dying, it is called shrubby, therein comming neere unto the nature of a shrubbe: it riseth up with divers limber stalkes, which for some yeares remaine fresh and upright, but after they be growne elder, that they are laden with leaves, the waight of them doth bend them downe to the ground, whereon sometimes they take roote againe, their stalkes have at every joynt two three or foure fleshy leaves of a deepe shining greene colour, somewhat like to the leaves of the Strawberry tree, both in forme and bignesse, but dented about the edges: from the middle whereof ariseth certaine buds, made as it were of small scaly heads, which turne into small twiggets, whereon are set three or foure or five flowers a peece of a white purple colour, somewhat bigger then the flowers of the first *Pyrola* or Winter greene, after the flowers are past come five square heads, containing very small seed: the roote is slender with some strings annexed thereto, and creepeth farre abroad under the ground.

The Place.

The first sort groweth in our owne land, yet but in very few places, and those Northwards, in *Yorkshire*, *Lancashire*, and farthest *North*, yea even in *Scotland*, in the woods every where, and seldome in fields. The second groweth at the foote of the high hils in *Austria* and *Syria* as *Clusius* saith. The third in *Germany* also neere *Nemy*. The fourth groweth in the woods of *Germany* in divers places, as also in the Beeche woodes in *Ireland*, as it is recorded by *Buchanus*, who saith Dr. *Craige* sent it him from thence, and on the mountaines in *Wales* likewise. The fifth of both sorts groweth in *Brasile*, towards the *West Indies*. The last groweth in most wilde Provinces of *Hungary*, *Germany*, and *Bohemia*.

The Time.

They doe all flower except the *American* sorts about *June* and *July*, but the other more late without.

The Names.

It is called *Pyrola* in Latine (for it hath not found any Greeke name) *a foliorum pyri arborei, & flore & similitudine* of the likenesse of the leaves, and I may say of the flowers also, unto Peare tree leaves and flowers: divers have taken it to be *Limonium*, as *Fuchsius*, *Lonicerus*, *Tragus*, and *Cordus* also, who calleth it *Pyrola*, but the true *Limonium* is now so well known, that it putteth all out of doubt, and some would make it to be *Britannica Petiveri*, which unto it hath no resemblance, but is generally of all now adaies called *Pyrola*, and *Pirigatior*, because the rest are scarce to be found. The second *Clusius* calleth *Pyrola minima*, and *Bauhinus Pyrola rotundifolia minor*. The third is called by *Clusius Pyrola ramosa*, by *Camerarius Pyrola Pannonica Ramosa*, by *Thalius Pyrola minor*, by *Ruelius* in his *Dioscorides*, and by *Lugdunensis Ambrosia montana*, and by *Bauhinus Pyrola folio macronato serrato*. The fourth is called by *Cordus in observationum fabris*, *Herba Trinitatis* by *Scopolus*, *Seldum Alsine Alpina*, by *Thalius Alsine alpina*, *id est*, *Alsines flos*, and by *Bauhinus Pyrola Alsines flore Europæo* to distinguish betweene it and the next, which he calleth *Pyrola Alsines flore Brasiliano* and *Americana*, and is much resemble the *Polycnemon latifolia* of *Lugdunensis* in my opinion, although *Bauhinus* referreth it to *Polycnemon pentaphyllos*. The last is called by *Clusius Pyrola frutescens* or *frutescens*, and *Bauhinus Pyrola Salicis Arbutifolia*. It is called by the *Italians* Pyrola, by the *French* Pyrole, by the *Germanes* Immergrun and Wintergolt, and *Waldmangolt*, after the name of *Betula sylvestris*, or *Limonium*, by the *Dutch* Immergroen, and of us Wintergreene.

The Vertues.

Wintergreene is very cold and drying and exceeding astringent, and glutinous withall, whereby it is a singular remedy for greene wounds, to consolidate their lippes speedily together, either the greene herbes stamped and applyed of themselves, or the juice of them, or a salve made of the greene herbes stamped, or the same boyled with *Axungia* or Hogs lard, or with sallet oyle and waxe, and some turpentine added unto it, for it is so soveraigne a salve for all manner of wounds and sores, that the *Germanes* use it exceeding much and call it

Original from UNIVERSITY OF MICHIGAN

beyond any other salve made of simple herbe: they likewise use it for inward wounds or burts, being boyled either by itselfe, or with other wound herbes, as Comfrey, Monseare, Burnet, Perywinkle, Tormentill, Horsetaile, Avens, Ladies Mantle, Hetony, Agrimony, Madder roores, and Golden Rodde, and the like, wherewith they vse to heale whomsoever is wounded, either in the body or bowells or any other part, by giving them to drinke of such a decoction: the herbe boyled in wine and water and thereof given to drinke to them that have any sore and ulcers in their kidnies or neck of the bladder, doth wonderfully help them: it staieth also all fluxes, whether of blood or of humors, as the laske, bloudy flixe, or womens too abundant courses, as also the bleeding of wounds, and to be briefe driveth away any inflammation rising upon the paines of the heart, and hindereth any to arise being presently applied after the hurt received: it is no lesse helpefull for fowle ulcers hard to be cured, as also for cancres or wolves: the liquor or water of the herbe doth effectually performe the same things, and some steepe the dried herbe in drinke in decoctions, or made into powder to drinke.

Chap. XIX.

Cynoglossum. Hounds tongue.

Dioscorides maketh mention but of one sort of *Cynoglossa* or Hounds tongue, which is generally thought to be that which is ordinary with us, but there hath beene of late dayes, divers other sorts found out, all which shall be here set downe together.

1. *Cynoglossum majus vulgare.* The ordinary great Hounds tongue.

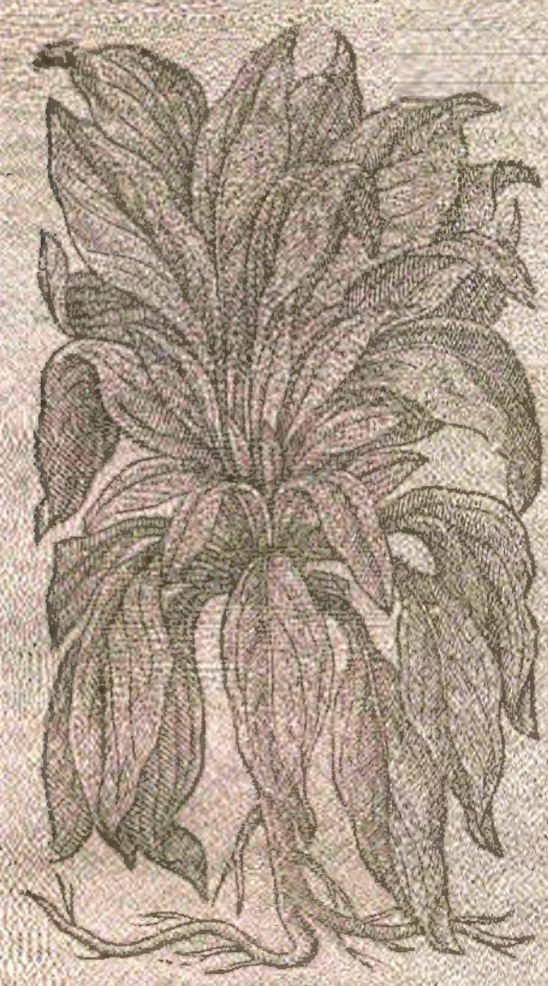
The great ordinary Hounds tongue hath many long and somewhat narrow, soft, or as it were hairy darkish green leaves lying on the ground, somewhat like unto the leaves of Bugloss, from among which riseth up a rough hairy stalke, some two foote high, with some smaller leaves thereon then grow below, and branched at the tops into divers parts, with a small leafe at the foote of every branch, which is somewhat long with many flowers set along the same, which branch is crooked or turned inwards, before it flowreth and openeth by degrees, as the flowers doe blow, which consist of foure small purplish red leaves, somewhat of a sad or dead colour, standing or shewing themselves, out of the rough greene huskes wherein they stand with foure threds in the middle; the herb hath beene sometimes found with a white flower: after the flowers are past there come in their places rough flat seede, with a small thread or pointell in the middle, easily cleaving to any garment that it toucheth, and are not so easily pulled off againe: the roote is blacke, thicke, and long, tough or hard to breake, and full of a clammy juice, smelling somewhat strong, or of an evill sent, like as the leaves doe, which some doe call a loathsome sent. *Are also*

2. *Cynoglossum maximum.* The greatest Hounds tongue.

The kinde differeth not from the former, either in leafe, flower, or seede, but onely that in them all it is neere twice so large: which maketh the difference.

3. *Cynoglossum montanum majus.*
The great mountaine Hounds tongue.

This great mountaine Hounds tongue hath also many large long hairy and soft leaves, lying on the ground, above a foote long, and an hand bredth broad, of a whitish greene colour, having ever one the middle ribbe reddish; with many greene veines running through them, and reddish footestalkes to sustaine them, those leaves which are in the middle of them standing more upright; from amongst which riseth a thicke hollow crested reddish woolly or hairy stalke, two foote high and above round on all sides with such leaves, but lesser and lesser up to the toppe, where it breaketh forth into foure or five branches of flowers, standing all on one side, yet forming at the first a round head, very pleasant to behold for the variety of colours there is: the hairy tufts of the flowers being greene ending in five points, the flowers hollow and long consisting of five purplish red leaves, somewhat sweete, standing above the flowers and greene leaves among them with red ribbes in them, which in the shadow where it delighteth to grow, is the more conspicuous and beautifull; after which in the said husks come larger seede than the former, foure usually together, which in the aforesaid are flat pricked about with a few short prickes, whereby it cleaveth fast to garments: the roote as blackish on the outside, and whitish within, somewhat like the former.



1. *Cynoglossum majus vulgare.*
This ordinary great Hounds tongue.

4. *Cynoglossum montanum angustifolium.*
Narrow leafed hairy great mountaine Hounds tongue.

This Hounds tongue hath many soft woolly, or hoary long and narrow leaves standing upright and not lying upon the ground, being halfe a foote long, and an inch broad in the middle, but small at both ends, whose middle ribbe, and footestalkes are both reddish: the stalke riseth up to be somewhat more than halfe a foote high, replenished so thicke with such like leaves as grow below, that no part of the stalke can be seene, and is likewise more hairy or woolly, and compasse

the

9. *Cynoglossum Creticum angustifolium.*
Narrow leafed Candy Hounds tongue.

10. *Cynoglossum flore carneo.*
Small Hounds tongue with blew flowers.

the ſtalkes at the bottomes of them, and ſharpe at the point: on the toppe of the ſtalke ſtandeth a round hoary head, of the bigneſſe of a reaſonable apple, which opening it ſelfe, ſheweth forth many woolly leaves, with red ribbes, ſtanding at the foote of the branches and ſtalkes of flowers, which are of an excellent vermillion red colour, ſtanding in larger and more woolly huskes, and are more laid open like a ſtarre, ſtanding on both ſides of the ſtalke, and not all on ſide as the laſt: the ſeede that followeth is ſmaller and not ſo rough, with a ſmaller hollow middle: the roote is thicke and long, with a thicke blackiſh barke, on the outſide, and a hard woodly pith in the middle, of an unpleaſant taſte as the leaves, bitter and aſtringent and hairy at the head, which are the ribbes of the withered leaves: the roote ſpringeth afreſh before Winter, after the leaves and ſtalkes are all dre and withered.

3. *Cynoglossum ſempervirens.* Ever greene Hounds tongue.

This Hounds tongue doth not much differ, from the common or ordinary ſort, but that the leaves are alwayes freſh and greene, lonnew hat long and narrow with a great whitiſh greene ribbe in the middle, ſmooth on the upperſide, and more hairy underneath: the ſtalke at the firſt is but low, with many narrow long leaves, compaſſing it about, but more thinnely than in the former: the flowers are red, but ſomewhat larger than the ordinary, ſtanding in the like manner upon ſmall branches that are writhed or turned like the *Heliotropium*, or the firſt kinde: the ſeede that followeth ſtandeth all on the one ſide, and is ſmaller and leſſe rough, but the ſtalke is alſo growne much higher: the roote is blackiſh, as the other: This hath no manner of hoarineſſe, or not ſo ſtrong a ſmell as the laſt, and doth ſpring forth with freſh leaves before the old ſtalke with ſeede is quite dre and withered.

4. *Cynoglossum ſylvaticum versicolore flore.* Hounds tongue with party coloured flowers.

This ſmall rare and rare Hounds tongue, from a ſmall ſlender wooddy roote, ſhooteth forth divers heads, of ſoft hairy and ſmaller leaves than the laſt: the ſtalke riſeth up a foote and a halfe high, ſet on both ſides, with the like ſmaller leaves than thoſe below, the toppe whereof is parted into three branches of flowers, which are ſmaller than the laſt, but of a bluiſh colour, ſtriped with long bloud red ſtrakes, having the bottomes of them of a deeper bluiſh: the ſeede likewiſe hath in the ſame manner that others doe ſtoute together in a huſke, but they have the middle ſomewhat raiſed up, and knit at the toppe, with a pomteil thereat, and a large thinne circle or liſt about them.

5. *Cynoglossum Creticum latifolium.* Broad leafed *Candy* Hounds tongue.

The *Candian* hath for the firſt yeare of the ſpringing, many leaves lying on the ground, ſomewhat broad and not very long, with a long ſoft ſtalke to every one of them, ſoft, and covered with a whitiſh ſhining woolliſneſſe, almoſt like ſilver, and a thicke whitiſh ribbe in the middle: but the next yeare after, the ſtalke riſeth from the middle of them, ſet here and there with ſhorter leaves compaſſing it at the bottome, and ſmaller up to the toppe: this ſtalke is branched from the middle upwards into divers others, that are crooked or writhed inwards, opening

opening by degrees as the flowers blow, which are short but somewhat large, ending in five round leaves, of a whitish colour at the first, with bluish edges, and in some with pale purplish veines or stripes, which after they decaying grow wan or blewish, standing in hoary cuppes, wherein after they are past, the seede groweth, two joyned together, rough and cleaving to garments as in the rest, with a pointell in the middle: the roote is woody, and perisheth after it hath given seede, springing from the seede that falleth of it selfe, but while it is young of the first yeare, is somewhat like unto others, not so thicke or fleshie and blackish on the outside, of an evill unpleasant sent, as the rest of the plant is.

γ. *Cynoglossum Creticum angustifolium.* Narrow leafed *Candy* Hounds tongue.

This other *Candian* hath divers long and narrow leaves, somewhat broad at the end, and round pointed, of a whitish greene colour, lying next to the roote upon the ground; from among which riseth up a stalke, in some plants higher, in others lower, whereon grow without order, such like leaves but shorter and lesser, compassing it at the foote of them: from the middle whereof upwards, it spreadeth into branches, bearing such like flowers as are in the ordinary sort, ending in five leaves, but of a paler red colour, with each of them five darker red lines in the middle: the seede and roote is somewhat like the ordinary, but hath no evill sent like it or the leafe: it perisheth every yeare, and is sowed or riseth of the fallen seede againe.

δ. *Cynoglossum minus non pusillum.* Small Hounds tongue.

This small Hounds tongue that groweth within in divers places of our land, is not much differing from the greater ordinary kinde, but is smaller in all things, having such like leaves smaller and thinner, greener and more shining: the flowers also being small, are of a pale red colour, and the whole plant hath not so strong an evill sent: this might be thought to be thus small from the barrennesse of the soyle wherein it doth grow, but that is not so, for it is often found in the same grounds where the greater groweth, and besides being tilled, or planted, or the seede sowen in gardens, it will still continue much smaller then the other.

ε. *Cynoglossum minus flore cæruleo.* Small Hounds tongue with blew flowers.

This other small Hounds tongue sendeth forth from a small long but annuall roote, one round soft hairy stalke, sometimes but a foote, and sometimes two foote high, brownish below and greene above, whereon are set on both sides without order, divers small and somewhat long but narrow leaves, of a blewish green colour, covered with a long hairy downe, that is tough and sticking, the middle vaine being somewhat greater, and taste of a hot bitter tatte; from the bottome of these leaves, especially upwards, come forth sometimes one smaller leaves in a tuft together, and is parted into divers branches, the toppes whereof are bended, as in most other sorts, bringing forth very small flowers, of a faire blew colour, with a yellow starre in the bottome, growing in tufts like bushes, wherein after they are past is contained very small round dish seede, without any pointell in the middle, as others have, but very rough or prickly, ready to sticke upon any garment, as others will.

The Place.

The first groweth in most places of the land, in waste grounds and untilled places, as by high wayes, ditches, and hedge sides: the second in the same Countries, especially in their gardens: the third on the mountaines of *Naples* to the Southward: the fourth on the same hills to the Northward: the fift in the shadowie woods and hills in *Germany* and *Naples* also: the last groweth onely at the foote of a certaine hill in *Naples*, as Southward, as *Columna* saith, who there observed it: the seventh as by the name it should seeme is originally of the East, from whence being brought into *Italy*, hath from thence become communicated to many countries, not onely in *Candy*, but on the hills of *Naples* also: the ninth is found in *Germany*, as well as in our owne soyle, being mentioned by *Cordus* upon *Dioscorides*, and it may be is that kinde that is found in the *Adversaria* about *Montpelier*, and called *Pusillum Narbonense*: the last groweth in *Austria* as *Clusius* saith, and in some parts of *Germany* as *Tragus* saith, in *Naples* also as *Columna* saith.

The Time.

They all flowre about *May* and *June*, and the seede is ripe not long after.

The Names.

It is called in Greeke Κυνόγλωσσον, and Κυνόγλωσσος, *Cynoglossum* and *Cynoglossos*, *idest*, *Canis lingua*, a dogs tongue, *Lingua canina*, *Lingua canis*, *Canis lingua*, *Lingua canina* in English.

There hath been no great controversie among divers the learned Writers of all times whether the *Cynoglossum* that is here first set downe, and is the most ordinary in all countries, and therefore called *vulgare*, should be the *Cynoglossum* of *Dioscorides*, because he saith it beareth leaves like unto Plantaine, which this doth; among whom wee must account *Matthiolus* to be one, who saith he found in some such grounds in *Rome*, behind or beyond *Adrianus* Mount the true *Cynoglossum* of *Dioscorides*, whom *Fuchsius* and *Lobel* in their *Adversaria* doe both taxe of want of knowledge of the true *Cynoglossum Dioscoridis* (for say they) wee in the same and other places beare both stalke and flowers; although in divers yeares and places it doth not bear, yet will beare after some reipite of time in any place, as not onely they but divers other good authours have knowledged as well herein, as in other places; and we our selves have often found divers plants of the small kinde of Hounds tongue, not to beare flowers in the same places that others have the same yeare, and the rest of the best Herbarists in these dayes, there is now no doubt, but that the common kinde is the right, as before we knew not that this his *Cynoglossum Dioscoridis*, is *Lycopsis*, that sometimes doth not beare flowers, nor with stalke as hath been observed oftentimes as well herein as in *Cambridge* shire: though some labour to prove this truth, as *Ruellius* & *Fuchsius*, who say that this *Cynoglossum*, which was then used by Apothecaries, and other places as the right was not the true kind of *Dioscorides* but rather *Lycopsis*, as shall speak hereafter, against whom *Cordus* upon *Dioscorides* and *Matthiolus* also do contend, affirming that *Cynoglossum* to be right, for the reasons before set downe, and *Matthiolus* simply casting off them, and judging the *Lycopsis*, for the red roote's sake, and other things therein, to be a kinde of *Buglossum*, as *Fuchsius* accounteth this common kinde, to be the second *Cynoglossum* of *Pliny*, in his 25. book and 8. chapter but first kinde that is fit to make Arbors, or Imagery hedges, is not yet knowne what it is) which grow in gardens, and of the best Writers and Herbarists now adayes is accounted the right kinde here set down, which *Fuchsius* also calleth it *Lycopsis*. There is an error likewise in *Arbelus* which *Dodonæus* noteth, in making *Cynoglossum*, to be both one plant. And another in *Rondeletius*, who tooke *Gleffum* (wherein we differ very little from the *Salvianes*, to be *Cynoglossum*: and lastly *Lugdunensis*, who setteth the *Plantago*

Original from UNIVERSITY OF MICHIGAN

Dioscorides, calling it *Cynoglosson prosopon*. The first is generally called by all Authors either *Cynoglossum*, or *Solsequium*, or *Cynoglosse vulgare*: the second is but onely mentioned by *Lobel* in his Observations, under the title of *Cynoglossum maximum*: the third is called by *Lobel* in his Icones, *Cynoglossa media*, *Cynoglossum medium*, and by *Bauhine Cynoglossum Dioscoridis secundum*, because he thinketh it is the same that *Thalius* in *Silesia* setteth forth, called *Cynoglossum sylvaticum Hirsutum*, and the *Cynoglossum minus* of *Lobel*: the fourth is called by *Fabius Columna Cynoglossa media montana angustifolia*, & by *Lobel*, *Cynoglossum globosis floribus*: the fift is called by the said *Columna*, *Cynoglossa media altera*, &c. by *Bauhine*, *Cynoglossum minus alterum*: the sixt is also called by *Columna*, *Cynoglossa altera media frutescens*, &c. by *Bauhine*, *Cynoglossum frutex umbilicatum*: the seventh is called by *Clusius*, *Cynoglossum Creticum tertium*, and by *Bauhine*, *Cynoglossum Creticum latifolium hirsutum*: the eight is called also by *Clusius*, *Cynoglossum Creticum quartum*, by *Columna*, *Cynoglossum in horto Cynoglossum parvum cretense Creticum*, thy *Columna*, *Cynoglossa media altera serotina stipulata*; and by *Bauhine*, *Cynoglossum Creticum angustifolia*: the ninth is mentioned by *Cordus* upon *Dioscorides*, and by *Lobel* in his *Adversaria*, calling it *Cynoglossum pusillum Narbonense*, whom *Lugdunensis* followeth: the last is very much confounded by *Bauhine* in his *Pinax* for his eight species, which he calleth *Cynoglossum pusillum*, and saith it is the same that *Cordus* upon *Dioscorides* calleth *Cynoglossa minor*, and *Cæsalpinus Cynoglossum Tragi*, and *Lobel Lugdunensis*, and *Lyfitanus* call *Cynoglossum pusillum Narbonense*, who all say that it is like the ordinary great one having such like red flowers, and yet he maketh the same to be *Clusius* his *Cynoglossum pusillum Creticum tertium*, and also *Columna* his *Cynoglossa minor montana serotina altera Plinij*, who both say that their sizes bear flowers, as the *Echium* of *Tragus*, and the *Lappula tuberosa* of *Lugdunensis*, which are both one & the same with it: this also *Bauhine* himself maketh his tenth species, calling it *Cynoglossum minus*, and there also making it to be the same *Cynoglossa Plinij* of *Columna*, before set downe: so that he confounded them much, making that but with red flowers, to be the same with that of *Tragus* and *Lugdunensis*, which hath blew flowers, and doth correspond altogether with theirs, which errour in him is usuall in many other places of his *Pinax*, and not in this onely. It is called by the *Italians Cynoglossa*, and *Lingua di cane*, by the *Spanish de Lengua de perro*, by the *French Langue de chien*, by the *Germans Hundts zungen*, by the *Dutchmen Honts tonghe*, and *c.* in *English* Hounds tongue generally, or of some Dogges tongue.

The Vertues.

Hounds tongue is temperately cold, drying and astringent, and yet hath a mollifying qualitie. The roote is very effectually used in pills as well as in decoctions or otherwise, to stay all sharpe and salt defluxions of rheume, from the head into the eyes or nose, or upon the stomacke or lungs, as also for coughs and shortnes of breath, for which purpose the *Pilulæ de Cynoglossa*, either of *Mesues* or *Trallianus* description, or as it is corrected by *Fernelius*, is singular good, which is set downe in this manner. Take of *Myrrhe* five drammes, *Olibanum* five drammes, of *Opium*, of the seedes of white Henbane, and the barke of the dried roots of Hounds tongue of each foure drams or halfe an ounce, of Saffron and Castor of each one dramme and a halfe, let all these be made into a masse of lumps for pilles, according to art, with the syrupe of *Stœchados*, the leaves boiled in wine: take *Diascordium*, *Fernelius* doth rather appoint it to be made with water, and to add thereunto oyle and salt, moderately or openeth the belly downewards: the same also taken doth helpe to cure the biting of a mad Dogge, and applying some of the leaves also to the wound: the leaves bruised, or the juice of them boyled in *Axungia*, that is Hogges larde, and applied, cureth the falling away of the haire, which commeth of hot and sharpe humours: the same also is a very good medy, to apply to any place that is scalded or burnt with fire: the leaves of themselves bruised and laid to any greene wound, doth heale it up quickly: the same ointment aforesaid with a little Turpentine added thereunto, or also the juyce used with other fit things, doth wonderfully helpe all old ulcers and deepe or much spread sores in the legges or other parts of the body, and taketh away all inflammation that rise about them, or any where else in the body, be it *St. Anthonies* fire or the like: the roote likewise baked under the embers, either wrapped in paste or wet papers, or in a wet double cloth, and thereof a suppository made and put up into the fundament, or applied to the fundament, doth very effectually helpe the painefull piles or hemorrhoides: the distilled waters of the herbe and roote is very good to all the purposes aforesaid, to be used as well inwardly to drinke, as outwardly to wash any sore places, for it doth heale all manner of wounds, or punctures, and those foule ulcers that are by the *French* Pocke.

Chap. XX.

Anchusa. Alkanet.

Here are divers sorts of Alkanet, whereof I have given you the description of one, and under it have made mention of some other sorts in my former Booke; but because I there did not shew you them in the cuts, I will in this place make further mention thereof, with the rest of it is kinde.

1. *Anchusa lutea major.* The greater yellow Alkanet.

This yellow Alkanet hath many long and narrow hoary leaves lying on the ground, and thicke set or compassed round about, which riseth not much above a foote and a halfe high, as the copies where of stand drawne: which at all seasons at the foote of every flower, which are somewhat long and hollow, like unto Bugloss flowers, but a little opening themselves at the brimmes, like unto Bugloss flowers, having five small yellow leaves in them, which they are pale there come in their places, small long blackish seeds, not unlike unto Bugloss seeds: the roote is of the bignesse of ones finger, and of the length of two, whole and intire, of an excellent orient red colour, ready to colour their hands and fingers that shall handle it, the inner pith being white and woody: the whole herbe is of an ordinary taste.

2. *Anchusa lutea minor.* The lesser yellow Alkanet.

This small Alkanet is very like unto the former, but that the leaves are narrower, and not so long, yet covered with

Original from UNIVERSITY OF MICHIGAN

with many leaves, and the stalkes are also, which in some are but a foote, in others a foote and a halfe high, with smaller leaves thereon: the flowers are hollow and yellow like the other, but lesser; the seede also is alike: the roote is great in the beginning of the plant, red and tender while it is young, but growing woodily when it is old, and like it is but five or six and abideth after seed time, which some others doe not.

6. *Anchusa minor purpurea.* Small Alkanet with purple flowers.

The small purple Alkanet hath greater and longer leaves then the last, hairy and greene like unto Bugloss, and somewhat like unto the first; but yet lesser and narrower, although more plenifull, that lye upon the ground, and those also thereon with the stalkes, which are many, tender and slender, whose flowers being like the others, are of a reddish purple colour: the seede following is more gray, the roote is greater and thicker then the other. We have another sort hereof, whose small flowers (after rising out of the husks) are of a red or dead red colour, the seede blackish rising againe yearely of its owne sowing, and leaning downe to the ground. *Alter purpureo flore.*

4. *Anchusa lignosior angustifolia.* Woodily Alkanet.

This smallest Alkanet, which scarse deserveth to be accounted one of them, both for the want of colour in the flowers, and for hardnesse of both rootes and stalkes; for the stalkes are scarse a foote high, hard and woodily having many small and narrow red greene hairy leaves, much smaller and shorter then the last, the flowers stand on crooked foldes, bending inwards like *Heliotropium*, and are hollow but smaller then the former, and of a very low colour like unto them, for the forme and manner of growing, the roote is hard and woodily, brown like red or sad ashes, and not colouring the hands with any red colour or very little, such as the rest doe.

5. *Anchusa humilis Cretica.* The low Alkanet of *Candy*.

It is a small long reddish roote of a fingers bignesse, having small stalkes halfe a finger long, bearing thereon many small white leaves on each side of them, set very thicke together, like but lesse then the other Alkanets, some edged as it were and reddish flowers inclining to purple, larger then those of Alkanet, and formed like them, and shaped like Sena, after which come small long rough vessels, containing within them the small seedes like the others: the roote will give a red juice, that will die their fingers that touch it, which is much commended by the Cretans to be singular good against the poyson of any Serpent.

6. *Anchusa arborea.* Greas and tall Alkanet.

The roote of this Alkanet is unpide, woodily, long, and of a fingers thicknesse, somewhat reddish within and with a thicke and rough barke without; the stalke is thicke and rugged, shooting forth divers branches, and those great and tall, with many small leaves like Savory set together at the joynts, and small white prickes about them, as also on the smaller branches they stand single for the most part, one above another at equall distances, at the ends whereof grow small flowers, somewhat like unto the ordinary Alkanet, of a yellow with purple colour, and the seede succeeding, and is not of any known use.

The Place.

The first groweth both in *Italy*, *Spaine*, and *France*, as well neare the Sea as further off into the land. I have not yet heard of any that have seene it growing any where in our Country. The second *Columna* saith groweth in *Italy*. The third about *Montpelier* and *Lions*, as *Lobel* saith, and this I thinke is the same that groweth in our Country, namely at *Kyte neare Rochester*, in a field neare Sr. *John Leveson* his house, and in some other places about London: as also in the West parts, as *Devonshire*, and *Cornwall*, as it hath beene affirmed. The fourth also about *Montpelier*, and *Fontainebleau* as *Pena* saith, the two last in *Candy*.

The Time.

They flower in *July* for the most part; and sometimes in *August*, but their rootes have their braverie colour in *June* and *August* at their seasons.

The Names.

Anchusa is called in Greeke ἄγχουσα, *Anchusa quod vino sapore habet, ut aliqui volunt, sed ab* [illegible] *quod ejus radix ad tingendum vinum bona est, & colorare queat, & rubricum vinum reddit, sic Dioscorides.* Some have called it *Alkanet* for the beautifull red colour in the roote, which not only made them knowne, but distinguished them from *Bugloss*, *Lycopsis*, *Buglossum*, and the rest that are like unto them in leaves, but want that colour in their rootes: some have called it *Alkanet* but very falsely, others *Fucus herba*. The first is thought to be some kinde of *Anchusa*, whereof *Matthiolus* giveth a figure, although he saith that all the *Anchusa*, that were knowne unto him, have purplish flowers: it is called *Fœnix Anchusa* by *Dodonæus*, and is the same *Anchusa exactibido flore*, that *Cæsalpinus* setteth forth in his History of Plants; it is also very likely to be the same, that *Cordus* upon *Dioscorides* mentioneth in the first sort, and *Lobel* calleth *Anchusa latifolia*. The second *Columna* calleth *Anchusa Fœminea minor*. The third *Camerarius* in his Epitome calleth *Anchusa altera minor*, and *Kaulfius Anchusa minor Pannonica*, to divers distinguisheth it from the *Anchusa minor flore Bugloss foliis Orvalle* of *Lobel*, and *Clusius* making them two distinct sorts, *Lonicerus* calleth it *Buglossa rubra*. The fourth is called by *Lobel* and *Pena* in their *Observations*, *Anchusa angustifolia*, and by *Clusius*, *Anchusa lignosior*, *Bauhinus* calleth it in his *Pomax*, *Anchusa angustifolia*, and saith it is the same he formerly in his *Phytopinax*, called *Lithospermum minus repens*, and in his *Prodromus* [illegible] *Anchusa folium*, and saith also that this is the same that *Lugdunensis* setteth forth in his *Hortus* [illegible] *Monspeliensis Dalechampii*. The two last are remembred by *Alpinus* in his History of Plants, under the same titles they are here expressed. The *Italians* call it *Anchusa*, the *Spaniards* [illegible], the *French Orchanette*, the *Germans Ochsenzung*, the *Dutch Ghele Ochsentonge*, in high *Dutch* [illegible], we in *English* after the *French* word, *Alkanet*.

The Vertues.

These plants [illegible] kinds [which as I suppose, is that I have described in this and my former booke, [illegible] and others, and those that are burnt with fire, being made into a salve with [illegible] flowers, it cureth all hot inflammations, and even that which is called Saint [illegible], it helpeth the morphew, leprey, and the like; the same also applied to the [illegible] of children, the decoction thereof made in water, for those that are ayleth, or [illegible] in the kidneys; the Apothecaries that used to make ointments saith he, used it to thicken their ointments, [illegible] Fuchsius (as he doth in some other things, relating the text of *Dioscorides*) and saith it is used to colour

colour ointments, and for that purpose they take *Cynoglossa* and *Anchusa*. To the second kinde (which I generally take to be that with the yellow flower, and is the first here described) *Dioscorides* giveth these properties; that whether it be eaten or drunke, or but bound to the wound, it helpeth all such as are stung by serpents, especially by the viper (or adder) and that if any that hath eaten hereof shall but spit it into the eyes of any Serpent, it will presently kill it, the leaves (but much more the roote) being drunke in wine, stayeth the fluxe of the belly. *Pliny* addeth hereunto somewhat more; the chiefest strength hereof saith he is in the rinde, a draught of wine wherein some of the dryed leaves and rootes have beene boyled, and given to such that are troubled with the falling downe of the mother doth helpe them; it killeth wormes, being taken with Hyssope. it is good also taken in wine for the paines of the backe and reines, as also for the liver. Now more exactly and distinctly set them forth in this manner. *Anchusa* saith he hath a more stronger and more hotter, and thereby fit both to condensate the thinne humours in the body, and somewhat to extenuate such that are thicke, and as well to clense the cholleticke, as to wash the salt humours therein, for it is found that a harsh salted quality joyned with a bitter, can performe those properties; in the like manner is it profitable for the yellow jaundise, for those that are splenetricke, and for those that have paines in the backe and reins by reason of the stone in the kidneyes. It is also cooling and applyed with Barly flower, helpeth inflammations and Saint *Anthonies* fire; it clenseth also either inwardly taken, or outwardly used, and therefore helpeth morphewes, lepries and the like, but these properties are chiefly in the rootes, yet the leaves in that they lie weaker then the roote, are not without the qualities of drying and binding, and therefore the leaves taken in wine, are good for all fluxes and laskes, but that which is called *Onochiles* or *Asclepiadon* is more powerfull, for in taste it hath a greater acrimony, and speedily helpeth those that are bitten by a viper, whether they eate it, or apply it as a salve to the wound, or but hang it or tye it to the wound, but the little weed which some hath a name, is like unto the *Asclepiadon*, being more bitter, and therefore more fit to open and is good to kill the broad wormes in the body, being given to drinke with Hyssope and Carrot seede. It is of late daies given to those that are bruised by some fall, or by beatings, or any other casualty, or also to drive out the small pose, meazles, or the like, to be drunke in hot drinke. Some have said there also, that it is good for the sore eyes, gellies, and the like; but *Pliny* saith it will not dissolve in water, but in oyle, and so we have found it true by experience, yet the colour holdeth not long, being boyled in oyle, butter, or other fat thing: and therefore the painting that was made therewith by the *French* Ladies, served onely for a small while, except they take it while it is fresh; but the ointment that is made with a pint of good sallet oyle, wherein two ounces of the rootes of Alkanet, and twenty earthwormes hath beene boyled, and afterwards strayned forth to keepe it, is a singular good salve to be for any fresh wounds, made either crosse the flesh or deepe thereinto, or into the body, as also where nerves and sinewes are, to consolidate and knit them againe; some adde to put into *Petroleum*, or oyle of *Peter*, and being let stand till any one needeth, it is a singular good remedy for any fresh cut or thrust: workemen of all sorts, that use sharpe and pointed tooles, ought to have it alwaies with them, to use upon all occasions of harme.

Cap. XXI.

Lycopsis. Wall Bugloss.

BEcause this herbe is so like unto the *Anchusa*, that as *Dioscorides* saith, it was called of divers *Anchusa*, and *Cato* in his time accounted it as a kinde thereof, as also that is like unto *Echium*, and other sorts of wilde Bugloss, whereof *Anchusa* is also accounted a species; I thinke it fit to joyne it next unto them, whose description is as followeth; it spreadeth upon the ground, with many long and narrow rough or rugged darke greene hairy leaves, somewhat like unto the *Echium* or wilde Bugloss, which doe abide in that manner, some yeares, without sending forth any stalke or flowers at all, (which divers having marked, have thought it never did beare flower or seede,) but if it or any other plant should abide so, no one could any man thinke it could cause there, or any where else, where they are found, and therefore I am very perswaded, there is no herbe or plant growing upon the ground, but hath a kinde of seede, whereby it is propagated, in all the places where they are naturall; I doe neither except the Fearne, Maidenhaire, Milkwall, Hartstongue, Coltsfoote, Butter burre, or any other whatsoever, although I know this my opinion, doth not well contradict divers other more learned mens observations, or rather other mens conceites now adaies (but to keepe me sufficiently I thinke said before in the Chapter of *Cynoglossum*, that as that, so this notwithstanding, or it doth not beare a stalke for flowers or seede some yeares, yet it is found to beare it in others, because both plants of each kinde, have beene found, as well with stalkes and flowers, as voide and without; and so it commeth it sendeth a stalke which ribbe three foote high, it carryeth many such like leaves thereon as grow below, but more distant from another, without order until it smaller up to the toppe, where the flowers stand upon the severall branches, that it hath spread, as also comming forth at the joynts with the leaves, like unto the hollow flowers of *Echium* or Wild Bugloss, with uneven and gaping dented brimmes or edges, of a pale purple colour, and a long stile or pointell in the middle, growing out of the flower above the length thereof; after which come the seede like unto Bugloss, but not altogether so great or blacke, the roote is somewhat woodily, long, but not much greater then a finger with some fibres thereat, of a brownish red on the outside, little or nothing smelling like the *Anchusa*'s doe.

2. *Lycopsis Anglica*. The *English* Wall Bugloss.

This *Lycopsis* differeth very little in leaves, stalkes, or flowers from the former, the only difference is in that the flowers doe all grow at the toppes of the branches, and are of a deeper purple colour, with blacke threds shooting out of them, the roote is a little reddish like the other, and giveth as little colour.

3. *Lycopsis Ægyptiaca*. *Egyptian* Wall Bugloss.

The roote hereof is red, the stalke straight, and two cubits high, with many rough and hard leaves like unto Bramble leaves, but long narrow and pointed, spread upon the ground, and dispersed upon the stalke, and

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

in that manner the rough wilde *Cynoglossum* doth, the stalke is branched from the middle to the toppe thereof into a number of slender twiggies, bare or naked of leaves for a good distance, and the flowers at the ends of them, which are small, and of a purple colour, made of five leaves a piece.

The Place.

The first groweth not farre from the sea shore about *Frontignan* neare unto *Montpelier*, as *Prosper Alpinus* the other *Lobel* observed in the Alpes comming in the way from *Aquisium* and *Bath* to *Lucca*: the last *Rauwolfius* saith hee found in a field where corne grew in *Egypt*.

The Time.

They flower about *July*, and sometimes in *August*.

The Names.

It is called in Greeke [illegible] *Lycopsis*, *quia asperitate gustus, quasi lupos fugat, & florem imitatur, qui apud quosdam Lupinum sanum, seu mansum, ab eorum nonnullis ex purpura colorem quo Lycopsis virgata Solis dicta, refundit, sive obscurius quidem, sed tamen aliquando omnino & primo loco, quæ octava hujus generis species Lobelio, qui vulgus in Italia vocant, & supra vocavi; sed alii variis de causis, ut opinor, & florum hiantis figura, quos lupi fauces aperte imitatur*: some as you have heard did take the *Cynoglossum vulgare* to be it, as *Ruellius* and *Fuchsius*; in which opinion *Matthiolus* saith he himselfe was formerly, but afterwards was disswaded because the roote was not red, but in finding fault with them, hee himselfe is reprehended by *Pena* and *Lobel*, I have given the same roote of *Lycopsis*, being not in flower for the *Cynoglossum* of *Dioscorides*. *Dodonæus* taketh the common Bugloss to be *Lycopsis*, and so doth *Lonicerus* also, and saith that the Bugloss in the warmer countries hath a redder roote; but herein surely he is much deceived, for the taste and propertie, as *Galen* saith, is nothing so allringent in Bugloss, as is in *Lycopsis*, wherein it exceedeth *Anchusa*, whereof he maketh it the fourth sort; and besides, *Dioscorides* describeth *Lycopsis purpurascente flore*, with a purplish flower, but so hath not Bugloss, but blew, although the buds be somewhat reddish before they be full open. The first, as is said, is *Matthiolus* his *Cynoglossum*, whom *Lacuterius* doth follow and *Duranter* also. *Dodonæus*, as is before said, maketh our knowne Bugloss to be the *Lycopsis* of *Dioscorides*, and calleth this *Lycopsis Echij altera species*. *Lobel* and *Pena* in their *Adversaria* calleth it *Lycopsis vel Lycopsis depressior Anchusa Ægineta*. *Bauhinus* doth call it *Lycopsis* simply without more words, and he maketh his *Lycopsis altera Anglica*, to be it also, although *Lobel* sheweth the difference: the last is set forth in the *Appendix* to *Lugdunensis*, where hee sheweth that *Rauwolfius*, who found it, did account it a kinde of *Cynoglossum*, and called it *Lycopsis vera Dioscoridis*.

The Vertues.

The roote of Wild Bugloss boyled in oyle, healeth greene wounds speedily, and applied with Barly flower helpeth all inflammations, and St. *Anthonies* fire, and being anointed in convenient places, provoketh sweate. *Galen* in his first booke of Simples saith, that *Lycopsis* is cold and drie, and more allringent than *Anchusa*, especially the roote, and therefore is very good against inflammations: it staieth rhëumes and fluxes, and the accesse of hot and thin choller to old sores, whereby they are hard to be cured.

Lycopsis Anglica. English Wild Bugloss.

Chap. XXII.

Onosma. Stone Bugloss.

The forme and likenesse of this plant with the former, and both with *Anchusa*, hath made me to annex it next to them, although the vertues hereof be not answerable unto them: it hath many long and narrow smooth leaves lying upon the ground, not above a finger broad, but foure long, like unto those of the first *Alkanet*; this is said by *Dioscorides* to have a reddish roote, and to be without stalke flower or seede, which thing he saith likewise of *Cynoglossum* and *Lycopsis*, which both have become known to us in divers plants to beare both flowers and seede, and therefore it is as probable in this, as in them. *Matthiolus* onely saith, that such a plant was brought unto him, with long leaves, and reddish rootes like *Bugloss* or *Adder*, and had neither stalke nor flower, which he thereupon tooke to be the right *Onosma*, not knowing whether it had or would beare.

The Place.

It groweth in rockie and stony places neare *Corinth*,

The Time.

It is greene all the yeare, and his time for flowring if it doth at all, is not expected.

The Names.

It is called in Greeke Ὀφιοσκόροδον, and so likewise *Ophioscordon* in Latine, *Cule* saith it was called also in his time *Ophioscordon Pharmacitis*, and *Ophiorhiza*, we may call it in *English* for distinctions take Stone Bugloss, both for that it is like in some and manner of growing unto some of the sort of wilde Bugloss, and that it chiefely delighteth in stony dry, and rockie grounds.

The Vertues.

This is sharpe, hot, and bitter in taste, differing in qualitie from the other sorts before, which are rather cold and dry: the leaves hereof in powder taken in wine, or the decoction of them made in wine and given to women with child, will cause them suddenly to miscarry, and if the child be dead before the birth, it will cause it speedily to be driven forth; it is also dangerous saith *Dioscorides* for great bellied woman to passe over it, for feare of causing them to miscarry.

CHAP. XXIII.

Cerinthe, Honywort.

Although in former dayes there was but one kinde of *Cerinthe* knowne, or two at the most, yet since in these our dayes, there have beene some other sorts found out, and published by *Clusius*, and some others also not untill now expressed by any; and although *Gesner* hath, and *Ranzonius* following him, doe call it *Cynoglossum montanum*, and thereupon joyneth it next the same unto, yet by comparing the flowers, I finde it therein not to resemble the Comfreyes, and therefore I have interposed it betweene them.

1. *Cerinthe major flore luteo & rubro.*

The greater yellow and red Honywort.

1. *Cerinthe major flore luteo & rubro.*
The greater yellow and red Honywort.

The greater party coloured Honywort, riseth up with divers thicke, hairy stalkes, almost two foote high, whereon are set large long leaves, of a blewish greene colour, spotted with great white spots, round at the further ends, and so much compassing the stalke at the lower end, that it seemeth to goe thorough them, set with some small prickes or thornes thereon, and a little hairy withall; the stalkes are branched toward the toppes into other smaller ones, full of leaves but much smaller, whose ends doe turne inwards like the Turnsole heads; at every leafe whereof commeth forth a long hollow flower, like unto a Comfrey flower and as great, which in some are all yellow, with a reddish circle about the middle the eof; but in others from the middle forwards of a yellow colour, the other part next the stalke being of a purplish red colour, with some threds in the middle, tasting sweete like Hony, wherewith bees are much delighted, each of them standing in a greene huske divided into five parts at the toppes, in which after they are past grow the seede, two for the most part set together, greater than Burrage seede, blackish, a little cornered and flat at the bottome, where is is joyned to the huske;

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

the roote is some what great and thicke, spreading many fibres within the ground, but perisheth every yeare after seede time.

3. *Caprifolium minus flore luteo & rubro.* The lesser red and yellow Honyworte.

The lesser Honyworte hath his branches both shorter and leaning downewards, not standing upright, whereon grow long greene leaves, without any spots on them, and lesser than the former: the tops of the branches are as full of leaves and flowers as the former, but set not in the same manner: the stalkes that sustaine the flowers, and so likewise the small leaves at the toppe of every stalke, are somewhat purplish, but the huske wherein the flower standeth is greene, cut into five divisions, the flower is long and hollow like the former, and almost as great, of a gold yellow colour, dashed at the ends, and with a red or deeper tincture circle about the middle of them: the seede that followeth is like the former, but a little lesser: the roote is long and full of fibres, perishing every yeare.

4. *Caprifolium majus flavo flore.* The greater yellow Honyworte.

This yellow Honyworte riseth up with a reasonable great stalke, branched on all sides from the bottome to the toppe, many of the lowest stalkes lying upon the ground, and the other standing more upright, whereon are set long and long broad, greene leaves, spotted as the former is, but not so large at the bottome, where they compasse the stalkes: set, having some prickles in the middle thereon as they have, and a little hoary about the brimmes or edges: the tops of the branches doe bend downewards set with small leaves and flowers at them as the former, and is great, but without any circle or bottome of purple, being wholly of a faire yellow colour, with small threds within it: the seede is like the former, and so is the roote also perishing after seede time in the same manner.

5. *Caprifolium minus flavo flore.* The lesser yellow Honyworte.

This lesser Honyworte hath a slenderer stalke than the former, neare two foote high, set with smaller, narrower yet spotted leaves thereon without order, one above another on both sides of the stalkes, which spreadeth many small out longer branches, from the middle thereof thicke set with leaves and flowers, which are like the last, as yellow but smaller, and dented at the brimmes of them: after which come such like seede as the last, but smaller, and whiter: the roote is like the other, and perished at the first therewith, yet *Clusius* saith that his lesser yellow sort, which he found wilde in the fields of *Austria* and *Styria*, did sometimes abide greene in the Winter.

6. *Caprifolium majus flore purpureo.* The purple Honyworte.

The purple Honyworte groweth very like the great yellow kinde, with low bending branches, and some what greene upon the leaves, like as the rest have: the flowers stand in the same manner that the rest doe, but are long, wholly of a darke purplish colour, on the superficies whereof is a little whitenesse perceived: the seede that followeth is like the other, but greater than any of them, and two for the most part standing together.

in a huske, flat as the bottome, the roote perisheth every yeare, and must be new sowen againe.

6. *Cerinthe minor flore albo.* White Honywort.

This small Honywort hath divers weake and small branches, leaning or rather lying downe upon the ground, set with such like pale greene leaves, but lesser than the former, whose white spots are not so easie or common to be seene as in many of the other: the flowers are white long and hollow, like them but smaller, set in a double circle about the middle of the flower, and standing with greene leaves, and in greene huskes wherein after they are pall, come very like seede, but not halfe so great as the last; the roote likewise long, slender, and white, perishing every yeare after it hath given seede.

The Place.

The first as *Clusius* saith, groweth generally throughout *Barbaria* of *Spaine* plentifully, and in some places of *Portugall* also: the second is not knowne from what place it came, but was onely observed by *Clusius* in the old Hoglelaud his garden: the third *Clusius* saith he found in the Kingdome of *Valentia* in *Spaine*. *Gesner* also saith it groweth in *Monte Palatino* at *Rome*, as also in *Germany*, betweene *Dresden* and *Misena*: and *Clusius* saith he found it in divers fields of *Austria* and *Styria*, where sometimes it would not live a Winter; and *Dodonæus* saith in *Bohemia* and divers parts of *Hungary*: the fift and sixt grow in divers places of *Spaine*, from whence we had them, by *Guillaume Boel* his diligence in finding them out there.

The Time.

They doe all flower in *July* and *August*, yet sometimes so late, that we doe not gather good seede many of them but the red, if they yeare prove not warme enough, and wet withall to ripen them, or be not well weeded if the Sommer be done to bring them forward the sooner.

The Names.

Theophrastus among the ancient Greeke Writers, in his 6. Booke, and 7. Chapter maketh mention of this herbe and calleth it *Κεγχρὶς*, and *Pliny* and *Virgil* among the ancient Latines, make mention thereof likewise, not but thought also to be their *Cerinthe*: *Pliny* speaketh thereof in his 21. Booke and 12. Chapter, and *Virgil* in *quarto Georgicorum* in these words,

——— *Huc te jussos asperge sapores,*
Trita Melisphylla & Cerinthe ignobile gramen,

and not *gramen* as some reade it; whereby it understood that it is a base or vile weede or herbe, growing every where as grasse, for so divers herbes are named grasse. Many learned men in *Germany* and *France*, especially about *Paris*, where they nurse it in their gardens, have called it *Telephium moschatum*, supposing it to be the *Telephium* of *Dioscorides*. *Dodonæus* and *Clusius* saith, that many tooke it to be the herbe *Alsine* or *Alsines* of divers, whereof in his 364 Chapter, he maketh five sorts, and this to be the fourth; but *Clusius* saith that *Alsine* is to meane no other herbe but either our Borage or Bugloss; he saith also thus may very well agree with the *Enecphyton Plinii*, whereof hee maketh mention in his 27. Booke and 11. Chapter, because the leaves are spotted white; some also hee saith tooke it to be *Memsbra* of the *Arabians*, but *Clusius* supposeth it to be *Glaucium Cisalpinum*: *Gesner*, as I said before *in horto Germaniæ*, saith it was called of some in his time *Cynoglossum montanum*; and *Daalichius* thereupon calleth it *Cynoglossum montanum*; but *Clusius* referreth it rather to the kinde of Borage or Bugloss, whereof in temperature he saith it is nearest. *Dalechampius* tooke *Calendula* to be *Cerinthe*, *a cereo ipsius flore fic appellata*: but the most usuall and common name, whereby it is generally called, is *Cerinthe*, and *Pliny* added, because the moist and best Herbarists, doe thinke it comes nearest unto his description. The first is called *Cerinthe major* by *Lobel* and *Camerarius*, and by *Clusius Cerinthe quæ minor non floribus flore*, and *Bauhinus Cerinthe flos Cynoglossum montanum major*: the second is *Clusius* his kinde, whereof he maketh mention in his other *Appendix*, which is joyned to his Booke of *Exoticke* things; and *Bauhinus* calleth it *Cerinthe folio non maculato viridi*: the third *Clusius* calleth *Cerinthe quæ quondam minor flore luteo*, *Bauhinus Cerinthe flore flavescente inferiore*: the fourth is called by *Clusius Cerinthe quæ quondam minor flore ferrugineo*, *Lobel Camerarius* and *Tabermontanus Cerinthe minor*, by *Bauhinus Cerinthe Plinii*: the fift is the third *Cerinthe* of *Clusius* in his history of plants, and called by *Bauhinus Cerinthe flore rubro purpurascente*: the last as yet extant, or remembred by any Author, we being the first to whom it was brought out of *Spaine* by *Monsieur Boel* before remembred.

The Vertues.

They are all of a temperate qualitie betweene cold and hot, but rather inclining to cold, and somewhat astringent withall, it is held good to lay the bleedings at the mouth or nose, to stay womens immoderate flux, and the loose or laskes of the belly, the herbe being boyled and given to drinke: the juice of the leaves with a little saffron dissolved therein, is good for bleared and watering eyes, and is used in foule ulcers when they are cleansed, to helpe to incarnate them, especially such as are in the tender parts of the body: some doe apply it as a remedie whereunto Borrage and Bugloss are good. *Pliny* and *Virgil* in the places before mentioned, did affirme that Bees are much delighted with the flowers being sweete, and from them we gather more then from any other flowers, doe gather both Hony and Waxe, and thereupon peradventure it was most likely, tooke the name of *Cerinthe*.

CHAP. XXIV.

Symphytum majus. Great Comfrey.

THere are many sorts of *Symphytum* called *Consolida* and *Solidago*, that is major and minor and mean, according to others, and a middle one: as also another kinde called *Symphytum petræum*, whereof *Dioscorides* maketh mention, and another called *Consolida* or *Solidago Saracenica*, which because they are not all tall herbes, I shall speake of them severally in the Chapters following: And to this I intend to adde one more forth unto you the greater Comfrey, which is of divers sorts, some ordinary growing wilde in the fields and ditches sides of our owne land, others nursed up onely in gardens with us.

Symph.

1. *Symphytum vulgare.*
Common great Comfrey.

3. *Symphytum tuberosum.*
Comfrey with knobbed roots.

1. *Symphytum major vulgare.* Common great Comfrey.

The common great Comfrey hath divers very large and hairy darke greene leaves lying on the ground, so hairy or prickly, that if they touch any tender part of the hand, face, or other part, it will cause it to itch: the stalke that riseth up from among them, being two or three foote high, hollow and cornered, is very hairy also, having many such like leaves as grow below, but lesser and lesser up to the toppe; at the joints of the stalkes it is divided into many branches, with some leaves thereon, and at the ends stand many flowers in order, one before or above another, which are somewhat long and hollow, like the finger of a glove, of a pale whitish colour after which come small blacke seede: the rootes are great and long spreading great thicke branches under ground, blacke on the outside and whitish within, short or easie to breake, and full of a glutinous or clammy juice, of little or no taste at all.

2. *Symphytum majus purpureo flore.* Great Comfrey with purple flowers.

This Comfrey differeth in no other thing from the former, but in this that it is somewhat lesser, and the flowers are of a pale purple colour.

3. *Symphytum tuberosum.* Comfrey with knobbed rootes.

The knobbed Comfrey riseth up with a hairy crested or cornered stalke, much lower than the former, with smaller leaves, and more thinnely set thereon, of the same forme and greenenesse, that thereby it may at the first sight, to any that hath well marked the former, be knowne to be a Comfrey; but especially when the toppe branches are in flower, which being set after the same manner, and of the same hollow fashion, but smaller, are of a more pale yellowish colour, whose seede following is like the former: the rootes branch out into thicke and short rootes, more knobbed at the ends with divers fibres thereat, blacke on the outside and yellowish within, having such like clammy or viscous juice, as is in the former, but not so glutinous, yet as tender or easie to be broken, or rather more easie: the stalke and leaves dye downe every yeare as they doe in the former: the roote abiding and increasing in the ground, and shooting forth new stalkes and leaves every spring: some doe *Minor.*
take this for the former, which I never saw, nor can be well assured thereof.

4. *Symphytum angustifolium Apulum.* Narrow Comfrey of *Naples.*

The narrow leaved plant *Cynoglossum* maketh an shewe like an *Echium*, yet from the viscous or slimy binding and holding juice in the rootes may (as doe both himselfe) therefore be accounted rather a Comfrey, and to that I have placed him with the description thus. The roote while it is young is reddish, but growing old is blacke without, whiter than the smallnesse of the plant might seeme to have with a blacke rugged barcke, which feedes from it, bunchy heads of narrow long leaves round about it with a whitish hue in the middle, from among which rise reddish stalkes of a foote or more high, with somewhat broader leaves thereon, at the tops whereof which turne themselves like to a Scorpions taile, grow many hollow long yellow flowers, opening at the brimmes into five parts, all of them flowring one after another with a long pestle in the middle of them, after which come foure blackish browne smooth seeds in each huske.

The

The Place.

Both the former grow by ditches and waterſides, and in divers fields that are moiſt, for therein chiefly they delight to grow, the firſt generally through all the land, and the other but in ſome ſeverall places. The firſt in the Woods of *Germany*, *Auſtria*, and *Hungary*, but in gardens onely with us: the laſt in the frutty places of the hills of *Sanicula* in *Naples* on the Southſide.

The Time.

They flower in *June* and *July*, and give their ſeede in *Auguſt*.

The Names.

It is called in Greeke *συμφυτον μειζον* & *συμφυτον ἡμερον*, *Symphytum* and *Symphytum, a facultate glutinandi ſic dictum*, vide *Conſolida Latinis*; it is alſo called as *Dioſcorides* ſaith *σανικλη ἡμερος*, *paſtor* or *paſtoris*. *Pliny* ſaith it was called *Aſa* and *Alum*, and is alſo of ſome called *Solidago*, and of *Scribonius Largus Inula roſtica*, of ſome as *Dodonæus* ſaith, *Offrecklon*; and *Unſhoofs* from the *Germane* word *Schmerwurtz*. But the moſt uſuall name is by all authors attributed, either *Symphytum* or *Conſolida major*; that with purple flowers is called *mas*, and the white flowered is ſo called by moſt, as is in the table. The laſt ſort I have tranſpoſed further, with a new title as ſeeming beſt for it in my judgement, although both *Columna* and *Bauhinus* make it an *Anchuſa*, for ſome reaſons let down in the deſcription. *Columna* calleth it *Anchuſa ecchioides lutea Corniti flore montana*, and *Bauhinus Cynoglo-ſſum luteum*. The *Italians* call it *Conſolida maggiore*, the *Spaniard Sueldo*, and *Conſolida mayore*, the *French Grande Conſolide*, and *Oreille d'Aſne*, the *Germanes Groſſerbeinwurtz*, *Schwartzwurtz*, & *Schmerwurtz*, *Schwartzwell*, and *Beinwellen*, the *Dutch Waterwortele*, in *Engliſh* Comfrey.

The Vertues.

The great Comfrey is as ſome ſay, cold in a temperate degree, and others ſay hot, which is not laid out but drying and binding in a greater meaſure, for it helpeth thoſe that ſpit blood, or that bleede at the mouth, or that make a bloody urine, as alſo for all inward hurts, bruiſes and wounds, and helpeth the ulcers of the lungs, cauſing the fleagme that oppreſſeth them, to be eaſily ſpit forth, the roote being boyled in water or wine, the ſame alſo drunke, ſtayeth the defluxions of rheume from the head upon the Lungs, the flowes of blood by womens immoderate courſes, as well the reds as the whites, and the *fluxes* proceeding of the raines, happening by what cauſe ſoever: A lympe made thereof is very effectuall for all ſodaine griefes and hurts; and the diſtilled water for the ſame purpoſe alſo, and for outward wounds or ſores in the belly or ſecret parts of the body whereſoever, as alſo to take away the ſins of ſquint, and to ſlay the ſharpneſſe of humours: a decoction of the leaves hereof is available to all the purpoſes, although not ſo effectuall as of the roottes: *Conſtantine* ſaith, that two ounces of the juice drunke, doth much good in the Lethargy and evil ſleepe; the roottes being outwardly applyed, helpeth freſh wounds or cuts immediately, being bound and laid thereto, by glueing together their lips, and is eſpeciall good for ruptures and broken bones; yea is ſaid to be ſo powerfull to conſolidate or knit together, whatſoever needeth knitting, that if they be boyled with diſſevered peeces of fleſh in a pot, it will joyne them together againe; it is good to be applyed to women breaſts, that grow ſorely the abundance of milke comming into them: as alſo to repreſſe the overmuch bleeding of the hemorrhoids, to coole the inflammation of the parts thereabouts, and to give eaſe of paine: the roottes of Comfrey taken freſh, beaten ſmall, ſpread upon leather, and laid upon any place troubled with the gout, doe preſently give eaſe of the paines; and applyed in the ſame manner, giveth eaſe to pained ſores, and profiteth very much for running and moiſt ulcers, gangrenes, mortifications, and the like, often experimented and found helpefull.

Chap. XXV.

Bugula ſive Conſolida media. Bugle or the middle Conſound.

THis browne Bugle is ſo like unto the *Prunella* or Selfe heale, that divers have made them but *ſpecies* to one *genus*, and ſo have confounded them together, and yet they have ſeemed to diſtinguiſh them by calling this *Conſolida media*, and the other *Conſolida minor*: yet there are other herbes that they do call alſo, which ſhall likewiſe be entreated of in the Chapters following; but I finding them to differ notably one from another, have diſpoſed of them ſeverally; intreating of the greater in this Chapter, and of the leſſer in the next.

1. *Bugula vulgaris flore cæruleo.* Ordinary blew flowred Bugle.

This Bugle hath larger leaves then thoſe of the *Prunella* or ſelfe heale, but elſe of the ſame faſhion, or ſtands a little longer, in ſome greene on the upperſide and in others more browniſh, dented about the edges, ſomewhat hairy as the ſquare ſtalke is alſo, which reacheth up to be halfe a yeard high ſometime, let with leaves thereon by couples, from the middle almoſt whereof upwards, ſtand the flowers together, with many ſmaller and browner leaves then the reſt on the ſtalke below, ſet at diſtances, and the ſtalke bare betweene them; the flowers are alſo ſmall ones, as thoſe of Selfe heale, and of a blewiſh and ſometime of an aſh-colour mingled, ſhaped like the flowers of Alchoofe, or Ground Ivy, after which come ſmall round blackiſh ſeedes: the roote is compoſed of many ſtrings, and ſpreadeth upon the ground into divers parts round about. Of this kinde there is another whoſe leaves are longer then theſe, and deeper dented in about the edges.

Alia longioribus foliis

2. *Bugula flore albo.* Bugle with a white flower.

The white flowred Bugle differeth not in forme or greenneſſe from the former, ſaving that the leaves and ſtalkes thereof are alwaies greene and never browne like the other, and that the flowers are very white.

3. *Bugula flore rubro.* Bugle with bluſh coloured flowers.

This other Bugle differeth little alſo from the other before declared, but that it is a more tender plant, and ſmooth in handling, not riſing full ſo high as the former, and the flowers thereof are of a pale red or bluſh colour, which maketh the greateſt difference.

3. *Bugle*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Bugula Alpina cærulea.* Blew mountaine Bugle.

The mountaine Bugle is not unlike the other, having longer and thicker leaves, especially at the bottomes of the stalkes, standing for the most part by fives upon short foote stalkes, dented about the edges, and somewhat hard or hairy, thinnely set upon the square hairy stalkes, a foote high or more, at the toppes whereof the flowers stand in spikes, greener then the former, and of a blew colour, following after the rest, the roote is long, with divers fibres thereat.

4. *Bugula lutea* Bugle with yellow flowers.

The yellow Bugle is smaller then any of the former by many, whose rounder leaves stand upon the stalkes, and dented about the edges like unto them: the flower is yellowish, standing by some almost like the rest doe.

5. *Bugula aliorum Lobelio.*

Divers sorts of Bugle.

The kinde of Bugle which hath but three or foure round and smooth leaves about a foote high, at the joyne whereof grow two or three couples, which are long hairy, and divided on the sides into two or three gashes, each bowing downwards, the lowest leaves are lowest, and smaller standing at the toppes, where among the great spikie heads of flowers long after, stand the flowers are of a violet purple colour, formed hollow with lips as it were hanging downe, somewhat like the former Bugles, standing in rundles, wherein afterwards grow white seeds, which by sowing it selfe doth encrease again, but it is but annuall, the roote is composed of many blacke fibres: all the whole plant hath a very pleasant taste.

The Place.

The first and second grow in woods and wet copses, and both commonly throughout *England* in many places, but the second is harder to be met withall. The third groweth in divers of the cooler places of *Germany* as *Clusius* saith. The fourth upon the hill *Baldus*. The fifth is said to grow with us, and the last in *Portugall*.

The Time.

They all flower from *May* untill *July*, and in the meane time they perfect their seede, the roote and leaves next thereunto upon the ground, abiding all the Winter, untill the next spring.

1. *Bugula vulgaris.*
Ordinary Bugle.

The Names.

It hath not (as the rest) the name or author, that we are certaine of, but is called in Latine in these times *Consolida media*, and *Sanicula minor*; but there are many herbes that are called *Consolida* and *Sanicula*, from their vertues as you shall finde them remembred in their severall Chapters; and *Bugloss* or *Bugla*, as *Ruellius* saith the *French* were wont to call it, and more usually now a dayes *Bugula*; but some as I said before confounded this with *Pseudo-dictamnum*, thinking them all one: some also take this to be *Symphytum petræum* of *Dioscorides*, to which it answereth in nothing to his description, as you shall heare hereafter in the next Chapter. *Matthiolus* called it *Laurentina* or *Minor Consolida*. Some would have it to be *Chamæleuce foliata Plinij*, lib. 24. c. 15. and others to be his *Anonymus* lib. 27. c. 4. The first is called by *Tragus Prunella Cæsalpini prima, vel major*, and as he saith in the *Germane* tongue, by *Thalius Consolida media major*, by *Dodonæus* and *Clusius Bugula*, by *Lobel* and *Pena Bugula*, and *Fuchsius galbanum*, by *Augillara Arbitrium Pandectharij*, by most writers *Consolida media prima cærulea*. The third is mentioned by *Clusius* with the name *Bugula carnea colore ilere*, by *Thalius Consolida media minor*, by *Tragus Prunella secunda vel quarta* as *Ruellius* thinketh, who calleth it himselfe *Consolida media pratensis parva*. The fourth *Lobelius* describeth in his *Marthiolus* and *Pemptades*. The fifth is remembred onely by *Ranzovius*, that he had it out of *England*. The last is entertained by *Iacobus Cornutus*, among his *Canadenses*. By the *Italians* it is called *Consolida maggiore*, and of them of *Verona* as *Matthiolus* saith, *Abrotella*, by the *French Dutch*, by the *Germans Gunsel*, and *Guldes Gunsel*, by the *Dutch Senegreen*, in *English* Bugle or Brown Bugle, and Middle Comfrey or Consound.

The Vertues.

[illegible] temperature in heate, but drying moderately, and is somewhat astringent. It is of excellent use for those that are subject to fall, or are outwardly bruised: for it dissolveth the congealed blood, and discusseth it: the decoction of the leaves and flowers made in wine, the same is no lesse effectuall for any inward, as outward bruises into the body or bowels, and is an especiall helpe in all wound drinkes, as also for those that spit blood, or are troubled with coughes, whose inward griefes and paines arise from the obstructions of the Liver, and helpeth among the rest after wards: it is wonderfull in curing all manner of ulcers and sores, whether they be new and fresh, or old and inveterate, yea gangrenes and fistulaes also, either the leaves bruised and applied to the sores, or else the juice made into a lotion with some honey of Rose, and therewith washed and bathed the places: and the same made into a lotion with some honey of Rose, cureth all sores of the mouth or gums, be they never so foule or of long continuance, it worketh the same effect in fistulaes, for such ulcers and sores as happen in the secret parts of men or women: it is also good to heale and knit together any bone of their body, or have any dislocation or joynt bruised inwards, being applied externally: an ointment made with the leaves of Bugle, Scabious, and Sanicle, bruised and boyled

1. Bugula flore rubro.
Bugle with red flowers.

2. Bugula minor Lusitanica,
sive Portugal Bugle.

led in *Aqua vitæ* until the herbes be dry and then strained forth and kept in a pot, for such occasions as shall require it, is found to singular good for all sorts of hurts in the body, or any part thereof, that I would not wish any good Gentlewomen in the land, that would do good either to her owne family, or other her poore neighbours, that may helpe and meanes to procure it, to be without this ointment alwayes at hand by them, it hath done and would doe so much good, for beyond the Sea in *France* and *Germany*, it is a common proverbe amongst them, that they vse neither Phisition to cure their inward diseases, nor Chirurgion to helpe them of any wound or sore that have this Bugle (or the *Prunella* Selfeheale, for with them they are accounted but one herbe, as I said before) and Spider hand by them to vse.

CHAP. XXVI.

Prunella sive Consolida minor. Selfeheale.

THere be divers sorts of the Selfeheale, some differing in formes, others in colour onely, as you by them here set forth unto you.

1. *Prunella vulgaris.* The common selfeheale.

The common Selfeheale is a small low creeping herbe, having many small and somewhat long yet pointed leaves, somewhat like the leaves of wild Mints, of a darke greene colour, without any dents on the edges at all, or very seldome, from among which arise divers square stalkes, scarse a foote high which spread sometimes into branches, with divers such small leaves set thereon to the toppes, where stand browne spiked heads, of many small brownish leaves like scales and flowers together almost like the head of *Strechas* or *Cassidony*, which flowers are gaping and of a blew with purple or pale blew colour, in some places sweete, but not so in others: the roote consisteth of many strings or fibres downewards, and spreadeth stringes also whereby it encreaseth, the small stalkes with the leaves creeping on the ground, shoote forth fibres, taking hold of the ground, whereby it is made a great rule in a forest ground.

2. *Prunella vulgaris flore albo.* Selfeheale with a white flower.

This Selfeheale differeth very little from the former, in any thing but in the flower, which in this is pure white and the small scales or leaves greene and not browne, saving that it doth not encrease or spread so much.

3. *Prunella maior flore purpureo.* Selfeheale with a great purple flower.

The greater flowred Selfeheale, hath a square softe hairy stalke, rising somewhat higher then the other with two leaves, and sometimes more at every joyne thereof, up to the toppe, which are [illegible]

yet longer than those of the former: the heads of flowers are much greater than in the former, but made in the same fashion, with small browne leaves among the flowers, but greater and more open and displayed, which in some are of a blewish purple colour, in other more pale or skenell blew or pale blew: after which come small seeded set together in a husk: the roote is blacke with white fibres therein shooting forth and encreasing new heads of leaves every yeare.

4. *Prunella magno flore albo.*

Selfeheale with a great white flower.

The selfeheale likewise differeth from the last onely in leaves and flowers, for the small leaves are greene, and the flowers white, as in the ordinary sort before.

5. *Prunella Laciniata folia.*

Selfeheale with jagged leaves.

The stalkes of this selfeheale are likewise square and hairy, as the leaves set thereon by couples at the joynts, the lowest whereof are long and whole without any cut or jagge in them, all the rest being longer and narrower, are cut in or jagged on the sides, and the biger leaves more divided or rent: the heads are like those of the common sort, and of the same forme and bignesse, but varying in colour as both the former sorts doe; for some plants are found with purplish flowers, others more declined like blew, some betweene blew and white, like an ash colour; others altogether white: the roote hereof is like the other, and encreaseth by the shooting strings, that put forth both leaves every yeare.

The Place.

The two first are found in woods and fields every where, yet the second much more seldome than the former: the third and fourth, and so likewise the last, on diuers hills and parts of *Germany* and *France*.

The Time.

The two first sorts flower in *May*, and sometimes in *April*, the other sort, somewhat later, as for the most part all mountaine herbes doe.

The Names.

This is generally called *Prunella* (for it was not knowne to the ancient Greeke or Latine Writers, that can yet be found) and *Brunella* from the *Germans*, who called it *Brunnelwa*, because it cureth that disease which they call *die Bronne*, common to souldiers in campe, but especially in garison, which is an inflammation of the mouth, throate, and tongue, with blacknesse thereto, accompanied for the most part with a strong burning feaver, and distemperature of the senses: it is also called *Consolida minor*, and *Solidago minor*, and of *Camerarius* *Consolida maxima*. *Lobel* and some others also with him, tooke it especially that with jagged leaves to be *Symphytum petraeum* of *Dioscorides*, which that it cannot be, you shall heare the description thereof as *Dioscorides* giveth it: (that is *Symphytum petraeum*) groweth saith he in rockie and stony places, with slender small branches like *Origanum*, and white heads and leaves of Time; it is all woody, swelling sweete and pleasant to taste, yet drawing water in the mouth and causing one to spit it out: the roote is somewhat reddish or browne, of the length of a finger; yet some copper, it hath branches like *Origanum* and small leaves and heades like Time: this is *Dioscorides* description: but the herbe Selfeheale, hath no woodie stalkes nor reddish roots, nor smelleth sweete except in some places, nor doth it so strongly consolidate or knit flesh together, as the great Comfrey doth; which is one of the properties *Dioscorides* appropriateth unto *Symphytum petraeum*. *Lobel* therefore first imagined that the *Consolida* should be it: *Bauhinus* also after him saith he did, but afterwards he learned that *Matthiolus* his *Symphytum petraeum*, was much differing, his figure being of *Corydalen*. The first and so the rest are called *Brunella*, by *Tragus*, *Dodonaeus* and *Lobel*, by *Tragus* *Prunella vulgaris*, and so by all Authors, only as I said before, *Lobel* in his Adversaria calleth this last, *Symphytum petraeum* and *Bauhinus* *Prunella Laciniata folia*.

The Vertues.

The Selfe heale belonging to Rie the Bugle as I said in outward forme, is no lesse like it in the qualitie and vertues being by the best reckoned to be hot and drie, and yet temperate in both degrees, and by some thought to be cold in the second, and dry in the second: it is so powerfull to helpe such an hot sickenesse as the Germane disease, called *die Bronne*, which as hath been in some part said before, commeth with inflammation and swelling both in the mouth and throate, the tongue rough and chapped or blacke, and a fierce hot continuall ague thereon, which is remedied chiefely by drinking the decoction of the herbe continually, and washing the mouth often therewith, having some vinegar added thereto, but bloud letting must be used in the cure, and that under the tongue, without which it will not be very hardly be effected: this herbe serveth for all the purposes whereunto Bugle is applied, and with as good successe both inwardly and outwardly: for inward wounds and ulcers wheresoever within the body, for bruises and falls, and other like griefes, for if it be accompanied with Bugle, Sanicle, and other like wound herbes it will be the more effectuall and to wash or inject into ulcers, in the parts outwardly, for where there is cause to represse the heate and sharpenesse of humours, flowing to any sore, ulcer, inflammation, swelling or the like, or to stay the fluxe of bloud in any wound or any part, this is used with good successe, as also to abate the foulenesse of all sores, and to cause them the more speedily to be healed: it is an especiall remedy

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

medy for all greene woundes to fader the lippes of them, and to keepe the place from any further inconvenience, the juice hereof dried with oyle of Roses, & annoint the temples and forehead, is very effectuall against the head-ach, and the same juice mixed with a little Honey of Roses, cleanseth and healeth all ulcers and sores in the mouth and throate, and those also in the secret parts: the same ointment that is set downe in the former, is made as often with this herbe instead of Bugle, if it be not at hand, or if it be, yet they are pleasant herbes together, to serve to helpe broken bones, or joints out of place: the Proverbe of the Germans, and others, whereof is made mention in the former, is no lesse verified, as I there said then of this, that he was a neither Physicion or Chirurgion, that hath Selfeheale and Sanicle by hue to helpe himselfe.

Chap. XXVII.

Bellis, The Daisie.

There be many sorts of Daisies, some growing wild both greater and smaller, and some also doe delight chiefely, whereof I have in my former Booke given you the hint of divers, but that is not to be spoken of here, that is not there set downe, which are fitter for this than that place, and I am the more willing and thinke it fitter to joyne their Chapter next unto the last, for some of them are called *Consolida*, which I would set together,

1. *Bellis major vulgaris flore pleno.* The great white wild Daisie.

The great white Daisie hath many long narrow and round pointed leaves next the ground, cut or jagged, making it seeme almost like the divisions of some sorts of Oaken leaves, the stalkes grow to be somewhat high with divers leaves thereon, but smaller and lesser divided than the lower, at the toppes whereof groweth large flowers each upon leverall foote stalkes, consisting of many white and narrow leaves as a pale or border, and yellow thrummes in the middle, of no scent at all, whose seede which is somewhat long is blowen away with the winde: the roote is a bush of white stringes, which abide many Winters with the leaves, shooting forth in Spring anew. Of this kinde there is one that beareth double flowers differing from the former in nothing but *Flore pleno.* which is set forth in my former Booke.

2. *Bellis montana major folio acuto.* The mountaine great Daisie with sharpe pointed leaves.

This Daisie groweth lower than the former, and hath much narrower leaves, and shorter also, not deepely dented, nor sharpe about the edges, but ending in an exquisite point; the stalkes beare but one flower a piece, somewhat lesse than the former, but else in all things alike.

1. *Bellis major vulgaris flore pleno.*
The great white wilde Daisie.

4. *Bellis major rotundifolia variata.*
The great strange white Daisie.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Bellis major Alpina latifolia.* The greater mountaine Daisie with sharpe edged leaves.

The leaves of this Daisie are longer and narrower then the first sort, whose dented edges are very sharpe, and of a darker greene: the stalke is round, and somewhat rough in handling, the tuftes in some are purpled, in others somewhat rounder: the toppes of the stalkes are furnished with single flowers like to the first, but larger then it: the seede is small and long like it, and the root likewise the first with strings or fibres thereat, being somewhat hard and woodily.

4. *Bellis major rubra & umbellifera Americana.* The great strange white Daisie.

The leaves of this great Daisie is longer and greater then of the first great sort, the leaves also are larger, and of a greener colour, dented likewise about the edges, those which are next the roote are broader at the ende, but longer and smaller at the bottomes, dented likewise about the edges, those upon the stalkes and beanches, and all of them bearing many white flowers at their toppes, as it were in an umbell, like unto the white leaves so large as it, but smaller, and more in number, with a greenish yellow thrumme in the middle, and some a little larger then others, the seede is smaller then the other, and the roote likewise.

5. *Bellis Alpina minor rigido folio.*

The lesser great Mountaine Daisie with rigid leaves.

This lesser Daisie is very like unto the last but that it is lesse, growing scarce a foote high, with hard or harsh narrower leaves, sharply and sharpely dented at the edges. The stalkes and beanches bearing each of them one large flower, made like the other, whose leaves of white leaves, have sometimes yellow, sometimes purplish yellow thrumme in the middle.

6. *Bellis perennis folijs Absynthij.*

The small Daisie with Wormwood leaves.

This small Daisie hath a small downy stalke, not rising above a hand high divided into two or three very small beanches, at the toppe whereof grow a few very small leaves, dented about the edges, very like unto the leaves of Absynthium, the rest of the stalkes and beanches, become full of leaves unto the toppes, every one whereof bare one small flower, having above twenty small white leaves, compassing a greenish head in the middle: the roote is small and white.

7. *Bellis major flore luteo nuda.*

The greater yellow Daisie with prickly leaves.

This prickly leafed Daisie springeth up with divers heads, of many small grasse leaves, dented about the edges, and every point sharpe at the point, which shooting up into stalkes, with the like, but lesser leaves on them, become hard and woodily up to the toppes, sometimes branched, other whiles but one upon their toppes divers small round flowers, which have small hoofe stalkes, which have no border of leaves, either white or yellow to compasse them, but are like the naked Camomill or Feverfew, and somewhat lesser, being a yellow round knop somewhat hollow in the middle; after the flowers fall there stand in their places small heads with seede, which is small long and whitish, which must be sowed when it is ripe, or else it quickly falleth, or is blowen away with the winde, the roote is a great tuft of strings, or long fibres; the taste hereof bitter and unpleasant, and the smell somewhat strong.

8. *Bellis Monspessulanum sive Bellis cærulea* flew Daisies.

The flew Daisie hath many narrower smaller and blacker greene leaves then the common field or garden small Daisie among which groweth the stalke which is to be halfe a foote high or more, set with some such small leaves, and at the toppes small tufts each compassed of many blew flowers, somewhat like unto the head of a small Scabious, and sometimes with white flowers: the roote is hard and stringy, the whole plant unpleasant in taste.

9. *Bellis cærulea spinosa.*

The flew Daisie with prickely leaves.

This is in every thing like the other flew Daisie, but that the leaves lie more upon the ground, as well as those which grow upon the stalkes, are like in forme unto them, are prickely, or have sharpe prickles at the edges of every stalke, which bare many small blew flowers, as the other, and are compassed of the like blew

7. *Bellis major flore luteo nuda.*
The greater yellow Daisie with prickly leaves.

9. *Globularia Monspessulanum sive cærulea*
flew Daisies.

10. Globularia montana lutea.
The mountaine yellow Daisie.

11. Bellis minor flore albo.
The lesse white Daisie.

12. Bellis minor flore purpureo.

13. Bellis minor flore variato.

12. The lesse red Daisie. 13. Branched small white Daisies.

10. *Globularia Intermontana.* The mountaine yellow Daisie.

This yellow Globe flower hath many thicke, hard, smooth, round pointed leaves spread into a tuft by [illegible] the ground, from among which spring sundry stiffe rushlike stalkes about a foote high, with a [illegible] the middle of them, and two small upright leaves set thereat, each bearing on their toppes a [illegible] head of flowers inclosed in a skinne, which opening, a number of the very same [illegible] to a head of sessions, each flower being set in a rough purplish husk consisting of five [illegible] laid foure fashion, with some long threds in the middle, standing about a small round [illegible] flat bicornued pointell rising out thereof, which unto one growing ripe is rough, and [illegible] shell, opening at the toppe into foure parts, wherein lie round flat, blacke seed, divided as it were [illegible] eat: the roote is white, a foote long, and of a small fingers thicknesse, with a thicke brow [illegible] woodily pith within, divers long fibres issuing out thereof on, whole taste is drying, and [illegible] the leaves being bitter and sharpe withall.

Original from UNIVERSITY OF MICHIGAN

12. *Bellis minor fylvestris simplex.*
The lesser wilde white Daisie.

The small common single field Daisie hath many thicke and somewhat long greene leaves, lying upon the ground, small at the footstalke, broad and almost round at the point, and a little dented about the edges: from among which rise many very slender, weake, and naked stalkes, or rather footestalkes, of two, three or foure inches high, bearing every one a small greene head, from whence rise many small white leaves, set about a yellow thrumme or head in the middle, sometimes the greene leaves will be found to be much larger in one place then another, and the flower likewise in some will be reddish at the ends, and sometimes understained, and yet is but still one kinde or sort, and not divers as some would have it: the roote is many small white fibres.

13. *Bellis hortensis multiplex.*
Double Garden Daisies.

13. *Bellis minor alba ramosa.*
Branched small wild white Daisie.

This small Daisie differeth very little from the last Daisies, for that the leaves are a little shorter and more dented about the edges, and the lowdry small stalkes beare such like leaves on them at the joynts where they branch forth into many parts, with such like small white flowers at their toppes.

14. *Bellis hortensis multiplex.* Double Daisies.

This differeth very little from the last, either in the leaves or manner of growing, the chiefest difference consisteth in the flowers, which in some are all white, but composed of sundry rowes of leaves, others of a whitish red, or more white then red, or rather white leaves dispersed among the red and others of other varieties, as I have formerly expressed them in my Booke.

The Place.

The first groweth every where by hedge sides, in the borders of fields, and other waste grounds. The second on the *Pyrenæan* hils by *Fontibus*. The third on Mount *Baldus*. The fourth came to us from *Virginia*. The fifth groweth on the Mountaines among the *Switzers*. The sixth in sandy barren places in the Ilands of *Stechades*, which lie over against *Marseilles*. The seaventh was first brought out of *Italy*, by Mr. Dr. *Flud*, with many other seedes, that grew in the Garden of *Pise*, in the Duke of *Florence* his Dominions, but of whence it is naturall, I have not yet certainely knowne, whether of *Candy* or any other place. The eighth groweth about *Montpelier*, and in many other places both of *France* and *Italy*. The ninth, grew on the hils in the Kingdome of *Granado*, there gathered by Dr. *Alleinus*, and brought to *Bauhinus* as himselfe relateth. The tenth, on the hils of *Aquicola* in *Naples*, as *Columna* maketh mention. The eleventh groweth in every field and medow almost. The twelfth was sent from *Portugall*. The last in Gardens.

The Time.

All the five first sorts doe flower in *May* and *June*, but the other foure next sorts later, that is, not untill the end of *July* or beginning of *August*, and but sometimes give good seed with us, the rest all the Spring and former part of the Summer.

The Names.

It is thought by most writers and others, that this was not knowne to any of the ancient Greeke authors, although some doe thinke that it is the same that *Theophrastus* in his seaventh Booke, and ninth Chapter, calleth *Anthemis*, which is with him *Alterum foliosæ speciei*, which *Gaza* translateth *Nigella*, but it cannot be that, *Plinie* onely among the Latines maketh mention of *Bellis*, in his 26. Booke, and fifth Chapter, saying *Bellis* groweth in medowes, with a white flower somewhat reddish, which draweth to our small wilde Daisie, but that where of he speaketh in his 21. Booke and 8. Chapter which he calleth *Bellis* or *Bellium latens*, as some have it, and hath set boards to crowne it, and is a field flower: is not certainely knowne what herbe it should be, yet many thinke the place corrupted, and to be otherwise read, but howsoever it be, he maketh it knowne no better. Some would have the name *Bellis* to be taken from *Belus* the King of *Damen*, whose fifty daughters, being married to their fifty husbandes, did the first night of their marriage make a mournefull massacre, every one of their husbands excepting one: some derive the word *a bella quæsa, pellis pro folium*, some also from the *French* word *Marguerites*, doth all the lesser wilde sort *Herba Margaritæ*. The first sort is called of divers *Consolida media*, and the common small or field Daisie, called *Consolida minor*: yet *Matthiolus* maketh a sort of them to be *Bellium* but not at liketh of that division. *Brunfelsius* called it *Oculus bovis*, and *Bupthalmum*, and *Tabernamontanus* and *Gesnerus* after him call all other sorts *Bellis major*. The next two that follow, that is the fifth and the sixth have been rarely set out in their colors, by *Parkinson* who first set them forth hath called them. The fourth I have so entituled therefrom. The seaventh was brought me with the title *Bellis pinosa Patris Mathæi*, who was President of the Parliament at *Pise*, at that time that Dr. *Flud* brought me the seedes thereof from thence, but *Lobel* called it *Bellis Hispanica altera, foliis per ambitum serratis herbarijs hullatis aureis floribus*. The eighth is called by *Lobel* *Bellis Pyrenæa, Chrysanthemum, Aphylanthes* by *Anguillara* and *Comerarius*, *Bellis montana* by *Cæsalpinus*, *Bellis sylvestris* by *Lobelius*, as he doth the ninth *Scabiosa montana minor repens*, but not rightly in both, seeing by his description saith, that the leaves and seede are like the other blew Daisie. The tenth is called *Bellis montana*. The eleventh is called *Bellis minor sylvestris* and *Consolida minor*, by others *Saxifraga minor*, by others and *Primula veris* by many. The twelfth and last have their names declaring them. The *Italians* call both sorts, *Fior de prima vera*, and the lesser *Margarite*, and *Fior de*

Original from UNIVERSITY OF MICHIGAN

primaveral gentile. The *French* call them both *Marguerites* and *Paſquettes*, yet uſually they call the leſſer *Marguerittes*. The *Germanes* call the greater *Gonſblum*, and the leſſer *Maſslieben oder zweyblum*. The *Dutch* call the great ſort *wilde oft groote Madelieuen*, and the leſſe *Madelieuen*, and *Margriten*. We in *England* call the greater the great Daiſie, and Maudelinewort, and the other the leſſer or field Daiſie, &c.

The Vertues.

The greater wild Daiſie is a wound herbe of good reſpect, often uſed and ſeldome left out in thoſe drinks & ſalves that are for wounds, either inward or outward: both it and the ſmall are held by the moſt to be cold and dry, yet *Dodonæus* ſaith they are cold and moiſt, which none other doth allow of: for the drying quality doe more properly conſolidate, the juice or diſtilled water of either of them doth much temper the heat of the liver, and refreſheth the liver and other inward parts. It is ſaid that they looſen the belly that is bound; which *Lobel* contradicteth, and true judgement doth the ſame, being taken in a ſalet with oile and vineger as the uſe of fat fleſh wherein the leaves hereof and a few Mallowes have beene boyled: they helpe to cure the wounds of the breaſt made in the hollownelſe thereof, if a decoction be made of them and drunke; the ſame alſo do cure all ulcers, and pultiſes in the mouth or tongue, or in the ſecret parts: the leaves bruiſed and applied to cods, or to any other parts that are ſwollen and hot, doth reſolve it, and temper the heat; they are alſo commended that a decoction be made hereof and of Wallwort, and *Agrimony*, and the places fomented, or bathed therewith warme, that are afflicted either with the palſie, the Seiatica, or the gouts to give reſt to the paine of paines: the ſame alſo diſſolveth and diſperſeth the knots or kernels that grow in the fleſh of any part of the body, and the bruiſes and hurts that come of fals and blowes; they are alſo uſed for ruptures, or other inward ſtrings with very good ſucceſſe: an ointment made thereof doth wonderfully helpe all wounds, that have inflammations about them, or by reaſon of moiſt humours having acceſſe unto them, are kept long from healing, and thoſe are ſuch for the moſt part that happen in the joynts of the armes, and legges: the juice of them dropped into the running eyes of any doth much helpe them: the ſmall Daiſie is held to be more effectuall in healing then any other ſort.

CHAP. XXVIII.

Sanicula. Sanicle.

THere be divers herbes that the learned writers have entituled Sanikle, from their eſpeciall property in healing, as Avens, Bearesears, Corrall wort, Butterwort, and divers others, as they are rehearſed in their ſeverall places, and ſome in my former Booke, as the ſpotted and Bearesears Sanicle, whereof I thinke it not amiſſe to ſpeake a little here, and to give you their figures withall, but the firſt that I here firſt propoſe unto you, is properly and peculiarly called Sanicle, ſimply without any other *epithite*, and thereof I finde no other ſort, although ſome have made *male* and *female*, accounting that the

1. *Sanicula vulgaris, five Diapenſia.* Ordinary Sanicle or Baſtard Sanicle.

2. *Plantula five Sanicula Ranarum.* Buttonwort or Toadſhoe Sanicle.

3. Sanicula guttata. Spotted Sanicle.

4. Sanicula Alpina sive Cornuti Matthioli. Beares eare Sanicle.

and *Astrantia nigra Dioscoridis*, to be the *semina*, but yet I thinke fit also to adjoyne hereunto, the *Pimpinella* or Burnet wort, called of some *Sanicula Ebracensis* and an *American Cornuta*, for the properties and use like, although differing in forme one from another. The description of the ordinary Sanicle is thus. It sendeth forth many great roundish leaves, standing upon long brownish stalkes, every one somewhat deeply cut or divided into five or six parts, and some of those cut in also, somewhat like the leafe of a Crowfoote or Doves foote, and finely dented about the edges, smooth and of a darke greene shining colour, and sometimes reddish about the edges; from among which riseth up small round greene stalkes, without any joynt or leafe thereon, saving at the toppe, where it brancheth out into flowers, having a leafe divided into three or foure parts, at that joyne with the flowers, which are small and white, starting out of small round greenish yellow heads, many standing together in a tuft; in which afterwards are the seedes contained, which are small round rough burres, long like unto the seeds of *Clevers*, and sticke in the same manner, upon any thing that they touch: the roote is composed of many blacke strings or fibres set together, at a little long head, which abideth with the greene leaves all the winter and perish not.

5. *Pimpinella sive Sanicula Ebracensis*. Burnet wort.

Burnet wort hath divers fat and long leaves lying upon the ground about the roote, broad at the bottome and pointed at the end, of a pale greene colour on the upperside, and white underneath, folded together at their first rising, which they are more white, from among which arise two or three slender naked stalkes, about an handfull high, bearing onely one flower at the toppe of every one, set in a small greene huske, made somewhat like a Violet flower or those of the Larkes heeles or spurres, having a small tayle or spurre behinde, in some of a purple, in other of a more blew colour, and in some white: after the flowers are past, come in their places small pointed round heads, wherein is contained small long blacke seedes: the roote is composed of divers small fibres or strings which dye not but abide with the greene leaves upon them all the Winter.

3. *Sanicula guttata*. Spotted Sanicle.

Because I have given you the description hereof and the varieties in my former Booke, I shall here rather point at it, then to declare that it hath roundish leaves, greene above and grayish underneath, and reddish withall, the stalke of the branches stalke is floured with many small five leafed white flowers, so finely spotted with red spots, that they seeme to be powred thereon.

4. *Sanicula Alpina sive Cornuta Matthioli*. Beares eare Sanicle.

This differing roote described at large needeth the lesse relation, that it hath larger and more crumpled hairy round leaves then the other: the stalkes also lower and bearing sundry small pendulous purple flowers.

5. *Sanicula sive Cornuta Americana fruticosa*. The Shrubbe Sanicle of *America*.

The former Sanicle of America hath sundry almost round leaves lying on the ground each upon a little long foote-stalke divided at the edges into two parts, dented likewise about the brimmes, from among which rise hard woody stalkes, some two foote high, having such like leaves thereon as grow below and branching forth with sundry

fundry ſmall white ſtarre like flowers in a tuft together at the toppes.

The Place.

The firſt is found in many ſhadowye woods and other places of this land. The ſecond in the common fields and ſundry bogs. In the hils in *Yorkeſhire* chiefly; in many places alſo of the Weſt Country, and *Wales*, and likewiſe in a Common, about a mile from *Oxford*, neare a village called *Herington*. The third and the fourth as *Cluſius* ſaith, groweth in all the *Auſtrian* and *Stirian* hils in the ſhadowy places of them. The laſt came from the backe part of *Virginia* called *Canada*.

The Time.

The firſt and ſecond flower not vntill *June*, and their ſeede is ſoone ripe after: the other two next flower much earlier and ſometimes againe in *Autumne*. The laſt flowreth in *July*.

The Names.

I have not found that any of theſe Sanicles were knowne to any of the antient Greeke or Latine authors, but are as many other vulnerary, and other herbes found out and named by later writers. For the firſt it hath his name *Sanicula a ſolvere ſanandi munere*, it is alſo called *Diapenſia*, by *Brunfelſius*, *Matthiolus*, and *Lobel*, and by *Tabernamontanus*, *Conſolida quinquefolia*, for *Matthiolus* maketh it his fourth kinde of *Quinquefolium*. *Fabius Columna*, would referre it to the third *Sideritis* of *Dioſcorides*: but of moſt writers it is generally called *Sanicula*, and ſome as I ſaid before call it *mas*, becauſe they would make the *Aſtrantia nigra Dioſcoridis*, ſet forth in the third Chaſme of this worke, 29 which is of purging plants, and 23. Chapter, vnder the title of *Helleborine vera foliis nigris ſeu major*, the great purging Sanicle) to be the *femina*. It is called by the *Italians Sanicula*, by the *Germanes* and *Dutch Sanickel*, by the *French Sanicle*, and by vs *Sanickle*. The other was firſt called *Porcinula* by *Geſner in deſcriptione montis fracti*, and from him all others doe ſo call it: ſome alſo with vs *Sanicula Hungarica*, becauſe it groweth ſo plentifully in *Yorkeſhire*. *Ingolmenſis* calleth it *Cucullaria*, and thinketh it may be *Cornucularis*, *Geſner* thought it to be *Dodecatheon Plinij*, others *Lingula Plinij*, and ſome, as *Geſner Viola humida ampliſſima*, *Bauhinus* in putting it among his Sanicles calleth it *Sanicula montana flore calcari donata*. We in *English* doe call it Butterwort, and Butter roote, becauſe of the vnctuoſitie of the leaves, or elſe of farning as *Gerard* ſaith, but vntruely, for they call it white rot and the white roote as *Gerard* ſaith, for the Country people doe thinke their ſheepe will catch the rot, if for hunger they ſhould eate thereof, and therefore call it the white rot, of the colour of the herbe, as they have another they call the red rot, which is *Pedicularis* red Rattle. The third is called *Sanicula montana alpina* by *Cluſius*, and *Alpina*, and *guttata* by *Camerarius* and others, by *Lobel Caryophyllata Genus Alpinum recedens ab folio hederaceo*. The fourth *Matthiolus* called *Conſiſa* having received it from *Conſius*, and reckoneth it amoog the *Auens*, and thereupon *Lobel* calleth it *Caryophyllata Veronenſium ſive Sanicula veſtra*. *Cluſius* calleth it his firſt *Sanicula montana*, and others *Alpina*: The laſt for ſome reſemblance was called *Cornuta* by the *French*, and *Americana* added to diſtinguiſh it.

The Vertues.

Sanicle is bitter in taſte, and thereby is heating and drying in the ſecond degree, it is aſtringent alſo, and therefore exceeding good to heale all greene wounds ſpeedily, or any vlcers, impoſtumes, or bleedings inwardly: it doth wonderfully helpe thoſe that have any tumour in their bodies in any part, for it repreſſeth the humours, and diſſipateth them, if the decoction or juice thereof be taken, or the powder in drinke, and the juice vſed outwardly: for there is not found any herbe that can give ſuch preſent helpe, either to man or beaſt, when the diſeaſe falleth vpon the lungs or throate, and to heale vp all the maligne putride or ſtinking vlcers of the mouth, throat, and priuities, by gargling or waſhing with the decoction of the leaves and roote made in water, and a little hony put thereto: it helpeth to ſtay womens courſes, and all other fluxes of blood, either by the mouth, urine, or ſtoole, and laskes of the belly, the vlceration of the kidneyes alſo and the paines in the bowels, and the *gonorrhea* or running of the reynes, being boyled in wine or water and drunke, the ſame alſo is moſt powerfull, to helpe any ruptures or burſtings vſed both inwardly and outwardly: and briefely it is as effectuall in binding reſtraining, conſolidating, heating drying, and healing, as Comfrey, Bugle, or Selfeheale, or any other of the Conſounds or vulnerary herbes whatſoever. Butterwort is as one writeth to me a vulnerary herbe of great eſteeme with many, as well for the rupture in Children as to heale greene wounds: the Country people that live where it groweth, doe vſe to annoint their hands when they are chapt by the winde, or when their Kines Vdders are ſwollen by the biting of any virulent worme, or otherwiſe hurt, chapt or riſt, the poorer ſort of people in *Wales* make a Syrupe thereof, as is of Roſes, and therewith purge themſelves and their children: they put it likewiſe into their broths for the ſame purpoſe which purgeth flegme effectually: they alſo with the herbe and butter make an oiniment ſingular good againſt the obſtructions of the liver, experienced by ſome Phyſitions there of good account.

CHAP. XXIX.

Primula veris præcoſſ. & ſylveſtris. Primroſes and Cowſlips.

THere is ſo great a variety in theſe ſorts of plants, Primroſes and Cowſlips, whereunto for their likenes both in forme and quality, is to be joyned the little army of *Auricules* Beares eares, (or Beares Cowſlips) as they are called, eſpecially in the various colours of their flowers, that to deſcribe them all againe, would but too much augment this volume, I will therefore here but give you the figures of thoſe, deſcribed fully in my former Booke, and the relation of ſuch others as have ſince the publiſhing thereof come to our knowledge.

1. *Primula veris Turcica Tradeſcanti flore purpureo. Tradeſcants Turkie* purple Primroſe.

The leaves of this Primrole are ſo like vnto other Primroſes, that they can very hardly be diſtinguiſhed vntill the flowers appeare, but the cheefeſt difference in the leaves is, that they are ſomewhat longer, rounder pointed and a little reddiſh at the very bottome of the leaves: the flowers are as large as any other Primroſe, and larger, made of five leaves like vnto them, but of a delicate violet purple colour, the bottome of them

...leafe were with a deepe saffron like yellow, which addeth a greater grace thereunto; in other things it is ...the ordinary Primroles. *Flore cherneo fusco.*

Of this kinde there is also another sort little differing from it in any thing save in the colour of the flower, which is a crimson, as in the other purple.

2. *Paralysios variæ species.* The divers sorts of Cowslips.

Of the various sorts of Cowslips, I have given you all the store I know are extant, and therefore will describe none of them here, but referre you to my former Booke, where you shall finde them. *Lobelij. 2. Purpureo variæ.*

3. *Auriculæ ursi varietates.* The varieties of Beares eares or *French* Cowslips. *Purpureo flore rotundo. 3. Purpureo flore minore. 4. Sanguineo. 5. Carneo. 6 Cæruleo. 7 8. Flore cæruleo folio Bonagotti. 9. Purpureo exactius laciniato folio. Flore crassiori. 10. Hortensi rubro. 11. Purpureo subrotundo. 12. Cornes cervi. 13. Flore nigro. 14. Flore albo. 15. Flore albo, foliis variegatis. 16. 17. Flore luteo. Magno. 18 Umbilicato. 19. Striato. 20. 21. Vellutato. Incerti. 22. Sanguineis fibris. Lutei fusci. 23. Citrino colore. 24. Lutea alia. 25.*

I have there also divided the varieties of the Beares eares or *French* Cowslips into three colours, that is purple or red, white, and yellow, of the rest that I have not there spoken, I will here make but briefe mention, of the difference in leafe and flower onely, without any larger description.

The bright crimson hath leaves of a middle size more greene then mealy, and flowers of a bright crimson colour larger then the blood red.

The deepe crimson velvet colour.

The double purple hath the purple flower once more double then the single, but is not constant.

The tripe purple differs in leafe little or nothing, from the ordinary purple, nor yet in flower, but onely that it is variously tripe with a kinde of whitish bluish colour; some of these will change wholly into the one or the other colour, as all or most of the severall sorts of other tripe flowers, whether *Tulipas*, Gillioflowers, &c. are observed often to doe, yet as in them so in these, if they change into the deeper colour, they seldome or never returne to be marked, as they will if they change into the lighter.

The heavens blew hath the leafe broader and of a duskie yellowish greene colour, the flowers being of a blewish colour tending to a purple.

The paler blew is somewhat like unto the last in the greene leafe, the flower being of a paler blew.

Horage leafed blew Beares eares is sufficiently expressed in my former Booke.

The Faire as the *French* call it, or the faire Collier as we in *English*, hath a pale greenish leafe without dents, and somewhat a large flower, and of a dainty violet purple colour somewhat sad but very lively.

The *Cinnamon* hath a smaller greene leafe without dents or very few, and the flower neere that of the faire Collier, but not altogether so lively nor so great a flower.

A purplish blew with a white bottome, and a mealy leafe.

The *Portugall* or blood red hath a yellowish greene leafe, somewhat small and long, with a few dents on the edges, the flowers are of a blood red colour with a yellow eye, and but few upon a stalke.

The party coloured red and white, we heare for certaine of such an one, but we have not as yet seene it.

There are sundry sorts of blushes, paler or deeper, more or lesse beautifull by much then others, as also wonderfull much variety of each of the former colours not to be expressed, in that from the sowing of the seede ariseth new colours almost every yeare.

The pure white, Snow white, or Paperwhite, as they are called by divers, hath flowers of a pure Snow white colour, but smaller then the next.

White hath a little larger flower, but is not so pure a white as the former, but yet commeth white from the first budding, and not yellowish as in the next.

The common white hath sundry flowers upon a stalke, of a reasonable size, whose buds are yellowish at the first, and become white afterwards.

Other sorts may be reckoned to these whites, and some may be set under the blushes of the paler sorts.

Of the great yellow there are sundry different sorts, all of them having large mealy leaves, and great tufts of flowers, some deeper or paler then others, and some greater or lesser also.

The Lemon colour is of a delicate pale yellow colour and of a middle size both leafe and flower.

Straw colour, Shanwey colour.

A number of other sorts of plaine yellowes there be, impossible to be distinguished.

The diversified kinde of the diversified or variable yellowes are numberlesse, which although their ground is yellow yet are so mixed and varied thereupon that I cannot expresse them.

The leather coats larger or lesser, deeper or paler one then another, they have all large mealy leaves, yet not so much as in the greater yellow, but yet seemeth to be produced from thence they come so neere it.

Flame colour, divers sorts.

Iron sable.

The Place and Time.

The purple and pale Primroses came first from *Tartaria* to us, and flowreth with other Primroses very early in the spring, and sometimes againe in Autumne. The originall of the *Auriculæ* came first from the mountaines of Greece, Germany, Italy, as the *Alpes* and *Pyrenes*, &c. but the greatest variety hath risen from sowing of the seede, and some of them will flower twice in the yeare, viz. in *Aprill* and *May*, and then againe in *August* and *September*, if the Autumne prove temperate and moist.

The Names.

The purple Primrose is said to be called *Arthritica* by the *Turkes*. *Fabius Columna* referreth the Cowslips to the division of *Dioscorides*, and calleth them *Alisma pseudo* or *spurium*, others call them *Verbascastrum*, *Verbascum Agreste*, *Verbascum*, but generally *Paralysis* and *Herba Paralysis*. The *Auricula ursi* is diversly named by sundry authors as *Lonicerus Arthritica*, and *Pseudoptica Alpina* by *Gesner*, *Primula veris* by *Lobelius*, *Sanicula foe Auricula ursi*, first by *Matthiolus*, and after by *Lobel*, and *Sanicula Dionysij Corydi* and *Cordus*, but usually now adaies *Auricula ursi* by all, and thereafter we in *English* Beares eares or Cowslips.

The Vertues.

Primroses and Cowslips are much used to be eaten in Tansie Sallets, &c. by those beyond Sea, and are accounted very profitable for paines in the head, and are accounted the best for that purpose next unto Betony, they are also good against any joynt aches as the pallie and to ease the paines of the sinewes, as the names doe import.

port. Of the juice or water of the flowers of Cowslips, divers Gentlewomen know how to cleanse the skin from spots or discolourings therein, as also to take away the wrinckles thereof, and cause the skinne to become smooth and faire, the roots made into a decoction and taken, easeth the paines of the backe and bladder, opening the passages of urine which was the cause thereof; they are likewise often used in wounds either greene or olde, and that to very good purpose. The Beares eares according to their name Sanicle, are no lesse powerfull in healing then the common, as also for the palsie and trembling of the joynts, *Clusius* saith that the mountaineers eating hereof after wilde beasts doe use the roots of Beares eares to helpe either paines in the head, or the giddinesse that may happen thereto, by the sight of such fearefull *precipices*, or steepe places, that they must often passe by as following their game, and are admitted as good Wound herbes as the former Cowslips.

CHAP. XXX.

Alchymilla, Ladies Mantle.

VNto the Sanicles set downe in the last Chapter, I thinke it fittest to place this next unto it, because both for forme and quality it is so assuredly like it, that it is called of divers the greater Sanicle, and will adde thereunto another sort thereof, which hath not beene formerly well knowne.

1. *Alchymilla major vulgaris*, Common Ladies Mantle.

Our common Ladies Mantle is very like to the former Sanicles, having many leaves rising from the roote, standing upon long hairy footestalkes, being almost round, with a little cut in on the edges, into eight or nine parts more or lesse, making it seeme like a starre, with so many corners and points, and dented round about, of a light greene colour, somewhat hard in handling, and as if it were foulded or plaited at the first, and then crumpled in divers places, and a little hairy, as the stalke is also which riseth up among them, to the height of two or three foote, with a few such leaves thereupon, but smaller, and being weake is not able to stand upright, but bendeth downe to the ground, divided at the toppe into two or three small branches, with small yellowish greene heads, and flowers of a whitish greene colour breaking out of them, which being past, there commeth small yellowish seede like unto Poppy seede, the roote is somewhat long and blacke, with many strings and fibres thereat.

1. *Alchymilla major vulgaris*.
Common Ladies Mantle.

2. *Alchymilla minor quinquefolia*,
Cinkefoile Ladies Mantle.

This small Ladies Mantle, hath also a few smaller and smoother greene leaves, rising from the small blacke fibrous roote, set upon long footestalkes, but divided at the edges into five corners or points, and somewhat deepelier dented about the brimmes then the former; from whence two or three small weake bending stalkes doe rise, not halfe a foote high: the flowers that grow at the toppes are smaller, but alike according to the bignesse of the plant, and of the same herby or greene colour.

The Place.

The first groweth naturally in many pastures and wood sides, both in *Hartford* and *Wiltshire*, and in *Kent* also, as in *Eastwood* neere *Feversham*, in the pastures nigh *Tidnam*, and *Chepstow*, and in other places of this land; the other groweth on St. *Bernards* hill among the *Switzers*.

The Time.

The first floweth in *May* and *June*, the other not untill *August*, but both abide after seede time, greene all the Winter after.

The Names.

It was not knowne by name unto the ancient writers, as can be gathered, and although *Brunfelsius* and some others thought it to be *Leontopodium* or *Lions* foote, deceived by the name, because divers nations have so called it, from the forme or likenesse of the leafe, yet is it not that of *Dioscorides*, as may plainely appeare by the description thereof. It is usually called *Alchymilla* by most writers, because as some thinke the *Alchymists* use such commendations of it. It is called also of *Matthiolus*, *Lugdunensis* and others *Stellaria*, from the figure of the leafe, that with the corners resemble a starre, but there are divers other herbes called *Stellaria* for diversities sakes, and some also call this *Pes Leonis*, and *Pata Leonis*: others call it *Sanicula major*, not without good reason. *Cordus in historia de plantis*, calleth it *Drosera*, *Drosium*, and *Pluvialis* from the *Germane* name *Thawkraut*, because the hollow crumplings and the edges also of the leaves, will containe the dew in drops like pearles that falleth in the night. *Bauhinus* calleth the other *Alchymilla Alpina Quinquefolia*. The *Italians* call it *Zolerba*, and *Stella herba*. The *French* *Pied de lyon*. The *Germanes* as I said before *Sinnaw*, and some *Leontopff*, and *Frawen mantel*. The *Dutch* *Sinofe vrouwen mantel*. And we in *English* Our Ladies Mantle, and great Sanicle, some Lions foote, or Lions paw, *ex Fuchsio* after the *French*.

The Decoction.

Ladies Mantle is more cooling then Sanicle, and therefore more proper for those wounds that have inflammation annexed unto them: it is more detergent in drying and cleansing, and therefore more effectuall to stay bleedings, vomitings, fluxes of women, worms of all sorts, and humors by salve or other wise, and to heale sores, it helpeth also such maides or women that have over great flowing of their ordinary monethly courses, and being drunke, and outwardly applied, and layed also to dry the whites in them, wherein it is so powerfull that it is used as a fumigation with the ashes. The distilled water drunke continually for twenty dayes together, to such women as are barren and cannot conceive, doth not only take away the cause of barrenness, which is the too much humidity of the matrice, and those unfit humours thereunto, causing the seede not to settle but to passe away without fruite, but will reduce the body to a good and conformable state, that they shall thereby be made more fit and able to retaine the conception, and beare out the children, if they doe also sit some space as in a bath, in the decoction made of the herbe. It is accounted a one of the chiefe singular wound herbes that is, and therefore the *Germanes* exceed it with praises, and never doe let any wound, either inward or outward, but they give of the decoction to drinke, and either wash the wound with the said decoction, or dippe some thereon, and put them thereon, which wonderfully dryeth up all the humidity of the sores, or of the humour flowing thereunto, even although they be filthie and hollow, and also stayeth all fresh inflammations, as often happen unto sores: but for fresh or greene wounds or cuts, it so quickely healeth them up, that it suffereth not any quitture to grow thereon, or any filthe under the lippes of the wound, yet not suffering any corruption to remaine behinde: it hath formerly been much accounted of by Chymists, who have affirmed that the juice hereof will restraine the volatility of Mercury, and make it fixt, from whence as it is thought it tooke the name, but these idle fancies are now quite worne out, as I thinke.

Chap. XXXI.

Solidago Saracenica. Saracens Confound.

Now there have beene diverse herbes that have beene mistaken and set forth for the right Saracens Confound, we will therefore shew you here in this place some of them that are like, with the true one also.

1. *Solidago Saracenica vera Salicis folio.*

The true Saracens Confound with willow leaves.

The true Saracens Confound groweth very high some times, with brownish stalkes, and other whitish ones, greene and hollow, to a mans height, having many long and narrow greene leaves, finely set about the edges in manner from after like unto those of the Almond, or Peaches, or Willow leaves, but not of such a white green colour: the toppes of the stalkes are furnished with many pale yellow funnellike flowers, standing in greene heads, which when they are fallen, and the seed ripe, which is somewhat long, fossil, and of a yellowish brown colour, wrapped in downe, is therewith carryed away with the wind, the roote is composed of many fibres or hares, strangetwitched together at a head, which perish not in winter, but abide, although the stalkes dry away, and fresh appeareth in Winter, the taste hereof is strong and bitterish, and so is the smell also.

1. Solidago Saracenica vera Salicis folio.

The true Saracens Confound with willow leaves.

2. *Solidago Saracenica major.*

The greater Saracens Confound.

The greater differeth not much from the former, rising up with upright hard round hollow stalkes, as high as it, with many darke greene leaves at the first, set at the head of the roote, which afterwards rise up with the stalkes, and are set there without order, somewhat longer then they, and dented about the edges, the flowers are like the former, with more and thicker long leaves standing thicke in greene heads many together, wherein like unto the lesse are contained the seede, which are carried away with the wind, in the like manner as the former doth, the rootes are composed of a great mass of white strings, or white fibres growing strongly in the ground, and shooting forth divers stalkes, which produce new plants, encreasing by small time, and overspreading a great quantity of ground, the head of leaves is somewhat browne at the first springing out of the ground, and so is the head of the roote in the Spring, and are of a bitter taste, and binding withall.

3. *Solidago Saracenica Germanica frutescens.*

The Germane Confound with small rods.

The Confound riseth up with great round wooddy rods, to be as high as the former, or more, but

are

are so weake by reason of the length and weight of leaves thereon, that they cannot stand upright, but fall downe upon the ground, bearing many darke greene leaves thereon, long and narrow like the sirik, within which in the middle, stand vp stalkes about the edges, and many smaller yellow with flowers at the tops, which turne into very small and long round darke pods, as small and long as those of *Typha* or Bull-rushes, and full brownish seeder within them, of an hot and quicke, sharpe and unpleasant taste withall, as the herbe is also, but much more; the roote in time groweth to be very great, even of the bignesse of a mans arme, and very deepe also, (for such I have digged vp in my owne Garden) of a strong unpleasant savour and taste, like vnto the Cowslip, and very like vnto that of Chickweede, abiding many yeares, but the stalkes perishing downe to the ground, and shooting forth anew in the Spring.

1. *Solidago Saracenica altera sive tertia Dod.* The second or third Saracens Consound.

This other Saracens Consound, is much like both in stalkes and leaves unto the middle kinde as before, with long leaves, being white as they are, the flowers stand at the toppes of the stalkes, many together, with small round greene heads, very like unto the last sort, being small and yellow, which after they are past, the heads with seed are ripe, open themselves, and with the downe in them, is carryed away by the wind, in the same manner, the roote creepeth in the ground, and shooteth vp branches round about; the taste of the herbe is bitter, whereby it is found to be drying, and of a cleansing quality.

The Place.

All these doe grow in moist and wet grounds, by woodsides, and sometimes in the moist places of the shadowy groves, as also by water sides.

The Time.

They flower in July, and the seede of the one falls, is some ripe, and carryed away with the wind, ere that such as doe bud and seede ripen, until the end of August, or beginning of September.

The Names.

Many of these herbes are of ancient, but after invention and appellation, it is called *Solidago* and *Consolida* of the old Latine word *Consolidare*, which in the barbarous Latine age did betoken, to solder, glew, or heale up fresh wounds, and *Saracenica*, because the Turkes and Saracens had a great opinion thereof, in healing their hurts and wounds of their people, and were accounted great Chirurgions and Wonder-healers: whereupon the Christians followed and called it thereafter, others called it *Senade yerbe* from the French down, and some vnwise thought, *Dragon* after it had obtained the *Solidago Saracenica vera*, under two forms more, the one as I take it, is the second, to the *Polygonatum latifolium*, and the third which is the tall herbe, *Bauhine* called *Consolida media Germanica*, referring it to the *Conyzas* or Fleabanes, but I have thought it fitter to place it here, together with the tall *Solidago Saracenica species*, and I suppose that *Bauhine* wrote very largely thereof, and yet I cannot expect not *Bauhine* to have called it so, but that he called the *Bellis sylvestris tertia minor*, to be *Solidago Saracenica*, divers have thought the *Virga aurea* to be it, and so doth *Tabernæmontanus* also, and therefore laughter I passe by. *Solidago* is the *Virga aurea angustifolia serrata*, *Tabernæmontani* called it *Consolida aurea*. The second called *Lanceolata*, *Solidago Saracenica minor*. The third I presume is the same that *Cordus* speaketh of in his *Adversaria*, and the figure in his Observations, yet maketh the heads weak to give away with the wind as the others doe, but surely the figure hereof, doth so truely represent this plant, that I doe leave it wholly vnto you, as not daring to say any more vnto it, and therefore I am perswaded that he was mistaken in the seede of seede, which as I shew you in mine, give small long pods with small browne seed therein, or else some other so like that it cannot, whose seed with the downe is carryed away with the wind. The tall kinde *Tragus* hath called *Solidago Saracenica*, which he calleth *Herba vulneraria & saracenica Tragi*. The *Germans* also is thought hath called it *Wundwurtz Wundkraut*, that is *Vulneraria Herba* Woundwort, Woundwort, from whence came the name *Solidago Saracenica*, and the *French* thereafter *Consolide Sarazine*, and so all other nations their severall tongues.

The Vertues.

Among the *Germans* this Woundherbe, is not onely of especiall account, but even preferred before all other of the same quality, be it Bugle or Sanicle or whatsoever else, for it is hot and dry almost in the third degree, and binding withall: being boyled in wine and given to drinke, it helpeth the indisposition of the Liver, and helpeth the gall from obstructions, whereby it is good for the yellow jaundise, and for the dropsie in the beginning thereof, as also all inward ulcers of the reines, or elsewhere, and inward wounds or bruises; and being steeped in wine, and then distilled, the water thereof drunke is singular good to ease all gnawing in the stomach, and other paines or torments in the body, as also the paines of the mother; and being boyled in water, helpeth continuall agues; and this said water or the simple water of the herbe distilled, or the juice or decoction are very effectuall to heale any greene wound, or old sore or ulcer whatsoever, both cleansing them from any corruption is bred in them, and healing them up quickely afterwards; the same also is no lesse effectuall, for the sores of the mouth or throate, be they never so foule or stinking, by washing and gargling the mouth and throate therewith, and likewise for such sores as happen in the priuy parts of man or woman, briefely wheresoever the said of Bugle or Sanicle may be found herein. The other sorts of Consounds doe runne the same vertues and are as the small in a manner as it.

Chap. XXXII.

Herba Doria sive Aurea. Doria his Woundwort.

Because this herbe doth notably differ, both from the former Consounds, and the Golden-rod which I shall follow, I have thought good to set it betweene them, whereof there are three sorts, as they may best be referred.

1. *Herba Doria vulgaris.* The ordinary *Doria* Woundwort.

This Woundwort hath many great thicke fleshy long deepe greene leaves rising from the root

...as long as it were leaves, but thicker, sharper at the points, smaller at the lower ends of them, and brow-... colour, somewhat harsh or hard in handling, among which riseth up but one great stalke for the most ... exceeding high, above any man, whereon are set very sparingly, scarce two or three such leaves, but ... at the toppes whereof stand a few yellow flowers, in greene scaly heads, greener then ... golden-rodde, or of the former Confound, which when they are ripe, are blowne away with the ... so great, as the plant would make shew it should be, having many fibres set at the head ... strong hold of the ground, and dyeth not, nor the leaves lose their verdure in the winter, but ... every yeare.

1. *Virga Devia minor & Amorsana.* *Devia* Woundwort of *America*.

... the former in shew, that it cannot better be referred then unto the former, abiding ... roots, the leaves are thicke somewhat long and narrow, but not halfe so great as the for-... and of a greene grayish colour, else being forme very like them: the stalkes which are many, and rise not so ... somewhat reddish, and for the most part, leane downe, not being able by the multitude of flowers ... leaves thereon, to stand upright, which flowers stand upon longer, and greater greene scaly heads then ... former, and are themselves also greater, and more laide open: with many small long narrow leaves, which ... some what downe, and is carryed away with the winde, the roote is composed of many blackish ... fibres.

2. *Consolida aurea minor.* The golden Confound.

... divers long and narrow sharpe pointed leaves, standing at the toppe of the roote, very ... greene colour, but not so great, yet thicke like them, and of a darker greene colour: the stalkes ... with many leaves, having here and there narrower long leaves on them, then below, the flowers ... tops of them, are larger then of the former, having many narrow long yellow leaves there-... like a starre flower, with divers coronnes in the middle, the roote is many small white fibres, ... smell of the whole herbe is somewhat sharpe, and aromaticall, and astringent or binding withall.

The place.

... grow with us neere the banke of Rivers, in *Provence* and *Narbone* of *France*. The second, ... the French Country in *America*, now *France*, for from *Vespasian Robin* of *Paris* I had it. The last in ... Woodsneere Oxford, as I also saith, they doe all well abide in Gardens.

The Time.

... and the last doe for the most part, flower a moneth before the second, which is not in flower before ... the latter end.

The Names.

... are here found out by *Andrea Doria*, the Generall of the Emperour, and the *French* ... commended or commanded to be used for the reliefe of his Souldiers and Mariners, al-

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

through Lobel) to name it, from the French, L. herbe Dure, herba Dura, which name he
thinketh it may retain. Pena Chamæcissus or Thymelæa, which he describeth in the 19. Chapter of his 2. Book,
whose forme and properties there related, doe very fitly answer hereunto (yet some doe rather refer
Dioscorides Plante cart unto it) or else (as he saith) is one of those Species of Thymelæa, which he
sets downe in the 3. Booke, and 4. Chapter speaketh of. Found by Clusius, and called Cannabina, and called also Thymelæa
of the King Portugall, who is said also to finde it. Cesner in horto Germaniæ, saith it was called of some
Chamæcissus, and Tabernæmontanus also calleth it, Planta Chamæcissus Theophrasti, as is that Lysimachia also,
which Cesner saith was so called of some Herbarists, setting it forth in the Chapter of Lysimachia, and yet
Clusius that so set forth for the Thymea Narbonensium of Pena and Lobel, in the Chapter of the Spurges, adding
to learn of him and not know so much, which kinde of error is very frequent in him. Gerarde calleth it
Cannabina sylvestris Theophrasti. The second came to me under the same name that is in the title, which because it
was so written I thinke not fit to alter. The last Pena and Lobel doe only make mention of it in their
Icones, by the name of Cassidonia minoris Limonij folio, and Parkinson called it, Virga aurea Anglica
prima.

The Vertues.

The gumme of it healeth greene wounds, and old sores is proper hereunto, being accounted a great
vulnerary, between the former & confounds, and the golden rods that follow, and therefore I need use no
further repetition, or ampliation of the same things: but if it be the Pena Chamæcissus of Theophrastus,
I could it should seem to be as effectuall against the hirings of the viper, and the Phalangium, and other such
Creatures, being given in wine inwardly, and annointed therewith, and the oyle outwardly: also the
oile or boyled wine, mixed with wine and oyle, and with honey for excellence in the flesh, wasteth away
moths of garments, unto all which properties, both the smell and taste in aromaticall in leaves and roote, as
even that of wild Anethum, may very well conduce us to believe, for many both Physicians and Herbarists
in France doe much esteeme thereof, and use it both inwardly and outwardly, as many ancient writers
have done, and to good effect.

Chap. XXXIII.

Virgaurea. Golden Rod.

Vnto the two sorts of golden Rods, that are known and set forth by many writers, we have added
foure more yet knowne publickly, whose originall was in *America*.

1. *Virga aurea vulgaris.* The ordinary Golden Rod.

This Golden Rod, that is most common to our Country, riseth up with brownish round
stalkes, halfe a yard or two foote high, but higher if it grow in a rich soile, or moist garden, having thereon many
narrow and long darke greene leaves, very seldome with any notches or dents about the edges, and as seldome with
any streakes or white spots therein, and yet sometimes and in some places they are to be found, divided at the top into
many small branches, with divers small yellow flowers on every one of them, which are turned one way, not looking
sundry wayes, as all the flowers of the former kinden doe, which likewise being ripe, doe turne into downe, and are car-
ried away with the winde, the roote consisteth of many small fibres, which grow not deepe into the ground, but abideth all
the Winter therein, shooting forth new branches every yeare, the old ones dying downe to the ground.

2. *Virga aurea Cretica folijs,*
Golden Rod with dented leaves.

The stalkes of this Golden Rod, rise not up so high as the
former, having as great, but longer, but shorter leaves
thereon, and dented about the edges, the branches beare such
like flowers, having one side of their stalkes as the former doth,
and are turned into downe, flying away in the same manner,
the roote is like the other.

3. *Virga aurea Americana.* Golden Rod of *America*.

The leaves of this Golden Rod before it runne up to stalke,
are no great as the last, being but narrow and long, yet broad-
dest in the middle, and very sharpe pointed at the ends some-
what dented also about the edges, but lesse then the former,
and of a darke greene colour, the stalke is a little hairy, rising
higher then the last, or about a foote and a halfe high or the
most, bearing yellow flowers all on one side like the former,
and lyeth in the middle with the downe as the rest, the roote is
not much unlike the other, and abideth under ground in win-
ter in the same manner, losing all the old stalkes. I have given
but one figure for all these three plants, they are all so like that
it were needlesse to multiply more figures, the place and the
dented leaves making the whole difference.

Original from UNIVERSITY OF MICHIGAN

The Place.

The firſt is a Plant frequent enough in divers places of the land, in the open places of woods and copies, in moiſt and dry grounds, the ſecond is not ſo frequent, and is found but in few places, although *Gerard* hath ſeen and viſit the common kinds, which he found ſometimes, as he ſaith, with ſmall dents about the edges, thought them to be other, and therefore ſaid that both ſorts were to be found plentifully in *Hampſtead* wood, neere unto the water, that runneth to *Kentiſh* Towne, which as all that there groweth, we find for the moſt part, is but ſcarce there, yea in ſome places it is there to be found alſo, but very ſparingly. The laſt as I ſaid before, came from *Virginia*, but from whence part I know not.

The Time.

The firſt floweth later then the ſecond, which is about *July*, and the other in the beginning or middle of *Auguſt*. The laſt alſo floweth very late.

The Names.

The firſt is generally called by all writers almoſt, *Virga aurea*, becauſe the ſtalkes being reddiſh, make the fairer tuppes of flowers ſeeme as if they were of a gold yellow. The ſecond is called *Virga aurea altera*, by *Cæſalpinus* in the Epitome of *Matthiolus*, or *major & anguſtifolia*, as he doth in *Lugd.* *Lobel* in *Adverſaria*, giveth the title of *Conyza aurea Villanovani*, but his deſcription is of the other. For in his *Icones* and obſervations, he ſaith that which is not ſeated about the edges. *Virga aurea Villanovani*, and the other *alterum ſerrato folio*. *Dodonæus* thought it might be the *Eupatorium* of *Plin.*, becauſe it is ſaid in the deſcription thereof, it is found ſometimes with white ſtalkes in the leaves, but why *Tabernæmontanus* ſhould take it to be *Stœchas citrina*, is not well known, for he maketh three ſorts, whereof this is his third, and the other two be the other two ſorts with white ſtalkes, whereof the one is found of raw one, with ſomewhat rounder leaves, and whole flowers were more white then the others. The firſt hath the name in his title, as is ſeene for it. It is called in *French Verge d'or*, and in high and low *Dutch* gardens, and we in *Engliſh* Golden Rod.

The Vertues.

As Golden Rodde is like unto the Sarasins Conſound in forme, but much leſſer, ſo is it alſo in the properties, not much inferiour, being hot and dry almoſt in the ſecond degree. *Aromatum & oliſarum*, commends it much againſt the ſtone in the reines and kidneyes, and to provoke urine in abundance, whereby the gravell ingendred in the ſaid parts, by raw and tough fleg matike humours, may be waſhed downe into the bladder, from whence into a ſtoole in thoſe parts, and thence may be avoided with the urine: the decoction of the herbe greene or dry, or the diſtilled water thereof is very effectuall for inward bruiſes, as alſo to be outwardly applyed: the ſame alſo ſtayeth the bleedings in any part of the body, and of wounds alſo, and the fluxes of the necthrall courſe in women, and the fluxes of the belly and humours, as alſo the bloody flixe in man or woman: it is alſo preſent in all ruptures, or burſtings, to be both drunke and outwardly applyed: it is the moſt ſoveraine wound herbe of many, and can doe as much therein as any, both inwardly for wounds and hurts in the body, and alſo in the greene wounds, quickly to cure them, or old ſores and ulcers, that are hardly to be cured, which ariſe by the fluxe of moiſt humours thereunto, and hinder them from healing: it is likewiſe of ſpeciall uſe in all ſorts of ſores or ulcers in the mouth, and throate, or in the privy parts, of man or woman: the decoction thereof likewiſe helpeth to faſten the teeth that are looſe in the gummes.

Chap. XXXIII.

Lyſimachia. Looſeſtrife or Willow herbe.

Intending next into the Golden rods, to ſhew you the ſorts of Looſeſtrife or Willow herbe, I am forced for methods ſake, and that I might not encumber your memory, with too many in one chapter, to divide them, and ſpeake of them ſeverally, firſt with yellow flowers: firſt; and ſecondly, of thoſe that doe not beare their flowers in ſpiked heads: thirdly, of them that doe beare ſpiked flowers: and laſtly of thoſe that doe beare their ſeede in longs huskes, or pods, bee they wilde in our owne land or in others, and brought into gardens.

1. *Lyſimachia lutea major vulgaris.* Common yellow Looſeſtrife or Willow herbe.

The greater yellow Looſeſtrife, or Willow herbe, which is the more common, groweth in ranke moiſt ground, to be foure or five foote high, or more, with great round ſtalkes, a little creſted, diverſly branched, from the middle of them to the toppes, into great and long branches, on all which at the joynts there grow, long narrow leaves, but greater and broader below, moſt uſually two at a joint, yet ſometimes three or foure, ſomewhat like unto Willow leaves, without nicks or dents on the edges, and of a faine greene colour, from the upper joynts of the branches, and at the toppes of them all ſtand many yellow flowers, of five leaves apeece, with divers yellow threds in the middle, which turne into ſmall round heads, wherein are contained ſmall ſeed, ſomewhat browne, the roote creepeth underground almoſt like Couchgraſſe, but greater, and ſhooteth up every ſpring new ſtalkes with heads, which afterwards grow up into ſtalkes, &c. It hath no ſent or taſte, but onely aſtringent, as the reſt of this kinde.

2. *Lyſimachia lutea minor.* The leſſer yellow Willow herbe.

The yellow Willow herbe, or Looſeſtrife, as it riſeth not up to high as the former, with his round joynted ſtalkes, which are ſomewhat woodily or hairy, ſo the leaves being alſo woolly and ſomewhat like them, are narrower and ſharper then they, foure for the moſt part, and ſometimes but three ſet together at a joint, ſpotted with black ſpots, on the underſide of them, not compaſſing it at the bottome, but every one ſtanding upon a ſeverall foote ſtalke, and not dented about the edges at all, from the middle of the ſtalke almoſt, upwards are every where ſtrewed with the like leaves, which are ſhort, nothing ſo long as the former, and ſtanding cloſer together, whereon grow alſo leaves, leſſer then thoſe below, at whoſe toppes, and at ſome of the upper joynts alſo, ſtand a few flowers leſſer then the former, but yellow, and conſiſting of five leaves as they are, with many yellow threds in them, of a ſtrong ſweete ſent, which to joyne together at the bottome, that the whole flower

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. *Lysimachia lutea vulgaris.*
Common yellow Loosestrife or Willow herbe.

2. *Lysimachia lutea flore globoso.*
Round eared yellow Willow herbe.

falleth away together, and not any leafe apart, the roote creepeth under the ground, and shooteth up againe in the same manner, this hath a little more acrimony in it then the other, causing one to spit after the chewing thereof, a while in the mouth.

2. *Lysimachia lutea flore globoso.* Round headed yellow Willow herbe.

The stalkes of this Willow herbe rise not up to be above a foote high, bearing onely two leaves at a joyne, which are shorter and narrower, yet very like unto those of the common sort, and of a pale green colour, at the joynts of the stalkes, which are crested and hollow, with the leaves come forth long stalkes of flowers, without any leaves on them, which are close set together, almost round, but yet shewing the small yellow flowers, of five leaves a peece, the rootes are long, creeping underground, with many joynts thereon, and shooting fibres at every one of them.

The Place.

The first groweth in many places of our land, in moist medowes and by water sides. The second groweth neere water sides, and in the valleyes, and moist fields of the *Alps*, and hils in *Austria*, as *Clusius* saith. This as *Lobel* saith, he found in the ditches neere *Gaunt* in *Flanders*, as also among the reedes, where with they thatch their houses, hard by *Amsterdam* in *Holland*, and *Clusius* saith it was found by a Physitian neere the *Alps*, who sent it unto him among other plants.

The Time.

All these sorts doe flower from *June* unto *August*.

The Names.

It is called in Greeke [illegible] *Lysimachium*, and *Lysimachia* by divers in Latine, it tooke this name of divers that this is that herbe, whereof *Pliny* saith *Lysimachus* the King of *Illyria* was the first finder, and did tooke the name *Lysimachus*. but therein they are deceived, for *Pliny* attributeth a purple flowre unto the same therefore the *Lysimachia purpurea spicata*, hereafter described, which is made famous by *Brasilla* who wrote a volume of the properties thereof, and so saith *Pliny*, and it also supposed to have taken the name of *dirimendo* for *dirimendo*, *id est certamen dirimere*, of taking away strife or debate between two bulls, those that are yoked together. But even those that are wilde also, by making them tame and quiet, as they say this herbe will doe, if it be either put about their yokes, or their neckes, which how true it is, others shall try, and finde it so. This is called also in Latine *Salicaria*, and *quod in aqua Salices crescunt*, *folio habet*, that is Willow herbe, either because it groweth among Willows, or that it hath Willow like leaves. *Leonicenus* saith it was called by divers in his time *Cornucola*, and that they dyed a greene colour therewith. The first is called by all writers, either *Lysimachia lutea vulgaris*, by *Cordus* in *Dioscoridem*, or *Lysimachia Dioscoridis*, because it is the same of *Dioscorides*. *Tragus* onely, and *Gesner* in horto call it *Salicaria*, *Fuchsius* calleth it *Lysimachia lutea major, quae est Dioscoridis*, The second is called by *Clusius*, *Lysimachia lutea* [illegible] by *Caesalpinus* *Lysimachia lutea* [illegible] *foliorum flavens*, and by *Bauhinus* *Lysimachia lutea minor folijs* [illegible]

valis, the laſt is called by *Lobel*, *Lyſimachia lutea altera*: by *Cluſius*, *Lyſimachia lutea tertia ſive minor*: by *Dodonæus* in his *Dutch* Herball, *Lyſimachium aquatile*: by *Ranwolfius*, *Lyſimachia ſerpilla folio ſtachidis lutea*. *Dodonæus* therefore that *Fuchſius* erred, in thinking that *Lyſimachia*, was the *Lutea herba*. It is called of the *Italians* and *Spaniards*, of the *Spaniards* *Lyſimache*: of the *French*, as *Ruellius* ſaith, *Corneille* and *Corneille*, as alſo *Salicaire* and *Salicot*: and *Pelle boſſe*, *Aeſt*, *Peſſi fogn*; but *Dodonæus* contradicteth *Ruellius* therein, ſaying that *Corneille*, with thoſe of *Leonmania*, is another herbe, even the *Ranunculus flammeus*, which will raiſe bliſters upon the skinne, and will draw the venome of a Plague ſore another way: of the *Germanes* *Weiderich* and *Weiderydes*: of the *Dutch* *Gaelwederick*: and in *English* Willow herbe, and Looſeſtrife.

The Vertues.

Galen ſaith that this Willow herbe hath an exceeding binding quality, and therefore *Dioſcorides* ſaith, it is good to lay all manner of bleedings at the mouth or noſe, or of wounds, or howſoever, and all fluxes of the belly, and the bloudy flix, given either to drinke, or taken by glifter, it ſtayeth alſo the abundance of womens courſes: it is a ſingular good herbe for greene wounds, to ſtay the bleeding, and quickly to ſoder, or cloſe together the lippes of the wound, if the juyce of the herbe onely be bruiſed and applyed: it is often uſed to make for ſore mouthes, as alſo for the ſecret parts: it is found very certaine by good experience, that the ſmoke thereof being burned, driveth away flies and gnats, and other ſuch like ſmall creatures, which vſe in great troopes, that are neere to Fennes, Marſhes, or water ſides, to infeſt them that dwell there, in the night ſeaſon, ſting and bite them, leaving the markes and ſpots thereof in their faces, &c. which beſides the deformity, which is but for a while, leaveth them that are thus bitten, not without paine for a time: it is ſayd alſo to drive away ſerpents, or any other venemous creature, by the ſmoake of the herbe burned.

Chap. XXXIIII.

Lyſimachia non ſpicata. Willow herbe, with diſperſed heads of flowers.

The ſecond ſort of Looſeſtrife is of thoſe whoſe flowers ſtand not in ſpiked heads, but diſperſedly upon the ſtalkes, whereof there is two ſorts onely to be remembred in this Chapter.

1. *Lyſimachia minor rubra ſive purpurea.* Small red flowred Willow herbe.

This ſmall Willow herbe or Looſeſtrife, is much lower than that of the purple ſpiked headbring but a foote and a halfe high, with ſmooth and ſquare ſtalkes, whoſe toppes are parted into narrow branches, on the lower part thereof ſtand long leaves, ſmaller and narrower than the other purple ſpiked kinde, two always ſet together at a joynt, one againſt another: but thoſe that grow above toward the toppes of the ſtalkes, are ſmaller than the lowermoſt, and keepe not that order, but ſtand confuſedly thereon one above another, neere unto which at the joynts with the leaves, come forth ſeverall flowers, but not ſpike faſhion, like ſquare heads uſually whoſe toppes are not ſo pointed, nor lyd ſo open as in the other, but being more cloſe, thruſt forth their flowers out of them, which conſiſt of five ſmall reddiſh purple leaves, with ſome threds in the middle: the roote creepeth not as the others doe, but is hard and ligneous woodily, with many ſmall fibres, getting encreaſe from the ſides thereof.

1. *Lyſimachia purpurea ſive rubra minor.*
The ſmall purple flowred Willow herbe.

2. *Lyſimachia purpurea ſive rubra minima.* The leaſt purple flowred Looſeſtrife.

This other Looſeſtrife, being the leaſt, riſeth up ſcarce a foote high, the ſtalkes branch themſelves forth from the very bottome, full of ſtalkes with ſmall, long, and narrow leaves, almoſt like thoſe of Lune or Flaxe, but ſhorter, with whom at the joynts come forth the flowers, ſometimes two at a place, but more uſually one, ſtanding in greene huskes like unto the laſt, compoſed of five ſmall reddiſh purple leaves, cluſtring together, in which huskes after the flowers are fallen, ſtand ſmall skinne bags, wherein is contained ſmall whitiſh ſeede, the roote is ſmall, long and browne. Unto this ſort might belong, according to ſome mens opinion, the *Lyſimachia cærulea galericulata*, of which I have already ſet forth in the Chapter of *Gratiola*, ſome kinde of that kinde, in the Claſſis of purging plants, but as I there ſaid, there is are more fit place for it in my judgment, becauſe that it is ſomewhat bitter, and hath hooded flowers, both which are proper to the *Gratiola*, and not to the *Lyſimachia*, from all which being ſet as alſo that diverſe good perſons have otherwiſe called it *Gratiola cærulea*.

The place.

The firſt groweth in moiſt meddowes, and grounds nigh unto waters, or water ſides, as *Cluſius* and the other ſet forth: the ſecond in Doctor *Atkins* garden, who gathered it in ſome place (not named) in his returne out of *Italy* and *Germany*.

Original from UNIVERSITY OF MICHIGAN

The Time.

They flower in *June* and *July* with the reſt.

The Names.

The firſt *Cluſius* calleth *Lyſimachia purpurea ſecunda ſive minor*: and by *Bauhinus*, *Lyſimachia rubra vulgaris*: the other *Cluſius* likewiſe calleth, *Lyſimachia rubra maxima*; and *Bauhinus Lyſimachia Lobelij ſive purpurea cærulea*.

The Vertues.

It is no doubt but theſe herbes, being ſo like in face and outward forme unto the *Lyſimachias*, are not onely to be accounted as *ſpecies* thereof, but of the ſame property in ſome meaſure with them, but thereof I know nothing myſelf made, and therefore can ſay no more of them.

Chap. XXXV.

Lyſimachia ſpicata. Looſeſtrife with ſpiked heads of flowers.

There are likewiſe two ſorts of this kinde of *Lyſimachia*, to be entreated of in this Chapter, which are as followeth.

1. *Lyſimachia ſpicata purpurea.* Purple ſpiked headed Looſeſtrife.

This Willow herbe or Looſeſtrife, that carryeth a ſpiked head of flowers, groweth with many woodily ſquare ſtalkes, full of joynts, about three foote high at the leaſt, at every one whereof ſtand two long leaves, not altogether ſo great and large as thoſe of the common yellow, but ſhorter, narrower, and of a deeper greene colour, and ſome browniſh: the ſtalkes are branched into many long ſtemmes of ſpiked flowers, eight a foote long, growing in roundles one above another, out of ſmall huskes, very like unto the ſpiked heads of the vanders, each of which flowers have five round pointed leaves, of a purple violet colour, or ſomewhat reddiſh purple hue; in which huskes ſtand ſmall round heads, after the flowers are fallen, wherein is contained ſmall ſeede: the roote creepeth under ground like unto the yellow, but is greater than it, and ſo are the heads & leaves, when they firſt appeare out of the ground, and are more browne than thoſe of the yellow.

Lyſimachia Virginiana flore carneo. Bluſh Willow herbe of *Virginia*.

This Willow herbe hath many ſlaire long and large leaves, &c. expect the reſt hereafter.

2. *Lyſimachia ſpicata cærulea.* Blew ſpiked Looſeſtrife.

This blue flowred Looſeſtrife groweth ſomewhat lower, with ſome branches in the like manner at the toppes of the ſquare ſtalkes, and with darke greene and narrower leaves, ſet by couples at the ſame upwards the

1. *Lyſimachia purpurea ſpicata.*
Purple ſpike headed Looſeſtrife.

2. *Lyſimachia cærulea ſpicata.*
Blue ſpiked Looſeſtrife.

Original from UNIVERSITY OF MICHIGAN

together set with three or foure at a joynt lower, somewhat deepelyer snipped or dented about the edges: the flowers grow in the same manner as the former doe, in long spiked heads, set round about with blue flowers, of foure leaves a peece, which turne into small flat heads with brownish seede therein: the roote creepeth not farre but doth shoote forth many sprouts round about it, whereby it doth much encrease.

The Place.

The former groweth usually by rivers, and ditches sides, in wet grounds; as upon *Lambeth* side about the Archebishops, in many places: the other is seldome found in our Land, but in *Austria*, and other places of *Germany* plentifully.

The Time.

Both these doe flower in the monthes of *June* and *July*.

The Names.

The former is certainely the *Lysimachia* that *Plynie* remembreth, and so take the name from *Lysimachus*, as is before said, and is the *Lysimachia altera* of *Matthiolus*, the *Lysimachia Plinij* or *purpurea* of *Lobel* in his *Adversaria* and Observations; the *Lysimachia purpurea communis major*, of *Clusius*; the *Pseudo Lysimachium purpureum alterum* of *Dodonæus*, and the *Salicaria alia facie* of *Tragus*: there have beene some that have taken it for *Eupatorium*, and some for a kinde of *Centaurium*, but they have erred both: the other is taken by some to be *Veronica vulgo major*, but others and that more truely make it a *Lysimachia*; as *Clusius*, who calleth it *Lysimachia cærulea flore*; *Lobel Lysimachia cærulea hortensis*; *Lugdunensis* and *Dodonæus*, who calleth it *Pseudolysimachium cæruleum*, and saith that many *Dutch* did call it *Paersicke*. *Rembertus* calleth it *Lysimachia Pannonica*, whom I thinke to be of as good and sound judgement, as any other, whom I doe follow as you see.

The Vertues.

The properties of these hearbes, being cooling and drying, are to be referred to the former, wherein they farre come behind the best of them, and therefore it needeth not that I should make a repetition of the same things againe, seeing any man may safely use the one in stead of the other, when it is not neere at hand, or to be gotten. And more by particular experience this hereafter hath beene found, and by a friend imparted, of whose learning and judgement there needeth no question: The destilled water is a present remedy for burns and blowes on the eyes, and for blindnesse, so as the christaline humor, or light it selfe of them be not perished or hurt, or be not spoyled; which experiments was found true, upon a boy, whose eye by chance was pricked, and restored hereby; as also by another who being hurt in the eye, athwart by a dart, was cured onely by applying the water outwardly: he that performed this cure, and the like upon divers, would not declare this secret to any; and therefore the Physitions and Chirurgions, that undertooke to cure another hurt in the same manner, and refusing this water, failed of their cure, and left him as that they dealt with. It is of as good use to cleere the eyes of any dust, or other thing gotten into the eyes, and keepeth the sight from much danger. It is also available against wounds and thrilles, to be made into an oyntment with *May* butter, waxe, and sugar, in this manner. Take to every ounce of the water, two drammes of *May* butter without salt, and of sugar and waxe of each as much also, let them boyle gently altogether; let rents be dipped in the liquor that remaineth after it is cold, and put into the wounds and the place covered with a linnen cloath, doubled and annointed with the oyntment: this was proved in a Captaine, who was shot in two places with bullets, the one through his breast, the other through his thigh, and was perfectly cured of both wounds without any scarre, onely by applying them as aforesayd, when as he could not be holpen by other remedies applyed. It likewise cleanseth and healeth all foule ulcers and sores whatsoever, and mayeth their inflammations, by washing them with the water, and laying on them a greene leafe or two in summer, or dry leaves in winter. This water gargled warme in the mouth, and sometimes drunke also, doth cure the Quinsie, and Kings Evill in the throate: The sayd water applyed warme taketh away all spots, or markes and scarres in the skinne, which are caused by the Measels, small Pocks or the like. And lastly, if one drinke of this water, when they are very thirsty, or in any journey not having any drinke, it will presently take their thirst.

Chap. XXXVI.

Lysimachia siliquosa. Codded Loosestrife.

The other kinde of Loosestrife to be spoken of, is those that beare their seedes in cods, whereof there are divers, one kind hereof under the name of *Chamænerium sive flore delphinij*. Willow flowered Loosestrife, belongeth to this place, which although I have set them forth in my former Booke, and will not describe them againe, yet I will here give you the figure of the *Virginian*,

Lysimachia siliquosa angustifolia Chamænerium Gesneri dicta.

The narrow leafed codded Loosestrife.

This is called Loosestrife, a plant full of this kinde, as most worthy in my judgement, both for the rarity, beauty and properties of the same. It riseth up with divers hard stalkes, about two and sometimes three foote high, with many very narrow leaves thereon, somewhat like unto Rosemary leaves in my opinion, set very thicke with two at a joynt, but certainely, being shorter then those up higher, at the toppes of the stalkes come forth many flowers, made of foure small round and pointed leaves, of a fine reddish colour, and some threds in the middle, standing on the toppe of a small long almost square codde, whitish on the outside, and stuffed with fine cotton or downe, wherein lye the brighter red seedes, which cods with seedes therein appeare, before the flowers be fully blowne: and at the cods of them, whereupon some have called it *Filius ante patrem*, the roote creepeth under the ground, more then the yellow and blew doe. Of this kinde both *Gesnerus*, *Thalius*, and *Clusius* say, they have seene white flowers, not differing in any thing else from the other. *Flore Alio*

Lysimachia Chamænerium dicta Alpina. The mountaine codded Loosestrife.

This mountaine Loosestrife hath very short stalkes, seldome more then a foote high, whereon grow very narrow

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

narrow leaves, like unto the former, yet some longer then others set without order: but the smaller come forth from the middle of the longer, and sometimes stand at the joynts, at the toppes of the stalkes stand the flowers upon slender long purplish stalkes, and sometimes whitish, of a purplish or reddish blew colour, not in some of a whitish blew colour, consisting of foure reasonable great leaves, even as great as the former, which the fruitbues of the plant doth scarce admit, with some threds in the middle, every one of them standing in a small huske, composed of foure short greene leaves, wherein after the flowers are falne, grow up small long pods, with small seed in them, enclosed in downe like the other, the roote hereof creepeth not, but is composed of many fibres, which whether it be annuall or longer abiding, I have not yet learned.

2. *Lysimachia fulgens major.*

The greater codded Loosestrife.

This greater Loosestrife sheweth forth divers round greene stalkes, three foote high at the least, bearing there great set severall joynts, two leaves a peece, which are somewhat like the common yellow Loosestrife, but smaller and narrower, greene on the upper side, and of a yellowish greene underneath, and coined about the edges, the stalkes send out from the middle upwards many branches, at the toppes whereof grow many small long pods, of a whitish greene purple colour, wherein the reddish seede lyeth in downe as is aforesaid, and at the end of them after they have appeared a good while, come forth the flowers made of foure round pointed leaves a peece, with some threds in the middle, of a faint reddish or purplish colour, the roote is long, white and white, creeping every way under ground, and quickly possessing a good piece of ground, which abide in the winter, although the stalkes dye downe every yeare. Of this sort likewise there hath been one found with white flowers, but very seldome indeed.

Flore albo.

4. *Lysimachia flore spadiceo vulgaris folio latiori.*

The wilde broader codded Loosestrife.

This latter sort that groweth wilde in divers places, sheweth up stalkes three foote high, and in some places, not so

1. *Lysimachia fulgens angustifolia.* Small narrow leaved codded Loosestrife.

3. *Lysimachia fulgens latifolia.* Broad leaved codded Loosestrife.

…high, with smaller stalkes and narrower leaves, not so greene, but rather of a grayish dusty greene colour, and hath many branches, bearing his flowers of foure leaves a peece, of a deepe blew colour, as the former doth, and hath like seede in downe but smaller: the roote is small and fibrous, dying every yeare.

2. *Lysimachia siliquosa sylvestris hirsuta.* Hairy wilde codded Loosestrife.

This differeth in growing, and height in leaves and flowers, and yearely dying like unto the last described, the only difference betweene them is, that the leaves are more hairy, and as it were woolly, and the flowers also small and pale.

3. *Lysimachia siliquosa Virginiana.* Codded Loosestrife of *Virginia.*

This set forth in my former Booke, and so is *Chamænerium Gesneri.*

The Place.

The first groweth moste often in moist grounds, then in dry, yet *Gesner* and others say, it doth grow in those places that are open to the Sunne all day, it will hardly abide in our Gardens, unlesse it be planted in some shadowy place. The second groweth upon the *Alpes*, in the Country of the *Switzers*. The third groweth in divers places, and is often found of it selfe in Gardens alwayes delighting where it may be kept moist by shadowe, the other for to grow wilde in dry grounds, as by the wayes, and lanes, and borders of fields.

The Time.

They flowre in *June* and *July*, and are quite past in *August* for the most part.

The Names.

They are all called *Lysimachia siliquosa* from the long cods they beare, which none of the others have, the former is also called *Chamænerium* by *Gesner*, but in my minde that name doth more fitly serve to the other sort hereof, which we call the Willow flower, set forth in my former Booke, by the name of *Chamænerium flore luteo*, for this hath long greene leaves, very like unto Peach leaves, or the leaves of *Nerium*, or *Oleander* the Rose bay, wherewith (as I said) hath narrow leaves like Rosemary, and *Gesner* himselfe doth not well like of the name *Chamænerium*, but rather calleth it *Epilobium*, a word made of three, that is *ἐπὶ λόβος*, *quia stilo suo super siliquam nascitur*, and reckoneth up five sorts thereof, as he setteth them downe at the end of Cordus his History of Plants. *Dodonæus* and *Lobel* have set this forth as a smaller kinde of the greater willow herb, which is the third here set downe. And *Bauhinus* calleth it *Lysimachia latifolia*, and this *Angustifolia*, as they make it to be. *Tragus* expresseth it under the name of *Linaria rubra*. *Dodonæus* calleth it *Pinaster Lysimachiæ purpureæ minor*, for as I said before, he maketh the third sort here to be the *major*. The rest neede no further application, being every one is expressed in their rule answerable unto them, and not much varying from what others call them, onely *Cæsalpinus* calleth the third sort, *Onagra genus alterum*, for hee calleth the *Chamænerion* sive *Delphium*, *Onagra*.

The Vertues.

The last which is more used in physicke then any of the rest, is hot and dry in the second degree, as *Gesner* saith, and very allopegia withall, and some what abstersive, whereby it consisteth of divers parts, but is effectuall both to stanch blood, reclaime lasses, heale the sores of the mouth and secret parts, close up quickly greene wounds and heale old ulcers, and briefely doe and performe almost as much as the ordinary *Lysimachia* can.

Chap. XXXVII.

Veronica mas. The male Speedewell.

Of the Speedewels there are two kindes, the male and the female, of the male there are many sorts, which shall be set forth in this Chapter, and the female in the next.

1. *Veronica mas vulgaris supina.* The common Speedewell.

The common Speedewell hath divers soft leaves, of an hoary greene colour, a little dented about the edges, and some what hairy also, set by couples at the joynts of the hairy brownish stalkes, which some drawe to the ground, never standing upright, but shooting forth roots as they lye upon the ground at divers joynts, the flowers grow one above another at the toppes, being of a blewish purple colour, and some times white, and sometime more sliver which come small flat huskes, wherein is small blackish seede included, the roote is made of many strings.

2. *Veronica mas erecta.* Upright Speedewell.

This Speedewell differeth from the former in this, that the stalkes leane not downe to the ground, but stand more upright, having somewhat narrower and greener leaves then the other, and the flowers stand thicker together, and more full, of a faint blew colour, and the roote creepeth under ground. There is a lesser sort hereof differing onely in the lowenesse, and in the smallnesse both of leaves and flowers. *Mum.*

3. *Veronica spicata latifolia major.* The greater spike flowred Speedewell.

The greater spiked Speedewell, sheweth us stalkes full of joynts, two foote high, whereon stand many leaves, thicke, and darke greene leaves, and in some neither shining nor so darke, somewhat dented about the edges, the stalkes have very seldome any branches, but have sometimes two or three stalkes of flowers, somewhat larger then the last, and of the same pale blew colour, flowring by degrees to the top, the seede that followeth is small, enclosed in small flat huskes as the other, the roote is some what long and creepeth, sometime by the sides.

4. *Veronica spicata angustifolia.* Spiked Speedwell with narrow leaves.

This Speedewell hath his stalkes about two foote high, set at the joynts with two leaves a peece, which are longer and narrower then the last, and slightly dented about the edges, of a bitter and unpleasant taste, on the toppes of the stalkes, which are as seldome branched as the last, stand the flowers in long spiked heads, many together, every one having foure pale blew leaves a peece, with some threds in the middle, which after turne into small round vessels, which are flat, but a little swelling in the middle, and bicornered at the head,

Original from UNIVERSITY OF MICHIGAN

small long threds, after which come the seede vessels, being greener then any of the rest, platted also and crooked wherein the seede lyeth, being flat, yellowish, and small, the roote is long and woodie, with many long threds.

9. *Veronica Alpina minor.* Small mountaine Speedewell.

This small Speedewell from a small hard and threddy roote, shooteth forth sundry stalkes with small leaves thereon by couples, somewhat larger then Mother of Time leaves, seldome dented about the edges, and of a darke greene colour, the flowers are small and of a pale blew colour, standing without order at the tops of them, sometimes consisting of foure, and sometimes of five or six leaves apeece, the seede that followeth is small round and blacke, and abideth with greene leaves thereon all the Winter.

10. *Veronica Pentaphyllos.* Germander like Speedewell.

This Speedewell hath square rough stalkes about a foote high, with long narrow dented leaves, by couples at the joints, the toppes ending in a long spiked head of foure leafed blew flowers and seede following. Many greater Speedewells.

The place.

The first groweth in all Countries of this land, upon dry banks and wood sides and other waste sandy grounds especially. The second groweth in *Austria* and other parts of *Germany*. The third and fourth grow in the mountaines of *Hungary*, as on the vallies at the foote of the *Alpes* in *Austria*, *Styria*, &c. The fifth groweth in some places of this Land, as well as beyond the Sea. The sixth *Clusius* saith he found on the hills about *Sueberg*, whereon snow lyeth alwaies all the yeare through. The seventh was found on the *Pyrenæi* by Doctor *Lobel*, who brought it to *Banbrow*. The eighth, and the last on Mount *Baldus*.

The Time.

They flower in *Iune* and *July*, and their seede is ripe in *August*.

The Names.

It hath no Greeke name that I know, being not knowne to the ancient writers, *Dodonæus* onely saith he be the other *Betonica Pauli* of *Cordus*, which he saith is like unto Pennyroyall, but not that is called *Nepeta* by the Greekes of the true and right Nepeta, and thereupon this is very ordinarily called of many, *Nepeta Pauli*, or *Veronica mas*, and *Nepeta* to distinguish it from the other. *Tragus* in his time tooke it to be *Pulegium montanum*, and many learned men doe like wise referre most of the other sorts thereunto. The second ordinary upright one is called by *Cæsalpinus Auricula muris tertia*, as the *Spicata* is his fourth, and the fifth here his owne, which *Dodonæus* calleth *pratensis*, *Tragus Teucrium alterum*, and *Brunfelsius Eupatoria nobilis*, but *Lobel* in his *Icones* *Auricula Veneris minor serpilli folia*. *Dalechamp* in his *French* Herball calleth this *Germanica*, and so did *Tabernæmontanus* but by the judgement of the best Herbarists of our times, all these sorts are *species* of the male kind, the female being another herbe of a differing forme, as you shall presently understand. *Gerard* hath badly cited not onely in the figure, but in the description also of his second *Veronica*, which he called *rotta*, not once in saying that it creepeth contrary to the very title, but in the flowers also, saying they are yellow. All the rest have them in their rules, as proper to them by most other authours, and therefore I shall not needs a further explanation of them. The *Italians* call it *Veronica maschia*, The *Germanes* *Grundheyl*, and *Ehrenpreiss*, i.e. *honoris virtus*, that is to say, honour and prayse, and so the *Dutch* as *Lobel* saith call it. In *English* Speedewell, and *Fooles* Betony, and of some *Fluellen*, which being a *Welsh* name, is more proper I thinke to the female kinde, wherein they give admirable praises.

The Vertues.

The male Speedewell is temperately hot and dry, the bitternesse thereof shewing it, and is held a singular good remedy for the Plague, and all Pestilentiall Fevers, and infectious diseases, to expell the venome and poyson from the heart, and afterwards to corroborate and strengthen it, from noysome vapours, if the weight of the hearbe to the quantity of a dramme or two, be given with a dramme of good Treacle, in a small draught of wine, and they be layd to sweate: the decoction of the herbe in wine, or the distilled water thereof, given in some wine, performeth the same thing: it is reported that a *French* King troubled with the Leprosie, was cured thereof by this hearbe, one of his Phisitions advising him thereunto: it doth also wonderfully helpe the memory, and to ease all mornings and swimmings, and other paines of the head, and as it is said helpeth women to be fruitfull that were barren: it cleanseth the blood from corruption: the decoction of the hearbe in water, or the powder thereof dryed, and given in it owne distilled water, is singular good for all manner of coughes and diseases of the brest and lunges, by the warming and drying quality; which thing the Shepheards have often tryed, who give them sheepe that are troubled with the cough, or the like, some of this hearbe and Rosemary with it: it openeth the obstructions of the liver, and is therefore good for the yellow Iaundise: it openeth all the obstructions of the spleene, being taken for some time together inwardly, or the herbe bruised and applyed with some Vinegar to the region of the spleene outwardly: it cleanseth the exulcerations of the mesentery, or of the mother also, or any other inward woundes or sores: it provoketh Urine, and helpeth the stone, breake the stone, and as *Paulus Ægineta* saith, is of much good use in all medecines for the bucke unwholesome: it is singular good to heale all fresh wounds, and cuts in the flesh, speedily closing the lippes of them together, and not suffering them to gather corruption: it is no lesse effectuall also for spreading ringworms, and for old festrings, or running sores or ulcers, that are of hard curation, or are of long continuance: it stayeth bleedings of wounds or other issues of blood in any other part, and dissolveth all tumors and swellings generally those in the necke. The distilled water of the herbe, either simple of it selfe, or the herbe and flowers infused in wine for twelve houres at the least, and then distilled in an ordinary still, but not in any *Limbeck* with hot water, as others are after that manner, doth wonderfully helpe, for all the purposes aforesaid, either the Plague, the Cough, Consumptions, &c. and all the other diseases before mentioned, as also to wash wounds and sores therewith: a little Saffron also dissolved in the layd distilled water, doth wonderfully helpe to heale scabbes and scurfe, tetters also and the morphew, and all discolourings of the skinne, as freckles, spots or marks whatsoever, cleares men from the infection of the blood, and from hot and sharpe salt humours, helpeth scarres that remaine after hurts or bruises, if they be bathed therewith: a little alome dissolved in the foresaid distilled water, and sprinkled upon garments, keepeth them from moths that spoyle them.

Fresh

Chap. XXXVIII.

Veronica Fœmina sive Elatine. Fluellen or the female speedwell.

Of this *Elatine* there are some varieties, observed by diverse, namely two sorts, but we shall therunto adde a third as followeth.

1. *Elatine folio subrotundo.* Round leafed Fluellen.

This Fluellen shooteth forth many long branches, partly lying upon the ground, and part standing upright, set with almost round leaves, yet a little pointed at the ends, and sometimes more long than round, without order thereon, being somewhat hairy, and of an evill greenish white colour: at the joynts all alongst the stalkes, and with the leaves come forth small flowers, one and a place upon a very small short foote stalke, each in fashion like those of Snapdragon, or rather *Linaria* Todeflaxe, whose upper jaw is of a yellow colour, and the lower of a purplish, with a small heele, or spurre behinde, as the *Linaria* hath: after which come small round heads that contains small blacke seede, the roote is small and threddy, dying every yeare, and reneweth it selfe again of it owne sowing.

2. *Elatine folio acuminato.* Fluellen with cornered leaves.

This other Fluellen hath longer branches, wholly trayling upon the ground, two or three foote long, and sometimes more, and more thinnely set with leaves thereon, upon small foote stalkes, which are a little larger, and more whe round, and cut in or cornered sometimes in some places on the edges, but the lowest pare of them, being the broadest hath on each side, a small point, making it seeme as if they were eares, somewhat hayrie but not hoary, and of a fresher greene colour than the former: the flowers come forth at the joynts with the leaves upon little long stalkes, every one by it selfe, one above another, in forme very like unto the other, but the colours therein are more white, than yellow, and the purple is not so faire: it is a larger flower, and so are the seede and seede vessels: the roote is small and threddy like the other, and perisheth every yeare.

3. *Elatine flore cæruleo folio que acuminato.* Cornered Fluellen with blew flowers.

This third Fluellen differeth little from the last, but that the leaves thereon are not so much cornered about the edges, and lesse pointed also, at the foote of lowest part of them, and the flower is almost all blew, with a very little whitish colour therein.

The Place.

These doe all grow in divers cornefields, and in borders about them, and in other fertile grounds, as about Sandwich in *Kent* abundantly: at *Barrowe* also, *Hamerton* and *Richmondworth* in *Huntington* shire, and divers other places, both there and elsewhere.

The Time.

They all likewise are in flower about *June* and *July*, and the whole plant is dry and withered before *August* be come.

1. *Elatine folio subrotundo.*
Round leafed Fluellen.

2. *Elatine folio acuminato.*
Fluellen with cornered leaves.

The Names.

It is called in Greeke Ἕλξινε *Elatine*, by the *Arabians Alsine*, and by the judgement of the most industrious those latter times, taken to be the true and right herbe that *Dioscorides*, hath set forth by that name, although some did seeme to doubt of it, as not knowing what *Helxine Dioscoridis* meaneth, unto whose leaves he compareth it, whether unto *Helxine*, which is *Parietaria*, or *Helxine Cissampelos*, the blacke Bindweed, or whether to make *Elatine* a kinde of small *Volubilis* or Bindweede, for so he compareth it to *Helxine*, which is no other than *Cissampelos*, but his interpreter *Paulus Ægineta* doth turne *Helxine* to be *Parietaria*, *Ruellius Repsilerum campelos*, the wilde *Charlocke* to be it, for the which *Matthiolus* contesteth against him, as also against those that would make *Nummularia* Money wort, or herbe two pence to be *Elatine*, and against others that make *Pimpinella*, *Burnet*, because neither of them were hayrie, nor grew in Corne grounds, as *Dioscorides* saith it doth. *Fuchsius* calleth it *Veronica fœmina*, and so doth *Matthiolus*, *Lonicerus*, *Camerarius*, *Tragus*, and others, and *Lobel* and some others *Elatine Dioscoridis*. *Lugdunensis* calleth it *Herbaticum pauperum*, for some in those parts, did it should seeme so call it, and yet giveth the same figure thereof that he setteth to *Veronica Matthioli*. The second is called *Elatine Matthioli* by *Lugdunensis* and *Castor Durantes*, but he doth not set forth the figure thereof in his last edition, sent him as he sayd from *Cornutus*, for in his other Editions he knew not this sort. *Dodonæus* and others call it *Elatine altera*. *Fabius Columna* calleth it *Teucrio Pseudo-Chamæpitys*, because as I sayd the flowers are somewhat like a *Teucrio* or Todeflaxe, and the leaves cornered like unto it. The *Italians*, *French*, *Dutch*, &c. doe all follow the Latine *Veronica fœmina*, and we call it by the name of female Speedwell.

The Vertues.

Although that *Elatine* be of a newer latine, yet it is held to be more cooling with the drying property, than the former Speedwell. The leaves sayth *Dioscorides* and *Pliny*, bruised and applyed with barly meale to eyes that are vvatrie, by derivations from the head, and that are hot and inflamed withall, doe very much help them: it helpeth also all other defluxions, as also the fluxes of blood, or humours, which are the lask, and bloody flixe, it also wonderfully stoppeth abundant courses, and stayeth all manner of bleeding, whether at the nose, mouth, or any other place, or that commeth by any vrine burst, bruised or hurt, wonderfully helping all inward parts, that neede consolidating or strengthning, and is no lesse effectuall, both to heale and close vvounds, as to cleanse or heale all foule or old Ulcers, fretting or spreading Cankers, or the like, as the vertue thereof made upon one can witnesse; whose nose being almost consumed with a Canker, was (as *Dioscorides* teacheth it) to have his nose cut off, by the Chirurgians appointed thereunto by the Physicians, to preserve the rest of the body, ready to fall into a Leprosie, whose determination being over heard by a simple Barber his companion, advised that he might beforehand, make tryall of an herbe, he had seene his Master use in the like case, which being granted, he by using the juyce and correction of this herbe taken inwardly, and the herbe boyled outwardly to cover the nose, who was not only cured of the danger of his nose, but of his whole body, and therewith was freed from the disease he was falling into. This occasion doth make me thinke, that not onely in this herbe, but in many other simple herbes, our forefathers found helpe of many diseases, and therefore called them simples: and were we in these times as industrious, to search into the secrets of the nature of herbes, as our forefathers were, and to make tryall of them, we should no doubt finde the force of simples, many times more effectuall than of compounds: but of this enough, yet not too much, for as I might provoke some learned to be more industrious, and not like droanes onely to sucke the honey from others hives: it helpeth also all the inward defects of the skinne, when it is discoloured, as it is sayd of the former: for they are both a kinde very neere in effect, one unto another, and therefore what is sayd of the one, may very well be applyed to the other.

Chap. XXXIX.

Nummularia. Money-wort, or herbe two pence.

There be two sorts of *Nummularia*, one greater than another, that beare both of them yellow flowers, if that the fertility, or sterility of the soyle doe not cause the same, which I shall shew you hereafter: with them I have another lesser sort, with purple flowers, which is also found wilde in our own Land, although but in a few places, which is remembered by no author but *Dodonæus* in his *Pemptades* and *Pinax*.

1. *Nummularia vulgaris.* Common Money-wort.

The common Money-wort, sendeth forth from a small threddie roote, divers long, greene, and reddish branches, lying and running upon the ground, two or three foote long or more, set on both sides with two at a joyne, one against another, at equall distances, which are almost round, but pointed at the ends, smooth and of a good greene colour: at the joynes with the leaves, from the middle forward, come forth every joynt, sometimes one yellow flower, and sometimes two, standing each on a small foote stalke, consisting of five narrow leaves, pointed at the ends, with some yellow threds in the middle, which being past, appeare in their places, small round heads of seede.

Minor. There is one of this sort, much lesser than the former, not else differing.

2. *Nummularia minor flore purpureo-rubente.* Small Money-wort with purple flowers.

This small Money-wort spreadeth and runneth on the ground, in the same manner that the greater doth, with two very little leaves, set at every joyne of the stalke, which are as round or more than the former, not pointed at the ends: the flowers likewise stand in the same manner at the joynts, but much smaller, and of a purplish red colour: after which come seede in round heads also but lesser, as the roote is likewise.

The Place.

Both the former sorts grow in our owne Land, in moyst grounds by hedge sides, although the greater

1. *Nummularia vulgaris.*
Common Money-wort.

Nummularia minor.
Small Money-wort.

2. *Nummularia minor flore purpurascente.*
Small Money-wort with purplish flowers.

generally, and almost every where, the last hath beene found with us also in sundry places.

The Time.

They doe all of them flower in *June* and *July*, and their seede is ripe quickly after.

The Names.

It is called of the later Latine writers (for none of the ancient either greeke or Latines, have made any mention of it, unlesse it be *Dioscorides* of *Theophrastus*, *lib. 6. c. 14.* as *Fuchsius* thinketh, which is *Cucumis asininus Belgis*, but that the vertues thereof doe not agree herewith; and *Nonnius* of *Plinie*, *lib. 18. c. 28.* which in truth, he drawes *Nummulus*,) *Nummularia* of the round forme of the leaves, like unto money. *Brunfelsius* and others call it *Serpentaria*, because it hath beene found that Serpents have helped themselves therewith being wounded, and *Centummorbium*, and *Gesner Centimorbia*, or *Centummorbia*, of the singularity in the cure of diseases and wounds. Some have called it *Lunaria minor*. *Tabernamontanus* (and others after him) called it *Hirundinaria*, some say, *quod hirundines instar pas sim terræ adhæreat*. *Rauwolfius* hath made mention of the last. The *Italians* call it *Nummularia*, the *French Monnoyere*, the *Germanes Egelkraut*, and *Wolfy Mung*, as we in *English* Herbe two pence, or two penny grasse, but more

The Vertues.

Money-wort is somewhat cold, but very astringent, binding and drying, whereby it is singular good for to [illegible] of blood in man or woman, whether they be laskes, bloody fluxes, the flowing of womens monethly [illegible] inwardly or outwardly, also the weakenesse of the stomacke, that is given to casting, it is very good also, for all ulcers, or excoriation of the lungs or other inward parts; yet some shepheards in [illegible] doe thinke it is very hurtfull for their cattell to feede thereon, and that it causeth their lungs to slutter, which [illegible] is but a conceit of opinion, for no cold and binding thing was ever knowne to exulcerate. It is also good for all wounds either fresh or greene, to heale them speedily, for old ulcers also, which by their [illegible]

humidity, and by the fluxe of moist and sharpe humours, are either spreading or long in curing, for all which purposes, the juice of the herbe, or the powder drunke in water wherein hot steele hath beene often quenched, or the decoction of the dry or greene herbe in wine or water drunke, or the seede, juice, or decoction applied to the outward places, to wash or bathe them, or to have rents dipped therein, and put into them is very profitable.

CHAP. XL.

Paronychia. Whitlow wort, or Whitlow grasse.

ALthough *Badonus* disclaimeth all the sorts of *Paronychia* expressed by all other Authours, refusing them all to some one or other herbe, and although those that I shall set forth here by that name, do not fully answer the description of *Dioscorides*, yet because divers worthy Authours have so called them, and I had rather if they have erred, erre with them, then be singular in error with *Badonus*, let them therefore receive their place here at this time.

1. *Paronychia major.* The greater Whitlow wort.

The greater Whitlow wort hath very many leaves lying on the ground, in a round compasse one by another, of three inches long, and one broad a peece, rough, hairy, of a darke greene colour, and somewhat deepe in the edges, standing upon short footestalkes, from the middle of whom rise up one or three small round naked stalkes, with few or no leaves thereon, scarce able to stand upright, but bending downewards, at the top whereof stand small white flowers, after which come small long pods containing small reddish seede, reading hot and sharpe as the rest.

2. *Paronychia altera minor.* The lesser Whitlow-wort.

This other plant is smaller, hath likewise divers leaves lying on the ground, lesser then the former, somewhat like unto the lesser Mouseare, called Cats foote, but not so hoary, yet a little hairy, and of a yellowish green

3. *Paronychia vulgaris Alsines folio.* Common Whitlow grasse.

4. *Paronychia altera vulgaris folio.*

5. *Paronychia incisa folio.* Jagged Whitlow grasse.

colour from which spring divers small straighe and crested stalkes, three foote high or more, branching forth at the toppes, whereon stand small white flowers, unto whom doe follow very slender long pods, like unto those of Flixeweed, full of small reddish seede, as sharpe and hot in taste as Cresses, the roote is small, hard and wooddy.

3. *Paronychia vulgaris Alsines folio.*
Common Whitlow grasse.

This is a very small herbe, seldome rising to be an handbreadth high, having many small and somewhat long leaves, lying neare unto the ground, somewhat like those of Chickeweede, but somewhat longer and broader, from whence rise divers slender naked stalkes, bearing many white flowers one above another, exceeding small, after which come small flat pouches lesse then of any *Thlaspi*, wherein is contained very small seede, of a sharpe taste, the roote is a tuft of fibres.

4. *Paronychia folijs incisis.* Jagged Whitlow grasse.

This other Whitlow grasse, hath some pale or reddish greene leaves, cut in on the edges into two or three small cuts, making them seeme like unto the leaves of Rue, or herbe grace, it hath fewer stalkes then the former and such like leaves but smaller, set thereon in some places, with some white flowers at the tops of the stalkes

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

yeallowish stone like a seed stone taste, greater then the other, and husks that hold the seede greater also, the roote as small and fibrous.

The Place.

The two first sorts are found upon open hils, and in the dryer grounds of them, both the last sorts are often found together, that is either upon old stone or bricke walls, or in dry gravelly grounds, yet still where it hath some moysture or the like, growing neere to shadow it.

The Time.

They bowre very early in the Spring, for they are all past by the end of *Aprill*, and are not to be found all the Summer following.

The Names.

That not as I said, the true *Dioscoridis Paronychia* of *Dioscorides*, but received under that name by good Herbarists before I had before disclaimeth all the sorts of *Paronychia*, & referreth them all to one plant or other, as I said before, and therein I think he hath as much erred, as he thought others did, for although the *Paronychia vera Dioscoridis*, be true *Sedum minus*, or *Saxifraga alba*, being of the taste and quality of the rest of the capillary herbes, as you shall heare when wee come to speake of them in their proper places, and *Matthiolus* his *Paronychia* or *Herbula Alsines folio*, yet how *Bauhinus* should make the *Paronychia folio serpilli sive vulgaris folio sedum minus*, rather then the other, calling it *Sedum creticum flore albo tetrapetalon*, I cannot well see, for the leaves doe not at all compasse one another as all or most of the *Sedums* doe, neither are the leaves thereof thicke, nor more, nor are the *Sedums* hot in taste as these are, and although *Lonicerus* setteth forth the *Medica lutea* (whose figure and description I have given you in my former Booke) for a *Paronychia*, whereunto as he hath *Dioscorides* his description doth not much vary, which is called also *Lupulina Italorum*, a difference from the *Trifolium Lupulinum*, which may be resolved, yet in my opinion he hath erred as much as in the others, to make it one more hereto downe to be *Species* of *Bursa pastoris*, and I cannot but marvaile also at *Gerard*, in that hee had meant, if he had lived to have seene his worke published againe, with the additions, to have made another *Synonyma*, or the name of *Paronychia Camerarij*, of an herbe that he had received from a friend that sent it him, being gathered upon a mountaine in *Austria*, which is the *Tyrola Lonicero adjecta flore nigro*, as by his description may plainely appeare, but I must excuse him in that, I thinke he never read or marked what he read of *Tyrola Alsines folio*, spoken of before in the Chapter of *Tyrola*, and therefore he referred the plant upon sight unto the nearest he saw would serve him. The first is called by *Thalius Polygala Sequanorum major*, *Arsion Tetraphyllum Dalechampij*, *Lonicero*, and *Bauhino*, *Bursa pastoris minor folijs oblongis majoribus folijs*. The second is called by *Thalio Polygala Sequanorum minor*, which *Cesalpinus* called *Paronychia altera Alsines folio*, and *Bauhinus Bursa pastoris minor Sequanorum minor tenuiorum foliis*. The third is called *Paronychia Alsines folio*, by *Lobel*, *Lugdunensis*, and *Lonicerus*, *Paronychia vulgaris* by *Dodonæus*, *Thlaspi minimum spicatum* by *Thalius*, who yet saith it may well be referred to these sorts, by *Lugdunensis*, *Myosuros altera species*, and by *Bauhinus Bursa pastoris minor Sequanorum obovatis foliis*. The fourth is *Paronychia viridis folijs* and *rotundifolia* by *Lobel*, *Paronychia altera* by *Dodonæus*, *Alsine perennis rotundifolia* by *Lugdunensis*. *Tragus* not knowing by what name best to call it, entituled it in high Dutch *Hechtkraut*, and *Thalius* thereafter *Dactylion Sesamoides*, and as I shewed you before, *Ruellius* called it an *Acon* or *Sesamum*.

The Vertues.

There is no certaine tryall made of late dayes of this herbe Whitlow-grasse, whether it performeth the cure, *Dioscorides* and *Galen* ascribe unto their *Paronychia*, for being by taste found to be somewhat hot and sharpe, it hath not that drying facultie without sharpenesse, that they say is in theirs, and therefore it is not probable to worke those effects, to heale the impostumes that grow at the rootes of the nailes of a mans hand, and other hot inflammations and impostumes, but onely a generall supposition it hath from the name that it will helpe whitlowes and fellons, that rise upon the fingers, most usually about the joynts of them, which is performed by a drying quality.

Chap. XLI.

Anagallis. Pimpernell.

There were formerly onely two sorts of Pimpernell knowne to *Dioscorides*, and the other ancient Authours, which are that with the red flowers, and that with the blew, but our times have found out other sorts, as shall be shewed in this Chapter, yet I doe not meane to speake of any of the Brooke limes, or Water sorts here, for they shall be entreated of in their proper place, which is among those plants that delight to grow in watery places.

1. *Anagallis flore phœnicea.* Red flowred Pimpernell.

The Pimpernell hath divers weake square stalkes lying on the ground, beset all along with two small and almost round leaves at every joynt, one against another, very like unto Chickweede, but have no footestalkes, further doe as it were compasse the stalke, wherein it differeth from Chickweede, the flowers stand single upon footestalkes, at the joynts between the leaves and the stalkes, consisting of five small round pointed leaves, of a fine red colour, tending to Orenge, with so many threds in the middle, in whose places after they are fallen stand smooth round heads like those of Chickweedes, wherein is contained small seede, the roote small and perishing every yeare.

2. *Anagallis flore cæruleo.* Blew flowred Pimpernell.

The other Pimpernell, is in all things like unto the former, saving onely in the colour of the flowers, for whereas that is of a red colour, this is of a faire blew colour, wherein consisteth the difference.

3. *Anagallis flore obsolete purpureo.* Pimpernell with sullen red flowers.

This Pimpernell doth in all things likewise resemble the former, save that the flowers hereof are of a sullen purple red colour, having a glimpse of purple therein.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Anagallis flore carneo.* Pimpernell with blush coloured flowers.

Of the same kinde also is this other, not differing in any thing, but in the colour of the flower, which is a faire blush or incarnate colour.

3. *Anagallis flore luteo.*

Pimpernell with yellow flowers.

The yellow Pimpernell groweth in the like manner, that the former doe, with many spreading branches upon the ground, but they are somewhat greater, and so are the leaves also, larger then the former sorts, but set by couples at the joynts, where the flowers come forth upon long footestalkes, like unto the other, but larger or greater, and of a faire yellow colour, with pointed leaves somewhat like unto *Nummularia*, with round heads also containing the seede, and small fibrous rootes not perishing every yeare, as the rest doe: for with the plant in flower, which I have gathered, there hath remained the dry stalke, with the heads of seede, of the former yeares growing.

5. *Anagallis tenuifolia flore cæruleo.*

Narrow leafed Pimpernell with blew flowers.

This blew flowred Pimpernell, groweth in the same manner that the rest doe, with spreading branches upon the ground, and leaves set at the severall joynts thereof, all along up to the toppes, but they are longer and narrower, somewhat resembling the leaves of *Orariola*, or hedge Hyssope, and not alwaies two at a joynt, but sometimes three or peradventure more, yet very seldome: at the joynts likewise with the leaves, stand severall flowers as in the other sorts, upon small long footestalkes, made of five small round pointed leaves, yet somewhat greater then those of the former blew sort, having a shew or circle of a purple colour in the middle, or bottome: which afterwards yeeld such like round heads and seede, and having small thready rootes like unto the other, perishing in the same manner every yeare.

The Place.

The first groweth every where almost, as well in the medowes and corne fields, as by the wayes, or in gardens

3. *Anagallis flore luteo.*
Pimpernell with yellow flowers.

4. *Anagallis flore carneo*, or *flore purpureo & cæruleo.* Pimpernell of foure sorts of colours in the flowers, that is, red, blew, yellow red, and blush colour.

6. *Anagallis tenuifolia flore cæruleo.*
Blew flowred Pimpernell.

arising of it selfe: the second is nothing so common, yet is found growing neere *Gaitle* by *Oxford*, and plentifully in *Bowers* Marsh, at *Higham Ferrers*, *Attleborow*, and *Hanslop* in *Northamptonshire*, and at *Bicons field* in *Buckinghamshire*. The third as *Clusius* saith, first grew with him, in his Garden at *Frankford*, and continually by the shedding of the seede, preserved it owne kinde, as well there, as in *Holland* at *Leyden*. The fourth grew of seede in my owne Garden here in *London*, and commeth up every yeere, of it owne sowing. The fift groweth in the bushy places of *Hampsted* wood, and in many places of *Kent*, and about *Aylesford* at a place called the Poule. The last *Clusius* saith he had from the noble and learned *Iohn Monson* of *Surrey*, who received it from *Colchester*, where it grew, and grew likewise in his garden at *Surrey*.

The Time.

They do all flower from *May*, into *August*, and the seede ripeneth in the meane time, and falleth.

The Names.

It is called in Greeke Ἀνάγαλλις, *Anagallis*, and so likewise in Latine. Now though it might take the name of *Flos sub celebres Hyacinthus inde a colore Hyacinthus*, *Anagallis cum sporis purpureis vel fusis flos ad caules quinos senosve, quis superbale floribus venustis vitae passim ornat, colore modo ceruleo modo purpureo*, *Iacobus Mantius*, and *Matthiolus* after him, call it *Alectorolophos Gallina*, and *Margellina*, but that name is more truely the name of *Rhinanthus*, or Cockscombe, which this may be accounted a *Species*. Some have called it *Auricula Muris*, following herein the *Lord Grammarians*. *Dioscorides* saith, that in his time it had divers names, among which he numbreth these which *Apuleius Platonicus* also remembreth, and *Cornarius*, and *Hallervordus*, whereby it is supposed to be the *Corchorus* of *Theophrastus*, which in his seventh booke, and seventh chapter, he reckoneth *inter olera*, as to be pot herbes, or sallet herbes; and for the bitternesse became a Proverbe *Κόρχορος καὶ ἐς κορδάκην*, *Corchorus ad chordacem*, which is understood of those men, that would be esteemed of some worth and account among others, when they are the eleft of others, for so *Plinie*, in his twenty fift booke, and thirteenth chapter, doth say that this *Anagallis Purpurea*, was called *Corchorus*, or *Corcoros* in the same manner: but not that *Corchorus* he mentioneth in his 25. booke, and 32. chap. which as I said before, is more truely taken to be *Malachia*, *Olus Indicum*, the Indian Mallow. *Fuchsius* also ignorantly ascribed the name Pimpernell in the composition. *Dioscorides*, because it was a wilde *Corallina*, whereof he speaketh in his seventh booke, which is used against the diseases of the Arteries and joynts, and was to be made with dew herbe, which some doe rather thinke should be called, *Stroebelium*, and the herbe *Ollarie*, which may seeme to take the name of glewing, which is proper to Pimpernell. Some also take this to be the *Melochia* of *Serapio*, but *Serapio* calleth the *Anagallis flore phoeniceo*, which is generally called *Mas*. In the *Arabian* tongue *Kantalis*, and the other *flore ceruleo*, which is the *Femina Cardiaca*, as *Tragus* saith. The *Italians* call it *Anagalli*, and *Herba di galline*. The *Spaniards Murages*. The *French Mouron* and *Mourgine*. The *Germanes Gauchheil*, *quasi latis faciendum*, or *corrupte pro cuculi*, for so they call *Gauchheil Von wunden*, and *Gauchblume fur wunden*, from a superstitious conceit as it is thought, that it being hung over the threshold of the porch or doore, will frustrate or expell all witchcraft or forceries. The *Dutch Gauchel heil*; and we in *English* Pimpernell. The first here set downe is generally of all writers called, *Anagallis mas & flore phoeniceo*, as the other, or second, *Anagallis femina flore ceruleo*. The third *Clusius* maketh mention of in his history of plants. The fourth is not remembred or spoken of by any other but my selfe: the fift is generally called *Anagallis lutea*, but of *Gesner* in horto *Germanico Nummularia sylvatica & mas*, and of *Lugdunensis Alsine lutea*. The last *Clusius* calleth *Anagallis tenuifolia Monelli*, and *Bauhinus Anagallis ceruleo similis tenuifolia*, *exadversa reflexifolia*.

The Vertues.

Pimpernell as *Galen* saith, in his sixth booke, of the faculties of simples, of both sorts with red or blue flowers, are of a cleansing faculty, they have also an attractive force, whereby they draw forth thornes or splinters, or other such like things setthed in the flesh, and therefore the juyce put up into the nostrils, purgeth the head: unto this they have a drying faculty without sharpenesse, whereby they are good to sodder the lippes of wounds, and to cleanse fowle ulcers; thus saith *Galen*, whereby it is plaine, that they are greatly, that make Pimpernell to be cold and moyst, when as they are quite contrary hot and dry, and of such a cleansing quality, that the distilled water or juyce, are by the *French* Dames accounted marvailous good to cleanse the skinne from any corruption, deformity or discolouring thereof, and to make it smooth neate and cleere; being boyled in wine and given to drink, it is a good remedy against the Plague, and other Pestilentiall Fevers, and contagious diseases, for if after the taking thereof warme, they lye in their beds, and sweate for two houres after, and hereby the venome of the disease would bee expelled, yet so as that it bee used twice at the least: the same also helpeth all stingings and biting of any venemous beasts, be they of Serpents, as the Viper, Adder, or Scorpion, or madde dogge, if any other used inwardly, and applyed outwardly: the same also openeth the obstructions of the Liver, and verie available against the infirmities of the raines, provoketh urine, and helpeth to expell the stone and gravell out of the Kidneys and Bladder, and conduceth much in all inward wounds, and ulcers. The decoction or the distilled water, is no lesse effectuall, to be outwardly applyed to all wounds, be they fresh, to consolidate them, or old bodyes of festring and running ulcers, venemous also, or infected, by cleansing their corruption, by refraining their malignant corroding, and infectious qualities, by drying up their fluxe of humours, which hinder their cure, and quickly bringing them to healing: a little honey mixed with the juyce, and dropped into the eyes, is verie good to cleare them of bloody nailes, or films growing over them, which hinder and take away the sight: a little of the same juyce being dropped into the eare, on the contrary side of the paine: it is effectuall also for the paines of the sciatica, or hipp-gout, or piles: the male Pimpernell is loyd to drive forth the fundament, and the women to repell it, and drive it into his place againe, whereby it is found that the male is more powerfull in expelling, and the female more repelling.

Chap. XLII.

Androsaces altera Matthioli. *Matthiolus* his Navelwort.

ALthough these plants contained in this Chapter, be referred to the Chickweedes, by divers writers, and might therefore have beene placed among them, yet in regard I finde them not onely to vary from all the sorts of Chickweedes, as well in the outward forme, as in the inward qualities, as by the taste may plainely be discerned, I have therefore thought good to separate them, and to place of them in this Classis, and of them in another.

1. *Androsaces major Matthioli.* *Matthiolus* his *Androsace* called the greater Navel-wort.

The greater hath diverse somewhat broade fresh greene leaves, a little hayrie, lying upon the ground, somewhat resembling a Plantaine leafe, with some ribbes in them, but much smaller, and a little unevenly dented about the edges, from among which rise up divers round stalkes, foure or five inches high, somewhat hayrie, but naked without a leafe up to the toppes, where stand foure or five leaves, like these that grow below upon the roote, and among them start forth divers slender small stalkes, bearing every one of them a small white flower, consisting of five small notched leaves, standing in a greene huske, divided also at the toppes into five parts, wherein after the flower is past, groweth a small round head, containing small blackish seede, the roote small and fibrous, perishing as soone as it hath borne seede, and riseth often of it owne sowing against the beginning before winter, or that it doth not runne up for flower the first yeere of the sowing, will abide the first winter, and flower the summer following.

1. *Androsaces flore albo. Matthioli.*
Matthiolus his *Androsace* called Navel-wort.

2. *Androsaces minor.* The lesser *Androsace*, or *Matthiolus* Navel-wort.

The lesser Navel-wort groweth like the former, with many leaves lying on the ground, but they are smaller and narrower by much, yet somewhat hayrie, and dented about the edges, from whence rise also many small naked hayrie stalkes, three or foure inches high, not having any leaves at the toppes like the former, but on naked tufts of many small flowers, like the former but whiter, after which start forth such like small round heads with seede the roote is likewise small and fibrous, but more reddish, and perishes every yeere, after seede time.

3. *Androsaces minima.* The least *Androsace*, or *Matthiolus* Navel-wort.

The least Navel-wort is also very like the former, with many hayrie leaves, lying in a round compasse upon the ground, very like unto the leaves of the smaller blacke beards purse, with more pointed and deeper dented tops than either of the former: the stalkes that rise from among them are much smaller than the former, so are they hayrie also, but not at all hayrie, having five small greene leaves set in a round compasse at the joynt, which is about the middle height, from whence arise as in the rest, foure small white flowers, which afterwards beare seede in small heads like the former: the roote is also very threds as the rest, and unprofitable to the plant.

The Place.

These all grow in divers places of *Germany*: the first in *Austria* in the cornefields about *Baden*, and *Vienna* *Austriæ* wetteth, although *Matthiolus* his friend that sent it him, loyd it was brought out of *Hungaria*: the lesser Doctor *Barserus* gathered neere a village called *Markersdorf*, about foure miles from *Heidelberg*, as *Bauhinus* in *Prodromus* setteth it downe. The least he saith likewise Doctor *Barserus* told him, groweth in the plaines of *Austria*.

The Time.

They doe flower in *May*, and their seede is ripe in *June* and *July*, yet the last is the earliest of the three in flower and seede.

The Names.

Androsaces, in Greeke, is called also in Latine *Androsaces, id quod sorte parare possit Dioscoridis, qui nomen ei imposuit, pitoreum aquas educendo*, yet this is not the right *Androsaces* of *Dioscorides* and *Galen*, because he saith it is without leaves, as it is extant in some copies, yet in others it is said to have leaves, having onely a long seede, *Matthiolus* first exhibited two plants under the name of *Androsaces*, the one which is a sea plant, as unto him, as he saith from *Lucas Ghinus* of *Pisa*, who found it about the Sea coasts in *Hetruria*, *Florence*, which doth not answer unto the Text of *Dioscorides*, who saith *folliculum in capite habet in quo semen*, it hath a huske at the toppe, wherein is the seede, and therefore *Bellonius* called the *Polygonum* which

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

what to be called *Uva marina*, or Sea Grape, by the name of *Androsace*, as it is declared before in the Chapter of *Solanum Somniferum*, Berry bearing Knotgrasses, *Anguillara* accounteth the *Cuscuta* to be the *Androsace* of *Dioscorides*, which is without leaves, according to those copies that have it so, and as *Tragus* before him doth, who saith that *Antonius Musa*, and *Ericius Cordus* were of the same minde before him, which is not without some probability, in that it carryeth no leaves but heads of flowers and seede, upon a number of small threds, but not the name of a Sea plant, as *Dioscorides* his *Androsace* is, nor is white as some copies have it, or with slender milky stalkes, as other copies have, and therefore I thinke we may easily conclude, that *Cuscuta* is not the same with *Androsace*, but the *Uva marina* Sea Grape, may be thought it is by many to come neerer thereunto, with whom *Bellonius* thinke so also of it, if it were an herbe, and not a shrubbe, and if it had white and slender stalkes, as it hath woodily, and climing, bearing red berries, which it is likely *Dioscorides* would not have omitted, if he had meant that plant, and for that first Sea plant of *Matthiolus*, for any thing we can perceive in her, no appearance of the Sea, not bearing any heads with seede, but small round Navell-like leaves, and for the next *Alsine palustris*, called *Umbilicus marinus*, which grow hard and white, being out of the water, although tender underneath it, as *Coralli*, *Coralline*, and some other Sea plants doe, whereof you shall heare more in the proper place, which is of Sea plants, the other *Androsace* that *Matthiolus* setteth forth and calleth also so after him as he saith, by *Cornutus*, for *Amilosace*, which although it agree not unto that of *Dioscorides*, yet divers writers since, have so called it, but both *Clusius* and *Lobel* deny it to be any Sea plant however *Cornutus* saith, it came from the places neare the Sea in *Syria*. The first here described is generally called *Androsace secunda Matthioli*, who as it should seeme, held the reading of *Dioscorides* his text, to be τριφυλλον χαμαι κεκλιμενον φυλλοις, spreading small rush like stalkes with leaves, for so hath this plant, and as I said before is referred to the kindes of *Alsine*, Chickweede, but for the reasons before alledged, I doe as ye see distinguish them, but *Bauhine* calleth it *Alsine Alpina Androsaces folia major*. The second is called by *Bauhine* in his *Pinace* and *Prodromo*, *Alsine Alpina Androsace folia minor*. And the last is called also by him, in the places before named, *Alsine cotyledonis capitulo*. I have called it in *English*, (not simply Navel-wort, for I see no reason why such a name should be given it) as others doe, but *Matthiolus* his *Androsace*, or Navel-wort, as a distinction between it and the *Cotyledon altera*, called also Navel-wort.

The Vertues.

This Navel-wort, being somewhat sharpe in taste, is accounted hot and dry in the second degree, and doth both cleanse old sores and ulcers, and slayeth those that are corroding or fretting from their malignity, and afterwards dryeth up the superfluous humidity, which hindereth their healing, and cleanseth also the skinne outwardly from roughnesse, Sunburning or the like discolouring, the juice clarified and dropt into the eyes, cleanseth them from those filmes or skinnes, that by growing over the sight, cause blindenesse.

Chap. XLIII.

Sagina Spergula. Francking Spurry or Spurrewort.

These plants also as the former, I might as others doe, referre unto the kindes of Chickewēedes, but their qualities being not alike, nor the forme of them, but very little conformable, I must likewise for this worke disjoyne them, how soever for another they may be joyned.

1. *Sagina Spergula major.* The greater Franck Spurry, or Francking Spurrewort.

The greater Spurry or Spurrewort, sendeth forth divers small round and upright stalkes, scarse halfe a foote high, whereon at severall distances or joynts, grow many small and narrow leaves, set together in the manner of a starre, or the rowell of a spurre, whereupon came the name, the flowers are many, small, and white, standing at the toppes of the stalkes, which turne into small round heads, containing therein blacke seede, the roote is small and threddy, perishing every yeare after seede time.

2. *Sagina Spergula minor.* The lesser or Sea Spurry.

This Sea Spurry is not much differing from the former, but that it hath not so many long and narrow leaves set together at the joynts of the stalkes, which doe not rise fully so high, and doe somewhat more leane downewards to the ground, which together with the leaves are more white, and of a saltish or brackish taste, if it grow neere the Sea side, as most Sea plants are, otherwise nothing so hoary white, or brackish at all, the flowers likewise no lower, but of a white colour, and the seede blacke like the other, the roote is likewise, small, long and lowe, or hard, with small fibres thereat.

3. *Sagina Spergula minima.* The least Franck Spurry.

The smallest Spurry hath likewise divers weake stalkes, but somewhat bowing downe to the ground, seldome above an handfull high, full of joynts, and at every of them, two small short leaves, compassing them at the bottome, from whence come the stalkes and the leaves come forth other small leaves without number, towards the toppes of the stalkes from the said joynts come forth the flowers, every one upon a small foote stalke, which are of a pale blew colour, and sometimes more blew, or tending to a purple, after which come such like round heads with blacke seedes in them, as are in the former, the roote is small and long, with some fibres, or threds at it.

4. *Alsine sive Stellaria Monspessulanensium.* *French* Spurry, or Spurrewort.

The French Spurry is likewise not much differing from the last sort, but that the small short and narrow leaves, that stand at the joynts of the small low stalkes, are all of an equall length, and being stiffer and harder, are set thereupon in an equall distance, one from another like a starre, the flowers hereof are small, having five small pointed leaves laid open abroad like a starre also, but of a reddish colour, so that whether you respect the leaves or the flower, they both resemble a starre, and from thence tooke the name, and yet we know how many other herbes so called, much differing one from another.

The Place.

These all grow in dry sandy grounds, as well among the Corne in divers Countries, as in untilled and shadowy

Public Domain / http://www.hathitrust.org/access_use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

shadowy places, especially the first and second, although it is also found growing neare the Sea shore in the like places.

The Time.

They flower in *June* and *July*, and the seede is ripe usually in *August* before Harvest time.

The Names.

It is called *Spergula* of all those that have written thereof, except *Thalius*, who calleth it *Anthyllioides*, and *Fabius Columna*, who calleth the first, *Alsine tenuifolia altera, vel sylvestris altera, tricophyllos*. *Lobel* calleth it *Segina Spergula, a fœcundo ejus effectu*, from the Francking or feeding fat of cattle, and therefore he saith, that divers *Brabanders* and others in the Low Countries, did sow their grounds therewith, for the same purpose, to cause their Kine to give the more store of milke. *Raubinus* calleth them *alsine Spergula*. The last *Lugdunensis* maketh mention of, under the same name in the title. Both the *Dutch* and we in *England* call it Spurry, or Franck Spurry, for the causes aforesaid, but I do a little more explaine the names, in calling it Francking Sparrewort.

The Vertues.

The seede is held to be a provoker to vomit, and thereby to bring forth Begmaticke and foule slimy humours, that sticke in the stomacke, both troubling the body, and hindering digestion, and health. the herbe a little bruised and laid to the fingers, or other places that are cut, will speedily heale them, whereof the Country people in divers places, say they have had good experience. It fatteneth cattle as you have heard before, and so it doth also Pullaine, and as it causeth the Kine to give more store of milke then ordinary other wise, so it causeth Pullaine likewise to lay more store of egges, which is no idle conceit, for those of *Brabant*, and other the parts thereabouts have found it sufficient true, by their daily use and tryall thereof.

2. Great Spergula major.
3. Segetum sive Franck Spurry.

CHAP. XLIIII.

Asperula. Woodroofe.

There are two or three sorts of this herbe Woodroofe, whereof although some be common, and well knowne, yet the others are not so.

1. *Asperula odorata.* Common Woodroofe.

The Common Woodroofe, or Woodrowell, feedeth forth divers square stalkes, halfe a foote high or more, full of joynts, and at every joynt seaven or eight faire greene shining leaves, broader then those of Clevers, in a manner smooth or but little rough at all, at the toppes of the stalkes stand foure or five white sweete smelling flowers, made of five leaves a peece, laid open like a flare, after which come small round seede, a little rough, or cleaving to whatsoever it toucheth, the roote runneth creeping under ground, and shooteth up new stalkes round about it every yeare.

2. *Asperula flore cœruleo.* Woodroofe with a blew flower.

This Woodroofe hath seldome more then one round stalke, rising from the roote, set full of joynts, at every one whereof stand divers small and somewhat long greene leaves compassing it, not so smooth and greene as the former, and likewise small branches, from the bottome almost up to the toppe, set with the like leaves but smaller, where the flowers stand three or foure together, each upon a small foorestalke, which are of the like greenesse with the former, or rather somewhat lesse, and of a faire blewish purple colour, without any smell at all; and after they are past, in their places grow small round brownish seede, not rough at all, the roote is long somewhat hairy yellowish and fibrous, and perisheth every yeare, and from the seede when it falleth, springeth up new plants every yeare.

3. *Asperula purpurea.* Woodroofe with a purple flower.

This is very like unto the last, but with more store of stalkes, and fewer pale greene leaves at the joynts then, having purplish flowers, and small fat oylie seede.

4. *Asperula Alsines minima.* Small thorny Woodroofe.

This small Woodroofe, (which doth in my judgement, better resemble *Galliums* then *Asperula*, for layeth others so call it, I am content to let it so passe also) hath divers square rough, and upright stalkes, about halfe a foote high, which are in a manner transparent, being full of joynts, and at every joynt sometimes foure or five small rough greene leaves, somewhat hairy and harder in taste: at the joynts above the leaves come forth the flowers, round about the stalkes, at certaine distances upto the toppes of them, which consist of foure small yellowish leaves, the roote is threddy and small, perishing also every yeare in these Countries.

Original from UNIVERSITY OF MICHIGAN

1. *Asperula vulgaris.*
Common Woodroofe.

2. *Asperula cærulea.*
Woodroofe with blue flowers.

The Place.

The firſt is found in the open woods of *Germany* and other places oftentimes, but is moſt uſually planted in gardens, as the ſecond is alſo. The third groweth as well in the fields as gardens, about *Lyons*. The laſt *Columna* ſaith, lee found in ſtony or rockie places, on the hils *Vulcenſes*, which are in the Kingdome of *Naples*.

The Time.

They doe all flower early, even about *May*, and their ſeede is ripe while they are yet in flower, or preſently after.

The Names.

The firſt generally called *Aſperula*, *Aſperula* or *Sperugula*, & *odorata* is put to the laſt, to diſtinguiſh it from the other, and not mentioned by any of the antient writers, except it be as *Geſner* in *Catalogo Plantarum*, thinketh it to be *Aſperula* name of *Plinie*, in his 26. booke, and 9 chap. and ſome others that tooke it to be *Abſynthium Caninum*, but unproperly: the firſt hath beene diverſly taken, of divers of the later writers, for *Brunfelſius* calleth it *Gallium*, or *Herba Stellaris*, and *Hepatica quarta*. *Tragus*, *Cordus*, *Lonicerus*, and *Tabernæmontanus* call it *Aſperula*, *Tabernæmontanus*, *Lobel*, and *Lugdunenſes*, *Aſperula*. *Cæſalpinus* and others *Aſperula odorata*. *Tragus* in *Adversaria* ſeeth *Asperula odorata* to be *Aſperula*, *Cordus* upon *Dioſcorides* *Aſperula ſylveſtris quadam*, *Geſner* in his *Appendix Rubia ſylveſtris*, *Lonicerus*, and *Tabernæmontanus* *Hepatica ſtellata*; but generally now adayes it is called of moſt men *Aſperula odorata*, although it hath not ſmall ſtrength at all, ſave only as I ſayd in the ſeede: the *Italians* call it *Aſperula*, the *French Muguet*, the *Germanes Hexenkraut*, *waldkraut*, & *Leberkraut*, the *Dutch Walderſtroo*, and in *Engliſh* Woodroofe, and Woodroofell: the ſecond is called *Aſperula cærulea*, by *Lugdunenſes*, *Lobel*, *Tabernæmontanus*, and *Lonicerus*, and one *Engliſh Turner* calleth it *Aſyſſon*, and to doe others alſo but falſely. *Ruellius* calleth it *Aſperula rubella arvenſis*: the third is called *Asperugo alteri ſimilis Italica* by *Lugdunenſes*, and *Aſperula hepatica purpurea* by *Bauhinus*. The laſt is called by *Columna* *Aſperula verticillata cærulea*, but not ſo well by *Bauhinus* *Aſperula verticillata cærulea*.

The Vertues.

The *Germanes* doe eſteeme very highly of this Woodroofe, uſing it very familiarly in wine, like as we doe *Borage*, to make the mind merry, and to helpe the ſtomacke dejected, unto a good appetite. Both the *Liver* being opprelſed and obſtructed; it is held alſo to be good againſt the Plague, and to expell the noyſome vapours that are received into the heart, and to arme it againſt infection:

CHAP. XLV.

Gallium. Maidenhaire, or Ladies Bedstraw.

OF *Gallium* Ladies Bedstraw, there are diverse sorts, some growing with us, others were not brought from other places, all which is to that we should joyne in one chapter, as followeth.

1. *Gallium luteum vulgare.* The common Ladies Bedstraw.

This Ladies Bedstraw riseth up with divers small browne and square upright stalkes, a yard high or more, sometimes branched forth into divers parts, full of joynts and with divers very small leaves, at every one of them, little or nothing rough at all: at the toppes of the branches grow many long tufts or branches of yellow flowers, very thicke set together, one above another; from the lowest joynts, which consist of foure small leaves a peece, which smell somewhat strong or rebious, yet not unpleasant: the seede is small and blacke, like Poppie seede, two for the most part joyned together: the roote is yellow, and hath many small shreds fastned unto it, which take strong hold of the ground, and creepeth a little wise, so the branches leaning a little downe to the ground, take roote at the joynts thereof, whereby it is easily encreased.

2. *Gallium flore rubro.* Red flowred Ladies Bedstraw.

This small plant hath slenderer and lower stalkes than the former, yet divided into many branches, whose joynts stand 4, 5, or 6. long leaves, and not of so darke a greene colour: the flowers are of a red colour, and thicke set together as the former, consisting of foure small pointed leaves, with a yellow pointel in the middle, but 5. or 6. or more standing together at the toppes of the branches at the most, which afterwards turne into small blacke seede like the former; the roote also is reddish like it, but greater and creepeth more deepe into the yeerth, and neither dyeth. Like hereunto is that *Gallium nigro-purpureum montanum tenuifolium* of Lobel, which therefore I doe but only remember here, not thinking it to be a differing *species* from it, although the flower bee in some places a little darker, they are so like in all things, although *Bauhinus* doth make two divers.

3. *Gallium flore albo major sive Asperugo montana.* Mountaine white flowred Ladyes Bedstraw.

The white flowred *Gallium*, which is the greater *Asperugo*, shooteth forth from the roote, which is great, and very threddy or fibrous, a number of slender and weake stalkes, which yee stand upright of themselves, diverly branching forth into many parts, so that it maketh shew of a pretty well spread bush, having many thinner and broader smooth greene leaves, set at the joynts, than any of the former, or the next that followeth: the flowers

1. *Gallium luteum.*

...red and white, standing at the toppes of the ...are more thickly or plentifully set then the other, ...ed flowers before, which likewise turne into ...ll downe until seede.

...The common white ...Ladies Bedstraw.

...ing like the last, but that the branches ...are so weake, that unlesse they be sustained by the hedges, or other things neere which it groweth, it will lye ...downe upon the ground, and the leaves are smaller and narrower, yet not so small as in the former, with yellow ...flowers, the flowers are likewise small and white, but not so thickly set thereon: and the roote threddy and ...stringy, may also make a smaller sort hereof, which ...may be proper herein, for upon transplanting it will ...grow to grasse as the last.

...Mountaine Cardy Gallium.

...Gallium montanum Creticum groweth like the ordinary ...but much taller, with greater rootes and branches: it is ...smoother, and lesse then the other, it is but and ...thereon liyons leaves of blood.

...Another (small ...Cardy Gallium.

...The roote is small and woodily; it hath two or ...three small long leaves, broad pointed and whitish, ...leaves standing at ...

...The place.

...The hill and dale sides are frequent in many places of ...this Land, in Meddowes and Pastures both wet and dry, ...and by the hedges: the second was found in Italy, as ...Clusius saith, and Cesalpinus in the Kingdome of Naples: the third is found in Germany, on divers hils there, ...for Matthiolus saith.

...The Time.

...All these are in flower in May, for the most part, yet ...that with the red flowers is later then the other, & flowereth two small time, the seede is ripe in July and August.

...The Names.

...It is called in Greeke ...and in Latine also Gallium, or as others have it ...Galium, and as Dioscorides ...hath it some ...Galeriza and Galeoza, and was so called from the effect, which is to cause the ...milke to gather into a curd, when they let it to make cheese; and therefore in many Countries, as well here as ...in other places, they call it Cheese-renner, and serveth for that purpose very well. The first is generally called ...of all writers, with the variation Gallium, and Gallium luteum. The second Clusius hath made mention of, and ...then Cabinus by the names for me ly set downe. The third is the Mollugo montana of Dodonæus, Clusius, Lobel, ...Lugdunensis, Pena, and Tabernæmontanus, Cesalpinus calleth it Rubia sylvestris altera, & mollis in his Appendix, ...and is the second Matrisylva of Tragus. The fourth is the Mollugo vulgatior herbarijorum of Lobel, and the ...Mollugo minor Dodonæi, Lugdunensis, and Tabernæmontani; it is Tragus his third Gallium, and called of Ta...bernæmontanus, the Wood and white Gallium album. The two last are mentioned by Matthiolus in his book de plantis Sylvestribus. The former all in Dutch, the Spanish Coninckle gerste; the French Petit Muguet; the Germane Wald...stro, and Lungen wurtz; Bruisse and Magerkraut, of helping of the dry scabbe in children, which they call Mougeon; the Dutch wealstroo, and we in English, our Ladies Bedstraw; according to the Germane name, or Cheese-renne, and Maidenhaire in diverse Countries of this Land.

...The Vertues.

...The whole herbe, I meane the common Ladies Bedstraw, being drunke, is used by divers, to help ...to provoke Vrine, and thereby to ease and breake the stone: the same also drunke helpeth to stay inward bleedings, wounds, ruptures, inward wounds, by the drying and binding qualities therein, the herbe as the flowers being ...united, and perhaps also the seede, stayeth their bleeding likewise. Dioscorides writeth that the roote is good ...to provoke bodily lust, and some say the flowers doe so also: the flowers and the herbe likewise made into an ...Vnguentum, or oyle, to be infolated or set into the sunne, and changed after it hath stood some reasonable ...time, as such herbs are made into an oyntment, it must be boyled in Axungia, or fasting oyle, with some ...Wormeseed therein after it is strained, which will helpe burnings with fire, and scaldings with water: the ...same allayes the swellings of the limbs and members, is good to bath the feete of travellers, who are surbated ...or tyred, and of Ladies or other like, whose running long, causeth not onely wearinesse, but stiffenesse in ...their knees, and joynts, for which cause the decoction warme is very available, and is of the oyntment to use ...afterwards: the meate also well layd before, helpeth the dry scabbe, and the itchim children, whereof the Ger...mane Housewives daily experience: these sorts with white flowers have beene thought unprofitable, and of ...small use, but those with the yellow flowers, the Dutch women in Austria, Hungaria, and other places in Germany, that gather herbes ...and roots to set forth Garlands that weare them, bringing them to the market to sell, calleth it Cleinkruit, and by their ...experience have found it good, for the lose wes, aruties, and joynes, to bathe them therewith, both to take away ...that wearinesse, and weakenesse in them, and to comfort and strengthen them also, after travaile, cold, or paines,

Chap. XLVI.

Cruciata. Crossewort.

WE have formerly knowyne but one sorte of *Cruciata* Crossewort, but because I find two other herbes neere in forme thereunto, and it may be in property also, as the rule may induce one to thinke, I have placed them together.

1. *Cruciata vulgaris.* The common Crossewort.

The common Crossewort groweth up with square hairy browne stalkes, little above a foote high, having foure small broad, and pointed, hairy, yet smooth not rugged yellow greene leaves, growing at every joynt each against other crosse wise, which hath caused the name, towards the toppes of the stalkes at the joynts with the leaves in three or foure rowes upwards stand small pale yellow flowers, after which commeth small blackish round seed, foure for the most part for in every huske, the roote is very small and full of fibres or strings taking good hold of the ground, and spreading with the branches a great deale of ground, which perisheth not in the winter, although the leaves do downe every yeare, and spring againe anew.

2. *Cruciata minor lutea.* Small yellow Crossewort.

This small plant is like the other, but smaller, and not hairy, having smooth pale greene leaves, with yellow flowers.

3. *Cruciata minor rubra.* Small Crossewort with bluish flowers.

This small Crossewort (for so I take it to be rather then *Gallium* as *Columna* entituleth it) hath divers small weake branches, lying at the first upon the ground, but afterwards raising themselves up on high, and bearing many leaves full of joynts, and foure leaves usually at them, the lowest very small and short, but those that grow more upwards to the middle of the stalkes, are larger and longer, and from the middle upwards much longer, and towards the tops but two leaves, long and narrow standing at a joynt, which joynts are more seperate one from another then below, all of them smooth, and not hairy at all as the stalkes are likewise the flowers stand at the toppes of the branches, in a thinne or sparsed umbell, as the small Centory, or Saint *Iohns* wort doth, which have somewhat a long and hollow trunke, and then end in foure small leaves of a bluish colour, very like for their forme, as well as for their sweetenesse, unto the flowers of the white or yellow *Iasmine* but lesser then they, and larger then any flowers of *Gallium*, after which come small rugged and somewhat crooked and long seedes, two alwayes set together, greater then those of the former, and of a yellowish colour, the roote is long and great, in respect of the plant, with divers fibres set thereat, of a brownish colour on the outside and white within.

1. *Cruciata vulgaris.* Common Crossewort.

4. *Cruciata minima montana.*
The leall Crossewort.

The least Crossewort hath many small square stalkes, smaller at the bottome, and greater upwards, sometimes reddish and somewhat hairy also, set full of joynts, and at every one of them, foure small leaves, one against another, in manner of a crosse; from those joynts likewise upwards, come forth the flowers, of a pale greene colour, consisting of foure leaves, but set in such a manner that they are scarce to be discerned from the threds, that stand with them, for one part seemeth to be a body or belly, with prickes thereon, another a head shewing to be prickly also, but not hurting, and the rest which are as it were beards, seeme to be armes, which when they are withered, seeme to be bearded: after they are past come small heads, or swelling round vessels, which were the bellies of the flowers, wherein is contained small round yellowish seede like Pannicke seede: the tolle of the whole plant is somewhat bitter and harsh: withall the roote is as small almost as a thred with some small fibres at it.

The Place.

The first groweth in many moist grounds, as well meadowes as untilled places about *London*, in the Close at *Hampsted* neere *London*, at *Wye* in *Kent*, at *Kenet*, and neere *Kingsmore* in *Sussex*, among the bushy wast, as in sundry other places. The second groweth under the hedges about *Bononia*. Fab. as *Columna* saith that it also groweth in the open hils in *Naples*, and the last in the ruines of the walls of *Dunkirke*, his seate in *Flanders*, and some other places thereabouts.

The Time.

They are all in flower from *May* all the Summer long, in one place or another, as they are more open to the Sunne, and the seede ripeneth soone after.

The Names.

It hath no Greeke name that we know, being unknowne to the ancients; it is called in Latine *Crucianella*, and *Cruciata*, of the situation of the leaves, as I said before, and so doe most other writers, *Tragus* calleth it *herba*

herbe, and *Lobel Crucifera minor*, to differ with it from the *Gentiana crucifera*. *Lugdunensis* calleth it also *Aspera folio Asperi*, and *Tragus* maketh it his second kind of *Gallium*, for his *Crucifera* is *Gentiana crucifera*. *Bauhinus* calleth it *Crucifera hirsuta*, the *French* call it *Croise*, the *Germans* Golden *Waldmeister*, the *Dutch* Croysette, and most of English Crosseworte and Golden Crosseworte. The second *Rembert* in his *Pemptades* describeth by the name of *Gallium latifolium glabrum*, but in his *Florax* he calleth it *Crucifera glabra*. The third *Columna* calleth *Gallium verum latifolium cruciatum*, but because I thinke it doth more truly represent a *Crucifera*, by the fashion of the leaves, I have called it *Crucifera montana*. The last *Columna* calleth *Crucifera nova Romana* with sundry, and *Caspar Crucifera minima in scriptis*.

The Vertues.

The Crosseworte is of a binding and drying propertie, and is accounted as singular a good wound herbe almost as any, and is used inwardly not onely to stay bleeding of wounds, but to consolidate them, as it doth outwardly the greene wounds, for by closing the lippes of the wound together it is quickly healed. *Conserve* thereof helpeth to expectorate phlegme out of the chest, and is good for the obstructions in the brest or stomacke, or in the bowels, or mesaicke veines, and helpeth a decayed appetite, to use the decoction of the herbe in wine: the same serveth also to wash or bathe any wound, or running moyst sore, to cleanse and heale it: the herbe bruised and then boyled and applyed outwardly for certaine dayes together, renewing it often, and in the meane time, the decoction of the herbe in wine taken inwardly every day, doth certainely cure the Rupture many times, if it be not too inveterate, but very speedily if it be fresh and lately taken.

Chap. XLVII.

Aparine, Goose grasse, or Clevers.

The herbe that is usually called Goose grasse or Clevers, is of two sorts, one which is rough, which is knowne to all; the other not rough at all, which is not so well knowne or observed by many, of which there are some varieties which I shall entreat of in this Chapter, but of a greater kind, whereof *Gerard* maketh mention, we know not of, but are sure this figure exhibited, is of a wilde Borrage, which *Lobel* calleth *Alyssum Germanicum Echioides*, as *Bauhinus* also testifieth.

1. *Aparine vulgaris.* Common Clevers.

The common Clevers hath divers very rough square stalkes, not bigger then the tagge of a point, but rising up to bee two or three yards high sometimes, if it meete with any tall bushes to run upon, whereon it may climbe (yet without any claspers) or else creeping over or lying upon the ground full of joynts, and at every of them shooteth forth a branch beside the leaves there set, which are usually six, set in a round compasse like a starre, or the Rowell of a Spurre, from betweene the leaves at the joynts, towards the toppes of the branches come forth very small white flowers, every one upon a small threddy footestalke, which after they are fallen, there doe have two small round rough seedes joyned together like two eares, which when they are ripe, grow hard and whitish, having a little hole or hollownesse on the side, somewhat like unto a Navel, both stalkes, leaves and seede are so rough, that they will cleave to any thing shall touch them, the roote is small and very threddy, spreading much in the ground, and abideth very yeare.

1. *Aparine vulgaris.* Common Clevers.

Semina Coriandri sativi.

2. *Aparine laevis.* Smooth Goose grasse.

The fourth Goose grasse groweth like the former, but that it is not growen so high, nor are the leaves so great, and not at all rough, or sticking to what it toucheth: the flowers are whyte and white as the former, and give such like seede, but smooth also, and not rough as the former. There is another little differing from this in any other matter, but the seede which is rough like unto a Coriander Comfit.

3. *Aparine flore purpureo.* Purple flowred Clevers.

This kinde of Clevers is in all things like unto the former, save onely the colour of the flower, which in this is purple, in the other it is white.

The Place.

The common sort groweth by the hedge and ditch sides in many places of this Land, and every where also in Gardens, where it is a weede of much labour to weede out, for it will runne upon every thing groweth next unto it, and be ready to choke and oppresse it, shadowing the seede if it be suffered to grow. The second was brought me out of *Spaine*, but the last is as great a stranger.

The Time.

They doe flower in *June* and *July*, and the seede is ripe and falleth againe by the end of *July*, or in *August*, not leaving any store from the roote, but from the shaken seede.

Original from UNIVERSITY OF MICHIGAN

The Names.

It is called in Greeke [illegible] *Asparine*, and so it is in Latine also usually, but it hath divers other Greeke names, as [illegible] and [illegible], as *Galen* saith out of *Hippocrates*, and as *Dioscorides* saith [illegible], as it is falsely read in many copies of *Galen*, *Pliny*, *Paulus Ægineta* and others, for [illegible], in Arabicke, and the seede is Navell fashion, whereof came the name; yet some have it [illegible]. It is called also [illegible], *quasi Hominis amans*, and [illegible] for the same cause: *Pliny* calleth it *Lappago laxior*: it is *Lappago sylvestris*, whereof this being one sort, is called *Asperago*, because the leaves are rougher then the other *Mollugo*, because they are soft: but *Pliny* his words concerning *Mollugo*, seemes not to be sincere, as his copies extant doe declare: I have therefore thought it fitter to referre the *Mollugo* (or that which were so call) unto the kinds of *Gallium*, then unto this *Asperine*, because we have a smooth *Gallium*, which is not the *Mollugo*, of which smooth *Asperine* I finde no author to make mention but *Tragus* only in his *Basilisca* himselfe in his *Fruits*, which is an enumeration of all plants, that were either set forth by any other Author, or that himselfe knew or heard of: The *Italians* call it *Spergnella*, the *Spaniards Prassia*, and *Hierua rolana*, the *French Rubie* and *Gratteron*, the *Germans Clebkraut*, the *Dutch Kleefcruyt*, and we in English Cleavers, grosse and Clevers.

The Vertues.

Clevers are hot and dry, *Dioscorides* saith and *Pliny* from him, that the juice of the herbe and seede taken in wine, helpeth those that are bitten with Vipers, or the great Spider *Phalangium*, by preserving the heart from the venome; *Galen* saith it clenseth meanely and dryeth, and is of subtill parts: it is familiarly given in broth to keepe them leane and lanke, that are apt to grow fat. *Tragus* saith, that the distilled water drunke twice a day helpeth the yellow Laundies, and the decoction of the herbe is found by daily experience to doe the same, and stayeth Laskes and Bloody fluxes; the juice of the leaves, or they a little bruised and laid to any wound, or place that bleedeth, will stanch the blood; and *Matthiolus* saith, that the juice is much commended and used to close the lippes of greene wounds, and to drie the powder of the dryed herbe strawed thereupon, and likewise helpeth old Vlcers being first well washed *Antiqua* and anointed, it healeth all sorts of hard swellings, or kernells in the throate: the juice dropped into the eares taketh away the paines of them: the herbe itself well the Country people in stead of a strainer, to cleare their milke from flies, wormes, or any other thing that falleth into it.

Chap. XLVIII.

Camphorata. Sinking Groundpine.

THere are two or three sorts of this *Camphorata*, or sinking Groundpine which I think fit to follow the former herbes, because of some resemblance in forme as well as in vertue.

2. *Camphorata major Monspeliensium.* The greater sinking Groundpine.

3. *Camphorata minor sive Asterolithos Dioscoridis.* Groundpine not sinking.

1. *Camphorata major Monspeliensium.* The greater sinking Groundpine.

The rough or greater kind of *Camphorata* shooteth forth many slender and pliant feathered round stalkes of leaves, parted into many branches from the very ground, growing upright to be about a foote and a halfe high or more, thicke set with joynts by certaine spaces, and many very small thicke and narrow whitish greene leaves at them, round about the branches, very like unto the leaves of the *Tamariske* tree, but longer below then they are up higher, which being broken or bruised betweene fingers smelleth somewhat strong, resembling *Camphire*, as many doe take it, and of a drying unsavory taste: these have not beene seene flowers or seede observed, but is increased by slips

ging the branches; the roote is somewhat great, thicke and wooddy, blackish on the outside, with many fibres at it.

2. *Camphorata minor.* The lesser stinking Ground pine.

The lesser *Camphorata*, hath many slender and weak stalkes lying or bending to the ground in a compasse, with divers couples of small long leaves, set at spaces, as in the former, of a yellow greene colour, especially towards winter, when the tops of the branches also will be reddish with some woolinesse thereon, whereon divers flowers do stand together, as it were in a tuft, consisting of five small white leaves a peece; after which arise small seed vessels, of the bignes of two barley cornes, wherein is enclosed very small seede: the roote is greater and longer then the proportion of the plant above ground may seeme to allow, of a reddish yellow colour on the outside, with many fibres thereat: the whole plant both leaves, flowers and seede, are of a strong and gleeuous sent, and of a very sharpe and quicke taste.

3. *Camphorata tenuior sive Anthyllis altera Italorum.* Ground pine not stinking.

The other Ground pine that smelleth not so strong as the former sorte doe, groweth upright in the same manner with divers, upright slender stalkes, and many small leaves set at the joynts, some of them more longer and some shorter then others, all covered with a small woolinesse: the flowers are very small, standing many together at the toppes of the branches, of a pale yellowish colour, and of an altringent and drying taste.

The Place.

The first groweth neare unto *Montpelier*, and *Narbonne*, especially out of the rifts and chinkes of the old walls of the *Amphitheater* there, and seldome in any other part of *France*, or *Italy* as *Lobel* saith; yet *Lugdunensis* saith it prospereth better in fertile and moyst places, then in such as are barren and dry. The second groweth both in sandy dry grounds, and in rotten unearthly grounds likewise: The last groweth in many places of *Italy*, but whether naturally of that country or no, is not signified, but they there keepe it in their gardens, where most usually it is to be seene.

The Time.

All these flower very late, or not at all with us, and are very hardly preserved in the winter, being tender, requiring most to hot and dry places.

The Names.

None of these plants were knowne to the antient writers, either Greeke, or Latines, by any the names of their kindes knowne to us now a dayes; the name *Camphorata*, is taken from *Camphire*, because the sent is thought to be like unto *Camfire*, as divers doe imagine, but surely then it smelleth otherwise in the hotter countries then they doe in ours, for with us the former two have a grievous heady sent, yet nothing so fierce, and quicke in my judgement as *Camfire* is: *Anguillara* saith, and others afterwards, as also *Pena* and *Lobel* referre the former unto the *Chamepeuce* of *Pliny*, whereof he maketh mention in his 24 Booke and 15. Chapter, saying that *Chamepeuce* hath leaves like unto the *Laurell* tree; but *Lugdunensis* saith, that divers did rather referre this to the *Selago* of the said *Pliny*, mentioned in his 24. Booke and 11. Chapter, where he saith that *Selago* is like unto *Savine*: Divers also tooke it to bee the *Cneorum tragum* of *Dioscorides*, and *Theophrastus*, but the learned of *Montpelier*, called it *Camphorata major*, and so doth *Lobel* call it *Camphorata Montpelliensium*. *Tragus* calleth it *Camphorata Italica*, whereas according to *Lugdunensis* his description, the roughnesse belongeth rather to the stocke of the stalkes and leaves, and not unto this herb. Divers also tooke it to bee *Erica prima genus*, a kind of Heath; others to be *Thymum mastichina*, and some also to be that *Abrotanum* that *Tragus* doth set forth, by the name of *Sabina Germanica*. Our *London dispensatorie*, or *pharmacopœia Londinensis*, in the description of *Unguentum Arthriticum*, maketh *Camphorata* to be *Abrotanum*, which is utterly untrue, yet I thinke it may very well be substituted in the roome thereof for that ointment: and *Lugdunensis* also saith, that divers did referre the second herbe here called *Camphorata minor*, *Dalechampij*, to the *Chamepeuce* of *Pliny* aforesaid: but *Bauhinus* calleth *Camphorata glabra*, as though this were smooth, which as I said before is contrary: The last is called *Anthyllis altera*, by *Anguillara* and others: The learned in *Italy*, as *Lobel* in his observations saith, referre it to the second *Anthyllis* of *Dioscorides*; but because as he there saith it is not sweet as that second *Anthyllis* of *Dioscorides* should be, hee doth rather judge the *Tertia Matthioli Montpelliensium* to be the truer *Anthyllis altera*, then this *Anthyllis Italorum*. *Gerard* hath much erred in calling this *Anthyllis tenuifolia*, and yet his figure doth expresse this *Anthyllis Italorum*, and not *Anthyllis tenuifolia*, although his description doth. *Bauhinus* calleth it, as *Lobel* and others before him have done, *Camphorata compacta*, & *Tabernæmontanus Camphorata altera*.

The Vertues.

These herbes are all of them of a drying faculty, and are very profitably used inwardly to stay defluxions from the head, that fall into the eyes, and upon the lungs: and outwardly in bathes, to allay running humours that rest in the joynts, as the Gouts, Crampes, Cattles, and Aches; it is no lesse effectuall for the Nerves and Sinewes to comfort and strengthen them, so be made into a salve or ointment; and is available both in fresh wounds, and old running ulcers and sores; and therefore divers doe account it of the same propertie with Southernwood for all the purposes aforesaid unto it is used.

CAP. XLIX.

Coris. The faire Heath Low Pine.

THere are three sorts of herbes called *Coris*, the one *Matthiolus* first set forth, and made known, the other *Dioscorides Belon* of *Candy*, and *Penn* and *Lobel* set out the last, which are as followeth.

1. *Coris Matthioli. Matthiolus* his faire Heath Low Pine.

This springeth up to the height of a foote or more, with divers hard, woodily, reddish stalkes, full of joynts, and many small and long sticke, fat leaves, set together as every of them somewhat like unto the *Spergula*, or Francke Spurry: at the toppes of the stalkes, stand divers flowers, either them upon a short foote stalke, consisting of five or six leaves, somewhat like unto *Hypericum*, S. *Johns* wort or *Ornithogalum* Starre of *Bethlem*, as *Lobel* compareth them, but of a whitish red colour, with yellow threds in the middle; yet *Matthiolus* and others say, the flowers are all yellow like *Hypericum*, smelling somewhat sweete, the seede is enclosed in round heades: the roote is somewhat long and woodily, with many thready fibres thereat: this keepeth his greene leaves all the winter, but turne somewhat of a yellowish red colour towards Autumne or seede time.

2. *Coris longifolia Cretica Belli.* The *Candye* faire Heath Low Pine.

This *Candye* as *Belon* saith, groweth to be a cubit and a halie high in good ground, branching forth many wayes, and bearing many small leaves, like unto Heath on the woody stalkes and branches: the flowers at the toppes, are not unlike to S. *Johns* wort and yellow, which passe into seede enclosed in huskes like unto the roote is long, spreading, and woodily, abiding with greene leaves thereon all the winter.

3. *Coris Monspeliensium.* The purple faire Heath Low Pine.

This faire Heath Low Pine, riseth up likewise, with many round woodily and reddish stalkes, not so high as the former, having many small, long, thick, & roundish leaves set thereon without order most commonly, & sometimes conformable one unto another, somewhat like unto the great kinde of Heath: the tops of the stalkes are hored with a great spiked tuft or bush, of purplish blew flowers (but pale red with us) smelling somewhat sweete, each consisting of foure leaves a peece, double forked as it were at the ends, two whereof that stand uppermost are greater than the other two that are lower, which will abide long in their perfect colour, being gathered

1. *Coris Matthioli.*
Matthiolus his faire Heath Low Pine.

2. *Coris foliis longis Cretica Belli.*
Candye faire Heathie Low Pine.

their prime, and each of them standing in a brownish huske, parted at the toppes into five points, and spotted with five blackish spots, on the outside, wherein afterwards groweth the seede, which is small round and blackish, wrapped up as it were in many coates or filmes, whose huskes then doe grow somewhat hard and sharpe at the ends, when as before, while the flower lasted, they were not so: the roote is reddish, and somewhat woody, greater than the proportion of the plant should seeme to require; giving a dye or colour, not onely to the fingers of them that touch it, but serveth also to dye leather withall, for those where it groweth naturally: the also tinctureth the water, although the leaves are then more reddish than in Summer, but requireth some care to preserve it with us.

The Place.

The first groweth in many places in *Italy*, in dry grounds and hills, as *Matthiolus* saith, and *Tena* seemeth to confirme the same, in giving a more exact discription thereof, than *Matthiolus* did: *Camerarius* saith it groweth by *Carara*, a Village in Greece: the second in *Candy*: and the last neere *Montpelier*, and the parts thereabouts, as *Tena* saith, and *Clusius* saith, he found it in the dry grounds about *Salamanca* in *Spaine*, and neere the sea also in *Valentia*, and by *Montpelier*.

The Time.

They flower early in the hot Countries as *Clusius* observed, some as soone as March in some places, as in May in others; but late with us, and seldome doe perfect their seede.

The Names.

It is called in Greeke κόρις, and as *Dioscorides* saith, of some in his time *Hypericum*, and in Latine *Coris* also: *ob pulchritudinem videtur sic, quasi virgo pudenter duci possit*, saith *Pena*, *quia sit pulchella, & perquam bilaris est: vernat Kalendis Aprilis, & aestate, tunc idest, propullulat, vegetatur, propter semen, acuto pappo, sed quorsum haerere cristatum, mobili sphaerico folio absimile, cum modo in hac Monspeliaca cernatur.* The first is called *Coris Matthioli*, by *Camerarius*, *Gesner in hortis*, *Lacuna*, *Lonicerus*, *Lobel*, *Lugdunensis*, *Tabernamontanus* and others; *Ruellius* calleth it *Coris dubia*; the second *Honorius Bellus*, in his first Epistle to *Clusius*, calleth *Coris legitima*, *vera prolis*, and contendeth against *Bellonius* for that in his first booke of Observations, and 17. chap. he saith, that the roote of the *Coris* which he found in *Candy*, having yellow flowers, is very unpleasant, whereby *Bellus* doth presume that *Bellonius* did never see this true *Coris*, for the cause aforesayd; that is, the unpleasantnesse of the roote, but that it was *Alsyroon seriberi similis* which *Bellonius* saw, and called it *Coris*: and therefore I also suspect, *Dodonius* hath not so rightly referred, *Honorius Bellus*, his *Coris inginuna*, to this first *Coris Matthioli*, but should rather have made it agree with the *Monspeliaca*, or *Hispanica*, of *Lobel* and *Clusius*, in regard of the manner of the growing and posture of the leaves: the other is called *Coris Monspeliaca*, by *Pena* and *Lobel* in their *Adversaria*, and so also by *Camerarius* and *Tabernamontanus*, and by *Clusius*, *Coris quorumdam*, *Ferramoli* calleth it *Coris serpilli modo minus*; and saith that although *Clusius* did suspect that the *Symphytum petraeum* of *Alpinus Matthiolus*, was this *Coris*, yet assuredly, saith he, it was a differing plant, and was brought him from the same place, where *Matthiolus* saith his did grow. *Clusius* saith that the *Spaniards* did call it *Pinzel* in their language, and *Bellus* saith that they in *Candy* called his sort *Orpilosaren*, *vitell*, *barba virgilo*. I have given heretofore to weake upon the other in the last Chapter, such as *English* names, as I thinke are proper unto them.

1. *Coris Monspeliensium.*
Purple fairy Heath Low Pine.

The Vertues.

The vertues especially that of *Monspelier*, is hot and bitter, and somewhat sweete in sent withall, and is very good to procure the Vrine, and womens courses that are stopped, and for the strangury, if the bladder be not exulcerated: the leaves boyled in wine or broiled and drunke therein: the decoction thereof or the seede it selfe drunke, is knowne for those that have beene bitten with the venemous Spider called *Phalangium*, as also for dimpsies are prescribed with the Goute or Sciatica to be bathed therewith, or made into an oyle or ointment: it helpeth all the Cruptions or shaking fits of agues, taken in with some pepper: It is often used also in oyntments and salves: the ashes of the same is used to heale any old or running sores, and to dry up the moysture of them which hinder their cure.

Chap. L.

Hypericum. S. *Iohns* wort.

THe ordinary S. *Iohns* wort is well knowne at this day to every, but there are foure other sorts brought to our knowledge, which *Dioscorides* and the other ancient writers, knew not besides the *Ascyron*, and *Androsæmon*, which are to be accounted other seuerall kindes, thereof, but larger: each whereof shall be declared in their order.

1. *Hypericum vulgare.* Common S. *Iohns* wort.

The common S. *Iohns* wort shooteth forth, brownish, upright, hard, round stalkes, two foote high, spreading many branches from the sides, vp to the toppes of them, having two small leaues, set one against another, at every place, which are of a deepe greene colour, somewhat like unto the leaues of the lesser Centory, but narrower, and full of small holes in every leafe, which cannot be so well perceiued, as when they are held vp to the light: at the toppes of the stalkes and branches, stand yellow flowers, made of fiue leaues a peece, with many yellow threds in the middle, which being bruised doe yeeld a reddish fayre like blood: after which come small round heads, wherein is contained, small blackish seede, smelling like Rosin: the roote is hard and woodily, with diuers strings and fibres at it, and of a brownish colour, which abideth in the ground many yeeres, shooting a new every Spring.

1. *Vulgare.* Ordinary S. *Iohns* wort.

2. *Hypericum minus erectum.* Small upright S. *Iohns* wort.

This small S. *Iohns* wort, is very rare to meete withall, being like the former, but that it is smaller, yet the leaues doe not fully answere the forme of the former, but are a little broader and not so sharpe pointed; the stalkes are reddish and the flowers smaller, and not fully so yellow, nor giue so bloody a colour, when they are bruised betweene the fingers, and sometimes stand in circles at the ioynts of the stalkes as well as at the toppes: the seede is reliketh as the former, and the roote long lasting also.

3. *Hypericum minus supinum.* Small creeping S. *Iohns* wort.

This other small S. *Iohns* wort, differeth little from the last small sort, hauing reddish stalkes, not aboue an hand breadth high at the most, not standing fully vpright, but leaning downewards, with small narrow smooth leaues, and small yellow flowers.

4. *Hypericum perforatis folijs.* Round leafed S. *Iohns* wort.

This little S. *Iohns* wort, is as small an herbe as the last, whose small reddish square branches, rise no higher than

3. *Hypericum tenuifolium erectum Hispanicum.* Small woolly S. *Iohns* wort.

Minor

a having two leaves set one against another, at every joyne up to the toppes: and are almost round, like unto Money-wort or heathe two sides, of a darke or sad greene on the upperside, and whitish underneath, spotted sometimes with reddish spotts and streakes: the flowers are of a paler yellow colour, than the former, but somewhat large in comparison of the plant, with divers yellow threds in the middle: the roote is small and long.

1. *Hypericum tomentosa anglicum Hispanicum.* Great woolly S. *Iohns* wort.

The greater woolly S. *Iohns* wort, hath divers hayrie, whitish woolly branches, lying upon the ground, and shooting forth fibres, very thicke set with such like leaves, as the Common S. *Iohns* wort hath, but hoare, white, and woolly, as the joynts towards the toppes, and at the toppe also, stand paler and smaller flowers than in the common; after which come seede vessels like unto the other sorts, and so is the seede, and woodly roote.

2. *Hypericum supinum tomentosum minus.* Small creeping Woolly S. *Iohns* wort.

The lesse woolly S. *Iohns* wort, is in most things like the greater, but that it is smaller, the branches having the woolly leaves, not so thicke set together, smaller and rounder than the former.

3. *Hyperico frutescens Americanum flore albo, Indian* S. *Iohns* wort, with white flowers.

The *Indian* S. *Iohns* wort, riseth up with sundry woodly stems almost to a mans height, covered with a whitish barke, from whence spring up all sides, divers branches, set thicke with greene leaves, narrow below, and broad and round at the ends, sometimes 2 or 3 at a place, from which joynts also rise divers white flowers, made of foure leaves a peece: the leaves fall away every yeere, and rise againe in the spring, the woodly stems abiding.

The Place.

The first foure sorts grow in woods, and copies, as well those that are shadie, as open to the sunne: the first *Clusius* found in *Salamanca*, and *Valentia* in *Spaine*: the first likewise is often found in our Country, as well on dry barren grounds, as in moorish and wet fields: the last was brought from the North-west parts of *America*.

The Time.

They doe all flower about Midsommer, and in *July*, and some of them later, and their seede is ripe in the end of *July* and *August*, for the most part.

The Names.

It called in Greeke *Ἐπὶ πᾶν Hypericon*, which the Latines doe retaine, and yet some have called it *Fugademon*, superstitiously imagining, that it will drive away devills: and some call it, *Perforata*, or *Forata*, from the many small holes, are to be seene in the leaves: but we finde that in *Dioscorides* his time, the name *Hypericon* was given unto five severall herbs; that is to *Rosa sylvestris*, *Onobrychis*, *Hypericum*, *Aizoum*, and *Cerinthe* as in his Commentaries, is extant to be seene: and concerning this *Hypericum* also, he saith, that in his time it was called *Androsæmum* (of the bloody colour, the flowers yeeld) and *Chamæpitys* (of the resinous sent of the seede and heads) and yet all these herbes are severally described by *Dioscorides*, in severall chapters of his Commentaries, *Matthias Florentinus*, from the Greeke word *Leucoion*, in the text of *Dioscorides*, whereunto he compareth the flowers of *Hypericum*, would thereupon interpret the flowers thereof to be white, and *Phuys* also mistaking the Greeke word in *Dioscorides*, as it is very frequent in him, where *Dioscorides* compareth the seede vessels of *Hypericon* unto a barly corne that is somewhat long and round, he saith that the seede ripeneth at the time, when barly is ripe. The *Arabians* call it *Ecrifican*, *Reifaricon*, and as others have it *Henfernon Nelifricon*: the *Italians Hipericon*, *Scorzonera*, or *herba di San Giouanni*: the *Spaniards Coraçoncillo*: the *French Millepertuis*: the *Dutch* S. *Iohns crutie*, and we in *English* S. *Iohns wort*. The first is generally now adayes, by all authors taken to be the true *Hypericon* of *Dioscorides*, as both the bloody colour of the flowers, and the resinous sent of the heads, and seede thereof doe declare, being two principall notes thereof: the second is thought to be *Hypericum pulchrum* of *Tragus*, and the smaller sort of *Matthias Lobel* rather otherwise thinke, but that it is also, the *Hypericum Syriacum* of *Lobel*, for such a one hath growne in severall places of this Land, with many small leaves set at a joynt, in the same manner. *Bauhinus* taketh the first for *Hypericum mas vulgare*, as above in the title, yet he maketh *Lobels Syriacum* to be another sort: the second for *Hypericum minus* of *Tragus*, the *Hypericum minus* of *Lugdun* and *Dodonæus*, *Hypericum minimum* of *Lobel*, and the *Hypericum supinum tertium minimum* of *Clusius*, which *Bauhinus* calleth *Hypericum minus tertium*, vel *Hypericum clusium*: the fourth is as I take it, the *Hypericum tertium* of *Tragus*, which *Bauhinus* also *Pinax* maketh for his second sort, and describeth it in his *Prodromus*, under the same name in the title: the fifth called *Hypericum supinum*, or *humifusum Hispanicum*, which as he saith *Johannes Plate* of *Valentia* sent him from *Valentia* for *Dioscorides*, but *Bauhinus* perceiveth that among the bastard names, *Bauhinus* calleth *Hypericum supinum tomentosum*, and *Hispanicum*, and yet maketh this to be *Lobel* his *Hypericum minimum supinum glabrum*, which he referred before to the *minus* yet *supinum glabrum*, but it cannot be both this and that, because one hath woolly, and the other smooth leaves: the sixth is the *Hypericum tomentosum* of *Lobel*, but *Clusius* checketh *Lobel* in making this and the *Hispanicum* to be both one. *Bauhinus* calleth it *Hypericum supinum tomentosum minimum* vel

Monspelian-

3. *Hypericum frutescens Americanum flore albo*, Indian S. *Iohns* wort with white flowers.

Monspeliacum, and thinke it to be the *Androsæmum album Dalechampij* of *Lugdunensis*, which I see no reason why he should so judge, in that the figure expresseth an upright, and not a bending plant, and there is no description given of it: The last hath the name imposed upon it, as is meet I thinke for it.

The Vertues.

S. *Johns* wort is as singular a wound herbe as any other whatsoever, either for inward wounds, hurts or bruses, to be boyled in wine and drunke, or prepared into oyle or ointment, bathe or lotion outwardly, for being of an hot and drying quality, with subtill parts, it hath power to open obstructions, to dissolve tumours, to consolidate or soder the lips of wounds, and to strengthen the parts that are weake and feeble, the decoction of the herbe and flowers, but of the seed especially in wine, being drunke, or the seed made into powder and drunk with the juice of Knotgrasse, helpeth all manner of spitting and vomiting of blood, bee it by any veine broken inwardly, by bruises, falls or howsoever: the same also helpeth all those that are bitten or stunge by any venemous creature: And is good for those that are troubled with the stone in their kidneys, or cannot make water, and being applyed provoketh womens courses: two drams of the seede made into powder, and drunk in a little broth, doth gently expell choller, or congealed blood in the stomack, and mesentery veines; the decoction of the leaves and seede being drunk somewhat warme before the fits of agues, whether they be *tertians* or *quartans*, doth help to alter the fits, and by often using taketh them quite away; the seede is much commended being drunke for 40. dayes together, to helpe the Sciatica or Hippe Goute, Falling sickneese and Palsie also. The herbe, that is both the leaves, flowers and seede, steeped in wine for 12. houres, and then distilled in an ordinary Still, the water hereof being drunke with a little Sugar therein, is accounted as effectuall as any decoction or other preparation, and killeth the wormes in the belly or stomacke. The oyle of S. *Johns* wort, either simple or compound, but the compound is more effectuall, is singular good both for all greene wounds, and old sores & ulcers, in the ioynts or else where, that are hard to be cured, and is effectuall also for crampes and aches in the joynts, and paines in the veines and sinewes, and is also good for all burnings by fire, to be presently used, or the juice of the green leaves applyed, the hearbe dryed and made into powder, is as effectuall for wounds and sores to be strowed thereon as the oyle or juice. The simple oyle is made of foure ounces of the flowers infused in a pint of oyle Ollive, called sallet oyle, and three ounces of white wine, for 10. or 12. dayes to bee set in the Sunne, and afterwards boyled in a *Bathes* or Kettle of seething water, strayned forth, and refreshed with new flowers, so set in the Sunne, and in the same manner boyled, strained forth and renewed the third time with fresh flowers, which after they have lastly stood in the Sunne a fortnight or more, are to be boyled in the sayd *Bathes* or Kettle of seething water, strayned forth, and the oyle, having some fine turpentine dissolved in it whiles it is hot, and so kept, is singular good for the purposes aforesayd. Like hereunto *Gerard* hath set downe away, which is, with sallet oyle two parts, white wine and oyle of Turpentine one part, set in the Sunne, with the leaves, flowers and seede, of S. *Johns* wort, for 8. or 10. dayes, and boyled and renewed the third time, in the manner aforesayd. But the compound oyle is made of the simple oyle, after the last infusion being strained forth, there is added, *Diacome* of Candy, *Gentian* or Felwort, *Carduus Benedictus*, or Blessed thistle, and *Tormentill* of each a small quantity, and some earth wormes washed and slit, and all of them infused in the sayd oyle, and set in the Sunne, and then boyled, strayned forth, and Turpentine and oyle of Wormewood put thereto, which then is to be reserved in some pot, or glasse close stopped, to be used as occasion doth require.

CHAP. LI.

Ascyrum, S. *Peters* wort.

IN this herbe likewise formerly there hath beene but one sort knowne, and described, but we have two other to shew, not long since found and brought to our knowledge.

1. *Ascyrum vulgare*, Ordinary S. *Peters* wort.

This S. *Peters* wort that is most common in our land, riseth up with square upright stalkes of the most part, somewhat greater and higher then S. *Johns* wort, but browne in the same manner, and at every joynt having two leaves, somewhat like those of S. *Johns* wort, but larger, whiter, rounder pointed, and with very few or no holes to be seene therein, and having sometimes lesse smaller leaves, rising from the bottome of the greater, and sometimes a little hayrie also, as the stalkes will bee: at the toppes of the stalkes stand many yellow flowre-like flowers, with yellow threds in the middle, very like unto those of S. *Johns* wort, so that but for the largeneese and height, it is hardly by many discerned from S. *Johns* wort, saue that it giveth not so bloody a juice, being bruised betweene the fingers, having also such like seede, of a hoary or rehuous sent; the roote abideth long, sending forth new shoots every yeare.

2. *Ascyrum magno flore*, Great flowred S. *Peters* wort.

This other S. *Peters* wort is like the former, having a round browne upright stalke, two foote high or at least, with such like, but larger leaves and round pointed, of a paler greene colour on the upperside, and paler underneath; the flowers that stand at the end of the stalke, are of a pale yellow colour like the other, but good deale larger, with yellow threds therein also.

3. *Ascyrum supinum villosum palustre*, Creeping S. *Peters* wort of the Marsh.

The Marsh S. *Peters* wort is like the last in the round stalkes, but that they are woolly and soft, and standing upright, but leaning downewards, taking roote at the joynts, having somewhat rounder pointed leaves then the joynts, two for the most part together; the flowers are as yellow, and of the same bignesse as the ordinary, but give not that red juice that they doe; and these things make the whole difference from the former besides the naturall place.

4. *Ascyrides rotundifolium maius*. Great S. *Peters* wort of Candy.

This differeth from the former onely in the largeneese of the leaves and flowers, which are foure times greater then it.

The

Androsæmum. Tutsan, or Parke leaves.

The Place.

It growth in many Groves, and small low woods in divers places of this Land, as in *Kent*, *Surrey*, *Northampton*, and *Cambridge* shires, and divers water courses in other places. The second was found on the *Pyrenean* hills. The third in the stoves of the Low Countries, and the last in *Crete*.

The Time.

They all flower in *June* and *July*, and the seede ripe in August.

The Names.

It is called in Greeke [illegible], *Hypericon*, and *Androsæmon*, *Dioscorides*, & *ambigue dicitur galacta: eodem modo Hypericon idem significat*: The Latines have no other name then *Hypericon*, from the Greekes to call it. *Dioscorides* saith, it was also called *Androsæmon* and *Hypericon* rose: and *Galen* therefore accounteth it a kind of *Androsæmon*. The first is usually called by most writers *Hypericon*, as *Matthiolus* doth; it is probable to bee the first *Hypericon* in the workes of *Tragus*, and is the first *Androsæmon* in *Ruellius* and by *Dodonæus* set for *Hypericum*, in the French Edition, but called *Androsæmon alterum humilius*, by *Fabius Columna*, who yet doubted whether to call *Hypericon* or *Androsæmum*, saying it came nearest unto *Hypericon*, although somewhat differing from it (which it may bee is but the soyle and climate) *Bauhine* calleth it *Androsæmum latifolium*: the next two have their names in their titles that *Bauhine* giveth them; yet the third is called by *Clusius*, in the *Auctuarium* of his other Appendix, *Hypericum hirsutum tertium*: the last is called by *Matthiolus*, *Androsæmum*, as it is in the title, all nations thrusting rake it was another kind of S. *Johns* wort, and so call it, and we S. *Johns* wort.

The Vertues.

It is of the same properties with S. *Johns* wort, but somewhat weake, and therefore more seldome used; the seede to the quantitie of two drams taken at a time, in Meade or honyed water, purgeth, saith *Dioscorides*, *Pliny*, and *Galen* chollericke humours, and thereby helpeth those that are troubled with the Sciatica, or paine in the hippes: the leaves are used as S. *Johns* wort, to helpe those places of the body that have beene burnt with fire.

Chap. LII.

Androsæmum. Tutsan, or Parke leaves.

Although our Tutsan be not the right *Androsæmum* of *Dioscorides*, &c. yet because it is so generally called and accounted by most, let it receive his place here among those other plants called *Androsæmum* by divers writers, that thereby you may see and know the difference betweene them.

1. *Androsæmum vulgare.* Common Tutsan or Parke leaves.

Our Tutsan hath not square but brownish shining round stalkes, reeded all the length thereof, rising sometimes or sometimes three foote high, branching forth seven from the bottome, but more thinly set or farbelow under, having divers joynts, and at each of them two faire large leaves standing, but more thinly set then are the other forts which are of a darke blewish greene colour on the upper side, and of a yellower greene underneath, growing reddish towards Autumne, but abiding on the branches all the winter: at the tops of the stalkes and branches stand large yellow flowers, then in any of the former sorts, and heads with seede like-wise, which being greene at the first, and afterwards reddish, turne to be of a blackish purple colour, when they are full ripe, with small brownish seede within them, and then yeeld a reddish juice or liquor, of a reasonable good scent, somewhat resinous and of an harsh or hot taste, as the leaves also and the flowers bee, although much lesse, but doe not yeeld such a cleere Claret wine liquor, as *Gerard* following *Dodonæus* saith it doth: the roote is brownish, somewhat great hard and woodily, spreading well in the ground.

2. *Androsæmum Matthioli.* *Matthiolus* his Tutsan.

This Tutsan hath no other English name I know not well what it may have, unlesse you would call it a great S. *Johns* wort, because it is so like it) hath brownish round stalkes, with two leaves at every joynt, fuller of branches, else very like some S. *Johns* wort, but more sparingly or thinly set thereon, much smaller and greener then the former Tutsan, and greater then those of S. *Johns* wort, without any holes at all in them: the flowers are yellow likewise, and greater then they, and so are the heads with seede, but spotted with blacke streakes on them:

Original from UNIVERSITY OF MICHIGAN

thom the roote is brownish and abideth, yet the stalkes perish; the leaves hereof as well as flowers, doe give a red juice like *Tobacco* wort, wherewith it may best be discerned, but because *Peters* wort doth the like also, therefore divers doe mistake one for another, and the rather, for that *S. Peters* wort is found to have a round stalke, although ordinarily it be square.

3. *Tulipa, mas et sativus, Apulus.* Turban of *Naples*.

This Neapolitane Turban is more bullate, but groweth not so high as the tall, for it sendeth forth from a reddish roote, somewhat thicke, reddish, or brownish round stalkes, not much above a foote high, with two crested sheathes like filmes all the length of them, and are full of branches, with two leaves at every joynt, so closely set thereunto at the bottome, that the stalkes seemeth to runne through them: and yet are wider then the tall crested Turban, shape-pointed, of a fresher greene colour, and smooth on the upper side, white underneath, and having many small holes therein, almost not to be perceived, and for the most part are greater and broader towards the toppes then they are below, the flowers at the toppes of the branches are of a paler yellow colour, many more set together then in the other, white greene husks wherein they stand have blackish spots on them, which withall when the leaves are full of seede both leaves and flowers yeeld a bloodie or reddish juice, being bruised between the fingers, as any of the other doe.

4. *Tulipa minor, vel Cerasina.* Sinking Turban.

This sinking Turban groweth upright with hard woodie stalkes, three or foure and sometimes unto five inches high, as great as any of the rest below, and of a reddish colour, branching towards the tops with divers wings of fresh greene leaves set thereon, two at every joynt, somewhat like unto those of *Hyacinthus*, and doe alwayes a-

1. *Tulipa mas vulgaris.* Turban or Tulip leaves.

3. *Tulipa mas et sativus Apulus.* Turban of Naples leaves.

4. *Tulipa minor vel Cerasina.* Sinking Turban.

Original from UNIVERSITY OF MICHIGAN

...on the branches, winter as well as Summer in the warme countries, wherein it is natural, but doth hardly endure our cold climate, although kept and defended with all the care wee can use: at the ends of the stalkes stand ...yellow flowers, like the common Tutsan, upon slender but longer footstalkes then in any of the former sorts, and the yellow threds in the middle of them longer also; which after they are past yeeld round and somewhat long seede, becoming the berries of the Turpentine tree, never falling away from the buffes of themselves, wherein is very small seede. In Cassia it yeeldeth a liquid Rosen or Turpentine that smelleth strong, more like ...Rosen, even as the leaves and all the rest of the plant doth, this yeeldeth no red or bloody ...like as the true *Androsæmum* and *Ascyrum* doe.

The Place.

The first groweth in many Woods, Groves and Woodsy grounds, as Parke and Forrests, and by hedge sides, ...this land, as in *Hampstead* Wood, by *Rosly* in *Essex*, in the weelde of *Kent*, and many other places ...The second is found also about *Rosline* and *Hastings*, and in other parts of the West country. The third *Fabius Columna* saith hee found on the hills *Corinalis*, which are to the Southward in *Naples*: And the last *Prosper Alpinus* saith, groweth by the brookes and springs of waters in *Candy* and no where else; but it grew upon Mount *Baldus* as *Pona* saith in the description thereof.

The Time.

They all flower later then S. *Johns* wort, or S. *Peters* wort, and the last later then any of the other.

The Names.

...the Greeke ...*Androsæmon a sanguine humano est comparatum assimilatur*. *Galen* saith it was of ...the one whereof was called *Dioscoris* by some in his time, the other *Hyoscyamus*, and *Ascyroides*. The ...is called by *Dodonæus Androsæmum*, and so it is also by *Camerarius*, *Gesner in hortis*, and *Lugdunenses*, and ta...ken by Authors to be the true *Androsæmum* of *Dioscorides*, *Galen* and *Pliny*, and the *Centaria* of *Theophrastus*; ...but *Lobelius* in his *Adversaria* contradicteth against it, & saith it is the *Clymenum Italorum*, as *Anguillara* doth, and likewise ...*Matthiolus* in his ...also *Caspar Durantes*, and of the *Italians* in many places called *Sicilliana*, or *herba Sicilliana*, because they supposed it grew no where naturally but in *Sicily*; or *Cecilliana* as *Camerarius* saith, who also ...*Dioscoridis*, *sed Plinianum*, as *Anguillara* before him did. *Bauhinus* calleth it *Androsæmum maximum vulgare*. We call it properly in *English* Tutsan, from the *French* who call it *Toutsaine*, & not from the *Italians* who call it *Tutsan*, as *Camerarius* saith. Some also call it Packe leaves, because it is so familiar to Parkes and Woods, that it almost groweth no where else. The second is called *Androsæmum* by *Matthiolus*, as also by *Fuchsius*, *Lacuna*, *Cordus* upon *Dioscorides* and *Gesner*; *Camerarius* as I take it calleth it *Androsæmum minus*, for he calleth the former *majus*, and *Lobel* calleth it *Androsæmum mas minus*, and *Excellentium*, because he was not perswaded that the last was worthy the name of *Androsæmum*. *Dodonæus* would have it to bee *Ruta Silvestris* of *Dioscorides*, and thereupon calleth it *Ruta Sylvestris Hypericoides*, because *Dioscorides* writeth, that the *Ruta Sylvestris* was called *Hyperoion* by some in his time; I take it to be the *Hyperoum secundum Tragi in duas species*; as also to bee the *Androsæmum Campestre* of *Columna*. *Bauhinus* doth impose two several names upon this herbe in my judgement, when as it is but one, for hee calleth that of *Matthiolus*, *Cordus*, *Gesner*, and the rest, *Alterum genus Hyperoides bifolium glabrum, non perforatum* and the other of *Lobel*, which *Dodonæus* called *Ruta sylv. Hypericoides*, *Androsæmum alterum folio Hyperici, quod aliquibus Hypericoides*. The third is called by *Columna*, as it is in the title, but by *Bauhinus Androsæmum perfoliatum & perforatum*. The last is called by *Camerarius Androsæmum minus sive angustifolium secundum*, and taketh it to be *Tragium* of *Honorius Bellus* of *Candy*, called by the inhabitants *Neroselli*, as hee saith, and as it is remembred by him, in his third Epistle to *Clusius*, set forth with *Clusius* his *Historia rariorum plantarum*, whose figure as *Camerarius* thought, was not as then set forth by any; but since his time *Bauhinus* hath exhibited the figure thereof in his *Matthiolus*, by the name of *Androsæmum tertium*, and afterwards by *Pona*, in the description of mount *Baldus*, both in his Latine and Italian Booke, when he calleth it *Tragium legitimum veterum*, *ab ipso Bello observatum*, and in the same Latine Edition, but there he calleth it *Tragium Creticum Bellonij non Dioscoridis*, and so doth *Bauhinus* also: but I thinke *Bauhinus* was mistaken, to thinke that this plant, which in his *Pinax*, he formerly referreth to *Tragium* of *Honorius Bellus*, should bee also the same with *Ascyrum Legitimum*, for *Bellus* saith, that the *Creticum* called this *Agrostemma*, and the *Tragium Neroselli*, as it is before sayd, so that these are two several plants, and called by two several names, as *Bellus* sheweth it, who was so singular in herbarisings that he would not fall into such errors as *Bauhinus* here doth.

The Vertues.

Tutsan moderately bindeth and dryeth, yet the seede hath an abstersive qualitie, whereby it purgeth cholericke humours, as S. *Johns* wort is sayd before to doe, for therein and in all other things it makes the same effect, both taken inwardly, as in the Sciatica and Gowte, and to heale burnings by fire: it stayeth also the bleeding of wounds, if either the green herbe bruised, or the powder of the dry be applyed thereto: it is, and so hath formerly in all ages among us, and in other countries accounted a soveraigne herbe to heale any wound or sore, either outwardly or inwardly, as the name importeth; and therefore it was alwayes one of their singular good herbes wherewith they made wound drinkes or potions, Balmes, oyles, or ointments, for any sort of greene wound, or old Vlcer, as long experience findeth, the continuall experience of many ages, to bee admirable good, hath confirmed the same, although it be not so much in request and use as formerly it was, when as Chirurgions addicted themselves to the herbes, then now they doe.

Chap. LIII.

Buplevrum. Hares eares.

...have referred the *Buplevra* fit to be placed with the *umbelliferi*, because they beare tufts of flowers ...and seede like unto them, but in that their growing is much different; I have thought it fitter to ...speake of them apart.

Original from UNIVERSITY OF MICHIGAN

1. *Bupleurum angustifolium.* Narrow leafed Hares eares.

The narrow leafed Hares eares, riseth up with a round stiffe greene stalke two foote high, at the ioynts whereof grow leverall long and narrow very darke greene shining smooth leaves, broadest at the ende and narrower by degrees unto the ende, with divers ribbes running thorough them, the middle and greatest, yet nothing so narrow as grasse leaves, as divers doe compare them, as any that I have seene of that sort: which stand one above another up to the top, growing smaller and smaller, as the ioynts likewise, but the middle of the stalkes at the least, upwards if it grow in any good ground, come forth small branches, sometimes with few or no branches at all, at the tops whereof stand many small tufts or umbells of yellow flowers, which turne into small seede, like Parsley seede, but of a darker colour, and somewhat longer: the roote is somewhat long, but small, and white on the outside, like unto a Parsley roote, with divers strings at it, perishing yearely with the, as the next also.

2. *Bupleurum latifolium.* Broad leafed Hares eares.

This other Hares eares groweth in the same manner that the former doth, with stalke branches, flowers, seede and roote, and herein chiefly if not onely differeth from it, that it beareth broader and shorter leaves, scarce a foote broadest in the middle, and ending in a small point, somewhat hollow, and bowing downwards, with divers long Nerves or ribbes therein, as in the former, and the middle most eminent, or raised highest.

3. *Bupleurum Angustifolium Alpinum.* Mountaine narrow leafed Hares eares.

This mountaine Hares eares, from a round thicke roote, about a foote long set with knobs or bunches offered of branches, and with a thicke barke, of a darke red on the outside, and pale within, divided to the bottome into many parts, ariseth divers long and narrow greene leaves, lying on the ground, compassing one another at the bottome like a starre, for the forme of them like unto the tall Hares eares, but narrower: from divers of the tufts of leaves, arise darke round stalkes, about an handbreadth high, bearing at the toppes many pale yellow flowers, made of seaven pointed leaves a peece, and in the middle of them divers small seed in their heades somewhat like unto the Thorowwax, set forth in the next Chapter, or as the former Hares eares, which are very strong; the whole plant elfe, tasteth like an Artichoke.

4. *Bupleurum minimum.* The least Hares eares.

The least Hares eares, is also like the first described hares eares in all things, the smalnesse of the plant, both stalkes, narrow long leaves, and all other parts making the difference.

The Place.

The two former *Lobel* saith grew about Mompelier in *France*, in the dry stony places, and in *Germany*, as he saith, and are also found in our Land, in divers places: the third upon Mount *Baldus*, as *Cesalpinus* in the description thereof saith: the last *Columna* saith he found in the borders of the dry fields, neare *Cumes* in *Naples*.

The Time.

They all flower late, that is not untill the end of *July*, and in *August*, and their seede is ripe in *September*.

2. *Bupleurum Latifolium,*
Broad leafed Hares eares.

3. *Bupleurum angustifolium Alpinum.*
Mountaine narrow leafed Hares eares.

The Names.

It is generally taken to be the *Panax Euphorbium*, that *Pliny* mentioneth in his 22. booke, and 25. chap. out of *Hippocrates*, and *Nicander in Theriacis*; and was as he there saith, used in meates in *Hippocrates* his time and otherwhiles reckoned among sallet and pot herbes, but used in Physicke and medecines, by *Olaus* and *Nicander*, who have diversly referred their herbes, as some to the *Bupreste* of *Theophrastus*, in his 7. booke, and 8. chap. whereof *Pliny* also speaketh in the layd booke, and chapter before layd: *Gesner* in hort. saith, that with the *Arabs*, it was called *Kirchofalcum* and *Oratia Dei*. Some also tooke it to be the *Panax Chironium*, of *Dioscorides*, but of that more anon, and some *Sesamoides*. *Bauhinus* in his *Pinax* saith, that *Panax Chironium Plini* doth not greatly agree unto the *Valerianæ campestris facie sallum agreste*, Lambs Lettice or Corne sallet: those of *Mompelier* as *Lobel* in *Icon.* and *Lobel* say, called it *Auricula Ursi*, especially the *Latifolium*, for the likenesse of the leaves to Beares eares. *Cordus* in his history of Plants, calleth it *Hyophyllon*, *Tragus* calleth it *Herba Panacea Heracleotes*, not understanding from any of his nation, by what other name they called it, and therefore he rashly referreth it to the *Panax Chironium* of *Theophrastus*, who saith it hath the leafe of a Docke, but that of *Dioscorides* & *Matthiolus* have the leaves of *Acanthus* or Marigrome. I finde a great mistake, and forgetfulnesse in *Matthiolus* as well as in *Lugdunensis*, this in setting forth, and he in admitting the errour to passe concerning the *Bupleurum* which *Lugdunensis* calleth *Lapathum sylvestre 4. sive Dodonæi* in one place, and *Bauhinus Lapathum sylvestre tertium*, and yet *Lugdunensis* saith there, that some called it *Pandex Chironium foliis Lapathi flore umbellato Plinii*, which was sufficient I thinke, to make him understand it to be this *Bupleurum*, and not a *Lapathum*, and yet both he & *Bauhinus* in their proper places, call it *Bupleurum* notwithstanding. The third is called by *Pona*, in his Latine edition of Mount *Baldus*, *Ardium petræum Buplevrifolio, aut potius Bupleurum petræum genuinæ speciei*; but he in setting forth the description of the layd Mount *Baldus*, giveth it this note, that it is *flore aureo, quem alii Buxum*. *Bauhinus* in the layd Latine edition of *Pona*, is set downe to call it then *Bupleurum Alpinum, Buplevrifolio* (which I have thought fittest to follow, as it is in the title, but afterwards in his *Pinax*, hee referreth it to the *Perfoliata*, calling it *Perfoliata Alpina graminea folio, sive Bupleurum angustifolium Alpinum*, whereby judging the *Perfoliata* and *Bupleurum* to be *congeneres*, for in the heads of seede, the one is somewhat like the other, as any that hath seene them both may well observe. *Fabius Columna* maketh mention of the last, and calleth it, as it is in the title: and *Bauhinus Bupleurum angustissimo folio*.

The Vertues.

The herbe are moderately hot and dry, and therefore may well be accounted *Vulnerarij*, or Wound herbes, and have the same properties that they have, and which *Pliny* and others attribute unto *Bupleurum*: if the seede or the roote in powder taken in wine, or boyled in wine be drunke; and so are the leaves also good against the stings or stingings of any serpents or venemous creatures; the hurt place also bathed with the same, and is of great effect to provoke Urine, and womens courses being stopped: they are also very good purposes, either used alone, or with other things, to heale wounds inward or outward, whether they be fresh and greene, or old cancres and sores, of evill disposition, and bad curation.

Chap. LIIII.

Perfoliata. Thorough waxe.

Here are divers sorts of Thoroughwaxe, some greater, some lesser, some of the fields and Meddowes, other of the hills and mountaines, &c. all of neere affinitie one unto another; and with them I thinke fit to joyne another herbe, which some have referred to another family, because of the long cods with seede that it beareth.

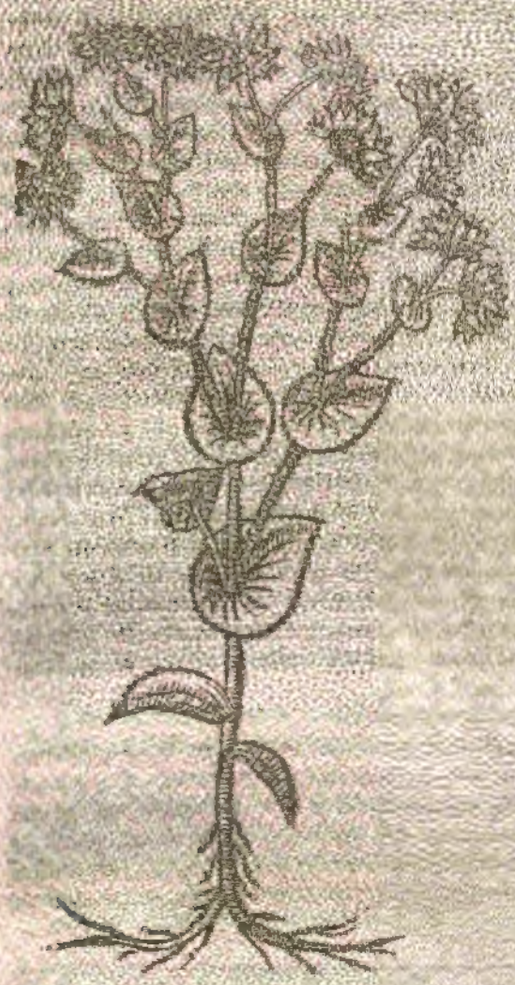
1. *Perfoliata vulgaris.* Common Thoroughwaxe.

The common Thoroughwaxe, sendeth forth one straight round stalke, and sometimes more, (where it is high and better) whose lower leaves being of a blewish greene colour, are smaller and narrower than those standing higher, and doe stand close thereto, not compassing it, but as they grow higher, they doe more and more compasse the stalke, untill it wholly as it were passe through them, branching toward the toppe into many parts, where the leaves grow smaller againe, every one standing singly, and never two at any joynt: the flowers are very small, and yellow, standing in tufts at the heads of the branches, where afterwards grow the seede, small and blackish, many thicke thrust together: the roote is small, long, and wooddy, perishing every yeere, and rising plentifully of it owne sowing, if it be suffered to shed it selfe.

2. *Perfoliata flore multiplici.* Double flowred Thoroughwaxe.

This differeth in nothing from the former, but in the heads of flowers, which are thicker set together, and larger, and give no seede, but is wholly a degenerate kinde, rising from the seede of the former, spending his force in the plentifull heades of flowers.

3. *Perfoliata montana latifolia.* Broad leafed Mountaine Thoroughwaxe.



The leaves of this Mountaine thoroughwaxe, are somewhat larger and longer, and more pointed than the former, many growing together, from the heads rising from the roote, every one standing on a small foote-stalke, imbracing, with it rise up stalkes with shorter leaves, which compasse the stalkes, that are branched at the toppes, with greene and yellow flowers, somewhat larger than the former, many in like manner set together, in the middle of the uppermost greene leaves, which are as a cup to conteine them, wherein afterwards stand the seede, as in the former but larger: the roote is thicke and reddish on the outside, lying long wise under the face of the ground, shooting forth heads of leaves in divers places, and with small strings and fibres downeward, enduring many yeeres, and not perishing like the former. *Bauhinus* maketh another sort hereof with smaller flowers, *Minor.* whereof is no description thereof.

3. *Perfoliata Alpina latifolia minor.* The lesser broad leafed Mountaine Thoroughwaxe.

The lesser Thoroughwaxe is some what like the first or common sort, but that it is smaller, rising not so high, and having smaller and shall broader like leaves but smaller, which are divided at the bottome of them into two parts, the stalke passing through them, but are not whole and round as the former are, and branching at the toppes.

whereon stood betweene two leaves, come forth such like pale yellow flowres, standing in tufts, with small seede following like it also: the roote is small and reddish, perishing as it doth.

3. *Perfoliata Alpina angustifolia major.* The greater narrow leafed Mountaine Thoroughwaxe.

The greater Mountaine kinde of narrow leafed Thoroughwaxe, hath divers very long, and narrow, whitish green smooth leaves, spread on the ground, about a foote long, or an inch, or inch and halfe broad, with corners also about them almost like Ivie leaves, which compasse the stalkes about the bottome of them, sildome more than one at a joynt; at the toppe whereof come forth five broad leaves standing round; from whence rise up severall small stalkes, some longer and shorter than others, bearing thereon tufts of yellow flowres, in the middle of small round leaves: the roote is long and thicke, covered with whitish barke, and endureth.

4. *Perfoliata Alpina angustifolia minor.* The lesser narrow leafed Mountaine Thoroughwaxe.

This Thoroughwaxe hath but one stalke, about a foote high, without any branches bearing thereon at severall distances long and narrow leaves like the last, but shorter and lesser; compassing the stalke at the bottome, and at the toppe some few reddish flowres, standing in tufts like the common kinde, and seede accordingly: the roote is small and reddish.

5. *Perfoliata Alpina angustifolia minima.* The least narrow leafed Mountaine Thoroughwaxe.

This least kinde is a small plant, not past an hand breadth high, with a reddish running or creeping roote shooting forth in divers places very narrow, long, smooth, greene leaves: from among which ariseth a stalke, parted into two branches and each of them againe into other smaller ones, with one or two leaves under them compassing them at the bottome, where it is broadest: the flowers are small and yellow, standing together in tufts like the other.

6. *Perfoliata minor ramis inflexis.* Small Thoroughwaxe with bending branches.

This small Thoroughwaxe hath divers leaves, arising from the roote, which are somewhat long, but shorter than those of the first Mountaine Thoroughwaxe: the stalke is small, and lyeth as it were upon the ground, bearing such like leaves as that Mountaine kinde doth, and compassing the stalke in the same manner: the flowers are yellow like the common kinde: the roote perisheth every yeere like unto it, and therein differeth from most of the other mountaine kindes.

7. *Perfoliata siliquosa vulgaris.* Common codded Thoroughwaxe.

The ordinary codded Thoroughwaxe, hath weake stalkes, branching forth at every joynt, with leaves set on them, compassing them at the bottome, very like unto the first Common Thoroughwaxe, but thicker, fatter, and more pointed, and of a whiter greene colour, most like unto Cabbage or Colewort leaves, and with square uneven welts on the edges usually: the toppes of the branches are furnished with many small white flowres, standing one above another, consisting of foure leaves a peece, which afterwards turne into small long and square codds, wherein is contained round brownish seede: the roote is small and woody, perishing after seede time.

10. *Perfoliata siliquosa flore purpureo.* Codded Thoroughwaxe with purple flowers.

This other codded Thoroughwaxe, is very like the last, having straighter, and more upright stalkes, and larger flowers thereon, of a pale purplish colour, like unto those of the white Sattin: in all the rest it disagreeth not from the last.

The Place.

The first, and the last save one are found oftentimes in our owne Land in many corne fields, and pasture grounds: the second, as I said, is but a degenerate kinde of the first, and is often found in gardens, where the rest is sowen: the 3, 4, 5, 6, 8. grow all upon hills, some in *Germany*, and the Alpes of the *Switzers*, and some upon the *Alpes* towards *Spaine* and *France*: the last also as well as the ninth *Cluſius* saith, he found in a Province of *Spaine*.

The Time.

They doe all flower about *July*, and their seede is ripe in *August*.

The Names.

It takes the name of *Perfoliata* (for there is no ancient Greeke, or Latine author, hath written of it) from the passing of the stalkes through the leaves, yet some have thought it to be the *Cacalia* of *Dioscorides*, and some would make it his first *Coryledon*, but neither of them agreeth with it. *Cæſalpinus* taketh it to be his *Scseli* 2 *Dioscoridis*, which differeth much from this: all the later writers doe generally call it, *Perfoliata*, and *Perfoliata minor*: the Herbarists call it *Perfoliata*: the French *Percfeuille*, and the *Germane Durchwachs* and so the *Dutch* also, as *Lobel* saith, Thoroughwaxe or Thoroughleafe: the second is expressed by *Camerarius in horto*, as also the third here following, which he set for one the good figure thereof, being the last Mountaine kinde here, and is the *Perfoliata Alpina angustifolia major* in *Lugdunensi*, although it may seeme much to differ from it in these: the fourth stalke taketh *Perfoliata minor* of *Lugdunensis*, whereof it is likely also *Camerarius in horto*, taketh occasion under the name of *Perfoliata minor*, and it may be *Bauhinus* remembreth it, under his *Lanceolata minor*: the fifth *Camerarius* calleth *Perfoliata Alpina angustifolia major*, and he maketh another like unto it, which he calleth *Asclepiadea*, and likewise referreth the *Perfoliata longifolia Dalechampii* of *Lugdunensis*, when as I can finde no other *Perfoliata* there, whereto the *minima* is to be referred, but there is so little difference betweene his *major* and *minor* (save that the one is greater than the other, the greatnesse of the one from the other being likely to be occasioned by the fatnesse, and leanenesse of the soyle) as well agree unto that of *Dalechampius*, as his *minor* doth to *Perfoliata Alpina angustifolia minor*, and is very like the *Buplevrum Alpinum angustifolium*, set forth in the former Booke, but he giveth a reason, that they should not make them both ones the seventh hee calleth *Perfoliata Alpina angustifolia minor*, and is very like the *Perfoliata minima Buplevri folio* of *Columna*, which he saith also is *Cotyledon* of *Dioscorides*: but I cannot or he write think then that his *minima* is *Columnæ* his *minima*, also and likewise the *Cotyledon* of *Dioscorides* the eighth is remembred onely by *Bauhinus* in his *Prodromus*, the ninth is called *Perfoliata siliquosa*, or *Napifolia Anglorum siliquosa*, by *Lobel* in his *Adversaria* and *Plantarum*, and so *Turner*, *Gerard*, *Camerarius*, *Tabernamontanus*, and all or most of the Herbarists at this time, although divers other, from the colour of the leaves, and forme of the flowers and seeds, would referre it unto Wilde Colewort, and thereupon call it *Brassica campestris (silvestris & agrestis) siliquosa*, or *perfoliata*; but

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

Lobel in his *Adversaria* saith, it partaketh of the Navew, (and therefore calleth it, as is before said, *Perfoliata Napi folia*) and Winter Cresses, as well as of the Throughwaxe, or *Perfoliata siliquosa* the last *Clusius* calleth, *Rapum campestre alterum*, or *purpureo flore*, but as I did referre the other, so I dos this, and call it *Perfoliata siliquosa purpurea*.

The Vertues.

Thoroughwaxe is hot and dry, and therefore of singular good use with Chirurgions, for all sorts of bruises or woundes, either inward or outward, and old ulcers and sores likewise, if the decoction of the herbe made in water or wine be drunke, and the places washed therewith, or the juyce or greene herbe, bruised and applied either by it selfe, or with other herbes, in oyle or *Ceratis*, to be made into an oyntment, to serve for all the yeere: the decoction of the herbe, or the powder of the dryed herbe, taken inwardly, and the same of the greene leaves bruised, and applyed outwardly, is no lesse singular and availeable to cure ruptures and burstings especially in children, before it grow to be too old, the juice still answering the commendations of the herbe applyed also with a little flower and waxe, to childrens navels that sticke forth, doth helpe them. *Tragus* saith that the codded Throughwaxe, is of the same operation with the other, and worketh the like effects, but hath rond *perfoliata* or *minor* hath long cods, which can be no other than this, although in *Camerarius* horte, it is taken, and *major Tragi*, set for *minor*, for so *Gesner in horto* hath it.

CHAP. LV.

Pimpinella sive Sanguisorba. Burnet.

Pimpinella hath a double interpretation declaring two sorts of herbes, for it either signifieth Burnet, and then it is usually also called *Sanguisorba*, or it is referred to the Saxifrages, and then it is called *Pimpinella Saxifraga*, Burnet Saxifrage, of either of which kindes there are diverse sorts: but of the Saxifrage kindes, because they are umbelliferous plants, I shall speake among the other of that order, and of their Burners in this place, whereof there is both greater and lesser, and in either of both some difference; and although I have set forth the common Burner in my former booke, yet because I there spake of it, onely as an herbe for a Kitchen garden, and spake very little of the properties, I thought good to entreate here againe, and enlarge the vertues.

1. *Pimpinella vulgaris sive minor*, Common Burnet.

The common Ordinary Burnet groweth with many long winged leaves, spread upon the ground, which consist of divers small roundish leaves, greene on the upper side and grayish underneath, finely dented about the

1. *Pimpinella vulgaris sive minor*, Common Burnet.

2. *Pimpinella major sativa*, The ordinary great Burner.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd

Original from UNIVERSITY OF MICHIGAN

rides, set on each side of a middle ribbe, among which rise up crested browne stalkes, two foote high or better with lesse smaller leaves set in some places thereon, divided into sundry branches, and at the toppes small round long heads, or knaps upon long foote stalkes, of a brownish colour; from whence stand forth small purplish flowers, and after them cornered seede: the roote is small, long, and blackish browne on the outside, growing downe deepe into the ground, with some fibres thereat: the herbe hath a fine quicke sent and taste, giving a delicate relish unto wine.

2. *Pimpinella minor vndata.* Vnsavory Burnet.

This unsavory Burnet is in all things like the former, but that the leaves of this are not so round, but something longer, nor have neither sent or taste in them to commend it like the other.

3. *Pimpinella major sive Sylvestris.* Great or wilde Burnet.

The great wilde Burnet hath such like winged leaves rising from the rootes, but nothing so many, and each of these leaves on the wings are twise as large at the least, as the other; and nicked in the same manner about the edges, of a grayish colour on the underside: the stalkes are greater and more higher, with many such like leaves set thereon, & greater knaps or heads at the tops, of a brownish greene colour, and out of them come small darke purple flowers, like the former, but greater: the roote also is blackish and long like the other, but greater: this hath in a manner neither sent or taste therein, like the common small, or garden kinde.

4. *Pimpinella maxima Americana.* Great Burnet of *America*.

This great Burnet is in all the parts thereof like the last, but much greater, having oftentimes all the leaves, which are of a fresh-green on the upperside, and folded halfe way together inward, the underside of the leaves, which are grayish, thereby discovering upward, nicked somewhat deeply about the edges, with greater dents, which make them shew the more comely and gracefully: the toppes of the stalkes carry smaller, and much longer, whitish greene spiked heads, set thicke with knaps, each whereof when it flowreth (beginning below and so rising higher) sheweth to be some whitish greene leaves, having many small white long threds in the middle: after which come the seede in the same places, being cornered like the other: the roote is much greater and woodily, longer also and thicker than the last: this hath little sent, but in taste is somewhat like the first, yet nothing so aromaticall.

4. *Pimpinella maxima Americana.* Great Burnet of *America*.

The Place.

The first groweth wilde in divers places of this Land, in dry sandy places, but usually preserved in gardens, to be ready at hand when it shall needs to be used: the second was found in *Ayrone* as *Bauhinus* saith: the third is found in divers Countries of this Land, especially in *Huntington* and *Northampton* shires, in the Meddowes there, as also neere *London* both by *Paris* Church, in two or three fields nigh unto Boobies barne, and by a cattle side in the middle of a field by *Paddington*: the last was brought out of the North parts of *Virginia*, where it is naturall.

The Time.

All these flower about the end of *June*, and beginning of *July*, and their seede is ripe in *August*.

The Names.

The Greeke word *Pimpinella* as *Gesner* hath it *Pimpinella*, is onely found in *Nicolaus Myrepsus*, and is thought by divers to be understoode of this herbe. (for it is not knowne to be mentioned by that name, in any of the writers) for divers by good judgement doe referre it to the *Sideritis secunda* of *Dioscorides*, whereunto it answereth fully, both in forme and qualities, so that we needs not any further to discover thereof, and the rather, because it is kept at this day, this herbe is called *Sideritis* by the Greekes, in the Iland *Chio*, or *Scio*, divers also before his *Iournall* unto the other kindes of *Pimpinella*, that are unbelliferous, but there is such a confusion among many of the later writers, that it is hard to understand, which of these two kindes they meane whereof they write, *Dodonæus* hath a *Germanica*, marked mention of *Pimpinella minor foliis latis*, to be of the same kind with the greater *Pimpinella*, or wilde sort & as he saith, not differing from it, but in the manuring, which his *Pimpinella* is the Scottish sage kind as may be plainly perceived, by his own words following (for he saith that the Germanes call usually *Pimpinella* is by other people called *Saxifraga*, and by the *Italians* *Bauhinus* imposeth the name) and yet *Bauhinus* maketh this *Pimpinella minor foliis latis* of *Gesner* to be *Sanguisorba minor*, which is contrary to his mind as I think; and although by saying it is used in salletes he might seeme to understand this Burnet kinde, which was wont often to be so used, yet his words of *Saxifraga Hircina*, cannot be understood of this Burnet, nor of the other *Saxifraga umbellifera*, the like doubt and difference there is concerning that which he writeth upon the rootes of *Pimpinella vulgaris*, as *Fragosus* maketh mention of it, saying that it is the *Cochinella*, for he there saith, that *Cochinella* is a certaine berry brought from *Peru*, and that it is found upon seedling small plants, like unto *Pimpinella vulgaris*, into whose rootes it doth sticke, of the bignesse of a little pepper, which some take to be the true *Coccigridium*, and others to be the *Chermes* of the Arabians, which differeth from the Greeke *Bephica* of the *Grecians*, thus saith *Fragosus*; all which is utterly untrue,

Original from UNIVERSITY OF MICHIGAN

unripe, for Cocheville is neither the berry of any Pimpinella, nor is it the true Coccognidium, nor doth the Grape of the Arabians differ from the Uuscus Raphanus of the Greekes, as shall be shewed in due place. Ian Bauhine saith that Cocheville groweth like berries on the underside of the leaves of a tree in the West Indies called Cacao, or by others Tuna, which tree we call Ficus Indica. Now whether of the two kinds of Pimpinella is meant, or that is not expressed, for some referre it to one and some to the other. Some as it should seeme call it Pampinula, and Peponella, but I rather referre all these names to the Saxifrage kindes: it is called Sanguisorba and Sanguinaria also of divers, but most usually Sanguisorba, quod sanguinem fluxum sistit and it may be called Bipennula, a foliorum binis ordinibus pennatim seve plumatim dispositis: the Italians call it Pimpinella or Sanguinella, the French Pimpinelle, the Germanes Bybergers Bertram (id est, Dens Barbula) Blutkraut, and Bibergkraut, the country people at Tragus saith give it to their Hennes and Geese when they have the Pippe, or else eate it; we doe in all places I thinke in England call it Burnet: but many of our ignorant Apothecaries doe grossely mistake this herbe, in using Pimpernell in their Syrupe of Dialthea, and in other their compositions for the same, from the nearenesse of the Latine and English names, of Pimpinella and Pimpernell, taking them to be both one: it may be referred also as it is thought to that herbe which in Pliny is called Sanguinalis, as I finde in his 24. Booke and 9. Chap. because it causeth mirth, and Dioscorides saith, because it doth wonderfully agree with wine. The first called Pimpinella Sanguisorba, to distinguish it from the other Pimpinella fragifera, and Pimpinella minor and hortensis, to distinguish it from the other Sanguisorba, which is called Major and sylvestris: Anguillara, Gallandius, Tragus, and Columna, call it Sideritis secunda Dioscoridis, and so doe some of them: they also call it Pimpinella Italica, and is the first of Tragus by that name. But the third is by Gesner called Herba major, and by Clusius called it also: others call it Pimpinella sive Sanguisorba minor, and Columna Dioscoridis minor. The second Ruellium onely mentioneth, and the last is not remembred by any of them, although Lobel may seeme in his Adversaria to point at this, where he saith, that the great kinde hath sometimes leaves as great as Betony, as this hath, but yet is not this, being a differing kinde, as by the leaves & flowers may well be knowne.

The Vertues.

Both the greater and the lesser Burnet are accounted to be of one property, but the lesser, because it is rather and more in request, is more effectuall being both hot and dry in the second degree, especially the dryer (some say it is cold in the second degree) which is a friend to the Heart, Liver, and other the principall parts of a mans body; two or three of the stalkes with leaves put into a cup of wine, especially Claret, we all know give a wonderfull fine relish to it, and besides is a great meanes to quicken the spirits, refresh the heart, and make merry, driving away melancholy: it is a speciall helpe to defend the heart from noysome vapours, and wonderfully resisteth infection of the Plague or Pestilence, and all other contagious diseases, for which purpose it is of great effect, the juice thereof being taken in some drinke, and they either layd to sweate thereupon, or wrapped and kept very warme. They have a drying and astringent quality also, whereby they are available in all manner of fluxes of blood, or humours, to stench bleeding inward or outward, Laskes or Scowrings, the Bloody flix, women too abundant courses, and the whites also, and the choleriche belchings, and vomitings of the stomake, and is also a singular good Woundherbe, for all sorts of wounds, both of the head and body, either inward or outward, for all old Vlcers, or running Cancers and mooyld sores, which are of hard curation, to be healed onely by the juice or decoction of the herbe, or by the powder of the herbe or roote, or the water of the distilled herbe, or else made into oyle, or oynement by it selfe, or with other things to be kept: the seede also is notable withall, both to stay fluxes and to dry up mooyld sores, and is taken in pouder inwardly in fleeked water or wine, as is wherein hot gadds of steele have beene quenched, or the pouder of the seede mixed with their ointments or injections.

Chap. LVI.

Sideritis sive Ferramentaria. Ironwort.

HAving in the last Chapter shewed you that Burnet is the second *Sideritis* of *Dioscorides*, I thought it not amisse to intreate next thereunto, of some other herbes called *Sideritides*, as being reputed of many authors unto the first Kinde of *Dioscorides*, leaving the third sort to be spoken of in a more due place hereafter.

1. *Sideritis prima Herba Indaica.* Iewes Ironwort.

This first *Sideritis* is a small low herbe, neither wholly standing upright, nor wholly leaning downe to the ground, but hath divers weake, rough, hoarie square stalkes not much above a foote high (if it grow at his full distance) whereof grow two small leaves somewhat long, rough, or as it were crumpled, but are not halfe so broad as Horehound leaves, dented about the edges, smelling and tasting somewhat strange, and spread abroad into diver branches, the upper parts whereof are replenished with many small whorles of pale purplish gaping flowers, with hoary leaves at the joynts under them also, where after they are past, the small blackish seede, contained in thole huskes, wherein the flowers stoode before: the roote is small and woody, yet living and shooting forth a new every spring.

2. *Sideritis pars humi procumbens.* Small Iewes Ironwort.

This small herbe is somewhat like the former in the hairy square branches, but more trayling or leaning in the leaves, but somewhat larger, a little hairy, and dented from the middle of them forward: the flowers stand compassing the stalkes at certaine distances as the others doe: the roote is small and perisheth every yeare.

3. *Sideritis altera parva Clusij.* Another small Iewes Ironwort.

This other small Ironwort hath the middle stalke upright somewhat hairy and square, spreading into many smaller branches, even from the bottome upwards, which in a manner lye on the ground, with two hoary leaves as the last at the joynts, but little or nothing dented at all; the flowers are white, without any purple: I remember but gaping in like manner: the roote of this likewise perisheth every yeare.

4. Sideritis

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Sideritis vulgaris Clusij.* The *Germane* Ironwort.

This Ironwort that is most common in *Germany*, as *Clusius* saith, groweth greater and higher then the other, with larger, hairy, rough, pointed leaves, set by couples one against another, at the joynts of the square hairy stalkes, dented about the edges, but set at farther distances, which branching themselves forth, are set from the middle upwards, with many whorles of gaping white flowers at the joynts with the leaves, spotted with blood red spots in the upper part of them, ending in a long spike, the seede that followeth is small, uneven and blacke, contained in five square heads: the roote is white and wooddy, shooting new stalkes every yeare.

5. *Sideritis Montpelicensis Lobelij.* Small Ironwort of *Montpelier*.

The small Ironwort of *Montpelier* riseth scarce to a foote high,

Original from UNIVERSITY OF MICHIGAN

heigh, having many square hoary upright hard stalkes, whereon are set at the joynts two long leaves, as long, hoary, and crumpled as the first lewes herbe, and as deeply dented about the edges: the tops of the stalkes and branches have many whorles of flowers set in rough huskes, like those of Savory, in some of a purplish colour, in others of a yellowish purple.

6. *Sideritis montana Hyssopifolia.* Mountaine Ironwort.

This mountaine Ironwort hath slender round stalkes, lying upon the ground, and shooting forth roots at the joynts, as they lyeth thereon, set with small long and narrow leaves on them, like unto those of Hyssope, but thinly by couples, and sometimes more growing out betweene them, lesser then they: the flowers are of a pale purplish colour, of the same fashion with the other, and set in such rough huskes: the roote is long creeping and hard.

7. *Sideritis montana Apula versicolor.* Mountaine Ironwort of *Naples.*

The Neapolitane Ironwort riseth up with a reddish, square, hoary and hard hairy stalk, a foote and a halfe high, divided into two branches, about the middle thereof, whereon are set at the joynts, two small and long paire of greene leaves one against another, covered with an hoary downe, and having three deves or notches on each side at the ends of them, which at the lower end of the stalke next the ground, have long footestalkes under them, but up higher at the top are without any: the flowers stand in sharpe pointed huskes and are gaping or hooded as the rest are but very small, whose head and jawes are of a darke purplish colour; the middle of the flower is yellow, and the long necke of the flower that riseth out of the huske is whitish: after the flowers are past come foure blackish shee-coloured seede, somewhat cornered in the hairy or hoary huskes, the roote is small and yellowish.

8. *Sideritis Germanica parva.* Small *Germany* Ironwort.

This small Ironwort hath low square stalkes of a foote high, branched from the very ground, being soft and hoary as the leaves are also that stand by couples, being long and somewhat narrow without any dent or all about the edges, yet larger below then above: the branches have flowers growing about them upward as some almost as they flower out, in shape as the other leaves are, but they are so small, that they scarce appeare out of the huskes, of a duskie colour; the jawes and lower part on the inside being whitish: after which come blackish seede smaller then in the other, the roote is white and woodly, and perisheth every yeare.

9. *Sideritis folijs Alsines Tertiagine.* Ironwort with Germander Chickweede leaves.

This Ironwort shooteth forth a square hairy stalke a foote long, spread into branches from the bottome, and those againe sending forth other smaller ones, all of them enclining to the ground, like the Germander Chickweede, but much greater, whereon stand a few hairy leaves by couples, in forme like unto that Chickweede also but larger, and dented about the edges: the flowers grow at the joynts with the leaves towards the tops, like unto the other in fashion, but some what longer, and of a blewish colour standing in short and rough huskes, wherein small round seede succeedeth, the roote is small and threddy.

6. *Sideritis montana Hyssopifolia.*
Mountaine Ironwort.

8. *Sideritis Germanica parva.*
Small Germany Ironwort.

10. *Sideritis*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

10. *Sideritis Quercifolia.* Ironwort with Oaken leaves.

The ſtalke of this Ironwort is ſtraight, and with few branches, bearing very ſparſedly ſomewhat broad and rough pointed leaves, unevenly cut in on the edges, ſet upon ſhort foote-ſtalkes by couples, which are ſomewhat like unto one of the kinds of Oake: the flowers are ſmall, and ſtand in ſmall rundles about the toppes, of a blewiſh purple colour.

11. *Sideritis Hederulæfolia.* Ironwort with Alehoofe leaves.

This ſmall herbe not much above an handbreadth high, bearing ſmall, broad and roundiſh greene leaves with ſome dents about the edges, like to Alehoofe, or rather unto the red Archangell leaves: the flowers are hooded and purpliſh, and the ſeede ſmall and blackiſh: the roote is ſmall and threddy, periſhing every yeare, ſurviving it ſelfe from it owne ſowing aboundantly enough in a garden where it hath beene once ſowen.

12. *Sideritis glabra oblonga ſplendentis folia.* Ironwort with ſmooth long leaves.

This plant hath ſquare and joynted ſtalkes, ſmooth below, but with ſome ſmall hairineſſe at the toppes: the leaves ſmooth and thinne, ſet by couples, the lowermoſt three inches long, and one broad, not dented at all about the edges: the flowers are hooded like the common ſort, but white, larger then they and longer alſo, ſtanding through hackes about the ſtalkes, even from the bottome almoſt, after which come ſmall blackiſh uneven ſeede, in head like Plantaine blue flowres.

13. *Sideritis arvenſis rubra.* Meddow Ironwort with red flowers.

The roote of this herbe is very fibrous or full of threds, from whence ariſeth up a ſquare browne ſtalke, full of branches, and cloſe ſet with divers narrow long and pointed rough leaves, ſomewhat dented about the edges, ſet by couples, at the toppes whereof ſtand the flowers, compaſſing them as the others doe, of a darke red colour, and the ſeed of a white colour: the whole plant is of an auſtere or harſh binding taſte, without ſmell, and periſheth every yeare.

14. *Sideritis arvenſis latifolia glabra.* Broad leafed meddow Ironwort.

This plaine meddow Ironwort hath larger ſmooth greene leaves below then thoſe above, a little dented about the edges, the lower ſtalkes are branched, and the flowers in ſome purpliſh, tending to white, in others of a pale or yellow ſad colour, ſet in coronets or circles about the ſtalkes, without any ſcent as the others alſo.

15. *Sideritis Anglica ſtramoſa radice.* Clownes Woundwort.

As a Complement to theſe *Sideritides*, let me adde this Woundwort as laſt of all, though not the leaſt in effect, which from a country mans experience, hath not onely obtained the name of a Woundwort, but famoured to poſterity, for others to receive good alſo thereby, which elſe might have beene buried with him that healed himſelfe therewith of a cut with a Sithe in his legge. It groweth up ſometimes to three or foure foote height, but uſually about two foote, with ſquare greene rough ſtalkes but ſlender, joynted ſomewhat farre aſunder, and two very long and ſomewhat narrow darke greene leaves, finely dented about the edges thereof, ending in a

14. *Sideritis Hederæ folio.*
Ironwort with Alehoofe leaves.

15. *Sideritis Anglica ſtramoſa radice.*
Clownes Woundwort.

long

long ioynts: the flowers ſtand towards the top, compaſſing the ſtalkes at the ioynts with the leaves, and are likewiſe in a ſpiked top, having long and much open gaping hoods, of a purpliſh red colour with white ſpots in them, ſtanding in ſomewhat rough huſkes, wherein afterwards ſtand blackiſh round ſeede, for taſte reſembling Liquorice, compoſed of many long ſtrings, and ſmaller fibres, with ſome tuberous long knobbes growing alonge them, of a pale yellowiſh or whitiſh colour; yet at ſome times of the yeare theſe knobbes ſometimes many doe not ſeeme in the plant; the whole plant ſmelleth ſomewhat ſtrongly.

The Place.

Many of theſe are ſtrangers in England, growing ſome in Medowes, others on Mountaines; yet ſome are naturall to our Country, beſides the laſt which groweth in ſundry countries of this Land, as in *Middleſex* at *London*, by the path ſides in the fields going to *Chelſey* and *Kenſington*, by *Hackney* in the ditch fences of a field called the troubles of mutton field, and in *Surrey* in S. *Georges* fields, and in the Medowes by *Lambeth*, and under that tree by Stangate, neere againſt *Weſtminſter* bridge, which ſtandeth alone upon the banke and ſeaſide: in *Kent* at Southfleet, and on the backſide of the Church yard of *Nettleſtead*, hard by Sir *John Scots* houſe, and in the middle of the next field to the Lime Kilne, at the foote of Shooters hill. In *Suſſex* towne in the ſeruice neere a place called the *Mandlines* in a fen by the ditch ſides, and on the ditches ſides on the left hand of the way beyond *Stratford Bow*. In *Suffolke* alſo *Cambridge* and *Huntingdon* ſhires more plentifully.

The Time.

They all flower in *June* and *July*, and their ſeede is ripe ſoone after.

The Names.

Trifolium in Greeke, *Sideritis* de quibus *Farnamentaria quod ambiebant in ferro fallis* for with it did beate woundes made by the ſword, whereof there was great uſe in the warres, and therefore from thence that were conducing to this purpoſe, although of different formes were called *Sideritis*, as alſo *Verbenaca*, *Philetrida Pliny* and others doe deriue (becauſe *milites* Souldiers had moſt ſpeciall uſe of them) as *Fuchſius* and *Matthiolus*, who have mentioned divers ſorts. The firſt ſort here expreſſed is thought by ſome to be *Trifolium pratenſe primum*, or *Herba Britannica*, *ſic dicta a propria virtute plane Britannica* (as ſome ſay the French but is to be accounted and called alſo) the reſt ſet forth in this place are referred thereto, all ſpecies of the ſame genus and moſt neere, and like thereunto, both in forme and qualities; for beſides all the herbes ſet downe in this Claſſis, vndoubtedly other might be called *Sideritides*, being they are *Vulnerary* wound herbes for that purpoſe; It is alſo called *Tetrahit*, *Trirahit*, and *Herba Iudaica* by divers, becauſe the leaves that ſeeme like Playcke and Trinitygreen, like the Charletonces and Mountcreſſes in *Italy*, and the Iewes in *Germany* had theſe herbes in much uſe with them; the ſecond and third at leaſt are the *Trifolium* of *Italy*: the fourth is the firſt of *Lobelius*, which he calleth *vulneraria*, becauſe it was moſt knowne and moſt vſed here to the *Britaines* growing amongſt them. The firſt is called by *Lobel* and *Penn Sideritis montana*, Soaring *Hempe-bane Nettle* &c. and in his *Icones plantarum*, it ſet *florentia lutea*, *Tragi quorundam priſcorum Francofurtenſium*, it is alſo the firſt of *Matthiolus* *Sideritis peregrinarum* of *Tabermontanus*, which *Dodonæus* calleth *Sideritis ſecunda ſeu ſexta* the ſixt is called by *Lobel* and *Penn Sideritis montana*, and is the ſeventh ſort of *Cluſius*, and ſixt of *Tabermontanus*, which *Bauhinus* calleth *Sideritis Alpina Hyſſopifolia* the ſeventh is by *Columna* called *Sideritis mas una parva ſpicata purpurea*: the eight is the firſt *Sideritis* of *Clusius*, which hee ſaith is called *Fumaria*, but not ſo truly as is alſo. The ninth is by *Bauhinus* ſo called as it is in the title: the tenth is *Lugdunenſis Gallorum*, and *Germanis* followeth him, and without faith, that ſuch a like Plant he gathered in his owne garden, by the name of *Sideritis*: the eleventh is of mine owne endeavours finding it wilde, and planting it in my gardens, where it hath continued ever ſince: the twelfth is by *Bauhinus* onely ſet forth in his *Pinax*, *Pedemontana*, which he had from *Gesnerus* of *Heidelberg*: the thirteenth is called *Lodonum ſeptentrionalium*, *Herba Wolfiana* alſo called it *Tetrahit angeſtifolium*: *Camerarius* calleth it *Sideritis arvenſis Wolfiana* and *Galeopſis*, ſuppoſes *Gesnerus* to be the firſt: *Cæſalpinus* *Sideritis alia in vineis*: *Tabermontanus* *Aſſyriaca Cami* *pentapetes*, and *Bauhinus* *Sideritis montana anguſtifolia rubra*. The fourteenth is the *Sideritis ſecunda Columnæ*, as *Bauhinus* calls it, although *Lobel* thinketh it to be a kind of *Cannabis ſpuria*, and others take it to be *Chamædrys* *Marrubiaſtrum Pedemontanum*: it is the *Sideritis Heraclea altera* of *Cæſalpinus*, the *Sideritis arvenſis foetidior* of *Camerarius*, the *Sideritis arvenſis ſpecies altera* of *Thalius*, ſet downe by *Gesner* & *Tabermontanus* under the name of *Alyſſum Germanicum*; and called by *Bauhinus* *Sideritis arvenſis latifolia glabra*. The laſt is called by *Penn Fumus Cattus*, from a cuſtome he had to ſmoake it for the ſpeedy cure of his owne Leg therewith, which he broke in mowing down a field of Peaſe, but why he ſhould call it *Fumus* in Latine, being not ſo heroe for all diſeaſes not like unto it knowne *Fumus* in former, I know not, unleſſe *Quicquid in buccam venerit* he tooke that which came next to hand for in my judgement it is a diff'ring *Sideritis* from any before, and therefore I have given it the title *Sideritis Anglica frutescens*, for the cauſes ſet downe in the deſcription. It may ſeeme probable to many that the title was not onely ſhuffled to diverſe of our moderne writers, but called alſo *Sideritis* by iumbly or *Pacto*, as it is ſuppoſed to be *Thalius* his firſt *Sideritis*, which he reſembleth *graui admodum odori*, *Camerarius* his *Sideritis altera Geſneri*, *Geſner* himſelfe calling it *Betonica ſylueſtris* or *Herba Iudaica repens*, notwithſtanding there is the *Tetrahit* that is moſt common amongſt theſe, and with *Longuewort* or *Hyſſopus montana*, but I find at the laſt there is, but in that the leaves of theſe are ſhorter then of this, then that the flowers are leſſe and of purple, not cleare red, ſpotted with white: their roote like wiſe are not deſcribed to have any ſcore knobbes at all, except *Thalius*. The *Arabians* call the *Sideritides* in generall *Sideah*, de *Indaica Sideritis*, *French* to Roſe ſleeve, as I heare, *Herbe Carpenaire*, the *Germans* *Gliderwort*, the *Dutch* *Glidcruyd*, and we *English* after the Dutch name, Glidewort of ſome, and Ironwort of moſt, for Wodwort is too groſſe a name, unleſſe you will the clowne to it as *Gerard* doth.

The Vertues.

Moſt of theſe herbes are very powerfull to ſtay all Fluxes of blood, in man or woman, inwardly or outwardly, as alſo to dry rotnes and defluxion from the head, but eſpecially the firſt, the fourth, and the laſt, the firſt and the fourth being ingrafted in forme and alſo in qualities, being of ſpeciall uſe for the ſoare and ulcerous beſidings of the ſtomacke, and to heale berſtings or ruptures, and the whites in women as well as the rede; for being exceeding drying and binding, and moderately hot, as wee take it, (yet *Gales* ſuch of laſte cold and

and mouth, and sore throat (being) it not onely preserveth those parts, but is admirable good for filthy sores and ulcers, the bleeding, and to heale and close up their lippes quickely without suppuration, as well as to stay the dysentery, and flixe of humors in old festring ulcers, and cankers, that eateth their hollow and spongie flesh: it hath his name *Heraclea*, by priviledge of excellency, as an *Heraclea* or soveraigne of medicines: and if there be any inflammation about the parts, by the application of the herbe, dryes or decocteth it away. The tail of *Dioscorides* his testimony of the use thereof is singular, for it is fresh wounds, and is more available in the staying of blood and humors than the other.

Chap. LVII.

Alyssum. Madwort.

Of the name *Alyssum* is diversly concluded both by the ancient and moderne writers, being referred to three herbes, for *Dioscorides* hath one sort, and *Galen* another and *Pliny* a third, each differing from other as it is thought, and *Aetius Galenist* hath a kinde of *Polion*, for the *Alyssum* of *Dioscorides*, and others as *Lobel* particular *Bugloss* or *Consolida media*, *Ruellius* a kinde of white or Ballard Hempe, *Matthiolus* taketh that kind of Horehound, that is called *Cardiaca* Motherwort, to be *Alyssum Galeni*, and *Fuchsius* our ordinary Clary, *Gesner* and others take *Lepidium* or some other smaller Maiden to be *Pliny* his *Alyssum*, and *Caesalpinus Cruciata*: but because they are all improperly applyed, I meane not here to entreate of any of these in this place, but of other plants, that this latter age hath found out most nearely to represent the two kindes of *Dioscorides* and *Galen*, their *Alyssum*.

1. *Alyssum Dioscoridis*. The Madwort of *Dioscorides*.

The Madwort of *Dioscorides*, hath many hoary, hard, and rough leaves, lying on the ground, somewhat broad and round for the first yeare of their springing, but the next yeare when the stalke beginneth to stande, they grow ever on both sides narrow and longer, and somewhat torne in on the edges, in some places, which stalkes be hoary about a cubite high, and spreadeth into two or three branches, at the toppes whereof come divers pale yellow, and very small flowers standing one above another severally, on both sides of the stalkes, which turne into somewhat large and round, flat, thinne, hoary, hard, rough huskes, resembling little bucklers, or rather mall like the yellow kinde, with seeds, of the *Lunaria major*, or *Bolonach*, which is the white Saxon, but that these are smaller, rougher, and harder, and wherein lye small flat reddish seedes, in a double order on both sides of the thinne and the stalke, which in this is not white like that of the latter, but else very like: the roote is small and woodie, dying every yeare, after it hath given seede, and seldome perisheth the first yeere, before it runne up to stalke.

1. *Alyssum Dioscoridis.*
Madwort of *Dioscorides*.

2. *Alyssum montanum Cordi.*
Madwort of Cordus.

Original from UNIVERSITY OF MICHIGAN

3. *Alyssum alterum Dioscoridis minus.* The leſſer Madwort of *Dioscorides*.

3. *Alyssum Galeni Clusio.*
Galen his Madwort according to *Clusius*.

This leſſer Madwort hath divers long leaves, lying on the ground, a little waved on the edges, of a pale or bleawiſh greene colour, about three inches long and one broad, rough and hayrie, but tolter than the former; from among which riſe ſlender weake rough ſtalkes, ſcarſe able to ſtand upright, parted into ſundry branches, whereon grow the leaves by couples, one oppoſite to another, ſmaller but not leſſe hayrie, and rough than the former, the flowers firſt beginne to breake forth at the toppes, and afterwards on the ſides or winges, which are many ſet together in tufts, conſiſting of foure white leaves, notched in the middle, which maketh every leafe ſeeme like a flote, with divers yellowiſh threds in the middle of them, and each ſtanding in a greene huske, the nacke ſide whereof have longer foote ſtalkes than thoſe more inward, and each flowret larger than the inner ones, which being paſt, there ſucceede round ſeede veſſels like bucklers, ſmaller than the former, hard and rough on the outſide, in which are contained flat ſeede, in foure round reddiſh cells or partitions, divided by a certaine ſhining ſkinne, two ſeede lying in each cell or partition: the roote is ſmall and long, with divers fibres thereat, and abideth, ſhooting forth a new, more ſharpe in taſte than the leaves, which are drying and aſtringent.

4. *Alyssum montanum Columnæ.* Mountaine Madwort of *Columna*.

This other Madwort of the Mountaines, hath a ſmall reddy roote, from whence ſpring up ſmall and weake round reddiſh ſtalkes, lying upon the ground, ſhooting forth rootes at the joynts, and raiſing themſelves up againe, the loweſt leaves whereof are ſmall and roundiſh, not much bigger than ones nayle, but thoſe that grow up afterwards upon the ſtalkes are greater, being two inches long, deepely dented about the edges, and very rough, covered with a long hairineſſe, two or the moſt part, ſet at every joynt, with long foote ſtalkes under them: at theſe joynts likewiſe on both ſides come forth three or foure blewiſh flowers, each ſtanding upon a very ſmall hayrie foote ſtalke, having foure ſmall greene leaves under them as a huske wherein they ſtand, and wherein afterwards groweth the ſeede veſſels, which are two, flat, ovall or round huskes like bucklers, joyned at the ſides together, hayrie at the brimmes, and containing five or ſixe yellow flat ſeedes in each partition: the roote dyeth every yeere, and muſt be new ſowen, when any will have it.

4. *Alyssum Galeni Clusio.* *Galen* his Madwort according to *Clusius*.

Clusius his Madwort of *Galen* is accounted a kinde of Horehound, and riſeth up with a ſquare whitiſh woolly ſtalke, divided into branches from the very bottome, having two leaves at every joynt, ſomewhat like unto Horehound, but leſſer, rounder, and more hoary, ſmaller at the bottome, broader at the ends, and ſomewhat devided at the edges, without ſent, but bitter in taſte: at the joynts with the leaves come forth the flowers round about the ſtalkes like unto Horehound, but of a purpliſh colour, ſtanding in hoary huskes, with points very ſharpe and prickly, wherein after they are paſt, lye red ſeede, like unto thoſe of Horehound: the roote is ſmall and ſtringie, and abideth in the warme Countries, as it is probable after it hath perfected the ſeede; for *Clusius* ſaith he found it in *Spaine* in *March*, having both flowers and ripe ſeede thereon, but being ſowne as he ſaith, in thoſe colder Countries, it every yeere periſheth, and by the ſeede which it ſheddeth is renewed againe.

5. *Alyssum verticillatum foliis crenatis.* Madwort with dented leaves.

This hath a ſmall woodily roote with fibres ſet thereat, from whence riſe ſundry ſquare ſtalkes of a foote or more high, leaning downe to the ground, ſet with leaves at ſundry diſtances, the loweſt being largeſt, ſomewhat like unto Horehound but longer, comming neere unto thoſe of Germander, but hoary, with a rough hayrineſſe, and dented not deepely about the edges, ſomewhat like Betony: at the joynts of the ſtalkes where the leaves grow leſſer upwards, riſe ſundry whitiſh purple flowers ſet in whorles or roundles as Horehound hath, out of prickly huskes which containe in them brownish ſeede: the whole herbe is in taſte aſtringent, yet not unpleaſant to the taſte, and having withall a little bitterneſſe, and ſweetneſſe withall in ſent.

The Place.

The firſt groweth in gardens both with us and in *Italy*, *France*, and the Low Countries, the originall not being yet well knowne: the ſecond groweth about *Rome*, and the third upon one of the hils in *Naples* as *Columna* ſaith: the fourth *Clusius* ſaith he found in one place in *Spaine* and no where elſe: the laſt *Columna* alſo groweth by the paſſes ſides of the dry rockie hills in *Naples*, where there is ſmall ſtore of earth for it to grow in.

The Time.

They ſee all flower about *July* and *Auguſt*, and the ſeede is ripe quickely after.

The Names.

It is called in Greeke Ἄλυσσον *Alyſſum*, and *Alyſſum* in Latine, ſo called becauſe it cureth thoſe that are bitten by a mad dog, yet *Plutarch in Symposiacis lib. 3. q. 1.* by ſaying it helpeth the hickock, would derive the name from ἀλύειν *ſingultire*. There is ſome doubt among many, whether theſe ſhould be the right or true *Alyſſa* of the

Aetius and *Galen*: for as concerning the first, they affirme, that it may more fitly be referred unto the sorts of *Thlaspi*, or of *Lunaria Graeca*, and therefore some have called it *Lunaria minor*, and *Lunaria lutea*, *Calathianus Lunaria*, and *Orbicularis*, and *Orbiculata flore luteo*: but *Dodonaus*, *Clusius*, *Camerarius*, *Lugdunensis* and *Lobel* doe all call it *Alyssum*, and *Alyssum*, & *Lobel* saith further, there is no herbe to be found that better agreeth with *Dioscorides* his *Alyssum* in all things then this first doth. *Pena* in his first booke saith, that *Alyssum* was called *Siderites Heraclea* by some in his time, that it grew by the way sides, and bore a purple flower, and thicke leaves (which is what most of these *Alyssum* have) some doe account it a kinde of *Lunaria*, and so do both *Columna* and *Bauhinus*; the one called it *Lunaria montana minor lunariae*, for he saith that the *Lunaria* and *Thlaspi*, be congeners; which I grant, but yet I thinke, that the *Lychnides* be nearer congeners to the *Lunaria*, then the *Thlaspi* be, the other that is *Bauhine* called it *Lunarium Alyssoides cinereum maius*. The second is called by *Columna*, *Lunaria parua tomentosa prima*, which saith it is a congener to the *Alyssum* of *Dioscorides*, which as I layd is the first here expressed, and therefore *Lobelius* calleth it, *Lunarium Alyssoides cinereum minus*. The third *Columna* calleth *Alyssum Dioscoridis minimum*: but *Bauhinus* setteth it among the *Chamaedrios*, calling it *Chamaedrys spuria villosa procumbens foetidula*, which in my judgement is very improper, and I may be set downe among the rest of his improprieties; for unlesse it bee the leaves in this plant that hath some likenesse, and that is very little, there is not therein else that can agree with any *Chamaedrys*, either *vera* or *spuria*: for whosoever saw a *Germander* with broad hoary leaves like unto the leaves of sedge? the fourth is called by *Clusius*, *Alyssum Galeni*, and saith hee never saw any plant that came nearer to the description of *Galens Alyssum* then this doth, and that notwithstanding that hee had read what *Columna* had written thereof in his *Ecphrasis*, calling it *Planta Hispanica*, *Absinthio similis* and not thinking it to be *Alyssum Galeni*, yet he was still of the same minde: and I finde that *Camerarius*, *Dodonaus*, *Lobel*, *Lugdunensis* and *Bauhinus*, doe all follow *Clusius* herein, but none *Columna*, onely *Lugdunensis* seemeth to contrary *Clusius* in saying that it seemed to him, that he did expresse the *Mollior planta* of *Alyssum Galeni*: the last *Columna* hath set forth in his *Phytobasanos*, calling it *Siderites Alyssum*, *Siderites Heraclea Dioscoridis*, *Alyssum minus Galeni*, whereby hee seemeth to judge the *Siderites Heraclea* of *Dioscorides*, to be all one with the *Alyssum Galeni*, and herein as it is likely confirmed, because he found *Aetius* and *Pena* (as I layd before) to say that some in his time called the *Siderites Heraclea*, *Alyssum*; yet the figure that *Columna* setteth out for it, is so like (as I have not seene his plant if it differ from) the *Herba Impia*, that I thinke it the very same, whereas *Dioscorides* maketh his *Siderites* to have longer leaves then Horehound, almost as bigge as Sage: but so is not this: but the same *Columna* in another place maketh the *Alsine Veronicae folijs* to be *Alyssum* also. *Bauhinus* counterfeiteth it, *Alyssum cretticum folijs crenatis*, when as he called that of *Clusius*, *Alyssum creticum folijs profundè incisis*.

The Vertues.

Their *Alyssa* of *Dioscorides* and *Galen*, although they differ in forme one from another, yet they doe agree as they lay in one, that being taken in wine, or in broth, or in meate, or how soever, doth cure the venome of the biting of a madde dogge, and thoroughly performe the cure, which *Galen* saith he *saw simplicium sed experto*, it worked from the likenesse of the whole substance, and was found so to doe by plaine experience, without any other worke, and that it would performe many other cures if any should try it, for those diseases where the vertues of drying, dissolving and moderately cleansing, which are in this herbe are required; and therefore both *Dioscorides* and *Galen* doe say of each of these plants, that they cleanse the skinne from wheales and pimples, from spots and other discolourings, as the morphew, sunburning, &c. *Dioscorides* saith that his *Alyssum*, taken in drinke stayeth the hickocke if there be no ague, and that it will doe so also, if any shall but hold it in their hand or smell unto it: They are also effectuall for wounds, either inward or outward, to digest the clotted blood that is gathered by any fall, blow, or bruise, and to cleanse and heale old rotten and filthy Vlcers, or creeping Cancers. And because *Dioscorides* saith it is an Amulet to expell charmes, that shall be used upon man to heale, and that tyed with a scarlet cloth to cattell that are diseased, it helpeth them; therefore divers in the age before, have filled this tale with the reports of farre greater things, which because they are not onely idle but prophane, I list not to confirm them here: for from the forme of the seede vessells of the first here expressed, which is that of *Dioscorides*, as I layd divers called it *Lunaria*, Moonewort, and were beyond the Moone in expressing the properties, and therefore I thinke had needs themselves to be cured of their madnesse herewith.

Chap. LVIII.

Ulmaria sive Regina prati. Medowsweete or Medesweete.

Of this herbe there are two sorts, the one familiar to our countrey, the other a stranger to us, and onely entertained of a few, and those the lovers of rare Plants.

1. *Ulmaria vulgaris.* Common Mede or Meddowsweete.

The stalkes of this Medesweete are reddish and easie to breake, rising to be three foote high, and sometimes to be foure or five, having at the joynts thereof large winged leaves, standing one above another at distances, which are made of many somewhat broad leaves, set on each side of a middle ribbe, being hard rough or rugged, crumpled much like to Elme leaves, whereof it tooke the name, yet having also some smaller leaves with them, even as *Agrimony* hath, somewhat deeply dented about the edges, of a fine greene colour on the upperside, and grayish underneath; of a pretty sharpe taste and taile, very like unto Burnet, and will no lesse give a fine relish to a cup of Claret wine if a leafe be put therein then Burnet: at the toppes of the stalkes and branches stand many tufts of small white flowers thrust thicke together, which smell much sweeter then the leaves; and in their places being fallen, come croked and cornered seedes, flat on the one side, somewhat woodily and blackish on the outside, and brownish within, with divers greater strings set thereon: it is a strong herbe, but nothing so pleasant as the flowers or leaves, and perisheth not but lasteth many yeares, shooting forth a new every spring.

2. *Ulmaria maior sive altera.* The greater Medesweete.

This Medesweete groweth higher then the former, with longer winged leaves, set one above another upon the trelled

crested brownish stalkes, having long foote stalkes upon them, each being divided usually into five parts, the lowest one against another, and every part also consisting of three or five smaller leaves then the other parts, each from the other being hard crumpled and finely dented about the edges: at the tops of the stalkes grow the flowers in longer spikes more sparedly and not so thicke thrust together, turning downe their heads like white like the former, and smelling very sweete also, more nearely resembling a Goats beard; whereof some have given it the name then the other: the roote is more woodily, with many blackish strings annexed, smell strong, and taste somewhat bitterish: the stalkes and leaves dye wholly downe every yeare, and new grow in the spring.

The Place.

The first groweth in moyst Meddowes that lye much wet, or neare the courses of water, and the later also in shadowie woods, and places very often.

The Time.

They are found in flower in some place or other all the three Summer monethes, that is, Iune, July and August, and their seede is ripe quickly after.

The Names.

They are not found mentioned by any of the ancient Greekes, or Latines, onely some thinke it may be referred to *Rodon* of *Pliny*. It is called by the later writers *Ulmaria*, *a foliorum Ulmi similitudine*, of the likenesse of Elme leaves, of *Regia herba* and *Regina prati*, and *Barba*, and *Barbula Capræ*, or *Barba Caprina* of the flowers, as him thought also that it might be *Hippocrates* of *Dioscorides*, as *Gesner* in his and *Lonicerus* doe. Some call it *Barba capri*, and *Label Barbi caprâ*. *Cordus Medsuisse* from the Germaine word *Medsuisse*, that is, Meddow sweete. Some as *Lugdunensis* saith, tooke the later to be *Melanderium Plinij*, and some also call it *Trago*. *Aegnillara* calleth them *Potentilla major prima* and *secunda*, and *Thalius* the greater and lesser. *Fuchsius* saith the *Italians* call it *Cbristofarina*, the *French* call it *Barbe de Chevre*, and *Reine des prez*, the *Dutch Geisbert*, and the greater *Wilde Geisbart*; and *Camerarius* saith *Wiesenkraut*, because as he saith they are often found, as if it were eaten by Wormes; but it is more likely for that it helpeth horses of the bots or Wormes, and so he saith the countrey people used it; the *Dutch Reinrie*, and as *Lobel* saith *Geyssbaert*, or *Camerarius*, in *English* Medsweete or Meddowsweete and Queene of the fields or Meddowes.

The Vertues.

Being neare a kinde of sedge and smell with Burnet, they are most likely to bee neare of the same kinde: *Tragus* accounteth them more hot and dry, they are also used in the same manner and for the same purposes to stay all manner of fluxes, bleedings, and vomitings, and women courses, as also their whites: it is also good and take away the fits of quartaine Agues, and to make a merry heart, for which purpose some use the [illegible] some the leaves: it helpeth also speedily those that are troubled with the Collicke, being boyled in wine and [illegible]

Original from UNIVERSITY OF MICHIGAN

little honey taken warme, it doth open the belly, but boyled in red wine and drunke, it stayeth the flux of the belly, & helpeth the Burres in horses as you heard before; being outwardly applyed it healeth old Vlcers that are rancrous or eating, and hollow or fistulous, which many have vsed and much commended: as also for the sores in the mouth, and secret parts: the leaves when they are full growne being layd upon the skinne, will after a small time, raise Blisters thereon as *Fragum* saith: the water thereof helpeth the heate and inflammation in the eyes: the seede as *Cordus* saith being taken, causeth paines in the head; and because both flowers and herbes are of so pleasant a scent, many doe much delight therein, to have it layd in their Chambers, Parlors, &c. and Queene *Elizabeth* of famous memory, did more delight in it then any other sweet herbe to strew her Chambers withall: a leafe, or two steeped in a cup of wine, will give as quick and as fine a relish thereto, as Bonnet will, as I sayd before.

Chap. LIX.

Potentilla. Wilde Tanley.

Wilde Tanley creepeth upon the ground, taking roote at the joynts, every where round about the place where it groweth, that it will quickly take up a great compasse, shooting forth sundry winged leaves made of many, set on both sides of a middle ribbe, some smaller, being set among the greater, somewhat like unto *Agrimony* or Medelwort, and like also unto Tanley from whence it tooke the name; for it partaketh in forme with them all, and dented about the edges, but of a fairer greene colour on the upper side, and of a silver shining white colour underneath: it beareth no stalk, but the leaves every one of them by it selfe stand upon a long short footestalke, rising from the joynts with the leaves: which consist of five small yellow rounded leaves, like unto a flowre of Cinkefoile, or Five leaved grasse: the prime roote slooteth downeward like the Cinkefoile.

Potentilla. Wilde Tanley.

The Place.

It groweth almost every where wilde abroad in most place.

The Time.

It flowreth in *June* and *July*.

The Names.

It is called *Potentilla à potentia virtutis quibus pollet*, and *Argentina à colore argenteo superiori foliorum*, some take it to bee *Siler montanum* of *Pliny*, *lib. 26. c. 13.* others referre it to *Argentina*: it is also called *Tormentilla sylvestris*, or *agrestis*, as *Dioscorides* doth: *Tabernamontanus* calleth it *Anserina*, *Gesner*, *Lotæ Germanis*, *Argentina alterius*: and to doth *Tragus*, and with all saith, it may be called also *Millefolium minus*, and *Lotæ pumilio*: *Matthiolus* the *Italians* call it *Potentilla*, the *Spanish Argentina fragosa*, the *Germanes Gensfot*, and *Gensfrut*, the *Dutch Ganserake*, wee in *English* Wilde Tanley.

The Vertues.

Wilde Tanley is cold, and dry, and binding withall, so that it layeth the laske, and all fluxes of blood in men or women, and some say it will doe so if the greene herbe be but worne in the shooes, so as it be next the skinne, it stayeth all spittings or vomitings of blood: the powder of the dryed herbe taken in some of the distilled water, helpeth the whites in women, but more especially if a little Coriall and Ivory in powder be put to it: it is also commended to helpe children that are burden, and have the wormes: being boyled in water and sale, it is also found to be good for those that have bin bruised by any fall, or the like, to dissolve the blood, & as it is said doth help to breed fleshe: being boyled in wine and drunke, it easeth the griping paines of the bowels, and is good for the Collick and stytch aches: the same boyled in Vinegar with Hony and Allome & gargled in the mouth easeth the paines of the teeth, fastneth loose teeth, and the gums that are sore and spongie, and ferleth the *Uvula* or pallate of the mouth when it is fallen downe: it cleanseth and healeth those Vlcers that are therein, or in the lippes, and is singular good also for inward wounds, and to consolidate or close the lips of greene wounds, and to heale the old moyst and corrupt running sores, in the legges or elsewhere being bruised and applyed rawe, as also the fresh, next to the wrests of the hands, it wonderfully cooleth the hot fits of Agues, be they never so vehement: the distilled water cleanseth the skinne of all discolourings therein, as morphew, sunburning, &c. as also pimples, freckles, and the like, and dropped into the eyes, or wet cloathes applyed unto them, taketh away the heat and inflammations in them.

Chap. LX.

Agrimonia sive Eupatorium. Agrimonie.

WE have divers sorts of Agrimonie, some of our owne land, and some of others, as you shall have them here set forth unto you.

1. *Eupatorium sive Agrimonia vulgaris.* Our common Agrimonie.

Our common Agrimonie hath divers long leaves made of many set upon a stalke, some greater others smaller, all of them dented about the edges, greene above, and grayish underneath, and also hairy withall, among which ariseth up usually but one stalke, strong, rough or hairy browne round stalke, 3. or 4. foot high, with smaller leaves set here and there thereon: at the top whereof grow many small yellow flowers one above another in long spikes; after which come rough heads of seeds hanging downewards, which will cleave to any thing that shall rubbe against them, and sticke upon garments, being touched or cast thereon: the roote is blacke, long and somewhat woodie, abiding many yeares, and shooting afresh every spring: it hath reasonable good lent yet very small.

2. *Agrimonia odorata.* Sweete smelling Agrimonie.

This other or sweete smelling Agrimonie is so like the other that there is hardly any difference to be discerned by the eye, but by the taste only, except that if there be any difference, this groweth somewhat lesser, with rounder and whiter leaves then the other, and the taste of a darke red colour, but the smell hereof much surpasseth the other, and is such as the same being aromaticall and dilligent; whereby it is held to bee of speciall excellent use to comfort the stomacke and strengthen weake parts.

3. *Agrimonoides.* Bastard Agrimonie.

This herbe is not unlike to Agrimonie, and yet is none, and therefore called Bastard Agrimonie, bringeth forth long, soft and hairy leaves next the ground, every one upon a long reddish hairy foote-stalke, which are cut and divided into many more leaves, seaven for the most part, three on each side and the seventh at the end, but the two lowest smaller ones be set next them, like as Agrimony hath, yet somewhat rounder then they, and all of them smaller dented, and sharper pointed, of a darker greene colour on the upper side, and grayish underneath: among these leaves rise up sundry weake stalks, not fully standing upright, but leaning downewards, whereon set very sparsedly such like leaves, but smaller and rounder, with small peeces at the joynts of every of them, & at the tops come forth three or foure hairy greene huskes like cups dented at the brims, out of every one whereof riseth a fortil yellow flower, like unto Agrimony, yet sometimes they seeme appeare above the husks as ye seene; wherein after they are fallen and past, appeare small long and round graynes like unto the graines of wheate

1. *Agrimonia vulgaris.* Common Agrimony.

3. *Agrimonoides.* Bastard Agrimony.

wheate

which, standing together like two small lumpes, which fall out at the linkes of themselves, when they are ripe, leaving the huske empty and gaping; the roote is small fibrilth and woodily, abiding and not perishing in the winter.

4. *Eupatorium Cannabinum.* Hempelike Agrimony.

The Hempelike Agrimony hath many long darke, greene, sowre, woodly leaves, lying upon the ground, among which riseth up a soft whitish stalke, full of a white pith within to the height of two or three cubits sometimes, set full of lesser leaves as grow below up to the top, where the flowers stake forth, many standing together in tufts, being very small and mossie, of a pale purplish colour, which turne downewe, and is carried away by the winde: the root is forkedly fibrous, with many strings and fibres thereat: the whole plant hath a little tartnesse left in it, but is very bitter and lowe the roote also.

5. *Eupatorium Cannabinum Americanum latifolium.*

The broader leafed Hempelike Agrimony of *America.*

This broader leafed kind of Agrimony groweth greater and higher then the former, with a brownish stalke, and longer and broader leaves thereon, so that some have compared them to those of Bloodwort: the flowers grow at the top of the stalke in greater number, and more sparsedly with longer scaly husks, being many long shreds standing in the middle, of a more purplish blew colour, and the seede at their bottomes, which together are blowne away with the winde.

6. *Eupatorium Cannabinum Americanum argutifolium.*

Narrow leafed Hempelike Agrimony of *New England.*

The other kind of *American* Agrimony groweth at the first with a few small hairy leaves upon the ground, unevenly dented in some places on the edges, and in others but little or not at all dented: the single hairy thicke round brittle stalke of two or three foote high or more, is full set on all sides very thicke with longer and narrow leaves without

5. *Eupatorium Cannabinum Americanum latifolium.*

order, foure dented and foure not, of 2. 3. and 4. inches long a peece, and halfe an inch broad or leſſe, of a greene colour and ſoft, full of haires from the middle at the leaſt upwards and ſmaller leaves on them, very many ſmall mallie pale threds for flowers on every branch, out of ſmall greene huskes or heads, ſet with the ſeede almoſt indiſcernible is carried away with the wind, that one would thinke it had no ſeede at all, which yet will ſpring very plentifully before winter of it owne ſowing: the roote is a few hard ſtrings with ſmall fibres at them, and periſhing yeerely after it hath ſeeded.

7. *Eupatorium aquaticum duorum generum.* Water *Agrimony* of two ſorts.

Although all theſe ſorts of Hempe-like *Agrimony* doe uſually grow by watery ditch ſides, and the like moiſt places, yet becauſe they will alſo grow well in different ſoiles, I thinke it not a miſſe to joyne them all together, for the likeneſſe of name, forme, and qualities. Of this water *Agrimony* we have two ſorts of our owne Land, and another alſo out of *America* or New *England*, being in all other things very like one unto another, onely in the placing or ſetting of the leaves upon the ſtalkes, which in one ſort hath divers leaves ſet together like the fingers of an hand, all meeting together at the bottome, ſet by diſtances at the ſtalkes, every one undivided, but whole, yet dented about the edges, and in forme and greeneneſſe like unto the leaves of wilde Hempe, or of the former *Agrimonies* but ſofter: and in the other, every leafe is ſomewhat divided, three or five upon a ſtalke, two are joyned: the flowers are yellowiſh browne, made of many leaves like a ſtarre, ſet about a middle thrum, with one or two under them, diverſ ſtanding together, thruſting forth from the joynts with the leaves, and at the toppes of the branches, which turne into long ſtarre rugged ſeede, which will ſticke to ones garments as it paſſeth: the roote is made of many blacke ſtrings and fibres, encreaſing much, the whole plant ſomewhat aromaticall ſmelling ſweete, and taſting ſomewhat ſharpe like Pepper, and ſo doth the ſeede alſo.

Auctum. We have another of this laſt ſort, brought us from *Virginia* and New *England*, whoſe great hard ſtalke browne round ſtalke, of 3. 4. and five foot high, is wonderfull full of long branches from the bottome, ſet with joynts ſparingly red, on the ſame ſtalke ſome, with large greene leaves on them, the loweſt having five or ſix, the ſtalke upward but three, yet larger than the former, as the flowers and ſeede is alſo, yet not rough but ſmooth and blackiſh: this hath no ſharpeneſſe of taſte in it.

The Place.

The firſt groweth in the borders of fields by ditches and hedge ſides throughout all the Land: the ſecond is a ſtranger to us, growing with us onely in the gardens of the curious, but is naturall to *Italy* in many places, both the former and this growing neere one to another, or not farre diſtant: the third *Cluſius* found in *Spaine*, and ſent to *Bauhinus* from many other parts of *Italy* likewiſe, as he ſaith himſelfe: the fourth is found in many places that are wet, as the brinckes of ditches, and water courſes, and in the upland grounds alſo, where it will thrive and endure as well: the fifth, ſixth, and laſt came to us from New *England* & *Virginia*, the two laſt of them growing ſometimes in the very water, the laſt in ſhallow ponds and plaſhes of water, as alſo ſometimes in places diſtant from them: the laſt *American* groweth huge and great in our garden grounds, coming firſt into us out of New *England* among the earth that *John Newton* a Chirurgion of *Colleton* in *Somerſetſhire* brought me with *Plants Aſphodilus*, their little red Lillies and other plants.

The Time.

They doe all flower in *July* and *Auguſt*, and the ſeede is ſoone ripe after, yet the laſt *American* flowers lateſt.

The Names.

The firſt is called in Greeke εὐπατόριον *Eupatorium*, and ſo the Latines call it alſo, of *Eupator* the firſt finder of it, as *Pliny* ſaith, who calleth it *Eupatoria*; and as it is thought is his *Argemonia* ἀργεμωνία *ariſtolochia*, but *Matthiolus* ſheweth that this was an error out in his time, in miſtaking *Argemonia*, for *Agrimonia*. Some alſo call it *Eupatorium quamvis hoc de praſtine medicis*: becauſe it is a chiefe helpe to the Liver: it is alſo called *Agrimonia* of diverſ: ſome other names are alſo given unto it, as *Hiarmicella*, *Concordia*, *Lapis lazuli*, and *Fumus*. The *Arabians* call it *Cabal*, *Caffe*, and *Caffe*: the *Italians Agrimonia*, and ſo doe the *Spaniards*: the *French Agremoine*, and *Eupatoire*. The *Germans Odermenig*, and *Bruchwartz*: the *Dutch Agrimony*, and we in *Engliſh Agrimony* of common *Agrimony*. All the Apothecaries of our Land, eſpecially of *London* now adayes, doe uſe this firſt kinde of *Agrimony* as the moſt aſſured *Eupatorium* of *Dioſcorides*: how beit in former times, both we and they beyond the ſeas, did uſually take the *Eupatorium Cannabinum*, which they called *Eupatorium vulgare*, but this miſtaken and either of ignorance not knowing the right, or of willfulneſſes in not enduring to be withdrawne from their old errours, but our age hath reformed very many of theſe errours, we were formerly miſled up in; and no doubt but by the diligent ſearch of divers for the truth both the light that hath riſen hath appeared, and the darkeneſſe that remaines may be expelled, which time muſt as it hath done in part already, bring to paſſe, the pernicious willfulneſſe of many being the cauſe that it is not wholly performed as yet. *Anguillara* firſt, and *Cluſius* after him deemed this *Eupatorium* of *Dioſcorides*, to be that of *Avicen* alſo, and ſo to be both one. *Dodonæus* becauſe he would not acknowledge the *Agrimony* of *Dioſcorides*, to be the *Eupatorium* of *Meſue*, found him ſelfe a ground, on the dangerous ſhelfe of two errours, namely that the *Eupatorium* of *Meſue* and *Avicen* do not differ, and the *Eupatorium* of *Meſues* and *Dioſcorides*, be both one; when as it is in neither of theſe two, as we ſhewed in the Chapter of *Agrimony*, that *Agreatum* was the true *Eupatorium* of *Meſue*, which differed much from this of *Dioſcorides*, ſo doth that of *Meſues*, from that of *Avicen* alſo, which is by the moſt learned now adayes, accounted to be the firſt *Eupatorium Cannabinum*, here ſet downe and as before time called *Eupatorium vulgare*: yet there is ſome doubt therein, in that *Avicen* ſaith, that the *Eupatorium* are like thoſe of *Nymphæa* or water Lilly, which the moſt judicious know not well how to underſtand, but doe verily ſuppoſe ſome errour or miſtake to be in the text: and although it be not the true *Eupatorium* of *Dioſcorides*, yet is our eſtimation thereof being now reformed, both their deſcriptions and figures inducing the contrary, yet is it not without very ſpeciall properties, as you ſhall heare by and by: the ſecond is called *Eupatorium odoratum* alſo *Canum*, and *Eupatorium alterum odoratum, & aromaticum* by *Columna*: the third is called *Agrimonia maior*, of *Columna*, of *Bauhinus Agrimonia ſimilis*, and of ſome *Pimpinella folio Agrimoniæ*: the fourth was uſually called in former times beyond the ſeas, as I ſayd *Eupatorium vulgare*, as *Matthiolus* and others have ſet downe. *Lythius* called it *Eupatorium adulterinum*, and *Dodonæus* and *Thalius Pſeudo hepatorium*, and others

called *Agrimonia, Eupatorium, Gesner Eupatorium agrimonia, & Trifolium cervinum aquaticum, Bauhin Cordus* calleth it *Trifolium, Anguillare, vulnerarium, Lysimachia, Lonicerus*, and *Camerarius Eupatorium Avicennæ*. Those called in high *Dutch* Wasserhanff, that is *Herba Cannabis aquatica*, of the low *Dutch* Boskoeswater: the other called by *Cordus Eupatorium folio Cannabis*, and I according to the rule, to put a difference betweene it, have set *Cannabinum*, and the other of that sort which I call *Eupatorium*, and hath only sprung with me, and hath not beene mentioned by any before: the last which is set of two sorts, the one with divided leaves, the other with whole, are diversly named by diverse: for the one divided leaves is called by *Tragus Trifolium fibrinum*, by *Cordus* upon *Dioscorides Cannabis rustica*, by *Geſnerus* here, *Eupatorium Avicennæ*, and by some *Abrotanum*, and by some *Abrotanella*, *Cæsalpinus* in his appendix by *Dodonæus Eupatorium aquaticum*. *Ruellius* taketh it to be *Hydropiper*, and to and *Lysimachia*, but yet doth confound the opinion, and sheweth the differences, as *Matthiolus* before hath done, by *Columna Lysimachia folio tripartito*, and by *Bauhinus Cannabina aquatica folio tripartito diviso*; the other with whole leaves is called by *Lobel, Cannabina Cannabina folio & spicatim nascitur*, by *Tabernamontanus, Eupatorium Cannabinum Clusianum*, by *Lonicerus* in *Hydropiper* called *Dalechampij*, by *Cæsalpinus, Cannabis palustris folio longo*, and by *Bauhinus* in his *Prodromus, Cannabina aquatica spicata foliis serratis*, and in his *Pinax Cannabina aquatica folio non serrato*: these *Virginia* may well goe under the same rule.

The Vertues.

The former *Agrimony* is held by divers to be the more excellent in all the properties of *Agrimony*, but because we cannot have it in that quantity, that may serve all turnes continually, our ordinary sort will serve sufficiently well and effectually. *Serapio* saith, it is hot and dry in the first degree, and as *Galen* saith, it is of thinne parts, and hath a cleansing and cutting faculty, without any manifest heate: it is also moderately drying, and binding: it openeth the obstructions of the Liver, and cleanseth it, it helpeth the jaundise, and strengthneth the inward parts, and is very effectuall to the bowels, and healeth their inward woundings and bruises or hurts, and cureth all inward distemperatures, that grow therein: the decoction of the herbe made with wine and drunke, is good against the sting, and bitings of serpents, and helpeth them that have foule, or troubled and bloody urine, it is good for the strangury, and helpeth them to make water currantly, and helpeth also the collicke, the ileon or iliacke, and helpeth the cough: it is accounted also a good helpe to make a *quartane* as well as *Verbena*: some use in taking a drench of the decoction warme before the fit, which by altering them, will in time alter them: the leaves and seede with *Diasmyrtes*, the seede with *Vinum*, stayeth the bloody flixe, being taken in wine: outwardly applyed it helpeth old sores, cankers, and ulcers that are of hard curation, being stamped with old swine grease and applyed, for it cleanseth and afterwards healeth them: in the same manner also applyed, it doth draw forth the shorne or splinters of wood, nayles, or any other such thing, that is gotten into the flesh, and helpeth to strengthen members that be out of joynt: it helpeth also foule impostumed eares, being bruised and applyed, or the juyce dropped into them: the distilled water of the herbe, is good to all the purposes aforesaid, either inward or outward. The Hempe like *Agrimony*, or *Eupatorium Cannabinum*, is of the same temperature of heate and dryeth, for it also openeth, cleanseth, cutteth and maketh thinne those humors that are thicke and tough, and therefore is very effectuall for the dropsie, yellow jaundise, obstructions of the Liver, and hardnesse of the Spleene, grossenesse of humours, and the evill disposition or habit of the body: the juyce being drunke, is commended much against the impostumes that come of a cold cause within the body, and for those that are without, the herbe bruised and applyed outwardly: the decoction thereof taken before the fits of long and lingring agues, doth helpe much to free any from them: the same also provoketh urine, and women vomit easily, and bootes with Pimpinerey in whey and drinke, helpeth scabbes, and the itch, which proceede of salt and sharpe humours: but the juyce mixed with vinegar, and annointed cureth it outwardly: and cureth the Leprosie also, if it be taken in the beginning, but the juyce being drunke, is held to be more effectuall: the juyce being clarified and dryed, and the weight of a scruple taken in pills, killeth the wormes of the belly, and the leaves steeped in drinke, and given to children doth the same. The leaves are often given by the Country people, to their cattle, and other beasts, troubled with coughes, and when they are broken winded, or have *Spavins* with them, all which it helpeth: the flowers chiefely are used to heale both greene and old sores, for the herbe it selfe will doe so likewise; it is said that hunters have observed, that Deare being wounded, by the eating of this herbe have beene healed of their hurts: the dryed herbe being burned, driveth away by the smoake and smell thereof, all flies, waspes, and the like, and all other hurtfull and venemous creatures.

Chap. LXI.

Cannabis. Hempe.

There are two kindes of Hempe, the tame or manured, and the wilde or ballard: of the manured kind there are two sorts, male, and female, of which I intend to entreate in this Chapter, and of the wilde in the 2 sorts in the next.

Cannabis sativa. Manured Hempe.

The Manured Hempe, (which is of two sorts, male, and female as they are called, yet both rise from one and the same seede, and herein is somewhat like the *Female Mercury*, but how the change in nature should be, no man can give a reason) the male hath the stronger stalke, and more sufficient, and the leaves greater, and of a darker greene colour, and bearing seede without any store of flowers, and endureth longer before it be ripe to cut downe: contrariwise, the female hath a slender stalke, for the most part, with few or no branches, and beareth flowers, but no seede followeth, and is ripe, and lookes to be cut downe, or pulled up before the other: they both rise up to a great height, even five or seven foote high or more, with many leaves set thereon at distances, every one divided into 5. or 6. or 7. severall leaves, joyned together at the foote of them, and dented about the edges, somewhat like unto the leaves of the

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

the *Palma Christi*, *Lupine* and baftard Hellebor, every one ſet upon a long foote ſtalke, of a darke greene colour, and of a ſtrong unpleaſing fauour; the flowers are ſmall, and of a whitiſh yellow colour, ſtanding many together, upon a long branch, which turne into duſt, and are carried away with the wind, not carrying any ſeede after them; which being the tenderer and weaker, and the ſtalke hollow and not ſo ſtrong, maketh the finer ſtalke, to be ſpunne and woven into linnen cloath, fit for mens bodies, or other the like uſes, and is called of ſome Sommer Hempe: but the other being ſtronger and called winter Hempe, becauſe it is not gathered vntill toward Winter, or at the leaſt not of a moneth after the other, beareth ſeede in the ſame manner, that the other bore flowers on long branches, which is round and contained in round heades: the rootes are made of many ſtrong ſtringes which take faſt hold in the ground, but dye and periſh every yeare: to ſhew you the manner of keeping, dryving, beating and cleanſing hereof to be made into cloth or Cordage, is not my purpoſe, nor pertinent for this worke, beſides that, it would take vp too much roome and time; it is familiarly knowen to every country huſwife almoſt.

Canabis ſativa. Manured Hempe.

Virginia Hempe.

We haue had from *Virginia* a very great kinde of Hempe, with greater ſtalkes, and much larger leaues and flowers, which being broken down with the wind, when it was almoſt at the perfection, we cannot fully expreſſe it as we would, and as time may doe it hereafter.

The Place.

Although *Plinie lib. 20. c. 23.* ſaith that Hempe was formerly ſowne vnder vines, yet know we not in theſe dayes, where ſuch may be found; for in all places of the world I thinke, it is onely ſowne in fieldes and places, choſen out for the purpoſe.

The Time.

It is ſowen in the end of *March*, or beginning of *Aprill*, and is ripe in *Auguſt* or *September*, as the two ſorts grow ripe and fit to be gathered.

The Names.

It is called in Greeke κάνναβις, and ſo *Cannabis* in Latine alſo, from the Greeke word κάννω, ſaith *Lobel*, *quod ſonticulos ſparſos ſcatebrigines ſive boas, qua bacillum ſonat, & ſuta incurrit*: the *Arabians* call it *Canab*, and *Schahdenegi*: the *Italians Canape*: the *Spaniards Cañamo*: the *French Chanvre*, and *Chanevre*: the *Germanes Zamer Hauff*: the *Dutch Kemp*, and in *Engliſh* Hempe.

The Vertues.

Hempe is cold and dry (ſay *Tragus* and *Lonicerus*, but *Galen* in *lib. 7. ſimpl. medicament. & primo de alimentis* ſaith it is hot and dry, and ſo doe *Actuarius*, *Ruellius*, *Feſtius*, and *Lupanenſis*, agreeing with them) the ſeede of Hempe conſumeth wind, and by the much uſe thereof, doth diſperſe it ſo much, that it dryeth vp the naturall ſeede of procreation, therewithall for it is hard of digeſtion, hurtfull to the head & ſtomach, and breedeth ill blood and iuyce in the body, yet being boyled in milke and taken, helpeth ſuch as haue adry and hot cough, ſ *Tragus* ſaith: the *Dutch* as one ſaith doe make an Emulſion out of the ſeede, and giue it with good ſucceſſe to thoſe that haue the laundiſe, eſpecially in the beginning of the diſeaſe, if there be no ague accompanying it, for openeth the obſtructions of the gall, and cauſeth digeſtion of choller thereto: but as *Matthiolus* ſaith, the women in *Germany* went a wrong courſe, to giue their children the decoction of Hempe ſeede for the falling of the neſſe, which it did rather augment, then helpe to take away: the Emulſion or decoction of the ſeede, ſaith laskes and Boxes that are continuall, eaſeth the paines of the collicke, and alayeth the troubleſome murmurings of bowels: divers alſo do vſe by bleedings herewith, whether at the mouth or noſe, or at other places, by tying leaues with ſome of the blood that hath come from them that bleed, and ſo given them to eate, it is held very good to kill the wormes in man or beaſt, as alſo the wormes in the eares, or the iuice dropped therein, or to driue forth any other living creature that hath crept therein; and to ſhew the ſtrength hereof for this purpoſe, *Matthiolus* ſaith, that the decoction thereof, powred into the holes of earthwormes, will draw them forth, and fiſhermen and anglers haue uſed this feate to get wormes to baite their hookes. The decoction of the roote is ſaid to allay inflammations in the head, or any other part, the herbe it ſelfe, or the diſtilled water thereof performeth the like effect, the ſame decoction of the rootes, eaſeth the paines of the gout, the hard matter or knots of the ioynts, the paines and ſtriuking of the ſinewes, and other the like paines of the ioynts: it is good to be vſed for any place that hath beene burnt by fire, if the freſh iuyce be mixed with a little oyle of [illegible]. *Matthiolus* ſaith, that Hempe ſeede, giuen to Hennes in the winter, when they lay few egges, will cauſe them laye more plentifully.

Cano

Chap. LXII.

Cannabis sylvestris sive spuria. Wilde or ballard Hempe.

There are two or three sorts of herbes, that are accounted by divers for wilde or ballard Hempes, yet are none of them the true *Cannabis sylvestris* of *Dioscorides*: *Eustomus* therefore in vaine to accounting of them, referreth them to the kinds of Nettles, as you shall heare by and by.

1. *Cannabis spuria prima.* The first ballard Hempe.

This ballard Hempe riseth up with a reasonable great hairy square stalke, not very strong nor upright, but as it were leaning downe, with divers joynts bunching out like knees, and two leaves set at every of them, somewhat long hairy and pointed, of a fresher greene colour then the manured Hempe, snipped about the edges: at the joynts likewise come forth divers branches joynted and set with leaves in the same manner, where about towards the toppes grow divers hoodded and gaping flowers, like those of the dead Nettle, but larger, and greater, of a pale purplish colour, standing in small greene prickly huskes; wherein afterwards groweth the seede, being small and round, three or foure growing together: the roote is hard and white, and somewhat spreading, but dying before winter.

There is another hereof, whose flower is of a perfect white colour for the most part, or a little pale whayish, which doth plainely expresse the difference. *Flos albus*

2. *Cannabis spuria altera.* The second ballard Hempe.

The other ballard Hempe differeth not in stalke from the former, but the leaves are shorter and rounder; the flowers hereof are as great as they, the uppermost part or hood whereof, is of a pale colour tending to yellow, and the lowest part of a deeper red or purple colour: the huskes of the flowers are somewhat more prickly than the other.

3. *Cannabis spuria tertia.* The third ballard Hempe.

The third ballard hempe is in the growing much like the former, but that the leaves at the joynts are somewhat long and narrow, a little jagged and not dented about the edges in the most; the flowers hereof are hooded and gaping, but they are of a pale yellowish colour wholly, with a little or no shadow or spot therein, and stand thicke about the joynts, whose huskes have longer and sharper points then the rest.

The Place.

All these doe grow as well in moyst grounds as in dry, by ditch sides, and by the path wayes, under walls, &c. and some of them will be found in gardens, to be continually pulled up as a weede, and unprofitable herbe: yet the second sort with a white flower was found by the path wayes neere *Clapham*, and in the ditches by *Red-Hill* called *Hatch Hills*.

1. *Cannabis spuria prima.*
The first ballard Hempe.

3. *Cannabis spuria tertia.*
The third ballard Hempe.

The

The Time.

They flowre for the moſt part in *July*.

The Names.

Moſt writers call theſe *Cannabe ſpuria*, and *ſylveſtres*; yet as I ſayd before, *Bauhinus* doth call them *Urtica mortua*. The firſt is called, *Cannabis ſylveſtris*, by *Tragus* and *Lugdunenſis*, and *Urtica mortua* by *Lobel*, *Cannabina alba*, and by *Bauhinus Urtica aculeata folijs ſerratis*. the ſecond is the *Cannabis ſpuria* of *Lobel*, *Alyſſum aroicoſe album* of *Tabermontanus*, *Urtica aculeata folijs ſerratis altera* of *Bauhinus*, he thinketh it may be alſo the *Sideritis Cordi*, whereof *Thalius* maketh mention in *Hercynia ſylva*. The firſt is called by *Lobel*, *Cannabis ſpuria facie Urtica*, by *Bauhinus Urtica aculeata folijs non ſerratis*, and by the ſame *altera Matthioli*, as *Lugdunenſis* expreſſeth it.

The Vertues.

There is little uſe made of theſe herbes, eyther inwardly or outwardly, yet they are thought to bee of the temperature and qualities of the former Hempes *Lobel* ſaith they are uſed as an aſſured remedy againſt kibed wennes, and other hard tumours in the fleſh, when other things have failed and would do no good.

Chap. LXIII.

Iſatis ſive Glaſtum. Woade.

Of this herbe there is accounted two ſorts, the one manured, the other growing wilde yet they are both alike the one unto the other, ſaue as it is thought the manuring only cauſeth the diuerſity, a third ſort I haue added to them for the colours ſake though much diſproportioned in ſtature.

1. *Glaſtum ſativum.* Manured Woade.

Woade that is ſowen in fields for uſe, hath divers large, long and ſomewhat broad leaues, like unto thoſe of Kibwort *Plantaginis*, but larger thicker, and of a darker blewiſh greene colour; from among which ariſeth up a ſtrong ſtalke three or foure foote high, and ſometimes more, with divers ſuch leaues but ſomewhat ſmaller up to the top, where it ſpreadeth into divers branches, at the ends whereof grow ſmall yellow flowers in whole places come long ſlattiſh huſkes, or cods like tongues, blacke when they are ripe, and pendulous hanging downewards, wherein lye the ſeede, which if it be a little chawed or broken with the teeth, will ſtaine a blew colour: the roote is white and long, growing downewards.

2. *Glaſtum ſylveſtre.* Wilde Woade.

This wilde Woade differeth little from the tame or manured, but that it is ſmaller, the ſtalke ſlenderer the leaues leſſer, and the huſke or cods ſmaller and narrower.

3. *Nil ſive Anil, Glaſtum Indicum.* Indico or Indian Woade.

Although *Nil* or *Indico* be not in formе like Woade, yet for the rich blew colour ſake I thinke good to ad

2. *Glaſtum ſativum.* Manured Woade.

3. *Nil ſive Anil, Glaſtum Indicum.* Indico or Indian Woade.

Original from UNIVERSITY OF MICHIGAN

warning of it here with it, not onely to shew you what it is, and how made, but to incite some of our nation, to the same industrie & diligence as they have beene with the former Woade, seeing no doubt but it would bee more plentifull ... *Monardus* and *Clusius* have both had the seede of a plant sent them under the name of *Nil*, or *Anil*, as they say, ... having growne with them they have judged it rather to be another plant, then that whereof it should come; for *Clusius* saith, that his plant was like unto a small *Colewort*, which he afterwards as hee saith found to ... *Alpinus* his *Egyptian Solsequa* (and sure he ghessed somewhat neare it, for if it be not the same it is very like, as you shall heare by and by) and *Camerarius* saith his plant had leaves like unto *Rocket sowne thicke*, but herein small comparison may hold a fit correspondence likewise; yet *Lobel* saith the true hath leaves like Rosemarie. But I shall here give you the deſcription of the plant by two severall men, the one is *Francis Ximenes*, as it is set downe in *Iohannes de Laet* his deſcription of *America*, or the *West Indies*, in pag. 330. and 551. who saith it is a herbe, producing many round smooth woodily stemmes from the roote, about six palmes or spans high, and the bignesse of ones little finger, of an ash colour, with leaves thereon like unto Cicers, having small red flowers, and afterwards many long Cods growing together, and hanging downe-ward like unto the wormes called *Aleacides* which we call Arle-wormes, yet somewhat thicke and full of blacke seede (*De Laet* addeth in a Parenthesis, Some say the seede is like unto *Fenegreek*, flat at both ends as if it had been cut.) For the manner of making whereof hee saith, They cut the leaves into a trifle vessell, pouring thereon (calling hot water or rather lukewarme (yet some allow of cold water as well) stirring them very well that the water may draw out the tincture, which they poure out into another vessell that hath an hole thereon some what high, whereout the cleare water may passe, the thicke coloured substance remaining behinde, which afterwards they straine through a cloth or bag, setting the thicke substance in the Sunne, and make it into cakes which is then dryed and hardened in pans at the fire; Thus farre *de Laet*. The other deſcription is by *Mr. William Finch*, a *London* Merchant, as it is set downe by *Mr. Purchas* in his fourth Booke of Pilgrime, the 4 Chap. pag. 419. It is a herbe saith he, not above a yard high, and as bigge as a mans thumbe at the biggest; the branches are woodily like unto Hyssope, having many leaves set together on a short footestalke, in forme like Cives (whereof I call for Cicers) or Ciche peaſe, or like those of *Senna*, but shorter and broader: the flowers (saith he) is like unto an Hearetale; the seede is inclosed in a small round cod about an inch long, resembling *Fenegreek* seede, but more slime at both ends (such very seedes for colour also we have often had sent for *Indico* seede, yet never any sowing with us but once, and that but one plant, and ever hastily plucked up before it had any forme to be discerned, yet the small threddy roote was of a pale blew colour, which I doe keepe by me to shew:) the seede also while it is fresh being steeped in water gave a blew-with colour. These deſcriptions so like in most things and so neere also resembling *Alpinus* his *Sefban*, but that it hath a yellow flower, perswadeth me that *Sefban* being confessedly a kind of *Glaux Leguminosa*, & so may *Indico* be also but differing in the Dye. The manner of making as Mr *Finch* saith is thus (being variously deſcribed by others.) They gather the leaves (when they have all the branches, in *August* and *September* after the raines, the seede being ripe in *November*) and cast them into a long Cesterne powring water thereon, and presse them downe with stones that they may be overcovered, to abide standing for certaine dayes, that the substance of the herbe may be drawne out into the water, which they let forth into another round Cesterne, in the midst whereof is another small Cesterne, or Center (the meaning whereof I doe not understand) and labour it with great staves, like butter or white Starch, scumming of the cleare water after it is settled; thus labour it afresh, and draw off the cleare water againe being settled, doing thus so often until nothing but a thicke substance remaine, which they dry in the Sunne being spread upon cloth, and after it is a little hardned, they make it into small balls with their hands, laying them to dry on the land, for any other thing would broke up the colour, as also if it take raine in the drying it will lose his colour and glosse. After it is sowen it endureth three yeares: that *Indico* of the first yeare while the plant is tender, is weighty and reddish called *Florez*: that of the second yeare is rich, being very light and of a perfect violet colour (swimming on the water and is called *Corves*: that of the third yeare when the plant is declining (and peradventure but fabulous traditions) is a weighty blackish *Nil* the worst of the three, and called *Cortedi*. The best is made saith hee, about fifteene or twenty miles beyond *Fetipore* in the wild *Mogols* country in the *East Indies*. And *Ximenes* afore said as *de Laet* hath it, saith, the *Indians* of the West call the Plant *Xiuhquilitl pitzahuac* and the *Mexicans* call the cakes made thereof *Mohuitli* and *Tlaxihuitli*, but the other *Barbarians* *Tlacehyhuahuitl*, and therewith colour their faces black. I have not heard that good *Indico* is one of the Merchandises of the West, but of the East Indies only. *De Laet* having given the figure of a branch of *Indico*, I doe here likewise exhibite the same.

The Place.

The wilde Woade groweth in sundry untilled places and fields in *Germany*, as it is said, but the manured is sowen as well in *Germany*, *France* and *Spaine* as in *Italy* also, in *Umbria* neare unto *Nursea*, as *Matthiolus* saith, where there is a towne called Woade, of the Woade that grew there abundantly; and in the *Hands* of *Terceras* belonging to *Spaine*. Some have sowen it in our owne land, but they have found it to be the cause of the destruction of their corne, for it hath beene observed, that they have dyed as it were of a Flix that have eaten thereof: it is said that in some places they sow their Woade upon the same ground, that afterwards they sowed their Corne, which soone after Woade is three times cut in a yeare, and that these rootes that are not turned up with the Plough will cause scabs among the Corne. The Plant whereof the *Nil* or *Indico* is made, groweth in divers places of the *East Indies*, but especially in *Cuncare*, and the best in and about *Bianie* in the *Mogols* country.

The Time.

Woade groweth for some, but the seede is late ripe.

The Names.

It is called in Greeke ... and *Isatis* in Latine, *Glastum* also and *Guadum* of some, after the *Italian* word *Guado*, whereby they call Woade. *Cæsar* in his first booke, *de Bello Gallico*, maketh mention of *Glastum*, wherewith the ancient Britaines used colour themselves to seeme the more terrible to their enemies in battaile as it is thought, or that they did then as the Savages of the West *Indies* doe now delight in such a colour, to paint their naked bodies therewith. Pliny also speaketh of the Britaines using of *Glastum* in his 22. Booke and first Chapter, but I cannot directly imagine from whence the word *Glastum* should be derived; some have imagined, that

in both those Authors the word *Pirum* should be read in stead of *Glastum*; because the former word from whence they thinke *Glastum* is derived, is signified by *Varro*, and some also would raise it vp to *Nerum*, but *Nerum* is not for such use, for it is very rare or scarce seene of any with vs (the same call it *Pisa*, *Pixbes*, *Chote*, *Chark*, *Alibar*, *Alken*, or *Adhken*, or as *Aurora* in his 112. Chap. saith *Nil*, pag. 306. Chap. he hath another *Nil*, which is a kind of *Convolvulus* or blew Bellflower, whereof I have spoken in my former Booke, which *Serapio* calleth *Hab alnil granum nil*: but this *Nil* (not *Nil* in the Arabian tongue as some say) doth signifie any blew colour, such as this Woade or the *Nil* or *Indico* maketh) or *Anil*, of whence was made a blew colour formerly called with vs Ancale for the Dyers and others vse, and was wont to be brought in round great cakes like wax, with round borrennes five or six pecke vp in double skinnes, many times which was but a base or counterfeit sort of *Indico*, (as it is probably ghessed) made vp with land and stones to augment the weight; or else it was a worser kinde of that *Nil* or *Anil* that grew in *Europe*; for the best *Anil* or *Indico* is store and commeth to vs from *Guzarate* in the East *Indies*; *Iosephe Acosta* his report of whom in *Purchas lib. 3. ch. 9. sec. 4. pag. 236.* (who by reason of shipwracke upon the *Maldiva* ilands, with others was forced to travell over land many dayes) saith that at *Xinde* the best *Indico* is made, where are two sorts and groweth upon small bushes, and beareth seede like Cabbadge seede, which being cut downe lyeth to rot for halfe a yeare to rot, and then trodden out by Oxen from the stalkes and so ground hard at the edges, and sodde boyled in furnaces, refined and formed, the best there worth eight pence the pound: which last clause of boyling refining, &c. me thinkes favoureth somewhat of *Dioscorides* text, (but you have another mans report also) *Dioscorides* mentioneth *Indicum* in his fifth booke and 67. Chap. to be of two sorts, the one naturall things out of *Indian* Canes or Reeds: the other a blew or purple scumme that riseth on the dyfat, which is taken off and dryed: this saith *Dioscorides*, and peradventure was our very *Indico*, although related it may bee in this manner, which sheweth how lame the ancients were in the knowledge of forraine doings: but we have indeede, even in these dayes, a certaine thing called by divers *Flores*, which the painters sometimes vse, and is the scumme of the dyfat, while the cloth is upon the dying a blew colour with *Indico* or Woade, and is a fine light powder. The *Italians* as I sayd before call Woade *Guado* and *Glasto*; the *Spaniards* call the herbe while it is greene and growing *Guisa*, but when it is made up and dry, they call it *Pastel, forse quia in pastillos exigantur*, the *French Pastel* likewise, the *Germane Waid*, the *Dutch Weet*, we in *English* Woade and Wade.

The Vertues.

The facultyes of Woade are binding and very drying, and somewhat bitter withall, but not sharpe, and the wilde sort much more, as usually all wilde herbes exceede the tame in the properties, and therefore it resisteth putrefaction, and preserveth thereof more then the tame: the same stancheth bleedings of all sorts, either inward or outward, either upwards or downewards more then the wilde: the decoction of the seede, but much more of the wilde sort, made with wine and drunke, helpeth the hardnesse of the spleene, and if the region thereof be outwardly fomented therewith also, it will doe the more good: the mundifies is much more profitably used for all greene wounds then the wilde, quickly to soder up the lippes of them, and no lesse propertie it is to represse the corroding and malignant qualities of fowle and eating Vlcers, foule Cancers and the like, and healeth them also; as also allayeth and discusseth all hot inflammations, impostumes, Carbuncles &c. and all moores of swellings. *Indico* (which as is sayd, was formerly taken for the scumme of the dyfat, in dying a blew colour, rather from Woade or *Indico*) as *Dioscorides* saith is of the same qualities, both to cleanse and repercusse, make ouze of fowle Vlcers, and to dissolve tumours, breake impostumes, and to dry up and binde the fluxion of blood or humours: the juice of Woade preserved all the yeare, or the distilled water of the herbe worketh the same effects that either the decoction or the powder of the dryed herbe doth.

CHAP. LXIIII.

Herba Lutea sive Lutcola. Would or Welde or Diers weede.

I thought good to joyne this plant unto the other before going, both for the dying quality and healing also, although not to so certaine as the other: but although with many former writers, there hath been but one sort remembred, yet we have attained the knowledge of two or three other as you shall heare them expressed unto you.

1. *Lutcola vulgaris.* Common Would or Diers weede.

The common Would or Diers weede groweth bushing with many long and narrow flat leaves upon the ground, of a darke blewish greene colour, somewhat like unto Woade, but nothing so large, a little crumpled as it were and somewhat round pointed, which doe so abide the first yeare; and the next spring from among them rise divers round stalkes, two or three foote high, beset with many such like leaves thereon, but smaller, shooting forth some small branches, which with the stalkes carry many small yellow flowers, in a long tuft head at the toppes of them, where afterwards come the seede, which is small and blacke, enclosed in husks that are divided at the toppe into foure parts: the roote is long, thicke and white, abiding the winter: the whole herbe changeth to be yellow, after it hath beene in flower a while.

2. *Lutcola vulgaris Cretica.* Small Would of *Candy*.

The small Would of *Candy* hath likewise many long narrow leaves like the former, and tall high stalkes with smaller leaves on them also: the long spiked heads have somewhat larger flowers, more spread open and standing singly each by themselves, in other things not differing from the former.

3. *Lutea maxima Cretica, foemina.* The bearing great Would of *Candy*.

This great plant riseth up in *Candy*, with divers great stalkes, some of them as bigge as a mans arme, of eight and ten cubits high, yet perish in winter, bare or naked of leaves next the ground for a cubit or two, the lowest leaves being without foote stalkes, joyning close at the bottome, the other growing up higher of the toppes, have all of them foote stalkes of a span long: the leaves of themselves are very large, made of many somewhat broad and long greene shining ones, set one against another on the middle ribbe, and not [illegible] directly

Original from UNIVERSITY OF MICHIGAN

...ecially opposite one unto another, every one somewhat ...resembling the leaves of Hempe (whereof it is most likely ...were it not ragged or dented about the edges, yet none ...of them divided but the end leafe, which is sometimes ...parted, seldome into two, and sometimes into three ...parts, each ending in a long point; the stalkes are ...couered, for both onely diuers small stalkes, or long ...spikes of flowers shoote forth which are yellowish, ...greene and grassie, bowing downewards, with many ...long and narrow leaues among them, and stand in yel-lowish greene husbes; wherein after the flowers are ...fallen, come the heades full of very small reddish seede; ...the rote is very great and woodily, and parted into ...many long roots or branches, which in the naturall pla-ces, and other warme countries, abideth many yeares, ...but will hardly endure the winters of our cold country ...abroad as we have often proued.

4. *Luteo maxima Creticaſterilis.* The barren great Woold of *Candy*.

There is no difference in this from the other, but that as Hempe and Mercury, and such like plants, one beareth ...seede and the other doth not, so this although it beare ...flowers, yet no seede is seene to follow at any time after ...it is in the flowers.

The Place.

The firſt groweth every where by the way sides, in moist ...grounds as well as dry, in corners of fields and by-lanes; ...in some places in *Kent*, they vse to sow their fields there-with after their Barley, which abideth untill the next ...yeare, and then is eared; the rest are naturall of *Candy*, ...and as I say will hardly indure, or at the least beare in our ...climate.

The Time.

The firſt is in flower about *Iune*, but the others flower very late or not at all with vs.

1. *Lutea vulgaris Cretica.* Woold Woold or Cassay.

1. *Lutea vulgaris.* Common Woold, or Dyers Weede.

2. 3. *Lutea Cretica ſerrata & ſterilis.* The great Woold of *Candy* both bearing and barren.

The Names.

There is not any Greeke name knowne to be given unto it. *Pliny* maketh mention of it in his 25 booke and 5. chap. and calleth it *Lutea*, yet *Ruellius* referreth it to the *Genista tinctorum* Greene weede. *Vitruvius* the 8 in his 7. booke of Architecture, and 13. chap. calleth it *Lutum*, and *Virgil* calleth it *Lutum*, in the 4. *Eclogue* of *Bucolicks* in these verses,

Ipse ferox ultro, meque ipsa suave rubenti
Murice, jam croceo, mutabit vellera Luto.

It is called also by some *Catenale*, and by some also thought to be the *Reseda* of *Pliny*, because they vse to boil it in divers parts. *Cesalpinus* in his ninth booke, and 35. chap. maketh it to be the *Anagallis* or *Molendrina* of *Dioscorides*, and calleth it according to the peoples terme in his time, *Guadella*. It tooke the name of *Luteum* not onely of the yellow colour of the herbe and flowers, when it is dry, but chiefely from the yellow colour of the dye. *Tragus* tooke it to be *Asterbotanum*, because the seede vessels thereof have as it were holes therein. Some have taken it also to be *Phyteuma* of *Dioscorides*, and some to be his *Struthium*, among whom are *Lonicerus* and *Stephanus* in his *Commentaries*: but *Matthiolus* calleth it *Pseudostruthium*; *Dodonæus* calleth it *Nasturtium Luteum*, *Lobelius*, *Tragus* and *Tabernæmontanus Cataputia*. The Second is thought by *Hieronimus Bock*, in his first title of *Lupine*, to be the true *Struthium* of *Dioscorides*, and saith that it is called *Cumone* throughout Germany: but *Cumonum* is sweet, secondly to make it and the common sort all one, the third and fourth are mentioned by *Pona*, the one in his Latine, and both in his *Italian* Edition more exactly.

The Vertues.

Matthiolus saith, that the roote hereof, is hot and dry in the third degree, and that it cutteth tough flegme, maketh grosse humours thinne, it doth resolve hard tumours, it digesteth raw flegme, and opened obstructions. Some doe not onely commend it, against the bitings of any venemous creatures, to be applyed as well outwardly to the wound or hurt place, as to be taken inwardly, to expell the poyson therbence: but also much commended it is to be used against the Plague or Pestilence: the people in some Countries of this Land, doe vse to make the herbe, and lay it to the sores or wounds, they chance to make in their hands, or legges, &c. the chiefest or otherwise they have their use, is to dye cloth, either woollen or linnen, or silke, raw or woven into a yellow colour, and also to give a greene colour to those clothes or silkes, have first beene dyed with Woade into a blue colour, which *Dioscorides* seemeth was not ignorant of in his time, for he speaketh thereof in the aforesaid place, and booke and chapter, that a yellow colour upon a blue, is changed into greene, and for these vses, there is great store of this herbe spent in all Countries, and thereof many fields sowen for the purpose.

Chap. LXV.

Lamium, The Dead Nettle or Archangell.

THe weed *Lamium* which we call dead Nettle or blind Nettle, is diversly taken by divers, for some doe make it a Nettle, and number it among their kinds; others make it a kinde of *Galeopsis*, as among others *Bauhinus* who confoundeth them together, maketh those herbes to be *Lamia* that *Lamium*, and others make to be *Galeopsis*, *& e converso*; some also make them to be kinds of *Scrophularia*, and some those to be *Lamia*, which others call Chickeweedes and Baltar, which are all in my judgement severall herbes, and to be handled severally: for which purpose I will endeavour what in me lyeth, how to distinguish them, that each shall have their owne due: and if I shall not herein perhaps satisfie every one for *quot homines, tot sententiæ*, yet I shall satisfie my selfe, who I am perswaded shall not want many partakers, and yet I cannot, nor doe challenge any prerogative of not erring in so intricate a businesse, where so many learned writers have failed before me: take therefore in good part what I here set downe, and if any finde fault with any of them to be misplaced, let them amend it, by true judgement not worthy of fault finding, and I shall soone subscribe unto them.

1. *Lamium vulgare folio subrotundo flore rubro.* Red dead Nettle or red Archangell.

This Dead Nettle, or Archangell, hath divers square stalkes somewhat hayrie, at the joynts whereof stande a good distance one from another, grow two sad greene leaves, dented about the edges, opposite the one to the other, the lowermost upon long footestalkes, but without any towards the toppes, which are somewhat pointed, yet pointed at the ends, and a little crumpled as it were and hayrie, round about the upper joynts, where the leaves which there grow close together, grow sundry gaping flowers, of a pale reddish colour, somewhat like unto Betony flowers, after which come the seedes, three or foure set together in a husk: the roote is long and threddy perishing every yeare: the whole plant, hath a strong sent, but not stinking.

2. *Lamium Hispanicum*, Spanish Archangell.

This Spanish kinde hath darke browne square stalkes, rising halfe a foote high, bearing two small and short round leaves at each joynt, resembling the former red common Archangell: the tops of the stalkes are somewhat thicke set with flowers, spike fashion, without any leaves among them, which before they open are shut up close, helmet like, but afterwards growing long and slender toward the bottome, the upper or end somewhat hooded and gaping of a purplish red colour; in the bottome stalkes afterwards stand some white seedes: the roote is thicke at the head with sundry small fibres, but creepeth not as others doe, abiding many yeares: the whole plant smelleth like the ordinary Archangell.

3. *Lamium vulgare album sive Archangelica flore albo.* White Archangell.

The white Archangell hath diverse square stalkes, not standing straight upright, but leaning downewards to the ground, whereon stand two leaves at a joynt, larger and more pointed than the other, dented about the edges, and greener also, more like unto Nettle leaves also than the former, but not stinging although somewhat hayrie: at the joynts with the leaves stand larger, and more open gaping white flowers, in husks round about the stalkes, but not having such a bush of leaves and flowers, so closely set at the toppes, as in the former, which stand small roundish blacke seede, after they are fallen: the roote is white with many fibres thereat, not growing

downeward, but lying under the upper crust of the earth, spreading and encreasing like unto *Calamentum*, which abideth many yeares still encreasing, this hath not so strong a sent as the former.

4. *Lamium folio oblongo flore rubro.* Long leafed red Archangell.

Of this same kinde there is one found in some places of this Land, agreeing with this last in all things, but the flowers, which are of a purplish red colour; and another whose flowers are more pale red, and the toppe with whitish veines; but are rare to be met withall, but in some places, where there is almost no other sort, and hath no ill sent.

5. *Lamium folio maculato.* Archangell with spotted leaves.

The spotted Archangell is also very like the former, in the forme of the leaves and flowers, but somewhat larger; in the manner of growing it is lower and more creeping: the chiefe difference herein is, that in all the leaves, there are certaine markes or spots, and some small short lines to be seene in them, whereby it is distinguished from the former.

6. *Lamium Plinij montanum Columnæ.* Archangell with white lines in the leaves.

This Archangell *Columnæ* hath well observed to differ from the last, first in the leaves being larger, and dented about with rounder dents, and then in the white lines therein, which in this runne straight forth, and somewhat large on each side the middle ribbe, and not spotted or straked as in the last, which white lines they will hold continually many yeares, after they have beene dryed, where as the other, either lose altogether or are hardly to be discerned, within a yeere after they are dryed: and lastly in the flowers which is this are of a paler red, tending to a bluish colour. *Columna* setteth forth another sort hereof, with smaller and deeper dented leaves, whose white lines in the middle of the leaves, are not so broad, nor differing in any thing else.

Alterius montis varietas.

7. *Lamium luteum.* Yellow Archangell.

The yellow Archangell, in the square stalkes, and large greene dented leaves, is like the white Archangell but that the stalkes are more straight and upright, not bending downewards, and the joynts with leaves are more separate in order, having longer leaves than the former: the flowers also are a little larger, and more gaping; of a faire yellow colour in moist, and in some more faint: the roote hereof I have not found to creepe under ground, so much as the white, but else very like thereunto.

8. *Lamium peregrinum Scordoides dictum.*
Strange Archangell.

This strange gaping Archangell, shooteth forth in the beginning of the Spring, a square hayrie straight stalke, about a cubit high, at the joynts whereof, are set the leaves by couples, which are some what long and deepely indented about the edges, of a dad greene colour, smooth, and a little hayrie withall, standing upon long hayrie footestalkes; about the middle of the stalke come forth divers branches on all sides, about an hand breadth long, set with narrower and longer pointed leaves, not dented at all; at the toppes whereof and the stalkes stand long spiked heads of purplish flowers, like unto the Archangells, before described, and in some white, but longer and more open, two sometimes standing in one huske, and with a hood or helmet at the head of them; wherein after they are fallen, are set foure rough seedes, round and flat, very hayrie, clammie, and sweete, sticking to the fingers, while they are fresh: at the toppes of every one whereof, there is a cleft like a mouth, and about that a crowne like unto an Helmet: the roote is yellowish and stringie not perishing.

Flore albo.

The Place.

All these Archangels grow wilde, some of the first sorts by wall sides, and the borders of fields, and way sides, almost every where within: the yellow most usually in the wet grounds of Woods, and sometimes in the dryer, in divers Countries of this Land: those with white spots and lines, are very rare to meete with in our Kingdome, but the fift in *Germany* as *Fuchsius* saith, and in *Italy* as *Matthiolus* and *Columna* say, very plentifully; the two sorts of the sixth in *Naples* onely as *Columna* saith: and the last in *Candy* as *Pona* saith and in *Naples* as *Columna* saith.

7. *Lamium luteum.*
Yellow Archangell.

The Time.

They flower from the beginning of the Spring, all the Summer long.

The Names.

The name *Lamium* was first taken from *Pliny*, who after he had spoken of Nettles, saith that the [illegible] stingeth not, and is not hurtfull, is called *Lamium*. It is called *Urtica mera, non mordax, & mortua quia mordax sed nimis frigida sit*, and *Archangelica* of some, *ab eximio ordine*, and *Lamium foetidum folio velute cucullo inclusum lamium quendam repræsentante*. The last is called by *Lobel*, *Urtica non mordax mortua*, and *Galeopsis vulgaris foetens purpurea*; *Lugdunensis* saith, there is no other herbe that [illegible] the description of *Dioscorides* his *Galeopsis*, then this, which *Gesnerus* alloweth of calling it *Lamium [illegible] fœtidum folio inferiore rotundo, Galeopsis Dioscoridis*, and saith, that *Cordus* upon *Dioscorides*, *Cæsalpinus* and *Tragus*, understood this *Lamium*, to be the *Galeopsis* of *Dioscorides*, but I doe not finde that this kind was [illegible] unto them; but that it is the other red Archangell, with longer leaves that is more like unto the white [illegible]

yellow Archangell which they meant; and *Cluſius* as you ſhall heare by & by, miſliked all other figures of *Galeopſis* & not ſufficiently anſwering unto *Dioſcorides* his deſcription, for I can finde no Author hath given a true figure hereof ſince *Lobel* and *Dodonæus*; whereby it ſeemeth that that is *Lamium* is more proper to England then to other countries. *Dodonæus* calleth it *Ortica mortua altera*. I would incline to thinke this kinde of *Lamium* to be the true *Galeopſis* of *Dioſcorides* with *Lobel* and others, if the leaves were not ſo round, but more like unto Nettle leaves, and that it had not a kinde, that ſmelleth ſtrong, with leaves more like unto the Nettle, as you ſhall heare in the next Chapter. And I would rather thinke alſo, that the other red Archangell that hath longer leaves very like the white to the *Galeopſis* of *Dioſcorides*, with *Matthiolus*, *Lacuna*, *Cordus* and others, if it had a ſtrong ſent which it hath not: ſo that ſeeing both theſe are defective eyther in the one or the other quality, I cannot deeme eyther of them to be right, eſpecially ſeeing I can produce one that hath both theſe properties more anſwerable to *Dioſcorides* deſcription. The ſecond is remembred onely by *Cornutus* in his hiſtory of *Canadas* plants, and there called *Lamium Alpeoloides*. The third is the firſt *Lamium* of *Dodonæus*, called by *Lobel* *Archangelica flore albo*, from whence came our *Engliſh* word Archangell, as I take it. The fourth is *Hayd*, the *Galeopſis* of *Camerarius*, *Lacuna* and others that follow him, *Tabernæmontanus* called both theſe ſorts *Lamium purpureum & album*. *Cordus* calleth them *Leucas*, and are his ſecond and third; *Raubinus* calleth them *Lamium purpureum non ſatis album*, *Lamium purpureum oblongo*. The fifth *Thalius* calleth *Ortica fœtida ſecunda*, and is *Tabernæmontanus* firſt *Galeopſis*, which *Lobelius* calleth *Ortica mortua maculis albis reſperſa*, and yt *Raubinus* *Lamium maculatum*. The firſt is the *Lamium Plinij* of *Fuchſius*, *Camerarius* and *Matthiolus*, and by him called *Perſicaria*, who would faine have made it the *Galeopſis* of *Dioſcorides*, but that he found it lay to make mention of the white in the leaves of *Lamium*, not eſpecially uſed for inflammations, *S. Anthonies* fire and the like, which made him deſiſt from that opinion, and concludes it *Plinies Lamium*. *Columna* calleth it *Lamium Plinij montanum*, and *Raubinus* *Lamium ſylveſtre minimum*, and this he ſaith the *Italians* call *Alfabella* or *Bilicaſtella*, which is to highly commended to cure ſcald cankeſpeeches but *Lobel* taketh the ordinary white, or the yellow Archangell to bee it, and ſo doth *Lonicerus* alſo, and both erroneouſly: The ſeaventh is called *Lamium luteum* by *Lobel*, *Dodonæus* and others; *Galeobdolon flos luteus* by *Camerarius*, and *Valerandus*. *Caſalpinus* calleth it *Lamium montanum*: the laſt is called *Coffea* by *Columna*; and *Scutellaria* by *Cordus*, and thoſe of *Italy*, as well at *Padua* as at *Naples*, *Columna* affirming it *Lamium peregrinum flos Scutellaria*, and ſaith that it is the *Scordium ſecundum Plinij* of *Pona*, in his *Prima deſcriptione* of Mount *Baldus*, which I hardly believe, becauſe the flowers are not equall, according to their figure, as alſo that *Botanica ſylveſtris* of *Paulus Ægineta*, that is like Pennyroyall and without hair, whereof I ſpake in the Chapter of Betony hereafter, by *Quadrevetus* judgement is this kinde of *Lamium*: the *Italians* call it *Ortica morta*, the *Spaniards* *Herliga muerta*, the *French* *Ortie morte*, the *Germans* *Todt Neſſell*, *Taub Neſſel*, and *Rotheng*, the *Dutch* *Doove Netelen*, and wee in *Engliſh*, Dead Nettle, Blind Nettle, and Archangell.

The Vertues.

The Archangells are ſomewhat hoter and drier then the ſtinging Nettles, and are more appropriate and with better ſucceſſe uſed for the obſtructions and hardneſſe of the ſpleene then they, to be uſed inwardly by drinking the decoction of the herbe in wine, and afterwards applying the herbe hot, or the decoction unto the region of the ſpleene, as a cataplaſme or fomentation with ſponges. The flowers of the white Archangells are preſerved or conſerved daily uſed, or the diſtilled water of them is uſed to ſtay the whites, and thoſe of the red to ſtay the reins in women, and is thought good to make the heart merry, to drive away melancholly, and to quicken the ſpirits. It is commended alſo againſt quartaine agues. It ſtancheth bleedings alſo at the mouth or noſe; if the herbe be ſtamped and applyed to the nape of the necke: the herbe alſo bruiſed and with ſome ſalt and vinegar, or with cowdung that is, Hogs Lard laid upon any hard tumour or ſwelling, and that in the neck or throate, which is called the Kings Evill doth help to diſſolve, or diſcuſſe them: in the like manner applyed to the Goute, Sciatica or Sinew gout, aches or of the ſinewes, doth very much allay the paines, and give eaſe. It is alſo very effectuall for all inflammations, as a repercuſſive, and to heale all greene wounds, by drying and cloſing up the lippes of the wounds, and for old Vlcers alſo to ſtay their malignitie of fretting, and corroding or ſpreading, thereby curing them to heale the more ſpeedily: it draweth forth ſplinters, or other ſuch like things gotten into the ſkin, *Matthiolus* commendeth it for many other things, as for bruiſes and burnings: but the Archangell with Yellow flowers is moſt commended, for old filthy and corrupt ſores or corrupt Vlcers, yea although they grow foule and hollow, and to diſſolve tumors.

Chap. LXVI.

Galeopſis. Stinking Dead Nettle.

Now have here to bring to your conſideration not onely the Genuine *Galeopſis* of *Dioſcorides*, both in *Cluſius* and my judgements, but ſome other plants alſo, which may not undigly for their likenes there-unto be referred unto it as I thinke.

Galeopſis genuina Dioſcoridis. The true ſtinking Dead Nettle of *Dioſcorides*.

This kinde of Dead Nettle hath divers ſquare, ſoft, and hairy ſtalkes, riſing up to be three or foure foote high, at the joynts whereof grow two leaves a peece upon long footeſtalkes, very like unto Nettle leaves, but ſmaller and not ſo hoarie or hairy, but not ſtinging at all, of a very ſtrong ſent, ſomewhat unpleaſant, ſtanding or growing in ſhadowy places, and nothing ſo ſtrong in the open fields: at the toppes of the ſtalkes grow the flowers for the moſt part, foure or five at a ſpace, and many of them one above another, in long ſpikes, every one ſtanding in a greenish huſke, like unto thoſe of the former Dead Nettles, but not ſo great nor of a red red or purplish colour, eſpecially the heads or upper parts; but the lower labells or lippes are ſome white ſpots in them: within thoſe huſkes after the flowers are fallen, grow ſmall rounde, yet ſomewhat rough ſeede, three for the moſt part ſtanding together: the roote is compoſed of many ſtrings, ſhooting forth head every yeere, and periſhing thereby very much.

2. *Galeopſis*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

3. *Galeopsis alterа incana*. Hoary stinking Dead Nettle.

This other Dead Nettle hath shorter square stalkes soft and hoary, very slender and weake, creeping as it were by the ground, with two leaves set at the joynts likewise soft and hoary, and more hoary underneath, not so large as the former; the toppes of the stalkes end in a long spike of purplish flowers, set in roundles as in the other; the seede and roote is alike and resemble unto the other.

3. *Galeopsis lutea Dalechampij*. Yellow stinking Dead Nettle.

The yellow Dead Nettle hath square low stalkes not above a cubit high, with long leaves set thereon by couples, very like unto Nettle leaves, smaller below next the ground then up higher upon the stalkes being hairy, but not stinking, and smelling somewhat strong like the bull: the flowers grow in long spiked heads in the same manner, but are all yellow when they are fully blowne, consisting of two leaves, the upper of which is not so much hooded as the former, but as it were a cover to the lower, and turneth it self up againe, having three yellow threds in the middle, but while it is in budde it seemeth somewhat reddish: the seede is set in huskes as the other, the roote is thredy and blackish like the former.

4. *Galeopsis altera pallida*. Pale Galeopsis or stinking Dead Nettle.

This hath sundry pale greene broad leaves set on long hairy footestalkes: the stem here is square and hairy also, with such like but lesser leaves thereon, and sundry small pale yellowish flowers set together at spaces, which turne into small round and pointed heads, with small blackish seedes in them, it smelleth strong or sunketh as bad as the rest.

5. *Galeopsis maxima Pannonica*. The Dragon flower.

This I have described in my former booke, whereunto I must referre you, although I give you the figure thereof here.

2. *Galeopsis altera Dalechampij*.
Sundaine Dead Nettle.

4. *Galeopsis altera pallida*.
Pale coloured Galeopsis or Stinking Dead Nettle.

5. *Galeopsis maxima Pannonica*.
The Dragon flower.

The Place.

They will very frequent in our land, in divers countries, as at *Hampsted* going from the towne to the Church, and many other places from *Hampsted* heath to *London*: the second and third I have not knowne grow wilde, but only in our gardens: the fourth *Gesner* saith he found growing naturally in his garden at *Vienna*, and so did I likewise in my garden in Long Acres not knowing otherwise of any such seede was sent me, for it grew not in any place by mine seeds, but straglingly in wall places.

The Time.

All these sorts are in flower or seede in *June* and *July*; for the most part, and the seede is quickely ripe after the flowers appeare.

The Names.

It is called in Greeke as *Dioscorides* saith γαλεόψις, γαλεόβδολον, & γαλεόβδελον. *Galeopsis*, *Galeopsis*, & *Galeobdolon*; γαλεόβδολον from γαλῆ, as some thinke, or as *Matthiolus* saith, ἀγαλλὸν τῷ βδελῷ, and then he would adde the *Lamium album* unto it, but himselfe disclaimeth that deduction, and the other is not right, for the word γαλεόβδολον, which signifieth *mustela fœtida*, sheweth the truer derivation as *Pliny* hath it *aforme figura, mustelæ odore, effectu quasi externa experimentur*. It is called usually in Latine also *Galeopsis*, as *Pliny* doth more truly, then *Galeopsis*, and *Urtica mortua spicata*, & *Urtica labra*, of the great lippes in the flowers. The first is from *Tragus* called usually *Urtica Horrida*, or by others *Herrulea Tragi*: of *Lonicerus Urtica Silvatica*, of *Clusius Galeopsis Dioscoridis*, but by *Bauhinus Lamium maximum Sylvaticum fœtidum*: the second is the *Lamium inscriptum* of *Tabern.* and the *Galeopsis rubra* of *Lugdunensis*, whereof he saith there groweth plenty in the groves there from it as well as the other yellow *Galeopsis*: whereof neither as he saith, is any *Lamium*, either thinking, or otherwise, for as he saith this red differeth from the yellow, onely in the colour of the flower, both of them bearing spiked heads like the first: the third is *Lugdunensis Galeopsis intima Dalechampij*, called *Galeopsis flore luteo tubi minore*, and *Galeopsis cordifolia* of *Camerarius in horto*, differing from the *Lamium luteum*, for he mentioneth it also among the other *Lamia*: the fourth *Clusius* calleth *Lamium Pannonicum sive Stiriacum sive exsiccum*, and is thought to be *Scrophularia flore luteo* of *Bauhinus* as you shall finde it noted in the chapter of *Scrophularia* afterwards: but lastly it hath little correspondency with the *Lamia*.

The Vertues.

The first sorte Dead Nettles, any of the kinds of them, boyled in wine and drunke, doth wonderfully helpe all inward wounds and hurts, bruises, falls or the like, and are singular good also for the spleene, and the diseases thereof: but especially for the hemorrhoides or piles, when they are painefull being swollen and fallen downe: the pyne thereof applyed warme with vineger, both easeth the paines and draweth forth the blood; and in the same manner used helpeth the warts, and other such like hard grumes or knots, that grow in and about the fundament; as also all other manner of hard swellings, as wennes, warts, and kernels, that grow in the necke or throate, or in any part of the body; it is singularly commended for all manner of filthy ulcers, gangrenes, and cancers, be they corroding or fistulous.

Chap. LXVII.

Scrophularia major, Great Figwort.

There are two sorts of *Scrophularia* or Figge-worts as they are so called by divers, a greater and lesser, the lesse being called *Chelidonium minus*, whereof I shall entreate hereafter: but of the greater in this Chapter, whereof there are divers other sorts that formerly were not knowne.

1. *Scrophularia major vulgaris.* The ordinary great Figgewort.

The common great Figgewort sendeth forth divers great, strong, hard, square, browne stalkes, three or foure foote high, whereon grow large, hard, and darke greene leaves, two at a joynt, which are larger, and harder then any Nettle leaves, but not stinging, very like unto the leaves of Water *Betonie*, so that they are sometimes mistaken, being somewhat hardly discerned one from the other, but that these are not so round dented about the edges, and are also smaller at the ends; at the toppes of the stalkes, stand many purple flowers, set in tufts, which are somewhat gaping and open, but not so much as any of the former dead Nettles, but closer and smaller, like those of Water *Betony*, after which come hard round heads, with a small point in the middle, wherein the seed groweth like the former: the roote is great white and thicke, with divers knobbes or bunches at it, growing close under the upper crust of the ground, and abideth many yeares, but keepeth not his greene leaves under winter.

Scrophularia major vulgaris.

There is another sort hereof very like in leaves, but more sometimes standing at a joynt, especially the lowest: the flowers are not gaping, but made of foure reddish leaves, which usually stand at the joynts with the leaves, which are not pointed.

2. *Scrophularia altera sine Cassida dicta.* Great Figge-wort without knobbed roots.

The other kinde of great Figge-wort, riseth up with many weake and tender stalkes, not above two foote high, set with broad narrow, long, and somewhat thicke darke greene leaves, cut in on the edges on both sides like the former, but smelling them selves like the leaves of wilde field Poppie, smelling somewhat strong like Rue. The flowers grow for the most part tender, sometimes but one or two, and sometimes more standing at a joynt; the flowers are also smaller, of a darke or dull purple colour, somewhat like the other, or like unto Toadflaxe, standing many together, upon severall small branches at the toppes of the stalkes, which smell as strong almost as the leaves: which turne into small heads like the former, the seede whereof is not much unlike: the roote hath no knobs thereon at all, but consisteth of a long, downeright bigge roote, with many small fibres growing to it.

3. *Scrophularia Urticæ folio.* Great leafed Figge-wort of *Candy*.

This Figge-wort of *Candy* hath a square cornered greene stalke, brownish on the side next the sunne: at the toppe whereof grow divers large, and long winged leaves, set upon their foote stalkes, made of many parts, some-

1. Scrophularia vulgaris.
Ordinary great Figge-wort.

Scrophularia major altera Anglica.
Another dainty great Figge-wort.

2. Scrophularia altera Radice Caliculata.
Great Figge-wort without knobbed roots.

3. Scrophularia Cretica latifolia.
Great leaved Figge-wort of Candy.

somewhat like the last, but larger and more cut in on the edges, and each part cut in on their edges likewise, and very like to the leaves of the great Nettle; from the middle of the stalke, whose ioynts about is set the tuppes almost, other branches, and they against some smaller, having on all sides leaves like vnto them grow below: set thereon; and at the toppes of the stalkes and branches are tufts of small ones, so some what like unto the full ordinary Figge-wort, but pale of a deeper and part of a paler purple colour, with some yellow threds, rising out of the middle: the roote is of a fingers thicknesse, and deuided into diverse other parts.

4. *Scrophularia peregrina.* Strange great Figge-wort.

This strange Figge-wort beareth divers square browne stalkes, rising from the roote about two foote high, where grow without any order, many soft leaves like Nettles, but not prickling or stinging at all, somewhat longer, and broader and deeper cut in on the edges, especially in some of them, of a darke greene colour on the upperside, and greene underneath: the stalkes branch themselves into many other smaller ones, with leaves on them for the most like the lower but lesser, where stand many darke purple flowers, whose upper leaves turne upwards, and the lower fall downe like lippes, each of them standing in greene huskes, that are parted into five points, whereunto after the flowers is fallen and past, commeth a round head, divided as it were with a seame into two parts, with a little point at the end, wherein lye small brownish seede, like the common sort: this also hath a strong ilsh, rather worse than the last.

5. *Scrophularia peregrina altera.* Another strange great Figge-wort.

The stalke hereof is about two foote high: the leaves are of a faire greene colour, as it were winged, the flowers are yellowish, with pale threds in the middle: the seed is small in round huskes being by forked at the ends.

6. *Scrophularia flore luteo.* Yellow Figge-wort.

The yellow Figge-wort bringeth forth diverse square browne stalkes, somewhat hayrie and soft, about two foot high, at the joynts whereof grow two large broad, round, hayrie, soft greene leaves, deeply dented about the edges, standing upon very long foote stalkes, those at the foote of the stalkes being largest, which in winter lye in a compasse upon the ground, round about the roote; and those on the stalkes lesser and lesses up to the toppes: at each joynt with the leaves commeth forth, even almost from the bottome, one small naked ioynted branch, bearing many flowers in tufts at the ends of them, which are round and yellow, somewhat like the ordinary sort, parted or cut in at the brimmes, into seuerall peeces, having some long yellowish threds in the middle: after the flowers are past, come larger round heads then in the former, whose point at the end is long, and a little crooked, containing within them small blacke seedes: the roote is thicke and blackish, with many strings and fibres thereat, but not having any knobbes thereon at all.

7. *Scrophularia Indica.* Indian Figge-wort.

The Indian Figge-wort, hath divers thicke but weake branches, lying all about upon the ground, full of ioynts,

8. *Scrophularia Sambucifolia.* Elder-like Figge-wort.

with

with large and long, darke greene leaves, cut in on the edges, into five long divisions, all of them standing on the edges, and from the same joynts come forth also other lesser leaves, divided and denied, and so run from ward the toppes of stalkes, divers large flowers of a yellowish colour on the out side, and lower part, but within of a reddish colour, mixt with the yellow: after which come larger and harder heads, than in any the former by much, pointed at the end as the rest, and within them small blackish seede: the roote is dusky and bushie, but perisheth in the winter, if it rise up to flower, else abiding.

8. *Scrophularia Sambucifolia.* Elder-like Figge-wort.

This Figge-wort riseth up with divers square hollow stalkes, two or three cubits high, with sundry winged leaves, issuing from the joynts thereof, consisting of many, set one against another, upon a middle rible resembling an Elder leafe, and smelling strongly thereafter: the branched stalkes beare the like leaves, and at the joynts with them, and at the toppes stand many hollow flowers, hanging downe their heads round about the stalkes, of a brownish red or purple colour, after which come small round blacke seede vessels, pointed at the end, with the like small seede in them as in others: the roote is somewhat long, with divers fibres thereto.

The Place.

The first is very frequent in all places of this Land, both in moyst and shadowie woodes, and in the lower parts of fields, and meddowes: the second *Lobel* saith, groweth not but in the warme Countries of *Narbon* in *France*, *Ravenna* and *Rome* in *Italy*. The third and fourth came from *Candy*: the fift was sent out of Italy among other seedes: the sixt came from *Hungary*, and other parts of *Germany*: the seventh and last from *Spaine* and *Italy*.

The Time.

They all flower about *July*, yet some a moneth sooner, and the seede will be ripe within a moneth after the flowers are past.

The Names.

This hath no Greeke appellation more then what may be taken from the Latine, for being of late worthy use at the least, it hath obtained divers Latine names, as *Scrophularia major*, because it is available as *Betonica*, and *major* to distinguish it from the lesser, (which most writers call *Chelidonium minus*, with what judgement you shall heare anon) *Ocimastrum*, *Ficaria*, *Ferraria* and *Castrangela*, as well from the forme of the rooted, from the many effects, the former ages more then ours did put it to, and did finde it available: the other have, though they want those knobbes in the rootes, yet for the other likenesse have the same name imposed on them. *Fuschius Cordus*, and *Dodonæus* did take it to be *Galeopsis* of *Dioscorides*, but *Dodonæus* in his last Edition, mending his former errour amendeth it saying, that this wanteth the strong sent that *Galeopsis* hath, besides other things. Some also tooke it to be *Chrysippos* of *Pliny*, which he saith, used with Figge helpeth the knobs or kernels in the flesh: the *Italians* call it *Scrofularia*, the *French Grande Scrofulaire*, the *Germanes Braunwurtz* and *Grosse Feigwartz*, the *Dutch Great Speenkruyt*, and we in *English* great Figgewort, and great Pilewort, and of some great Kernell wort: the first is called *Scrophularia*, and *major* of most writers: onely *Tragus* not allowing of the name *Scrophularia*, more to be given unto this plant then unto the *Saxifraga alba*, calleth it *Ocimastrum album*, and *Matthiolus in horto*, calleth it *Chrysosplenium*, and as I sayd before *Galeopsis* of *Fuschius*, *Cordus*, and *Dodonæus*, in the *Dutch* Herball; the other of the great kind hath not beene mentioned by any before. The second is called *Rota Canina* of *Lobel Clusius* and others, from them of Montpelier: but hath little or no likenesse to any Rose: and is called by many also *Scrophularia cucullo simplici obtuso tuberosa*, *Matthiolus* setteth it forth for *Sideritis tertia Dioscoridis*, as *Camerarius* and *Bauhinus* say, although not well expressed; but *Lacuna*, *Lonicerus*, *Dalechampius* and some others would make it the *Sideritis altera* of *Dioscorides*, and *Dodonæus* in his *Dutch* Herball (which I have translated into *French*) *Galeopsis tertia*, *Calthpinus* calleth it *Scrophularia similis planta major*, *Sideritis secunda Dioscoridis*. *Bauhinus* calleth it *Scrophularia Rota Canina dicta vulgatior*: the third is the fift *Scrophularia* of *Clusius*, which as he saith is very like unto the *Rota Canina*, and therefore *Bauhinus* calleth it, *Scrophularia folijs ad basin laciniatis*, *vel Rota Canina laciniata*: the later *Gerard* calleth *Scrophularia Indica* but how truly let others judge. The fourth is called *Scrophularia peregrina* by *Camerarius*, who thinketh it to be the *Sideritis* of *Anguillara*, and is the second *Scrophularia Cretica* of *Clusius*, and by *Bauhinus* called *Scrophularia folio Urticæ*, the fift hath the name in the title whereby wee received it: the sixt is called *Scrophularia flore lutea*, by *Bauhine*. *Fabius Columna* calleth it *Scrophularia montana maxima*, and thinketh it also to be the *Lamium Pannonicum folio Urticæ dum flore exoticum* of *Clusius*, but saith *Bauhinus* there is some difference, and I doe verily thinke them two severall plants. The seventh is called by *Bauhinus Scrophularia folijs laciniatis*, and saith it was sent him of the name of *Scrophularia Hispanica*, but we received it under the name of *Scrophularia Indica*: which whether it be naturall of the *Indies* or of *Spaine*, wee cannot tell, for many things are to misconstrued: the last name of it among other seedes by the same name is in the title, and by me with many other of our severall sorts of seedes sent unto Dr. *Moore* while hee lived at *Padua*, and by him imparted to *Alpinus*, who mentioneth it as received from him.

The Vertues.

It is very effectuall to dissolve clotted or congealed blood within the body, which happeneth by any fall, or by any bruise or fall, both to be taken inwardly by the decoction of the herbe and by applying the herbe stamped upon the hurt place outwardly: the same also is no lesse effectuall for the *Kings Evill*, or any other hard kernels, tunches or wennes growing in the flesh whereseever: it is of singular good use to be applyed to the hemorrhoides, or piles, when they grow painefull and fall downe, and for other soft knobbes or kernells sometimes grow in and about the Fundament. An ointment made hereof in this manner may be used at all times when the fresh herbe is not to be had. Wash the rootes cleane, bruise them and put them into a pot with fresh Butter well mixed together, and let them so stand for fifteene dayes close covered in some moist place, which afterwards set upon a gentle fire to boyle easily for a little space, which done being strained and put it be kept in a pot covered to use when occasion requireth: with the roote and leaves likewise bruised and boyled in *Axungia* or oyle and wax, is made the like ointment, exceeding good to breake all sorts of Scabbe and Itch also. The distilled water of the whole plant rootes and all, is used for the same purpoles, either to take inwardly or to apply outwardly by bathings, and serveth well also for fowle Vlcers that are hollow or corrosive

dry the superfluous virulent moysture of them; the same also taketh away all rednesse spots and freckles in the face, as also the scurfe, or any foule deformitie therein that is inveterate, and the powder likewise.

Chap. LXVIII.

Scrophularia aquatica. Water Betony.

Because this herbe is so like unto the former Figwort, that many as I sayd are mistaken therein, and that it is called *Scrophularia aquatica* also by some; I thought it not amisse to joyne it next thereunto, as well as for the same properties that this serveth, especially for Vlcers and sores.

1. *Betonica aquatica major.* The greater Water Betony.

The greater Water Betony riseth up usually higher then the Figwort, with square hard greenish stalkes, and sometimes browne, set with such like broad darke greene leaves, as the Figwort hath, and dented about the edges, but with rounder notches whereby it may if heede fully observed be knowne from it, and wherein it somewhat resembleth the leaves of the Wood Betony, but much larger two for the most part set at a joynt; the flowers are many set at the toppes of the stalkes and branches, being round bellyed and open at the brimmes, and deuided into two parts, the uppermost being like a hood, and the lowest like a lip hanging downe, of a darke red colour, which falling away there come in their places round heads with small points in the ends, wherein lyeth small and browne seede: the roote is a thicke bush of strings and thrids growing from a head.

Betonica aquatica
Water Betony.

2. *Betonica aquatica minor.* The lesser water Betony.

The lesser Water Betony is in all things like the former, but lower and lesser in all parts, for the stalkes are square and greene, the leaves round almost, but yet pointed, of the same darke greene colour, the flowers are of a sad red, or purple colour, and it scorns standing, so that the fairenesse only differeth the greater from the lesse.

The Place.

The first groweth with us by ditch sides, by brookes and other water courses, generally throughout the land, and is seldome found anything farre from the waters sides: the second also loves wet and moyst grounds about *Basil* as *Bauhinus* saith, and in other places of *Germany*, and will well abide in the gardens as I have found in the garden of Dr. *Penny* at *Cambridge* and Dr. *Alderson* at *Tornay*.

The Time.

They flower about *July* and their seede is ripe in *August*.

The Names.

It is called *Betonica aquatica* and *aquatilis* by *Dodonæus*, *Lobel*, *Tabernæmontanus*, *Gerard* and *Turner*, who yet do not agree with *Cæsalpinus* & *Dalechamp*, but *Cæsalpinus* also did, calling this *Cymbalaria*, as he did the common *Scrophularia*, as I sayd before, *Dalechamp* and therefore calleth this also *Scrophularia aquatica*. *Tragus* in *Dutch* maketh it his second *Ordinarius* and *Cruciatus* his greater *Ordinarius*. *Lobel* saith that some call it *Sisymbrium*, and some *Terpsimelea*, *Thalius* calleth it *Betonica minor aquatica*, and so doth *Bauhinus*, the other called by *Cæsalpinus* in his *Matthiolus*, and Epitome of *Matthiolus* *Scrophularia femina*, and saith the *Germans* call it *Nachtschat*, that is, white Nightshade. *Lobel* in his observations pag. 188. calleth it *Betonica aquatica minor*. The *Dutch* doe call it *Rechte waterwortel* and *Kleyn Betonica*, we in English call it Water Betony and usually, but some Brownewort. From the *Germane Etymologie*, as it is likely, which I have before in the greater *Scrophularia*, the likenesse of the plants causing such interpretation of names, and leaves and stalkes.

The Vertues.

Both sorts of the Betony are effectuall for all old and filthy Vlcers, being of a cleansing quality, if the same be washed and bathed therein; but is much more effectuall if the juice of the leaves be boyled with a little honey and some Aloes therein & the sores dressed therewith, as also for bruises or hurts whether inward or outward. A decoction of the leaves is used for the same purposes, as also to anoint the face or hands that are scurfie, or any spots or blemishes therein; as also for any redneſſe or high colour that is in the face, by taking away the same.

Chap. 1 XIX.

Betonica. Wood Betony.

OF Betony wee have foure or five sorts, differing either in the leafe or flower, or spiked heads of flowers one from another, as shall be shewed you.

1. *Betonica vulgaris flore purpureo.* Common Wood Betony.

The ordinary or common Betony, which because it is frequent in woods, is therefore generally called Wood Betony, hath many leaves rising from the roote, which are somewhat broad and round at the ende, roundly dented about the edges, standing upon long foote-stalkes; from among which rise up small square slender, but yet upright hairy stalkes, with some leaves thereon, growing at the joynts, smaller then the lower, whereon are set severall spiked heads of flowers, like unto those of Lavender, but thicker and shorter for the most part, and of a reddish or purple colour, spotted with some white here and there in the lower & upper part on the inside: yet there is observed a different sort from this, whose head is larger, the flowers usually redder then the former: the seede followeth contained within the husks that hold the flowers, which are blackish, somewhat long and uneven: the roote are many white threddy strings, like unto those of Plantaine: the stalkes perisheth, but the roots with some leaves thereon abide all the winter, for which cause it is somewhat small and of a rammous savour.

2. *Betonica flore albo.* Wood Betony with white flowers.

This Betony differeth in no one thing from the former, so much as in the colour of the flowers which are in both white, without any spots at all in them, onely the leaves may seeme to be a little greener, and the spiked head of flowers somewhat smaller then the other.

3. *Betonica montana Alpina Helvetica.* Small Mountaine Betony.

This small Betony likewise differeth not from the former, neither in forme or colour, but in the smalnesse of leaves, stalkes and flowers.

4. *Betonica Danica.* Broad leafed Betony.

This great Betony likewise differeth not from the ordinary, in any other thing then in the largeness of the leaves, being twise, and in some at sometimes three or foure times as large as the common sort, and of a more almost stinking smell, and in the stalke which is stronger growing higher, and the heads of purple flowers greater also.

5. *Betonica Alopecurus montana Clus.* Foxtaile Betony.

This herbe that I here bring to your consideration, is accounted by *Bauhinus* as a kinde of Betony, or referred thereunto for the likenesse of the leaves, whom I also herein follow, and place it with them; it hath a blackish tuberous roote, with some fibres thereat; from whence rise up divers slender round stalkes, about a cubit high,

1. *Betonica vulgaris flore purpureo.*
Common Wood Betony.

5. *Betonica montana Alopecuroides.*
Small Mountaine Betony.

1. Betonica vulgaris. Broad leafed Betony.

2. Betonica alopecuros montana dicta. Fox tails Betony.

having at the bottome of them some small long and narrow leaves, like threds or peeces as it were torne off from the ende of the lower part of the stalke and sharpe pointed, some greene and some browne: the rest of the stalkes are naked unto the middle, which from thence to the toppes at farre distances one from another, have at every joynt two broader, rounder, and shorter leaves then Betony, the middle ribbe being blackish, and dented about the edges: above the two uppermost leaves come forth a soft round spiked short head made of a number of white haires, somewhat resembling a white Fox taile, whereof it tooke the name.

The Place.

The first two sorts are frequent in woods and copses, and other such like shadowie places throughout the land, but that with the white flowers is more usually found in the sunne dry grounds, then in any other mould, and in the woods by *Bromley* in *Kent*; the third grow on the *Alpes* of *Helvetia* or *Switzerland*: the fourth was brought from *Denmarke* by Dr. *Lobel*, when he went thither with the Lord *Edward Zouche* Ambassadour from the Queene *Elizabeth* of famous memory, in the yeare 1592. The last as *Lugdunensis* saith, groweth in the moyst vallies that are shadowed with trees of the high hills.

The Time.

They flower in *July*, and the seede ripeneth quickly after.

The Names.

It is called in Greeke [illegible] yet some take it *a florum spicatâ & interruptâ dispositione*, and *Lycopsis*. *Pyrethropsion*, *quod in frigidis locis nascatur*: the word *Cestros* hath divers interpretations in Greeke as in *Suidas* for a kind of dart, in *Sophocles* for a pricke or pointed thing; others make it a hollow bodies containing much variety of matter, and *Pliny* speaking of graving, saith anciently there were two sorts, the one in wax, the other in *Ebore Cestro dicto*, *viricula*, set downe for *vermiculum*, which is engraven with a knife and leaves the sharpe pointed mole wherewith they did grave in ivory. It is called in Latine *Betonica*, and *Vettonica ab inventoribus Vettonibus Hispaniæ populis* as *Pliny* saith; but *Galen* seemeth in his [illegible] to make *Betonica* and *Cestros* to be two herbes, in the [illegible] worde translated, *Conjicitur [illegible] Cestros quod in foliis articulatis sanasciat; sit autem aut cultata herba Betonica*. [illegible] also in his fourth booke and 30. [illegible] recounting the place of *Carniola*, [illegible] *Betonicam, sed crisson Gallorum* [illegible] in his seventh Booke doth plainly set downe two sorts of [illegible] with slender branches like unto Pennyroyall, but smaller, and almost without taile, growing especially in [illegible] as I said before in the Chapter of *Lamio* it taken by *Quadrarius* to be *Lamium Scutellaria* [illegible] called in shade medicines that are for the reines; the other is the Romane Betony which *Dioscorides* [illegible] and others *Pyrethropsion* because it joyeth in cold places, and hath no likenesse to the former

met but in the qualities and vertues, thus saith *Ægineta*. It is called by the *Arabians Chasthara*, by the *Italians Betonica*, but as *Pliny* saith (*lib. 25. cap. 8.* speaking of his times) *Serratula*, by the *French Betoine*, and *Betoyne* by the *Germanes Braun Betonick*, by the *Dutch* and us Betony. There needeth no further declaration or explanation of these unto you, seeing all Authors almost agree in the name. The third and fourth by their title and figure are expressed wherupon they tooke their names: the last *Lugdunensis* calleth *Alopecurus montana*, which hath Betony like leaves, and therefore *Bauhinus* as is before said referred it thereunto. One thing more I would advertise you that *Betonica* and *Betonica* are diversly taken in divers Authors for *Veronica*, although it be set downe in some Authors for *Betonica*. yet more properly and usually it is understood to bee the *Caryophyllus*, our Gilliflower, and then it is denominated *Betonica altilis*.

The Vertues.

Betonie is hot and dry, almost in the second degree: it is said *Pliny saith that Antonius Musa*, the Emperour *Augustus* his Physition, who wrote a peculiar booke hereof, saith of it, that it preserveth the lives and bodies of men, free from the danger of diseases, and from witchcrafts also; but it is found by daily experience, as *Dioscorides* formerly wrote thereof, to be good for innumerable diseases, as *Matthiolus* rehearseth it, for it helpeth those that either loath or cannot digest their meate, those that have weake stomackes, or have lower belchings or continuall rulings in their stomacke, if they use it familiarly, either greene or dry, either the herbe, the roote, or the flowers, in broth drunke, or meate, made into conserve, syrupe, electuary, water, or powder, as every one may best frame themselves unto, or as the time or season requireth, taken any of the foresayd wayes it helpeth the jaundise, falling sickenesse, the palsie, convulsions or shrinking of the sinewes, the goute, and those that are inclining to dropsies, as also those that have continuall paines in their heads, yea although it be some to trouble: it is no lesse available the powder mixed with pure honey, for all sorts of coughes or colds, wheezing and shortnesse of breath, distillations of thinnes from the same upon the lungs, which causeth consumptions, the decoction made with Meath and a little Pennyroyall added thereunto, is good for those that are troubled with putride agues, wherein *quartanes, tertians*, or *quotidians*, that rise from the stomack; and to draw down and evacuate the blood and matter, that by falling into the eyes, do hinder the sight: the decoction thereof made in wine & taken, killeth the wormes in the belly, is good to open the obstructions, both of the liver & spleene, & for stitches or other paines in the sides or back, the torments also & griping paines of the bowels, and the wind Collick, and with honey helpeth to purge the belly: the same also helpeth to bring down womens courses, and is of especiall use for those that are troubled with the falling downe and paines of the mother, and to cause an easie and speedy delivery for those in travaile of childbirth: it helpeth also to breake and expell the stone, either in the Kidnes or bladder; the decoction with wine gargled easeth the toothach: it is commended against the sting or biting of venemous Serpents, and mad dogs, both uled inwardly, and applyed outwardly also to the hurt place: It is sayd also to hinder drunkennesse, being taken before hand, and quickely to expell it afterwards: a dramme of the powder of Betonie taken with a little honey, in some Vinegar, doth wonderfully refresh those that are overwearied by travaile: it stayeth bleedings at the mouth or nose, as also those that spit or spitte blood: it helpeth those that are burssen and have a rupture, and is good for those that are bruised by any fall or otherwise: the greene herbe bruised, or the juyce applyed, to any inward hurt, or outward greene wound, in the head or body, will quickely heale it and close it up, as also any veines or sinewes that are cut, and will also draw forth any broken bone, or any splinter, thorne, or such other thing, gotten into the flesh: it is no lesse profitable for old filthy sores, and ulcers, yea though they be fistulous and hollow; but some doe advise to put a little salt thereto for this purpose: being applyed with a little Hogges Lard, it helpeth a Plague sore, and other biles and pushes: the fumes of the decoction while it is warme received by a funnell into the eares, easeth the paines of them, destroyeth the wormes, and cureth the running sores in them; the juyce dropped into them, doth the same likewise: the roote of Betony is found to be of much differing quality from the leaves and flowers, as being much displeasing both to the taste and stomacke, procuring loathing, vomitings, and belchings; whereas the leaves and flowers, by their sweete and spicie taste, are comfortable both in meate and medicine.

CHAP. LXX.

Chelidonium. Celandine.

FOrmerly there were two sorts of Celandine generally knowne, as *Dioscorides* and others make mention, which differ in outward face, very much one from another, whereof I entend to intreate in this Chapter, but unto them I must adjoyne some other sorts of the greater, which are of late invention.

1. *Chelidonium majus vulgare.* Common great Celandine.

Common Celandine hath divers tender, round whitish greene stalkes, with greater joynts than ordinary in other herbes, as it were knees, very brittle and easie to breake, from whence grow branches, with large and long leaves, much divided into many parts, and each of them cut in on the edges. Set at the joynts upon both sides of the branches, of a darke blewish greene colour on the upperside, like unto Celandine, and more whitish greene underneath, full of a yellow toppe or milke, where any part is broken, of a bitter taste and strong savour. At the toppes of the branches which are much divided, grow gold yellow flowers, of foure leaves a peece, after which come small long pods, with blackish seede therein: the roote is somewhat great as the thumb, sending forth divers other long rootes, and small fibres reddish on the outside, and yellow within full of a yellow juyce therein.

2. *Chelidonium majus laciniatum.* Jagged Celandine.

This other great Celandine groweth in all things like the former, but that the leaves are thinner, as also the divisions slenderer, and more cut in on the edges; the flowers likewise are of the same gold yellow colour, consisting of foure leaves, somewhat larger than the other, and are each of them cut in on the edges as the greater

Original from UNIVERSITY OF MICHIGAN

...ferent: these the other by the shedding of the seede, which in one beares white, and so abideth flowring the next spring, and seeding in common.

5. Chelidonium maius Canadense flore simplici.
Great Celandine of Canada.

...Canada hath a thicke roote, full of a yellow juice, smelling strong like the ordinary, from whence rise up three large bi-wift greene leaves, cut in after the manner of Oke leaves, without any foote stalke under them, but divers short ones, from among which riseth a stout reddish stalke, with a white flower on the toppe of it like unto the flower of Sowthead.

Chelidonium minus. Small Celandine or Pilewort.

...though there is no affinity in the forme hereof unto the former, as before sayd, yet because it generally beareth the name of the lesser Celandine, and that it is of an healing quality, especially for the piles, I thought good to joyne it with the other for this worke, which else might be severed. This small Celandine doth spread many round pale greene leaves, set on weake and trayling branches, which lye upon the ground, and are fat, smooth, and somewhat shining, and in some places, though seldome, marked with blacke spots, each standing on a long foote stalke; among which rise small yellow flowers, consisting of 9. or 10. small narrow leaves, upon slender foote stalkes, very like unto a Crowfoote, whose seede also is not unlike, being many small seedes together upon a head: the roote is made of many small kernels, like graine of corne, some twice as long as other, of a whitish colour with some fibres at the end of them.

There is another sort hereof, which hath as it were double rowes, or rabbing of two rowes of leaves, in all other things not differing from the former, which Gesnerus in ...writ, orally mentioneth.

5. Chelidonium maius laciniatum.
Vulgar Celandine.

Flore duplici.

1. Chelidonium minus.
Small Celandine or Pilewort.

4. *Chelidonia rotundifolia major.* A greater small Celandine.

This greater sort of the small Celandine, hath a fibrous roote, whereunto grow small round knobs; the leaves are round thicke and smooth, growing almost as large as *Asarum*, or *Aristolochia*, sometimes a little waved about the edges, each standing upon a longer foote stalke than the former, yet lying upon the ground: the flowers stand severally as the others doe upon longer foote stalkes, are of a pale yellow colour, and larger than the former, consisting but of five or six leaves, each at the ends, unto the middle of them, and having some reddish specks in the middle of the flowers.

The Place.

The first groweth in many places by old wall sides, and by the hedges and way sides in untilled places: and being once planted in a garden, especially in some shady place, it will still be found therein, the second is not known where it is naturall, but is received into gardens for the varietie: the small sort groweth for the most part in the moyst corners of fields, and places that are neere water sides, yet will abide in dryer grounds, so as they lye a little shadowed; the third in *Canada* as the title sheweth: the last groweth in the wet grounds about *Hampton*.

The Time.

The two first sorts flower all the Summer long, and the seede ripeneth in the mesne time: the small flower beginneth about *March*, or *Aprill*, and is quite gone in *May*, so as it cannot be found until it spring again; that of *Canada* flowred late but gave no seede.

The Names.

The first and greater is called in Greeke [illegible], in Latine *Chelidonium majus*, and *Hirundinaria major*: the lesser is called [illegible], and in Latine *Chelidonium minus*, and *Hirundinaria minor*: some call them *Chelidonia major & minor*, and tooke the name as *Dioscorides* saith, because it springeth when Swallowes come in; and withereth at their going away (which is true in neither, the greater whereof *Dioscorides* chiefely speaketh, being greene both winter and Summer, and the lesser springing before Swallowes come in, and is gone and withered long before their departure,) *Dioscorides* likewise and *Pliny* also, say it tooke the name from Swallowes that cured their young ones eyes, that were hurt, with bringing this herbe, and restored it to them: but *Aristotle*, and *Celsus* from him, doe shew that the young ones of Partridges, Doves, Swallowes, &c. will recover their sight (being hurt) of themselves in time, without any thing applyed unto them, and therefore *Celsus* accounteth this saying but a fable. The *Germans* in former times in mistaking the Greeke name, called the greater kinde *Cole dauenie*, and thereupon did highly extoll the Quintessence drawne from it, not onely to expell many diseases, but for many their idle and fantasticke transmutations: the lesser forgetting the former names, is called *Ficaria*, *Scrophularia minor* of *Brunfelsius*, of *Fuchsius Myagrum minus*, whom *Matthiolus* taxeth therefore, *Gualterius* and *Cordus* tooke it to be *Asarum Virgilii*, as we shewed you in the Chapter of *Asarum* or *Asara*. *Lobelius* calleth it *Testiculus fœtidus*, and is likely to be the *Ficaria* of *Lobelius*, *Englishmen*. *Bauhinus* calleth it *Chelidonia rotundifolia*: it is thought also to be the *Struthea* of *Pliny*, whereof he speaketh among the *Paronychi*: many doe make doubt whether this herbe be the *Chelidonium minus* of the *Græcians* and *Italians*, because it hath not any acrimonie or sharpenesse therein, as they say is in theirs; for all writers doe agree, that how soever it hath not any acrimony, it is in forme and all other properties the same, it is as I said called *Ficaria* and *Scrophularia minor*, *a signatura*, from the likenesse of the roots unto those Kernes called *Scrophulæ*, which appeare in *ano, & ad tonsillas*, and therefore as in many other the like, held powerfull in cure them: the greater is called of the *Italians Celidonia maggiore*, of the *Spaniards yerua de Lungolonrinon*, and *Celidonia*: of the *French Chelidoine Eclongue* and *Eslaire*: of the *Germanes Lerch Schalkwrtz* and *Goldwurtz* and *Schwalbenkraut*: of the *Dutch Gonenwortel* or *groot gouwe*: and we in *English* great Celandine and likewise Swallow-wort, and Tetterwort. The lesser is called by the *Arabians Alhenicen*, by the *Italians Fenugio* and *Pauoncello*: by the *French Eclaires de preire*, or *petite Eslaire*: by the *Germanes Meuskraut* and *Wild Pettwartzen*: of the *Dutch Cleyne Gouwe* or *steene crupt*: and we in *English* small Celandine, Pilewort, and of some Figge-wort.

The Vertues.

The greater Celandine is hot and dry in the third degree, and of a cleansing facultie; It openeth the obstructions of the Liver and Gall, and thereby helpeth the yellow Iaundies, the herbe or the roots being boyled in white wine with a few Annis seedes and drunke. *Matthiolus* saith that if the greene herbe be warme in their shoes that have the yellow Iandies, so as their bare feete may tread thereon, it will helpe them of it: the same also taken in the same manner, helpeth those that are inclining to the dropsie, or have it confirmed in them by often taking it, as also for those that are troubled with the itch, or have old sores in their Legs, or other parts of their bodies: the juice thereof taken fasting, is held to bee of singular good use against the Plague or Pestilence, and so is the distilled water also with a little Sugar, but especially if a little good Treacle bee mixed therewith, and lay upon the taking layd downe to sweate a little: the juice dropped into the eyes doth clense the eyes from rheumes and clouds that darken them: but because it is somewhat sharpe, the hardned juice reteined with a little fine milke will well allay it: it is to good purpose used in old filthy or corroding and creeping Vlcers wheresoever, to stay their malignitie of fretting and running, and to cause them to heale the more speedily: the juice applyed to reuerend ringwormes or other such like spreading Cancers, will quickly kill their sharpenesse and heale them also: the same rubbed often upon warts will take them away: the herbe with the roots stamped, and mixed with oyle of Camomill, and applyed to the Navill, taketh away both the griping paine in the guts of bowells, as all the paines of the mother, and applyed to womens breasts that have their course in too great abundance stayeth them: the juice or the decoction of the herbe gargled betweene the teeth that ake, doth take away the paine, and the powder of the dryed roote, layd upon an aking, hollow, or loose tooth, will soone cause it quickly to fall out: the juice mixed with some powder of brimstone is not onely good to annoint such places that are troubled with the itch, but taketh away all the discolourings of the skinne whatsoever, as the spots or markes of bruises, stripes or wounds, the Morphew also, sunburning or dry the like; and it is said that in a tender body it causeth any itching or inflammation, by bathing the place with a little Vinegar in which it is boyled: the lesser Celandine, because it hath not that acrimony with us, that it seemeth it hath in Germany where *Dioscorides* lived, cannot have those properties, they ascribe unto their *Chelidonium minus*, which is, the pile-wort

in it a little roote, and put up into the nose purgeth the head, and a decoction thereof with a little honey put into and gargled in the mouth, doth the same effectually, and doth purge and clense the braine of flegme or any other euill humors that doe offend: it also helpeth a running itch, and those paines of the fingers and toes that are benumbed, and fractured: thus farre *Dioscorides* and *Galen*, but it is certainely by good experience, that the juice of the leaves and roote doth wonderfully helpe the piles or haemorrhoides, as also kernels by the eares vnder the eares called the Kings Euill, or any other hard wennes or tumors.

Chap. LXXI.

Dentaria, Toothed Violets, or Coralworts.

There be divers sorts of these toothed Violets, differing one from another, either in roote or leafe as both as you shall presently vnderstand.

1. *Dentaria bulbifera*, Bulbe bearing toothed Violets.

This toothed Violet shooteth forth one or two winged leaves vpon long browniſh footestalkes, which in their rising vp out of the ground, are as it were doubled or folded downewards, and diuided themselues into seaven leaves most vsually, and sometimes but five, each whereof is somewhat long, dented about the edges and pointed, of a sad greene colour, and set on both sides of the middle ribbe one against another: the stalke that beareth flowers riseth vp in the same manner with the leaves, and is bare or naked of leaves vpon the middle thereof, where it shooteth forth a leafe, and so one or two more vp higher, each consisting but of five leaves, and sometimes but of three, having also the vppermoſt single, at each whereof commeth forth a small round Bulbe, cloven, or as it were diuided into some parts or cloves, of a sad purplish greene colour, which being ripe and put into the ground, will grow to be a roote, and beare leaves like as the Bulbes of the round rooted Lilie, about which at the very toppe stand foure or five flowers in long Bulbes vpon short footestalkes, opening into foure leaves, of a purplish colour, very like vnto the flowers of Stocke Gilloflowers, or Dames Violets, after which come small long horne or cods pointed at the ends, wherein lye such like seede, as in the cods of Dames Violets, which will as soone as it is ripe, breake the podde and fall out: the roote is very white smooth and slimie, made of divers small round knobbes set together not growing downewards, but long wayes, and creeping vnder the vpper crust of the ground, having very few fibres thereat: the taste both of leafe and roote is somewhat bitter, hot and sharpe like Raddish, as all the reſt of these sorts are.

2. *Dentaria Pentaphyllos*, Cinquefoile Coralliwort.

The bulbed Cinquefoile Coralliwort or toothed Violet, hath likewise one or two leaves rising from the roote, vpon long footestalkes, consisting of five parts or leaves, each of them somewhat like the former, and dented about the edges, but they are longer, rougher and harder in feeling, and more closely set together, rising for the most part from one joynt, like as the Cinquefoiles doe: vpon the stalkes also are some such like leaves, set one above another, at the toppe beare or five such like flowers, but somewhat larger, of a purplish colour, somewhat deeper then the former which turne into such like pods, with the like seedes in them, and hath no bulbes on the stalke: the roote hereof is greater, made as it were into joynts not so white as the former, and with longer fibres shooting from betweene the joynts.

3. *Dentaria pentaphyllos altera*, Another Cinquefoile Coralliwort.

The roote of this Coralliwort is very like the last, consisting of many round cleare white knobbe but more intangled together by peeces, with divers long fibres growing out of it, which shooteth forth a smaller and lower stalke then the former, being not above a foote high, with some leaves set thereon, as also there is some of small size like the last, but narrower more smooth and gentle, of a pale greene colour also: the flowers that stand in the toppe like into the other, are of a purplish colour, after which come the like pods with seede in them, as in all.

4. *Dentaria trifolia*, Trefoile Coralliwort.

This kinde also bringeth forth two or three leaves consisting of three parts onely, each whereof are rounder and broader then the other sorts, dented about the edges, and of a darke greene colour: about the middle of the stalke but beareth flowers, the lower part being bare or naked of leaves, it and three leaves each of them standing by it selfe upon a stalke, consisting of three leaves a peece, nine in all, which are narrower and longer then those below, and longer pointed: the flowers are of a pale greenish colour, hanging downe their heads, after which come such like seede, in somewhat thicker pods: the roote is composed of somewhat long knobbes set together somewhat like vnto the lesser Lungewort, which will turne blackish when it is a little dry.

5. *Dentaria Heptaphyllos*, Setfoile Coralliwort.

The seaven leafed Coralliwort much likewise with two or three leaves from the roote, set vpon long footestalkes one vnto the other, consisting of seven leaves set all along a middle ribbe in the same manner, and somewhat dented about the edges, of a paler greene colour on the vpper side, and more grayish vnderneath; the stalke with such like leaves thereon, but no bulbes, and the flowers at the tops are in forme like the other, but white in some place, and in others purplish: the cods and seedes are like the reſt, but the roote hereof is not so many parted as the former, but more thicke and ruberous.

6. *Dentaria angustifolia bulbifera*, Bulbed narrow leafed Coralliwort.

This kinde hath one reddish round stalke of two, bearing long and narrow leaves dented about the edges, of a green colour and pointed at the ends somewhat like the leaves of *Veronica spicata*, called wilde Fetherfoy set one standing singly by it selfe, and at the joynts therewith, come forth such like scaly bulbes as are in the former, but thicker and of a darke purplish colour, but none among the flowers which grow many together, of the

the lame fashion with the other, that is, of foure leaves a peece, but they are of a whitish colour, after which come long pods with seede like the other: the roote is white and somewhat short, growing slope as the rest doe, set together with joynts, somewhat closer and rounder with some fibres at it.

1. *Alabastrites sive Dentaria maxima.*
The leaft Coralwort.

1. *Alabastrites sive Dentaria maxima.*
The leaft Coralwort.

Although I know that this plant is referred by most unto the kinds of Crowfeet, & so have I done here before, as hereto annexed a verie perfect figure thereof, and considering the small likenesse it hath with any sort of Crowfoot, yet the nearer resemblance of it unto these kindes of plants have presumed to infert it in this place for the roote sake, and likenesse of the roote, although you have a full description thereof among the Crowfeete under the name of *Ranunculus nemorosus Matthioli* also.

The place.

The red and the last have been found in our land; the first in Kent in Swisse, in a wood called Highweede, and in another wood there also called Foxholes, both of them belonging to one Mr. *Stephen Perkhurst* at the writing hereof; the red in the shadowie woods of *Germanie*, *Switzerland* and *Savoy*, *Naples*, *Italy*, and divers other places.

The Time.

They flower about the end of *Aprill*, and beginning or middle of *May*, and are withered and gone before *July* be the most part, the rootes abiding safe under ground.

The Names.

Neither *Dioscorides* nor *Pliny*, nor any other of the ancient writers, as divers have supposed have made any mention of this plants, but being found out by later searchers are called diversly; some from the forme and colour of the leaves, calling them *Dentaria*, *Pentaphyllis*, *Coralloides*, and *Alabastrites* as *Lobel*, and *Dentaria Coralloides radice* as a difference from other *Dentarias*; and some also thereupon make it to be an *Aconitum*, as *Dalechampius* doth in *Lugdunensis*; some both from the roote and the flowers, that are like unto Stocke Gillyflowers, which were anciently comprehended under the name of *Viola*, called it *Viola Dentaria*, as *Dodonæus*, some from the effects and properties as *Cordus lib. 2. plantarum historia cap. 111.* and *Gesner in hortis*, *Samuele also* and *Lonicero montano*, and saith that about *Savoy* they call it *Pulmonaria*, but *Columna* taketh it to bee *Cressa Plinij*, and thereth plainely that this *Dentaria* hath all the properties that *Pliny* ascribeth unto his *Cressa*; for whereas *Pliny* saith, it hath but one leafe, so saith *Columna* this hath but one sometimes, for hee maketh that leafe to bee but one that standeth upon one stalke, howsoever divided into 3. 5. 7. or more parts, as it is to bee seene in the Ashtree, Quicken tree, Service and Wallnut, &c. the whole leafe springing forth together and falling away all together, and not one peece after another, as in others that are single, which is a true note how to know two good leafe from others, as I shewed you formerly in another place. The first and last are called *Dentaria bifolia*, or *bacciferæ*, because they onely and none of the rest doe beare any bulbes like berries upon their stalkes. They are all generally called *Dentaria*, and most of them from the number of their leaves, called either *trifolia*, *quinquefolia*, or *heptaphyllos*; but the *trifolia* is also called by *Lobel Enneaphyllos*, onely the two last differ in some things from all the rest; the first being called by *Bauhinus*, that set forth the great booke of *Hortus Eystettensis*, *Dentaria angustifolia baccifera*, and *Bauhinus* thereupon *Dentaria baccifera folijs Pimpinellæ*, *Cordus* in his second booke 111. Chap. of his History of Plants, setteth forth the figure thereof in my minde, but without any mention at the leaves, under the name of *Coralloides alia species*, *Gesner* in his *scholia*, at the end of that Chapter saith that the *Dentaria baccifera* was called by some *Consolida Saracenica*, and judgeth it himselfe a kind of *Aconite*; and the last as I have declared in the first division of the Crowfeete.

The Vertues.

The roote of Coralwort is drying, binding and strengthning, yet it helpeth to provoke Vrine, and to expell gravell and the stone, as some doe affirme: it is exceeding good to ease the griping paines of the sides and bowells, and for inward wounds that are made in the breast, lungs and bowells, a dram of the powder of the roote taken for many dayes together, in red wine, the same also given to them that are burstен, or have a rupture is very beneficiall to be drunke in the distilled waies of the herbe, called Horsetaile: it stayeth also Lasks and Fluxes that flow too much of hot and chollericke humours: the decoction of the herbe is good to bee applyed both to greene wounds quickly to consolidate them, and for old filthy sores, to dry up their moysture and thereby to cause them take the sooner.

Chap.

CHAP. LXXII.

Leucoium, Stocke Gilloflowers.

HAve in my former booke shewed you many sorts of Stocke Gilloflowers, there we don remaine divers others which are of lesse beauty and durabilitie to be entreated of here, as I there promised. And because the word *Leucium* in Latine, is referred as well to these Stocke Gilloflowers, as the Wallflowers with this distinction of *Luteum* onely. I will also distinguish and separate them, entreating in the next Chapter of those that beare yellow flowers and greene leaves, which is no distinction betweene a Wallflower and a Gilloflower, yet I will here give you the figure of the single guilty Stocke Gilloflowers.

1. *Leucium marinum maximum.* The greatest Sea Stocke Gilloflower.

This Sea Stocke Gilloflower hath divers long thicke whitish soft leaves, lying upon the ground one upon another in a round compasse, and are stiffer then the other Sea kinds, or the garden kind, formerly set forth, jagged also or cut in on both sides evenly, into deepe dents like the knagges of a Bucks horne, white also it seeme the more beautifull: thus it doth abide for the first yeares growing, but the next yeare it beareth very white stalkes, three foote high or thereabouts, branching forth into many parts, somewhat thicke but weake, scarce able to stand upright, whereon grow narrower leaves little or nothing jagged about the edges, and number of flowers at the toppes one above another, for a great length each of them consisting of foure white pointed leaves a peece, but not altogether so sweete as the other Stocke Gilloflowers, yet somewhat large, and of a pale blewish purple colour, almost like unto a Dove or Crane colour, after which come such like long pods as the rest have, with seedes lying in a double row in the same manner, larger and of a darker colour: the roote is white hard and long, spreading into many branches, which abideth not after it hath yeelded seede, but perisheth as the other Sea kindes doe.

2. *Leucium marinum latifolium.* Broad leafed Sea Stocke Gilloflower.

This Sea Stocke Gilloflower hath many hoary leaves lying about the roote, shorter and broader then the other Sea kindes, harder also in feeling, and as it were rugged, more hairy and finely dented about the edges: from among which rise up divers round hairy stalkes about a foote high, bearing purplish blew flowers like the other, and small long pods with brownish flat seede in them.

3. *Leucium marinum magnum.* Great Sea Stocke Gilloflower.

This Greater Sea Stocke Gilloflower hath divers long thicke hoary leaves lying on the ground for the first yeare; some of them being cut in on the one edge and some on both, with but one gash and those not at all: the stalke riseth up the next yeare about a foote high, or more spread into divers branches, yet all of them weake, and rather bending downewards then standing upright, whereon grow leaves little or nothing jagged or cut in, and divers flowers on the toppes of them, of a pale purple colour, drawing neare to the colour of red wine lees, such

Leucium album vel purpureum.
Ordinary Stocke Gilloflowers white red or purple.

1. *Leucium marinum maximum.*

4. *Leucoium marinum album.* The white Sea Stocke Gilloflower.

both this and the next finell fweeter after the Sunne is downe, then in the day time: the cods that follow are long and fomewhat flat, with reddifh flat feede in them. the roote is divided into many parts.

2. *Leucoium marinum minus.* The leffer Sea Stock Gilloflower.

The leffer kinde hath roote upright ftalkes divided from the bottome into many branches, whereon grow fome woolly leaves, fmaller narrower, and leffer jagged than the former: the flowers that ftand at the toppe of the branches are fmaller than the other, but made of foure leaves like the reft, of a freth red or crimfon colour, which upon their fading feeme to be of a deeper colour, and of a weaker fent than the other, in their places come long pods wherein are contained the like red feede: the roote is woodily like the other, and perifheth after feede time.

3. *Leucoium marinum minimum.* The fmalleft Sea Stockegilloflower.

The fmall Sea ftock Gilloflower hath a browniſh fquare ſtalke, not above two inches high, fet with five or fix fmall and fomewhat long round pointed hoary and hayrie leaves, on both fides the ſtalke, bearing at the toppe one or two yellow flowers, whofe footeſtalkes are hayrie alſo: the roote is ſmall and threddy, with five or fixe very ſmall and fomewhat round pale greene leaves, lying about it, for the firſt yeare after it is fowne, and ſhortly after dies.

4. *Leucoium marinum Creticum maius.* The greater *Candy* Stocke Gilloflower.

The greater *Candy* Stocke Gilloflower hath a round weake ſtalke, branched into many parts, whereon are ſet diverſly long and narrow leaves fomewhat thicke and hoary, without any dents or diviſions on the edges, or with very few, and thoſe not deepe: the toppes many flowers chiftering together, as it were in tufts, conſiſting of foure leaves a piece, whoſe ends are cut in fomewhat deeper than others are, making the end ſeeme like unto a heart, as it is in many other flowers: they are of a reddiſh purple upon the firſt opening, but of a blewiſh purple when they are full blowen, the bottomes of them being yellow, pearled up like a ſtarre: the cods that follow are about two inches long, and in each of them within them, fomewhat long and browne ſeede.

5. *Leucoium Creticum minus.* The leſſer *Candy* Stocke Gilloflower.

The leſſer kinde is like the former *Candy* ſort in the growing and leaves, but that it is leſſer in both, the ſtalkes are not above halfe ſo great, being fully white at their firſt blowing, and gathering after wards a little purple upon the edges, yet ſo as the whiteneſſe appeareth ſtill.

6. *Leucoium Creticum longifolium.* Long leafed *Candy* Stocke Gilloflower.

This kinde hath longer leaves than either of the two laſt, plainely dented about the edges, from the middle of the ſtalke, not halfe a foote high, ſending forth diverſe branches ſtored with ſmall flowers of a deeper ſide with purple colour, than the firſt *Candy* kinde.

7. *Leucoium marinum Caeruleum.* The blue *Candy* Stocke Gilloflower.

This kinde hath many ſmall greene hayrie and ſtraked ſtalkes, not much above an hand breadth high, bearing for the moſt part two or three whitiſh ſoft greene leaves, ſet togethers at a place, and fome alſo ſingly, each of them being fomewhat like the other Stocke Gilloflower, but round and broad at the ends,

ends, with long foote stalkes under them: the toppes of the stalkes are parted into small branches, each whereof sustaine sundry small flowers, somewhat long, made of foure leaves a peece, of a faire blue colour, after which come small blackish seede in long cods like the other: the roote is small and slender perishing yearely after some time, yet abideth a winter from the seede; but sowen in the spring groweth quickly to flowring and continueth in flower most part of the Summer. You have a branch hereof expressed in the table with *Leucoium Creticum auriculato semine* in the next Chapter.

10. *Leucoium saxatile Thlaspifolio.* Small Rocke Stocke Gilloflower.

The Rocke Stocke Gilloflower for the beauty of the flowers is not unfitly placed here among this Tribe, which else for other respects might more truly in my judgement be put in that *Classe* of the *Thlaspies*, as the description sheweth) is a small low plant, having hairy small leaves like unto those of time; yet very thicke on both sides of the weake stalkes, which doe lye in such a round compasse that it seemeth like a small round bushe of an ashy or stinking sent, but sharpe biting taste, comming nearer to the degree of a *Thlaspi* then *Leucoium*, as *Columna* himselfe, who setteth it forth: it beareth small flowers plentifully on the toppes of the stalkes and branches of a blewish purple colour, the middle part being of a whitish yellow with divers small threds standing in the midst of them.

The Place.

The first was brought out of the Isle of *Ree* by *Rochel* by Mr. *John Tradescant* when the Duke of *Buckingham* was sent with supplies for Mounsieur *Subise*: the second growes by the Sea side, as the third and fourth doe all the Sea coasts in *Narbone*, not farre from *Montpelier*, and on the coast of *Portugall* and *Spaine* beyond the *Streights*: the fift neare the Sea at *Terracina*: the three first *Candy* kinds *Clusius* saith hee received from *Casabon*, having brought them out of *Candy*: the ninth *Bauhinus* saith was brought out of *Signor Contarens* of *Venice* his Garden, but *Alpinus* saith from *Candy*, the tenth *Columna* found on the hills *Vulturnes* in *Naples*.

The Time.

They doe all flower in the Summer moneths of *June* and *July* for a great while, and the seede ripeneth not untill *August*.

The Names.

The Greeke word *Viola* is given to all these wilde plants as well as to the other of the Garden, entreated of in my former booke, whether they be those we call Stocke Gilloflowers or Wallflowers: for so *Dioscorides* and *Pliny* and the rest that follow him, have distinguished the *Leucoium* (as the Latines also call them) into three colours, white, purple and yellow, for of a blew one as some copies of *Dioscorides* have it there is some doubt among many writers, as that *Pliny*, *Cordus*, *Fuchsius* and *Serapio*, all following the Text of *Dioscorides*, and as *Matthiolus* saith the Text of *Dioscorides*: also in the *Septuagint Longobardus Characters* hath no mention at all of a blew one, but this word *Viola* or *Leucoium* that is, *Viola alba*, here is not applied unto *Viola Martia Alexandrina* (which signifieth *Viola nigra*, and are our March Violets, white or purple as the composure of the Greeke words import) into *Viola* properly is *Viola*, but is imposed upon these plants, as the proper names to them; for so *Dioscorides* devideth them into severall places and chapters from the whitenesse of the leaves rather then of the flower as I think, and yet the name *Leucoium* is so variously transferred to other plants in *Dioscorides* text, that the flowers of some herbes, much differing one from another, are referred by *Dioscorides* to the flowers of *Leucoium*; and so *Plinie* saith, that the name of Violets in his time were given to very many flowers, that were put into garlands for the beauties sake and sweete savour of the flower, custome prevailing above reason, yea many other nations in like manner, have followed them and called them Violets, as *Viola Damascena* or *Adrianopolitana*, which are the Damas Violets or Winter Gilloflowers, & those in *Italy*, *Viola marina*. The first hath the name in the title well for it in my judgement. The second *Lobel* calleth *Leucoium marinum alterum Isatidis folium*, *Camerarius Leucoium marinum aliud*, and saith *Anguillara* tooke it for *Tripolium*, and *Bauhinus Leucoium marinum Isatidis folium*, and doubteth whether it be not the *Leucoium maritimum minus* of *Lugdunensis*, which as he saith some take to be *Hesperis*. The third and fourth are *Clusius* his *Leucoium marinum magno* and *minus*, and so doe *Lobel* and *Camerarius* call them, *Bauhinus* calleth them *marinum latifolium* and *angustifolium*: the fift *Bauhinus* onely mentioned by the same name in the title: the first, seventh and eighth *Clusius* calleth, *Leucoium marinum Creticum grandius & tenuius*: the ninth *Bauhinus* thinketh to be that *Leucoium Creticum pulcherrimum, forte Leucoium Creticum Dioscoridis*, that *Prosper* mentioneth in his description of Mount *Baldus*, and calleth it plainely *Leucoium Creticum maximum petiolo subrotundo*, and after a sort describeth it: to his *Prodromus*, and peradventure may be the first sort there described likewise, for I finde little difference the one from the other: but *Alpinus* [illegible] describeth it more perfectly and exactly, and calleth it *Leucoium caeruleum marinum*. The last *Columna* set forth by the name of *Lutescens Leucoium maximum supinum*, and *Bauhinus Leucoium saxatile Hyoscyami folio caerulea purpurea*, but might as I hold be rather accounted a *Thlaspi*.

The Vertues.

These wilde or wea Stocke Gilloflowers are of the same qualitie with those of the garden saving that they are not of so sweete a scent, and are almost esteemed as effectuall as the ordinary yellow *Leucoium* or Wallflowers for so is *Galens* judgement of them all, saying they are of a cleansing qualitie and of thinne parts the Garden and Gilloflowers (for under them I comprehend the vertues of these also as I said) especially the dryed flowers rather then the fresh and greene boyled in wine and drunke doth rectifie the indisposition of the liver and gall, provoketh womens courses, as also helpeth the hardnesse and paines of the mother, and expelleth the secundine or afterbirth, and the dead child also, yea and the living also saith *Galen*, if they shall drink of it when it is applied made for them to sit in: doth the same, & the seed or the juice drunk worketh in the same manner also. If it [illegible] be drunke twise a day, it will helpe to strengthen and restore any member growne weake, loose, or out of joint: the decoction of the roots in vinegar, is held good for the hardnesse of the spleene, to be used outwardly as well as inwardly. The distilled water of the flowers is available, to all the purposes aforesaid, and to cleanse the blood, to comfort the inward parts, to ease paines and to procure a merry disposition: the [illegible] fed with salt is used as a remedy for the Ague, tobe tyed to the wrists: The juyce dropped into the eyes cleanse them from the mists and clouds, that seeme to hinder the sight, and such films or skinnes, that seeme to grow over the sight to take it quite away: it is good also to gargle the mouth, with the decoction of the [illegible]

honey put to it, and a little allome, and is found good for ulcers and sores therein, as also all other foul and filthy ulcers: boyled also in Vinegar and applyed warme upon the place pained by the Gowte, giveth great ease, as also to the joynts and sinewes that have weakenesse and paines, or are troubled with hard tumours, swellings, or inflammations.

Chap. LXXIII.

Keiri sive Leucoium luteum. Wallflowers.

HAve in my former booke, shewed you all or most of those Wall-flowers that carrying beautifull flowers are received as the delights and ornaments of a garden of Pleasure, I there also declared that there were some other, of no such beauty, or scent fit for that place, and therefore to be referred to this, as shall be now shewed you.

1. *Keiri sive Leucoium montanum luteum.* The Mountaine Wall-flower.

The Mountaine Wallflower riseth up with divers upright, strong, and woodily stalkes, as high as any man sometimes, or else with many short greene pointed leaves, dented about the edges: the flowers are single, but somewhat of the ordinary sort, and of a faire yellow colour, consisting of foure leaves, smelling very sweete like them, the long pods that containe reddish seede, are somewhat slenderer than the other: the roote is woodily dispersed under the ground into branches, and endureth long especially in the warmer Countries, where the cold doth not too extreame, as they are with us.

2. *Keiri sive Leucoium sylvestre Clusii.* Wild Wallflowers of *Clusius*.

This wild Wallflower, hath sometimes many, and sometimes but one head of long narrow greene leaves, lying on the ground about the roote, somewhat like unto the ordinary Wallflower, but a little waved or sparingly dented as at the edges, which so abide the first yeare for the most part, yet some the yeare of their first bringing up send forth a stalke or two, of about a yard high, with many such like leaves set thereon, as grew below but smaller and with few or no dents on the edges at all: the flowers are many that stand clustring together, as it were in an umbell, (and not in a long spike, as the ordinary Wallflower doth) at the toppes: consisting of foure leaves peece, not altogether so large as the Wall-flower, nor of such a yellow colour at little or none at all: after which come long slender pods, with flattish seede in them like the other: the roote is long and single, with divers fibres thereat, and perisheth after seede time.

3. *Leucoium luteum Erucæ folio.* Wallflowers with jagged leaves.

This kind of Wallflower, hath his lower leaves much more and deeplier jagged on the edges, (almost like

Keiri sive Leucoium vulgare luteum vel album.
The ordinary yellow Wallflower or the white.

3 Keiri sive Leucoium sylvestre Clusii.
Wilde Wallflowers of *Clusius*.

High those

those of Rocket, or of the wilde Poppie) than those upon the stalke, yet all of them very long greene and hayrie and somewhat hayrie: the stalke which is round and somewhat hayrie, about two foote high, and sometimes branched, beareth many yellow flowers, like the common Wallflower, but set more closely together, growing in an umbell, and of the smell of new Waxe: but afterwards doe more separate asunder, when it beareth long pods like unto the other; the whole plant hath a sharpe quicke taste.

4. *Leucoium Creticum luteum articulatæ feminæ*, Candy Wallflowers with roundish pods.

From a small Woodddy roote divided into sundry branches, rise up divers wooddy stalkes, about a foote high branching forth and set at severall places, with many small whitish greene leaves set together, lesser than those of the ordinary sort, harder in handling and set with sharpe haires: the flowers are yellow at the toppes of the branches, made of foure round pointed leaves a peece usually, but sometimes with foure or five, they which come yellowish with roundish pods, conteining many whitish seedes, like unto the ordinary but broader and greater, this abideth with some leaves greene above ground in the winter, not perishing as many others doe.

4. *Leucoium Creticum luteum articulatæ feminæ & Matthiolum Creticum simile.*
Yellow Stocke Gilloflowers with round heads and in the leafe Candy kinde with blue flowers.

The Place.

The first *Fons* hath set forth, in the description of Mount *Baldus*, in his *Italian* Edition, but not in the Latine, found growing there: the second groweth in *Germany*, in many places, as *Gesner*, *Tragus*, *Camerarius*, and *Clusius* make mention: and in *Spaine* also, for from thence hath the seedes thereof beene brought to me: the third *Columna* saith groweth in the vallies of the *Campestere* hills in *Naples*: the fourth in *Candy*.

The Time.

They flower almost all the Summer long, and in the meane time ripen their seede.

The Names.

I have shewed you in the Chapter next before this, the Greeke and Latine names to be *Leucoium*, and the derivation and transposition thereof, to many other herbes; whereunto I referre you, onely these yellow kinds, as well as the other set forth in my former booke, are called *Leucoium luteum*, or *aureum*, as a distinction to leverthem: the *Arabians* doe properly call this yellow kind *Keiri*, or *Cheiri*, although divers doe transferre the name, to all the other sorts of *Leucoium*, but because this is more excellent and vertuous than any of the Stocke Gilloflowers, even by *Galens* his judgement. I doe name *Keiri*, more proper to this Kinde than that some also call it *Viola lutea*, as *Tragus*, *Fuchsius*, *Dioscorides*, and *Calchipinus*, but *Tabernæmontanus Viola petræa lutea*: The first here set downe is called by *Fons* aforesaid, *Leucoium luteum montanum serratis folijs*: the second is called *Leucoium sylvestre* by most writers thereof, by *Tragus Viola lutea sylvestris*: it is very probable that it is the same also, that *Bellonius* so barely *Englisheth*, calleth *Leucoium sylvestre inodorum flore flavo pallidore*, as also the *Leucoium sylvestre* of *Clusius*, although *Lobelius* would set them two severall plants, calling the one *Leucoium luteum sylvestre Viburnis folio*, and the other *Leucoium sylvestre angustifolium*: the third *Columna* calleth *Leucoium terrestre majus*, and *Lobelius Leucoium luteum folio*: the fourth is onely found extant in *Alpinus de plantis exoticis* by the same name as in this title: the rest call it *Viola Matiola*: the *Spaniards Violas amarillas*: the *French Violas Iaunes & Violiers Iaunes*: the *Dutch Geele Violen*, and Winter *Violen*: the *Dutch Steen Violieren*: we in *English* Wall flowers, Wall Gilloflowers, Winter Gilloflowers, and some Bell flowers, and yellow Stocke Gilloflowers.

The Vertues.

All writers doe attribute the most especiall vertues, of all the sorts of *Leucoium*, to the *Leucoium* that is our common Wallflower: and some of these wilde kindes here expressed, doe come in neere thereto, though wanting that sweete scent that they may be used in their stead, for even these are somewhat hot, and conducible (but especially the ordinary or sweete kindes) unto all the purposes that are specified in the former Chapter; for *Galen* saith in his seventh booke of simple medecines, that the yellow *Leucoium* [illegible]

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

worke more powerfully then any of the other kindes, and therefore of more use in Phisicke: it cleanseth the head and breast the heart and reines from obstructions, provoketh womens courses, expelleth the secondine or dead child, helpeth the hardnesse and paines of the mother, and of the spleene also: slayeth inflammations and swellings, comforteth and strengthneth any weake part, or ouer ioynt; helpeth to cleanse the eyes from mistinesse and filmes growing on them, and to cleanse foule and filthy vlcers, in the mouth or any other part: and is a singuler remedy for the Goute, and all aches and paines in the ioynts and sinewes.

Chap. LXXIIII.

Hesperis sive Viola Matronalis. Dames Violets.

I Have in my former booke set forth two sorte of Dames Violets, both of them with single flowers, but the presse had scarse pasted that Chapter, where I mentioned them, but I did understand of two others, with double flowers, the one that was sent me from *Paris*, and yet was in *England* long before, as I understood afterwards, although I heard not of it; and another likewise nursed up with the other, in the West parts of our Land, which I meane to declare unto you here, (and may be transferred to the other single ones, when that booke shall be reprinted) together with some other sorts here of.

1. *Hesperis sive Viola Matronalis flore albo pleno.* Double white Dames Violets.

The double white Dames Violets groweth not so great in any part thereof, nor so high as the single doth, except in the flowers, which being very thicke of leaves, of a pure white colour, and many standing in a cluster, greater also than the ordinary, and longer abiding, causeth it to be had in some esteeme; it hath somewhat lesser leaves and whether greene colour, little or nothing snipped about the edges, and more tender; but the branches grow more plentifull, and more easie to be slipped and transplanted, than the single kinde, but giveth no seede, as many other plants doe, that carry double flowers, and is more tender to be kept in the Winter.

2. *Hesperis flore pleno purpurante.* Double purple Dames Violets.

This other double Dames Violets differeth not much in any thing from the former, but in the colour of the flowers which in this is of a fine pale purplish colour, and not fully so double as the others, nor so many thrusting together.

Hesperis Neapolitana.
The Neapolitan Gentleman.

Hesperis Syriaca Tricornis, &
2. Sylvestris tenuifolia flore albo simplici.
Dames Violets of Syria, and the small white flowred Dames Violets.

3. *Hesperis Pannonica laudata.* Vnlavory Dames Violets of *Hungary*.

This *Hesperis* is so like unto the ordinary sort, in all other things having the sent, that there can be no difference found betweene them: this onely hath no sent at all, neither morning, nor evening, neither day, nor night to commend it, which maketh it to be a differing sort from the rest: and some have made another differing sort hereof, (which is likely to be but a degeneration of the same) that beareth greenish flowers.

4. *Hesperis sylvestris folio sinuato.* Wilde Dames Violets with waved leaves.

This Dames Violet sendeth forth an hairy, rough, crested, pale greene stalke of about a foote high, parted at the top into divers branches, with leaves set thereon from the bottome, which are thicke, rough, and hairy, narrower and longer then the other, and waved about the edges, the lowest having footestalkes, and those above none, but stand close to the stalke: the flowers are as large, and consist of foure leaves in the same manner that the rest doe, and smelleth pretty sweete also, but of a deeper red colour then they: the cods with seede in them are like the other and perish after seede time moit usually, yet sometimes abiding a third yeare of it selfe, but not certainely if it be hindered from bearing too many branches and flowers, by cutting them downe before they goe to flower.

5. *Hesperis sylvestris angustifolia flore parvo.* Small purple flowred Dames Violets.

The leaves of this small *Hesperis* are narrower and longer pointed then in the common sort, lesse rough also and deepelier cut in or dented on the edges: it hath a stalke about halfe a yard high, branched toward the top with very small flowers thereon, of a purplish colour, so that one of these flowers, are not much bigger then one of the leaves of the flower of the ordinary; the pods that follow are long but much smaller.

6. *Hesperis sylvestris latifolio flore albo parvo.* Small white flowred Dames Violets.

The leaves of this kinde are large and broad, small at the bottome of the stalke where it is a little parted as forme, but crumpled and dented all about the edges, a little rough hairy and woolly, but in Summer most about the stalke, riseth up the next yeare after the sulk springing about a yard high, branching forth at the top into many long spikes, full of very small white flowers no bigger then the last, consisting of foure leaves a peece, which afterwards yeeld very many and very long slender flat pods like the Stocke Gilloflowers hanging downe; but smaller, with very darke browne flat seedes therein on both sides like the *Leucoium*: so that it participateth with the *Hesperis* in the greene leaves, and with the *Leucoium* in the flat pods and seede: the roote is not very long nor white and woodly perishing yearely after it hath borne seede: the flowers have little or no sent in them; but the leaves have a little hot and drying taste. I have given you onely a leafe hereof, and a few flowers at the foot of the *Hesperis Syriaca*.

Because both the *Leucoium Syriacum* and *Melancholicum*, that I have set forth already in my other booke, as I there call them, partake more with this *Hesperis* then with *Leucoium*, in that their leaves are greene, and not white like them; and in that the seede in the pods of the *Melancholicum* are not flat but long and round like *Hesperis*. I have given you here the figure thereof, and with the *Syriacum* a leafe and some flowers of the last. I might have multiplyed the sorts of *Hesperis* unto you as *Bauhinus* doth if I would follow him, who maketh the *Leucoium alterum saxatile obsoletè flore* of *Columna* to be of a different sort from the *Melancholicum*, which undoubtedly is the same, and the *Hesperis Syriaca* or *Leucoium Syriacum*, of *Camerarius*, and *Clusius* to be the *Leucoium Melancholicum* also, which certainely also are differing plants, and even *Bauhinus* himselfe would seeme to have acknowledged, if ever he had seene both the plants.

The Place.

The first was as I said before sent me both out of *France*, which perishing I had both it againe and the second also by the liberalitie of Mr. Iohn *Goodyer* a Physitian in *Exeter*, son to the elder *Goodyer* an Apothecary there, who both affirmed unto me for certaine that the white one was in many mens Gardens in the West parts, and the purple also although not so plentifull, before my booke came forth, but from whence the originall of them came is not known: the third as *Clusius* saith groweth in the skirts of the vineyards at the foote of the hills that are neare *Vienna* in *Austria*: the fourth groweth as *Bauhinus* from *Bursserus* reciteth it, among the stone places in *Provence* that are inoystned with springs: the fift also neare *Montpelier*, in the watery grassie places on *herbæ Dei*: the last grew in my garden from seede received from some friend but I have forgotten who.

The Time.

They all doe flower in the Summer Moneths of *June* and *July* chiefly, and the first abideth longest, if it stand not too much in the Sunne.

The Names.

There is some doubt among many learned, whether this *Viola Matronalis*, as it is usually called in Latine should be the *Hesperis* of *Theophrastus*, in his first Booke *de causis plantarum* and 25. Chap. because he is so short therein, that there can be no more learned out of him, then that it smelleth sweeter in the morning and evening then in the day time, even as some of these and the ordinary sort doth, whom *Pliny* followeth in his 21. Booke and 7. Chapter, and thereof tooke the name *Hesperis*: It is also called of *Tragus Viola alba*, and *Turner Violet* and taken to be *Leucoium* of *Fuchsius*, *Bauhine*, *Dodonæus* and *Lugdunensis* call it *Viola Matronalis*, and *Gesner Damascena*. Some also call it *Viola hyberna*, *sive hyemalis*, and some *Viola Mostibarella*: the first and second called *Hesperis flore pleno albo*, and *flore pleno purpurante*: the third here is the third *Hesperis* of *Clusius* and other two are mentioned by *Bauhinus*, the former by the name of *Hesperis sylvestris hirsuta folio Hortensis* & others *Hesperis sylvestris flore parvo*, to the last I have given the title as is fittest: the *French* call them *Violettes Dames*, and *Violette de Damas*, *Giroflee de Damas*, and *Giroflee de Dame*, the *German* winter *Violen*, as they do the Wallflowers also in the last Chapter, the *Dutch Pomas Bleemen*; we in *English* Dames Violets, and Single Violets, Queenes Gilloflowers, Winter Gilloflowers, also of some, Rogues Gilloflowers, but why I know not in the West parts of this Iland, from whence I had the double kinds as I am informed, they call it also Scincy, and the single close Scincy, but *Gerard* saith close Sciences.

The Vertues.

Hesperis, all the sorts of them are hot and sharpe in taste, like unto Rocket, and therefore *Dodonæus* saith they may be *Species* thereof, being so like in taste, to be also in propertie the saith that the distilled water is very effectuall to procure sweating. *Clusius* further addeth, that it provoketh Vrine also, and helpeth the

have a tough stem and short winded: it is also of a cutting quality for tough flegme, of a digesting property for raw and undigested humours, and of a cleansing nature for foule and filthy Cankers, Vlcers and sores, either inwardly in the mouth, or outwardly in any part of the body.

Chap. LXXV.

Lychnis, Campions.

HAve given you a dosen sorts of Campions in my former booke which are all delightsome and pleasant plants fit for that worke, being A Garden of Pleasure: there are many other sorts to bee incerted of which shall be here exhibited, even to the least sort which is like Mosse upon the ground, that so you may understand all the varieties that nature hath shewed us, and because two sorts with double flowers are come to our knowledge since the publication of my booke, which else should have beene therein inserted, and may bee at the next Edition. I will begin with them first in this Chapter, and adde unto them a smaller sort of single not there expressed, and of the rest in the other following, yet give you the figure of the single kinde and declare the properties.

1. *Lychnis Coronaria flore albo pleno.* Double white Rose Campions.

The double white Rose Campion hath not altogether so woolly white leaves, as the other Rose Campions have, but are a little greener and smaller, the flowers grow upon the branches of the stalke in the same manner but the seed finally so high as the double Red, set in whitish cornered huskes, and consisting of two or three rowes of leaves in the same manner; this is a little more tender to keepe then the double Red, and desireth more shadow and moysture.

2. *Lychnis Chalcedonica flore albo pleno,* Double white Nonesuch.

The double Nonesuch is so like unto the other double Red, for the forme of the leaves and manner of growing, that there is hardly any difference discerned before it come to flower, yet the leaves seeme to bee a little of a greener colour, the stalke riseth not so high, and the flower or tuffe is not so large as the double red and is of a pale whitish colour.

3. *Lychnis Chalcedonica minor simplex.* The lesser single Nonesuch or flower of Constantinople.

The lesser riseth not so high as the other sort by the halfe, neither is the stalke so great having but a few leaves set thereon by couples like the other: the flowers that stand at the toppe likewise are fewer but of the same colour, the roote is small and fibrous and perisheth every yeare.

The Place.

These are onely nourished up in Gardens with us, and their naturall places are not knowne.

The Time.

They both flower at the time of their other kinds.

The Names.

It is called in Greeke λυχνὶς (*Lychnis*, from λύχνος, *Lucerna*) and λυχνὶς *Elychnium quasi lucerna funicus*

Lychnis Coronaria vulgaris.
Ordinary Rose Campion.

Lychnis Chalcedonica vulgaris.
The ordinary Nonesuch or flower of Constantinople.

Original from UNIVERSITY OF MICHIGAN

lem and therefore tooke the name: for in the former times they tied the leaves of the Campions, as of many other plants, in their lampes instead of the week or nature. The single kind is called also by divers other names, as *Silene*, or *Ballerina*, *Lenticularis*, and *Corymbo* of *Columella*, in his tenth booke, as *Ruellius* thinketh, where *Columella* hath this Verse:

Nunc vernat glaucum cicerisque humica Corymbe. Vnlesse he understand Crambe thereby.

The Greeks also called it ὀθονίον, *i. linum vile, sive dirius versicolor*, and some *Tauria* or *Taura*, which is a venemous plant as I have shewed before; in Latine most usually they call it *Lychnis* or *Coronaria* and *Sylvestris*; *Lyræus* calleth it *Verbascum montanum*. Some have taken this to be the *Lychnis* of *Theophrastus* in his 6. booke and seventh Chap. but that cannot be, for he reckoneth both *Lychnis* and *Dioscorides* among the Summer flowers: some also to be his *Rose Flammea*, but hee mentioneth that also in the same place, and cannot be both one herbe. *Pliny* in his 21. booke and fourth Chap. saith they called an herbe *Agrostis*, which the Greekes called *Lychnis*, and in the 11. Chap. of the same 21. booke he nameth *Lychnis Thessalica* doth among the Summer flowers: the Garden kind therefore as fitteth for the vses aforesaid is held by the most iudicious in these times to be the true *Lychnis* of *Theophrastus* and *Dioscorides*: the *Italians* call the Garden kind *Lychnide*, *Lychnide ortolane*, and the wilde *Lychnide sylvestre*: the *French*, *Oeillet Dieu* for the Garden kind, and *Campion sauvage* for the wilde: the *Germans* call the manured sort *Frawenrosslin*, *Marienroslein*, and *Himmelroslein*, that is to say, *Dominarum Rosa*, *Mariana Rosa*, *Cœli Rosa*, and *Cœli flos*: they call the wilde kind *Margenblumlein* and *Wild Margenroslein*: the *Dutch* call the Garden kinde *Christus oogien*, and the wild *Lamerickies*, and wee in *English* Rose Campions (both of the Garden and the other wilde Campions, as you shall heare in the next Chapter. The other Campion (as we call it) the single as double kindes) is called *Lychnis Byzantina*, *Chalcedonica*, *Constantinopolitana* of some, *flos Graecus* of others, and *flos Hierosolymitanus* of *Gesner*, who also calleth it *Orientalis purpureus*, and *flos Constantinopolitanus* of *Lobel*, *Lugdunensis*, and others: wee in *English* usually call it Dionesiack, Flower of *Bristow*, and Flower of *Constantinople*. It is thought by some to be *Struthium* or *Lunaria*, which the Germans call *Cenkist* because it will make water to lather like sope, and cleanse such cloathes as are washed in it: notwithstanding that quality (which is also given to *Saponaria*, and thereby also thought to bee *Struthium*) it agreeth not with the descriptions of *Theophrastus* and *Pliny* (for *Dioscorides* describeth it not) which describe it a thorny plant bearing leaves like unto an Olive, and hath a great roote, none of all which this plant hath, and therefore cannot be it. Some likewise thinke it to bee *Pathos* of *Theophrastus* in the same 6. booke and 11. Chapter, which he describeth agreeing with him saith is of two sorts, the one *Hyacinthe similis*, the other *Lutea id est, hordeo non coloratius, nisi lute colore*, and may very well agree with the severall colours of the flowers heere. The second or lesser sort is very like to be the *Flos sacerdotis* of *Englishmen*, and the *Coronaria* of some, or *Flos ab Hierosolymis missus* of *Gesner in hortis*, and not the *Blattaria Lobelij* or *Lychnis sylvestris* of some, as *Bauhinus* maketh the doubt, for *Gesner* there saith, that the lesser sort endureth long and hath fewer flowers.

The Vertues.

The Rose Campions are of little use in Physicke now adayes with us, being chiefly tied as flowers, to adorne the Garden or the house. *Galen* saith that the seede thereof is hot in the second or third degree, and dry in the same, and *Dioscorides* saith that the seede of the Rose Campion drunke in wine doth helpe those that are stung by a Scorpion: which if it be true and so found now a dayes; I see no reason but the same might bee available for the pest, it being as free a poyson, apt to kill in a short space: and besides that wee have many things as effectuall against the Plague, as which will expell also the poyson of the Scorpion, or other venemous beasts: the leaves applyed to any sore or fowle Vlcer in the Legs or other parts, doe cleanse and heale them. Of the Rose such, there is neither ancient nor moderne writers hath given any property, but is wholly neglected of all.

Chap. LXXVI.

Lychnis sylvestris. Wilde Campions.

BEcause I haue many sorts of *Lychnides sylvestres*, wilde Campions to declare unto you: I thinke it fittest and most methodicall way, to distinguish them into severall Chapters, and intreate of them severally, that so both my writing and your reading be not confounded nor they with it. I therefore purpose to entreate in this Chapter of those wilde sorts that beare rough leaves and stalkes, and in the next of those that are glutinous and clammy; and lastly of those that either lend or lye downe upon the ground, or creepe thereon, and of those that are small, or that are like Mosse upon the ground.

1. *Lychnis sylvestris flore albo.* White wilde Campions.

The white wilde Campion hath many long and somewhat broad darke greene leaves lying upon the ground with divers ribbes thereon running like unto Ribwort Plantaine, but somewhat hairy, broader, and not so long: the hairy stalkes rise up in the middle of them, three or foure foote high, or sometimes more, with two great white joynts at every setting on thereon, and two such like leaves thereat up to the toppe, sending forth branches at the severall joynts also; all which beare on severall footestalkes white flowers at the toppe of five, consisting of five broad pointed leaves, every one cut in on the end, into the middle, making them seeme to be two a peece, standing some what but wyde, and each of them standing in large greene tripod hairy cups, long and round below, neere the stalke: the seede is small and grayish in the hard heads that come up after: the roote is white and long, spreading divers wayes in the ground.

2. *Lychnis sylvestris flore rubro.* Red wilde Campions.

The red wilde Campion groweth in the same manner as the other, but his leaves are not so great, but somewhat shorter, rounder, and more soft or woolly in handling: the flowers are of the same fashion of the other, but in some of a pale, and others of a bright reddish colour, cut in at the ends, more deeply, and the jagged leaves seeme to bee more in number than the other: the seede is like, and so is the roote: the roots of both these sorts doe not perish after seede time, but abide many yeares.

3. *Lych-*

3. Lychnis sylvestris flore albo simplici.
The white or wild Campion.

4. Lychnis sylvestris variis striata.
Wild Campion with straked leaues.

5. Lychnis flore albo minor.
The smaller white wilde Campion.

6. Lychnis sylvestris angustifolia.
Narrow leafed wilde Campion.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

3. *Lychnis sylvestris rubra minor.* The lesser red wild Campion.

The lesser red wild Campion, is very like the former red sort, but smaller, and lower, the very much branched, and with darker greene leaves: the flowers are reddish, but smaller, and not so much deuided in the ends: the huskes and seede, are like the other, but smaller, and the roote perisheth after seede time.

4. *Lychnis sylvestris striata foliis striatis.* Wild Campions with straked huskes.

This wild Campion riseth up with a round joynted stalke, with two greene leaues a peece at them, narrower and smaller pointed then those before, and branched, bearing small flowers of a fullen reddish colour, parted in the ends, standing in large hard skinnie huskes, striped or straked with white and greene, the seede is more grey then the other: the roote is small, growing downeright, with a few fibres thereat, and perisheth every yeare.

5. *Lychnis sylvestris alba minor, flore Ocymoides minori albo.* The smaller white wild Campion.

The smaller white Campion, is somewhat like unto the first wild Campion, but that his grosse leaues have no stemmes or stalkes, and are not so full of veines or ribbes, much lesse also and narrower then they, and somewhat like unto Basill, not pointed at the ends, but those that rise up with the stalke, and stand at the joynts opposite to the other, doe as it were compasse the stalke, being lesse, and lesse, up to the toppes, where come forth small branches, with two or three or more white flowers upon them, smaller then the former, and more deuided or cut in, with some white threds in the middle, which when they begin to decay, doe rowle their leaues backward, after which come small grayish seede, in somewhat large pointed huskes: the roote is somewhat great, and yeeldeth new stalkes every yeare.

6. *Lychnis sylvestris angustifolia.* Narrow leafed wild Campions.

This wild Campion hath divers narrow long whitish greene leaves, lying on the ground, from whence the next yeare after the springing rise up stalkes, deuided into branches from the joynts, whereon grow lesse and narrower leaues then those below, sometimes three or foure, and sometimes more set together; at the toppes whereof grow small flowers, made of five leaues a peece, notcht or cut in at the ends, white on the inside, and somewhat purplish on the outside, rowling themselues before they fall, as the last doth: the huskes that containe the small grayish seede, are very hard small and round: the rootes are small, and perish after seede time.

7. *Lychnis Nocti-flora.* Morpheus sweete wild Campion.

This sweete wild Campion, that smelleth sweetest in the night time chiefely, and little or nothing in the day, and in the hot Summer onely, and not toward Autumne, is but an annuall plant, rising not a foot high, with small narrow whitish greene leaues on the stalke, set by couples, whose flowers at the toppe, are of a very white colour, parted at the ends as the other are, and standing in hard huskes, which will be a little clammie

8. *Lychnis sylvestris altera maior.*
The greater hayrie wild Campion.

9. *Lychnoides sylvestris flore luteo simplici.*
Cockle.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

1. *Agrostis 2 vasa calicibus striatis.* Hoary wilde Campion.

2. *Lychnis sylvestris Dioscoridis rubra dilute.* Corne Campion of the gardens.

in the heate of Summer sometimes, and yet but seldome: the seede is grayish and small, and the roote perisheth every yeare.

8. *Lychnis sylvestris hirsuta major.* The greater hayrie wild Campion.

This hayrie Campion hath divers joynted hayrie stalkes, having two small long and narrow, hayrie and hoary leaves set at them; branching forth, and towards the toppes feeding out from the joynts, severall large flowers, upon short fistie stalkes, of a pale reddish, or carnation colour, made of five round pointed leaves, dented or notched in the middle: the seede that followeth them is reddish, in such like heads as the rest; the roote is thick and great, yet perisheth the same yeare it beareth seede, for the first yeare it doth not.

9. *Lychnis sive Lychnoides segetum & Nigella sativa.* Cockle or Corne wilde Campion.

I had rather put this Cockle in this place among the wild Campions, whereunto both in face and other properties it is most like, than either put it with the *Nigellas* as some doe, or make a Chapter of purpose for it. It hath also an upright hayrie stalke, shooting forth branches on all sides, with two long hayrie, or woolly soft leaves at the joynts: the flowers stand at the toppes of the branches, in hayrie long huskes, whose ends or points, are longer than any of the former Campions, standing upright both before the flowers open, & after they are pull'd and laying themselves betweene the five round pointed leaves, when they are blowen, which are of a bright reddish purple, or crimson colour: the seede that followeth is in hard round heads, is bigger and blacker, than in any of the former: the roote is small and woodily, perishing as soone, as it hath borne seede. Some have observed a sort hereof with white flowers.

10. *Lychnis Cretica angustifolia. Candy* wilde Campions.

This wild Campion of *Candy*, spreadeth forth many branches, from the very bottome of the slender hayrie stalke, and driveth a foote high, whereon are set two leaves one opposite to another, as every joynt, which are small, long, and narrow, somewhat thicke, and woolly or hoary; at the toppe of each branch standeth one small flower like unto the other wilde Campions, dented in at the ends, of a fine reddish colour, upon the first blowing and opening, but declining to whitish afterwards, with divers threds in the middle eye with yellow, standing in hayrie huskes, small at the bottome, and larger at the toppes, the heads and seede are like unto the common Corne Campion: the roote is small and fibrous, perishing every yeare, yet rising of the seede, if it be sowen to stand a while.

11. *Lychnis sylvestris incana caliculis striatis.* Hoary wilde Campion.

This hoary wood Campion shooteth forth five or six small hoary stalkes, about halfe a foote high, with two long and narrow hoary leaves set at each joynt, the flowers grow 4 or 5 together being red like in shew to those of the two former, growing out of thicke swelling streaked huskes wherein afterwards the seede is contained.

12. *Lychnis segetum Dioscoridis rubra dilute.* Corne Campion of the Gardens.

This wood Campion is but an annuall plant and riseth up with one round stalke for the most part, spreading

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

into sundry branches, having two long leaves set oppolite at the joynes, being broad at the bottome, and imbracing the stalke and branches almost like unto Thoroughwaxe, ending in a small point of a pale greene colour: the toppes of the branches stand sundry flowers, made of foure leaves a peece, of a pale red colour, after which come small round and hard blacke seede, contained in skinnie huskes: the roote is long white, and lowmie wooddy: this plant for the beauty of the flowers is received among others into our gardens, and was but lately taken out of my former booke.

The Place.

The three first sorts grow commonly through our Country by fields, hedge sides, and ditches: the other three have beene found some by *Clusius*, and some by others, both in *Spaine* and *Germany*: the tenth in *Candy*; Castle is very plentifull in our Corne fields: and the last in the borders of the corne fields in *Germany*.

The Time.

All these sorts flower in the Summer, some comming earlier than others, and some yielding longer than others.

The Names.

I have shewed you in the former Chapter, the Etymologie of the name *Lychnis*, and therefore neede not to repeate it here againe. All these are called *Lychnides sylvestres*: the first is thought by *Cruſius* more fitly referred unto *Melandrium* of *Pliny*, in his 26. booke and 7. chap. then the *Papaver spumeum*, which *Lobel* would have thereunto, and therefore entituleth it *Melandrium Plinii quorundam*, *Matthiolus* calleth it *Urnarium*, and *Ocimoides*, and so doth *Gesner*, *Dodonæus*, and *Dalechampius*. *Camerarius* and *Tabernæmontanus* doe expresse them, as the former sorts, by the name of *Lychnis sylvestris alba & rubra* or *purpurea*, and *Lobel Lychnis sylvestris flore simplici* by the second, which *Bauhinus* calleth *Lychnis sylvestris flore aquatico purpureo simplici*: but why so many I know not, for in our Land I have not seene it grow in any watery grounds, other than ditch banks, as before. *Clusius* calleth the third here expressed his *Lychnis sylvestris* in his history which *Bauhinus* calleth *Lychnis viscosa pilosa rubra altera*, and thinketh that to be the *Adiscipula* of *Lobel*: but *Camerarius* is herein faith, that the same is not well cut, and that he meant the *Adiscipula* that is common, which he there calleth *Fuchsii minor*, as doth also *Clusius* in his history, very truely set forth. *Bauhinus* likewise maketh the *Adiscipula altera* of *Lobel*, to be the *Armeria flore purpureo*, of *Dodonæus*, which is the same that *Lobel* of *Clusius*, in his history of plants, and is quite contrary, for *Lobel* in his *Adversaria* saith that that *Adiscipula* hath a yellowish greene flower: and all know the *Ben rubrum Monspelliensium* or first *Adiscipula* hath not, but a red flower; *Lychnanthe pallidum flore purpureo*: *Bauhinus* likewise maketh a doubt whether that *Adiscipula Lobelii* called by others *Rosa sylvestris Monspeliensium*, or first *Lychnis sylvestris* of *Clusius* be not the *Flos Constantinopolitanus* mixtus of *Gesner*: I dare not name *Constantinopolitanus*, but *Flos ad Hierosolymam mixtus* (or *minor*) which otherwise he calleth *Flos peregrinus*: the greater I verily thinke is the *Lychnis Chalcedonica simplex* as we call it, but this lesser I certainly cannot be the *Ben rubrum* or *Adiscipula*, for *Gesner* there saith that they both endure the winter and the bearing of seede which this *Adiscipula* doth not: and againe he saith his lesser sort hath *Ramos steriles* and stalke flowers, and that hath many: but I thinke as I layd before that it may be the *Flos Constantinopolitanus*. The fourth is *Clusius* his second *Lychnis*, or *calliculis striatis*: the fifth is the ninth *Lychnis* of *Clusius* in his history, which *Lugdunensis* calleth *Ocimoides minus flore albo*, and *Camerarius Odontis, quorundam flore candido*: the sixe kinds, I have set forth in my former booke, under the name of *Lychnis pinnaria sylvestris* knowne whereof it is likely *Tabernæmontanus* maketh mention, and *Bauhinus* putteth a *quid* upon it, as being a plant he never saw or heard of before, and (whereof there is a sort that beareth double flowers) which there he calleth *Armeria Germanica*, & *Bar-Cocab*. *Clusius* setteth them both forth by the name of *Lychnis flore simplici flore & pleno flore*: the sixt is the eight *Lychnis* of *Clusius* in his history of plants, which he made the first in his *Spanish* observations, *Bauhinus* calleth it *Lychnis sylvestris pluribus foliis simul positis*: the seventh is called by *Camerarius* the younger *Lychnis Germanica* with flowers, and *Lychnis nectiflora annua*, *Besler* in the great garden books of Eystet calleth it *Ocimastrum nectiflorum flore albo*: the eighth is *Clusius* his *Lychnis sylvestris quarta*, and with *Bauhinus Lychnis syl. Sangvinea major*: the lesser of this sort is the sixe *Lychnis sylvestris* of *Clusius*, which I have found in the west chalkie have one: the ninth is called by divers diversely, some *Lychnis segetum*, *Lychnoides Fuchsii*, *Tragus* calleth it *Githago*, and in his *Rosa marina 6. genus*, *Dodonæus*, *Nigella sylvestris*, and *Antherum*, as many before him called it *Antherum folio rosmarini*, *Brunfelsius*, and *Lacuna Nigella vulgaris*, but very erroneously (for to have any resemblance to *Nigella* it is more in the blacke seede than in the flower or any thing else) and thirdly *Matthiolus* calls them *Pseudomelanthium*, as divers others since him: *Fuchsius* and *Lonicerus* tooke it to be *Lolium* as erroniously, *Bauhinus* calleth it *Lychnis segetum minor*, because he maketh the *Adiscipula coronaria* of *Lugd.* to be by others to be his *Lychnis segetum major*, the tenth is the seventh *Lychnis syl.* of *Clusius*, which he also calleth *Viscaria*, for that he had the seede from *Candy*: the eleventh *Lobel* so calleth as it is in the title & *Lugdunensis* from the last is called *Viscaria sylvestris* by *Lobel*, and *Viscaria rubra*, as it is also by *Gesner*, *Dodonæus* and others: *Viscosa* by *Anguillara*, *Tunicea minor* by *Cordus*, *Candidum Plinii* by some, and *Perfoliata rubra* by others, as before hath saith, whereupon *Bauhinus* calleth it *Lychnis segetum folio Perfoliato*: the *Italians* call it *Garofolo* of the Campions *Ocimoides*, and *Rapitico salvatico*, the *French* and *Dutch* men are expressed in the Chapter before.

The Vertues.

Some have used the white flowers of these herbes, to slay the whites in women, as they doe the red flowers for their red courses, but with what good successe I know not: an old tradition being secret with many, whether red flowers or white flowers, are effectuall in those diseases: but it is found true by experience, that the decoction of the herbe being drunk, doth stay inward bleedings, and applyed outwardly doth the like: the seede being drunk, doth helpe to expell urine that is stopped, and gravell or the stone in the reines or kidnies: the seede given in wine, to the weight of two drams, purgeth the body of cholleriche humors, as *Dioscorides* saith, and also helpeth those that are stung by Scorpions, or other venemous beasts, and may as I layd before, be taken against the Plague: it is said to be so effectuall against the Scorpion, that this herbe call upon, or put into a house doth make him of no force to envenome any: it is of very good use in old sores, ulcers, cankers, fistulaes and the like, to clense them and heale them, which it worketh by the consuming of moyst humours falling into them, and by correcting the putrefaction of humors offending them; but the Cockle is of especiall properties in all the above layd, and besides doth heale the itch, scabbes, and running sores.

Lych-

Chap. LXXVII.

Lychnis viscosa sive Muscipula. Catchflie.

The next ranke or order of wild Campions, is as I before sayd of those whose stalkes are glutinous and clammy, which now are to be entreated of in this Chapter; one of them I have already set forth in my former booke called *Muscipula Lobelij*, and therefore need not describe it here againe, I will onely give you the figure thereof here.

1. *Lychnis sylvestris viscosa latifolia Cretica Auriculæ ursi facie. Clusio.* his Catchflie of *Candy*.

This wilde Campion hath many leaves lying upon the ground, which are thicke fat and hoary, whose somewhat resemble unto the leaves of the yellow *Auricula ursi*, Beares eares or *French* Cowslips smooth on the edges, and alittle pointed, which doe so abide the first yeare of the springing: the stalke riseth up the next yeare to the height of two or three cubits, with two leaves at the joynts, and spreading on both sides into branches from the ground, which are glutinous or clammy, causing every light or small thing to cleave thereunto, as flies, strawes downe or the like: at the toppes whereof and the joynts next below them come forth many flowers together, standing in clusters but very small, whose small huskes containe every one of them, a small greenish yellow flower parted in two at the broad end: the seede is small and blackish in the huskes, the roote is small and thredy.

2. *Viscaria maxima Cretica Alpina.* Great Candy Catchflie.

The roote of this Catchflie is white, long, and growing small downewards of a fingers thickneſſe, bearing about a number of long leaves which are small at the lower end, growing broader to beyond the middle, and ending in a point, from among which rise up divers stalkes a foote high, with few joynts, and two small long leaves at each of them, bearing sundry white flowers at their toppes as it were in umbells, and out of them some-times shoot forth small flowers still starre, all of them like the ordinary Catchflie: the seede vessells that follow are small and round pointed at the ends with small blacke seede within them: the whole plant is very clammy causing every thing to sticke thereunto that toucheth it. This is not that former *Lychnis latifolia* of *Clusius*, or *Auricula*, yet they are so like that any that shall judiciously view the figures without sight of the plants will easily account them both one, and therefore I give you their severall descriptions and figures also.

3. *Muscipula altera flore albo.* The white flowred Catchflie.

The other Catchflie sendeth forth divers branched stalkes, with small darke greene leaves set thereon by

Viscaria Cretica maxima Montpelliensium. The Great Candy Catchflie.

1. *Lychnis sylvestris latifolia Clusij, sive Muscipula Cretica Auriculæ ursi facie.* Clusius his Catchflie of Candy.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

couples, the tops whereof where the flowers ſtand, and under them alſo are ſo clammy that it will ſticke the fingers of them that touch them, eſpecially in the heate of the day, and in the hot Summer time: the flowers are ſmall and white, made of five leaves notched at the ends, and ſmelling ſomewhat ſweete: the ſeede ſmall and blackiſh, contained in ſmall hard huskes: the roote ſpreadeth many long ſtrings under the ground, and dureth many yeares.

4. *Muscipula Salamantica major.* The greater *Spaniſh* Catchflie.

The greater *Spaniſh* Catchflie hath divers grayiſh greene leaves lying upon the ground next the roote, which are ſmall and ſo long at the bottome as if it were a footeſtalke, but broader toward the end and ſomewhat long withall, of a grayiſh greene colour, from whence ſtand up divers round greene ſtalkes a yard high, bearing ſuch like leaves at the joynts by couples up to the tops of them almoſt, but ſmaller where the branches beare many ſmall whitiſh greeniſh flowers at ſeverall ſpaces round about them, and where in the heate of Summer there will be a certaine or glutinous ſappe on the outſide, ſo as to make any ſmall light thing to ſticke to it: after the flowers are paſt, the ſeede ſheweth it ſelfe of a grayiſh colour, contained in ſmall hard greeniſh huskes: the roote is white, tough, long, abiding after ſeede-time, and ſpringing afreſh every yeare.

5. *Muscipula Salamantica minor.* The ſmaller *Spaniſh* Catchflie.

The ſmaller *Spaniſh* Catchflie differeth ſo much in forme from all the other ſorts of wilde Campions, that it might ſeeme to be none of the family: but becauſe as *Cluſius* ſaith, the learned of *Salamanca* did call it *Salamanca* as they did the former, which is moſt true of the number of the wilde Campions, I thought it not beſide not amiſſe to joyne them together, and to doe ſo, untill I may know a fitter place to ſet it in: it beareth many thicke long greene leaves, like unto line or flax upon the ſlender ſtalkes beſides thoſe that are at the foote of them, ſet thicke the one above another, but without any order or proportion; at the toppes whereof growe ſmall ſpiked heads of ſmall flowers of a purpliſh greene colour at the firſt, which turne into whitiſh greene ſtarres towards with foure round heads in the middle, wherein when they are paſt grow ſmall blackiſh ſeede: the roote is ſomewhat great and white, and not periſhing. *Cluſius* ſaith hee found another ſort ſo ſmall, with white flowers and woolly leaves. *Vide alio.*

6. *Lychnis ſylveſtris rubella rubra anguſtifolia.* The red *Germane* Catchflie.

The red *Germane* Catchflie ſendeth forth from the roote divers long and narrow darke greene leaves, ſomewhat at the edge, ſomewhat rough or rugged, and not fully ſmooth as many other ſorts are: ſtalkes a yard high, and from among them ariſe up two or three, and ſometimes but one ſtreight ſtalke, bearing ſuch like leaves at the joynts, which are much ſeparate one from another, and which will be clammy like the reſt in the hot Summer moneths: the flowers have no ſcent and ſtand almoſt from the middle of the ſtalke towards the top in branches, divers together, every one by it ſelfe, upon a ſmall footeſtalke, of a freſh cleare red colour, like the ſingle red ſorte Campion, made of five round leaves, pointed at the middle, with a paire of ſmall ones at the bottome, ſet in greene huskes, ſmaller at the bottome and larger at the head, wherein after the flowers are fallen, the ſeede groweth of a browniſh colour: the roote is long, ſomewhat thicke and woodily, continuing many yeares.

7. Ep-

5. *Lychnis villosa Italica, sive Multipula Italica alba.* Woolly Italian Catchflie.

This white Italian Catchflie sendeth forth a browne jointed stalke two foote high, branched therefrom in the upper part, whereon stand many flowers in long striped whitish huskes, consisting of five jointed leaves, cut in at the ends to the middle, making every leafe seeme as if it were two, and of the flowers ten white threds, tipt with whitish thrumbs, whereof appearing when the flowers doe open and shut themselves when they decay and swime themselves after they are fallen, come grayish seede in hard huskes or heads like unto a small round knot: the roote perisheth not, but

6. *Lychnis viscosa rubra angustifolia.* Clustred Clove-pink Catchflie.

abideth long.

6. *Lychnis viscosa purpurea flore.* Browne Italian Catchflie.

This other likewise hath woolly leaves, set by couples on the joints great stalke somewhat larger then the former Italian, the stalkes and branches that grow up higher and especially at the tops are more reddish in browne, and as clammy as under the eyes, from whence come forth divers darke browne striped stalkes bearing many flowers, consisting of five narrow leaves, cut into the middle of a smoakie purplish colour on the outside, and white within, with five longer threds in the middle, blake and purplish at the ends, and five other shorter with white tipses: when the flowers beginne to decay they turne themselves in the fall dosh, the heads and seede are like unto the 5th, and so is the roote likewise which endureth long.

7. *Lychnis flore rubro.* Bluth coloured Catchflie.

This bluth *Lychnis* hath woolly stalkes and leaves set thereon at the joints by couples as in the rest, where also toward the toppe on every side, at every place and joynt with the leaves commeth forth a woolly striped swolne huske, with purplish white or bluth coloured flowers, of five leaves a peece, divided at the ends in the middle with some threds therein also: the roote of this is small and perisheth the same yeare it beareth seede, which is usually the second or third time of the sowing.

8. *Multipula altera Lobelii.* The other Catchflie of *Lobel.*

The leaves of this Catchflie are somewhat broad round pointed and of a whitish greene colour, but not woolly or hairy, not much unlike the other *Multipula* called *Ben rubrum* set forth as I said in my former booke, and the figure also here: the stalkes have two or three joints with leaves at them, and are glutinous towards the tops, where the flowers stand in clusters one by another being very small, and of a yellowish greene colour.

The Place.

They have their places signified in their titles, where they grow except the third, which came among other seeds unto me from a friend, the originall place being not knowne, and therefore there needeth no more to be said hereof.

The Time.

They flower in the Summer moneths, and some not untill winter especially the last.

The Names.

The names of wild Campions are called *Muscipula, quia muscas capiunt,* because they catch flies, &c. and *Viscago Viscaria verum,* the clammineſs like Birdlime whereby the flies are caught. *Thalius* calleth some of them *Lychnis* which signifieth the same thing, and *Heuchnis Lychnis sylvestris alterius.* The first is the *Lychnis Sylvestris* of *Gesner*, the second is so called by *Alpinus lib. de plantis exoticis*, as it is likewise the third wee usually call *Muscipula purpurea*: the fourth and fift are called by *Clusius Salamandra Lychnis sylvestris, flore pleno & simplici*, the greatest being called by *Camerarius Viscago maior*: the sixt is the fourth *Lychnis sylvestris* of *Clusius*: the seventh eighth and ninth are the three sorts of *Lychnis sylvestris* that sprang with mee from the seede received from *Italy*: the last is mentioned by *Lobel* by the name of *Multipula altera* which *Bauhinus* in my judgement doth much confound with the *Salamandra magnum Salamandra* simplex, making them to be both one, and yet as I said in the Chapter before, he maketh it also agree with the *Lychnis sylvestris* of *Clusius* in his History, which is the fourth *Armerium* with *Dodon*, usually called *Viscago Pumilionum Muscipula.* which all know are farre differing one from another.

The Vertues.

There are no especiall properties attributed to these Plants, but may be referred to those of the other wild Campions unto which they are likest in face and outward appearance.

Chap. LXXVIII.

Lychnides minores & repentes. Small and creeping wilde Campions.

The laſt kind of wilde Campions are theſe, which eyther lie downe and ſpread or creepe with their branches, whether they be greater or ſmaller, or elſe being ſmall ſtand upright.

1. *Oenoides repens.* Creeping wilde Campion.

This creeping wilde Campion ſendeth forth divers ſlender weake trayling flexible branches, divided into others, ſet full of joynts, and two leaves alwayes at them which are ſomewhat long like unto Mirtle leaves, or as *Lobel* ſaith unto knotgraſſe, but larger, that is ſhorter and broader at the toppes of the branches, ſtand two bluſh coloured flowers in hairy long greene huskes, like the common wilde Campion, but leſſer, conſiſting of five ſmall round pointed leaves, cut or dented in with ſome threds in the middle, the roote is ſmall and long, and diſperſeth ſome ſtrings and fibres under ground, abiding divers yeares.

2. *Oenoides Lychnitis Columnæ ſive Lychnis incana repens.* Hoary creeping wilde Campion.

This hoary wilde Campion hath ſmall hoary leaves ſet by couples upon the trayling hairy branches, which are ſomewhat broad comming neare unto the leaves of Baſill, and a little pointed at the ends, the flowers grow many together in hoary long huskes, like the wilde Campions.

3. *Lychnis marina repens alba.* The white Sea Campion.

This Sea Campion hath divers weake flexible branches, lying all about upon the ground (which divideth into other ſmaller ones) two or three foote long, thicke ſet with ſmall long fat and whitiſh greene leaves, out of every branch ſtandeth one ſhort, thicke, whitiſh greene huske, parted or dented at the toppe, out of which ſhooteth forth a ſmall long necked white flower, very like unto that of Sparling Poppie, and as white, made of five ſmall round pointed leaves, with ſome blackiſh threds in the middle: the ſeede that followeth is round, contained in ſuch like huskes as other wilde Campions have, the roote is ſlender and long, and abideth many yeares.

4. *Lychnis marina repens flore rubello.* Red flowred Sea Campion.

This red Sea Campion differeth not from the former in any thing but in the colour of the flower, which unto is of a fine delayed red colour as in the other it is white.

5. *Lychnis arvenſis minor Anglica.* The ſmall white field Campion.

The lower leaves of this our ſmall wilde Campion are ſmall and hairy, very like unto the ſmall Monſeere, but thoſe that grow upon the ſlender ſmall ſtalke, which is ſometimes ſingle of it ſelfe, and ſometimes many from the roote, are not above a foote high, two alwayes being ſet together at a joynt, ſmaller then thoſe below, and ſpotted with white ſpots; from the boſome whereof, that is, betweene them and the ſtalke come forth two other leaves, much ſmaller then they, without any manifeſt taſte: the flowers are ſmall and white like unto other wilde Campions, after which come ſmall long heads, with grayiſh ſeede in them: the roote is ſmall and white and periſheth every yeare.

6. *Lychnis ſylveſtris Hiſpanica minor.* The little *Spaniſh* wilde Campion.

This ſmall wilde Campion hath a ſmall ſlender upright ſtalke, about an hand breadth high, in ſome more with divers joynts, and two leaves at every of them which are hoary, ſomewhat long and narrow: the flowers ſtand ſingle for the moſt part, each comming forth at the joynts with the leafe, and ſome alſo at the toppes of the ſtalkes and branches, ſet in ſmall long hoary huskes ſtriped, conſiſting of five ſmall bright red leaves, dented at the ends in two places ſo making three points: the roote is ſmall and dyeth after ſeede time.

7. *Lychnis ſylveſtris maxima exiguo flore.* The ſmall flowred wilde Campion.

This wilde Campion riſeth up with a ſmall round browniſh ſtalke, not halfe a foote high, ſpreading from the joynts (where there are two ſmall narrow and pointed leaves, ſmaller then the laſt, otherwiſe not much unlike) very ſmall branches ſomewhat rough or hairy, on the top of every one whereof ſtandeth one purpliſh flowre made of five leaves, ſo dented in at the end of every leafe, that it expreſſeth the forme of an hart: the ſeede contained in the ſmall heads is like the other: the roote is ſmall and endureth not.

8. *Lychnis exilis rubra.* The very ſmall red wilde Campion.

This ſmall Plant might rather be accounted a kind of ſmall Pinke, if the head with ſeede did not gaineſay. For it hath many ſmall graſſe-like leaves at the foote of the ſtalke, and at the joynts of them, which ſtand by twos together, two or more ſuch like leaves but ſmaller: the flowers ſtand at the toppes of the ſtalkes, two or three together in ſlender long huskes, very like unto thoſe of that *Muſcipula* or Catchfly, that is called *Lin noſtras Adonſpelienſium* of a reddiſh colour dented at the ends, the roote is very ſmall and long and laſteth not.

9. *Lychnis tenuifolia minor.* The leaſt wilde Campion.

There is ſmall difference in this from the laſt in the ſmalneſſe of the growing of leaves, or poſture of them, ſo that this hath ſeldome above two leaves at a joynt, the flowers chiefely diſtinguiſh them, which are not but growing from the upper joynts, and ſome at the top of the thred like ſtalkes, of a pale greene colour, and without any notch or dent at the end of the leaves: the ſeede and ſeede veſſells are ſmall and like the reſt: the roote is like a thred, like unto theſe two laſt.

10. *Oenoides montana ex Alpibus.* Small mountaine wilde Campion.

The roote of this ſmall Campion although ſmall, yet is woody and of a whitiſh colour, not growing deep but ſpreading much under ground, and ſhooteth forth a number of heads of ſmall greene leaves very thicke together in taſte, in that manner ſpreading much ground, and covering it like Moſſe, from the middle of each head whereof, riſeth up a ſmall bluſh coloured flower, out of a ſmall long huske, but ſtanding upon a long ſtalke above the leaves, that it is ſcarſe to be diſcerned, in each part very like unto the firſt creeping wilde Campion; the ſeede is ſmall and browne, it hath no great ſent to commend it, but onely the beauty of the redde and bluſh, ſo thicke intermixt like a wrought carpet to pleaſe the ſight.

The Place.

The firſt groweth on Mount *Baldus* and in the ſhadowie hills and woods of *Provence*, and in other ſhadowie places: the ſecond *Cabanna* saith he found in *Naples*: the third groweth by *Hurſt Caſtle* neare the Iſle of Wight, and in the Iſyd Iſle alſo in many places by the Sea ſide: the fourth is found in ſome of thoſe places aforeſaid, as alſo about a mile from *Southampton*, in the ground of one Mr. *Gouch* a Divine: both of theſe ſorts grow in ſouth parts of this land, on the moſt ſhonie banks by the ſea ſide: the fift groweth in divers grounds of *Eſſex* in *Eſſex*, and in a field called the Millfield, behind the houſe of Sir *Thomas Lucas* neare *Colchester*: the firſt as *Cluſius* ſaith he found no where elſe then on the hills neare *Salamanca* in *Spaine*: the ſeventh groweth at the foote of the hill that is by *Buntingford* neare unto *Moreplace*, and in the borders of the fields about *Barkway*: the eighth and ninth in divers places of our owne Land: the laſt upon mount *Baldus*, as *Pona* ſaith, and by *Cluſius* report upon the *Alpes* of *Auſtria*, and *Styria* on the higheſt places of them.

The Time.

They all flower in the Summer Moneths of *June*, *July* and *Auguſt*, ſome earlier or later then others, and their ſeede is ripe quickly after.

The Names.

The firſt is called *Orobanche repens* by *Camerarius* and *Pona*, *Lobel* addeth *Polygoni folio Sempervivi flore*, *Gesner* and others call it *Pinguicula Alpina*, *Bauhinus* taketh it to be the *Cneorum* of *Matthiolus*, but I thinke amiſſe, for that as *Cluſius* ſaith, that *Cneorum* beareth a long white berry (a red faith *Matthiolus*) like unto the berry of *Thymelea*, with a ſeede therein like unto it alſo: which in part was the cauſe that *Cluſius* did referre it to the *Thymelea*, excepting the ſtarne only: and *Bauhinus* followeth him alſo in folio 405 of his *Pinax*, making a Chapter peculiar of *Cneorum Matthioli*, which he likewiſe calleth *Thymelea affinis facie externa*; and if it be that, how can it be then this *Lychnis*, for the *Cneorum* hereof has ſeede of ſcarſe perfect forme what like unto the other wilde ſorts, and ſeede therein like unto them alſo: but ſecondly *Cneorum Matthioli* ſhould be either that of *Dioſcorides* or *Galen*, or of any Ancient, for of *Theophraſtus* in his firſt Booke and ſecond Chap. is much doubted of by divers, and what plants are the ſame is as much controverſed. *Anguillara* and others thought the *Cneorum album* and *nigrum* of *Theophraſtus*, were *Lauenda* and *Roſmarinum*, our ordinary Lavender and Roſemary (as is ſayd before in both the Chapters of Lavender and Roſemary) whom *Matthiolus* contrarieth, ſhewing that neither of them can bee ſo at all declared: others thinke they might be referred to the *Chamelea* and *Thymelea* of *Dioſcorides*, but in theſe two there can be no diſtinction of white and blacke, being both of them greene, and neither of them white nor other: and beſides they doe both flower in the ſpring, and not in the Autumne, as *Theophraſtus* ſaith he doe: notwithſtanding that the leaves of *Thymelea* by *Dioſcorides* was called *Cneorum*, and *Pliny* ſaith that *Thymelea* was called of ſome in his time *Coriſſum* and *Cneorum*. Now how neare *Matthiolus* his *Cneorum* commeth unto that of *Dioſcorides* and *Galen* is to bee ſhewed: it is certainely held that that of *Dioſcorides* and *Galen* doth much vary from thoſe of *Theophraſtus*, as *Matthiolus* ſaith in both his Epiſtles to *Crato*, in his third Booke of Epiſtles Fol. 134. and in his fourth Booke Fol. 172. and ſaith that becauſe the *Cneorum album* is ſweete, therefore according to *Pliny* in his 21. Booke and ninth Chap. and twelfth Chap. it was reckoned among the ſweete herbes that were put into Garlands, which neither *Chamelea* or *Thymelea* doe, but is as hee there ſaith called *Caſſe* by *Virgil*, which is confirmed it was alſoby *Virgil* in divers places of his *Georgicks* and *Bucolicks*; as firſt in his ſecond *Eclogue*, ſhe ſhewed the manner of the *Nymphs* works in making a Garland in theſe Verſes:

Tres Caſia atque aliæ intexunt ſua calathiſcis herbas,
Mollia lutea plagis narciſſus ralibus.

And in the ſecond of his *Georgicks*:

Thea humilis apibus caſias roremque miniſtrat.

And in the fourth of the ſame,

Nec vero ceſſet circa ſpecies ve alentia late
Serpylla, & graviter ſpirantis copia thymbræ
Florea, ſerpentumque fugat Oaxaria fontem.

All which doe plainely ſhew that *Caſſe* was commonly accoimted with them a ſweete herbe, uſually planted by Bees to feede on, as well as to put into Garlands: and not that *Caſſia* which is a tree like unto Cinamon, uſed of the Apothecaries *Caſſia lignea*, for which cauſe it is very probable that *Gaza* in tranſlating *Theophraſtus* Greeke copie into Latin, put *Caſia* for *Cneorum*, taking them to bee both one: for *Cneorum* as *Dioſcorides* and *Galen* ſay, was the leafe of that plant that bare the *Coccus Ginidius*, which by all the beſt modern Hiſtories groweth upon *Thymelea*, being the fruit thereof, which both in face and qualitie differ much in kinds as ſhewed before. Now how much it differeth from thoſe of *Theophraſtus*, reſteth to bee declared, that it cannot agree with his blacke *Cneorum*, needeth no further demonſtration then is ſhewed before: but that it cannot neare to his white moſt doe agree, yet ſome things therein are doubtfull, as firſt there is no likelyhood that it ſhould be called white, ſecondly the branches are not ſo pliant and ſtiffe that they may ſerve to binde withall as rufhes are: thirdly the roote is not very great; and laſtly it doth not flower after the Autumne ſolſtice, but in the Spring. Thus farre I have digreſſed from the firſt *Orobanche*, being drawne on by *Camerarius*, whereunto as I ſayd *Bauhinus* referreth it, and calleth it *Lychnis vel Orobanche repens montana*, and ſaith that it is the *Orobanche Alpinum* of *Geſner* in horto, and the *Saponaria minor Dalechampi* in *Lugdunenſi*: the ſecond *Fabius Columna* calleth *Orobanche Lychnitis*, and by *Bauhinus Lychnis ſerena repens*: the third is mentioned by *Lobel* and *Lugdunenſis*, and *Tabermontanus* that follow him and called *Lychnis muſcoſa Anglica*, and *Lychnis maritima repens* by *Bauhinus*: the fourth is mentioned in *Gerards* Herball, taken but by report, and is not elſe written of by any before this time, that I know of: the fift is not remembred alſo by any other before: the firſt is the firſt *Lychnis ſylveſtris* of *Cluſius* called by *Lobel Lychnis ſylveſtris hirta maxima*: the ſeventh is not unto it, and called by *Bauhinus Lychnis ſylveſtris minima flore parvo*: the eighth and ninth are not ſpecified by any other: the laſt is called *Muſcus floridus* by *Geſner*, and *Caryophyllus ſylveſtris* 9. or *pumilus Alpinus* by *Lobel*, and

and by Lobel called *Cerefolium Alpinum*, by *Bauhinus Lychnis Alpina pumila folio graminis, sive Muscus Alpinus* Lobelij, &c. Every one hath his English name in his title set to distinguish them.

The Vertues.

Although most of these herbes are of later knowledge, so that there is but little said of their vertues, yet by their taste and smell being somewhat drying and astringent may be probably applyed to stay the fluxes of blood whersoever, and thereby also conduce to the healing of old and moyst Vlcers or sores: the Sea kinds taste somewhat saltish, yet not unsavory, so that they are often eaten colde as a Sallet herbe, or stewed and so eaten.

Chap. LXXIX.

Saponaria. Sopewort or Bruisewort.

Now for a supplement to the wilde Campions, I have some other sorts of herbes to bring to your consideration, which both for face or forme, and for use and properties are so like unto the former, that they might well be taken as *species* of the same *genus*.

1. *Saponaria vulgaris.* Common Sopewort or Bruisewort.

Having shewed you in my former booke the double *Saponaria* and under it in a sort described the single or common kinde, it might seeme needelesse here againe to set it forth, which indeede I would not have done, but that being so like as well in the description as in the vertues in that place, I thought good here to enlarge my selfe and therefore to inferre the description thereof as well as another sort thereof with it. The roote creepeth under ground farre and neare, with many joynts therein, of a browne colour on the outside, and yellowish within, sending forth in divers places many weake round stalkes, full of joynts, set with two leaves a peece at every one of them on the contrary side, which are ribbed somewhat like unto Plantane and fashioned like the common wilde white Campion leaves, seldome having any branches from the side of the stalkes, but set with divers flowers at the toppe standing in long huskes like the wilde Campion, made of five leaves a peece, round at the ends, and a little dented in the middle, of a pale Rose Colour almost white, sometimes paler, and sometimes of a deeper colour, of a reasonable good sent.

2. *Saponaria Anglica convolvulo folio.* Hollow leafed Sopewort.

This kind of Sopewort, which is peculiar to our owne land, in the forme and manner of the running of the roote is very like unto the former but much smaller sending forth divers weake round stalkes, with fewer joynts then in the former, and at every one of them one leafe and seldome more, which either compasseth the stalke at the bottome as many of them doe, or being hollow the whole leafe like a pipe or trunke compasseth it before it open it selfe on the outside, or sometimes doth not open it selfe at all, and are ribbed like the former, somewhat

1. *Saponaria vulgaris.* Common Sopewort.

2. *Saponaria Anglica convolvulo folio.* Hollow leafed Sopewort.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

broader and rounder at the ends: these ſtalkes have no branches at all, but from ſome of the upper ioynts, vnder the toppes ſtand three or foure flowers, vpon ſlender footeſtalkes in long huskes, made of five leaves long, moſt part ſomewhat broader at the ends then the former, and vneven, and many times breaking the huſke wherein they ſtand, on the one ſide or other, of a pale white colour enclining to a bluiſh, eſpecially on the backe ſide, of little or no ſent at all: wee never yet obſerved the ſeede or ſeede veſſells, being increaſed ſufficiently by the roote.

The Place,

The firſt groweth wilde in many low and wet grounds of this lands, by the brookes, and ſides of running waters, and is brought for the flowers ſake into many country gardens alſo, to ſerve to decke up their houſe, the other was firſt found and ſet forth by Mr. *Gerard* in his Herball, and hath not beene found to grow any where elſe then in that little Grove called the *Spinny* which is neare unto *Lichfeerrow* in *Northamptonſhire*.

The Time,

They both flower in *July*, and uſually not before, and ſo continue all *Auguſt* and part of *September*, before they will be quite ſpent.

The Names.

This Herbe is uſually called *Saponaria* becauſe it ſerveth inſtead of Sope to waſh any thing withall, & therefore *Fuchſius* firſt of all other writers as I take it, ſet it forth for the ſecond *Struthium* of *Dioſcorides*, *Galen*, *Paulus* and *Pliny* which commeth from the Greeke word σαπω, which ſignifieth *Cano purgo*, & *candida facio*, but quite differeth from it as you ſhall here by and by; for although this as well as many others, may be called *Struthia*, of their waſhing and cleanſing quality, yet none of them have the right deſcription of *Struthium* (which of the Latines is called *Radicula*, and *Lunaria herba*, and by ſome others alſo transferred to this *Saponaria* but vnorderly) and overpaſſed by *Dioſcorides* as too well knowne in his dayes: and therefore needed no deſcription, and but remembred onely by *Theophraſtus* in his firſt Booke and third Chap. of his hiſtory of Plants, among thoſe herbes whoſe leaves are prickley, *Ebenus* in his 19. Booke and third Chap. deſcribeth *Struthium* at large, in theſe words I thinke it to ſet downe and afterwards interpret them, that all may know what little cauſe and reaſon divers have ſhewed in referring the more obſcure Plants of the ancients, to not duly comparing and conferring their Authors words and declarations. *Atque oriuntur Radicula* (ſaith *Pliny*) *lauando dentes candidiores, mirum quantum conferens cordi mollitieque. Neque noſcitur ſatiua vbique, ſed ſponte præcipue in aſſa Syriaque, ſaxoſis, & aſperioribus, trans Euphratem tamen laudatiſſima, caule ferulaceo, tenui, & ipſe rubi modo aculeato, folio, & tingente quo quidem decoquuntur folia Olex, Struthium Græci vocant: floret aſtate gracili virgulto, ſingulis ex equite lanugine ſeminis nullum, radice magna quæ cum vino ad quercedinem eſt vtilis*, which may be thus Engliſhed, but that herbe which is called *Radicula*, hath a juice or ſappe therein ſo to waſh clothes, as wonderfull to ſee what whitenelle and ſmoothnelle ſhe thereby it giveth unto them. The manured ſort groweth vpon many in divers places, but of it owne accord in *Aſia* and *Syria*, in rocky and rugged places; but the chiefeſt and moſt praiſe worthy groweth beyond *Euphrates*, having a ſmall ferulous ſtalke, which the inhabitants decrate with their meates, and is apt to colour or dye any thing that ſhall be boyled with it, and hath the leafe of an Olive tree: the Greekes call it *Struthium*. It flowreth in Summer, and is pleaſant to behold but without any ſent, being prickly, and the ſtalke woolly: it beareth no ſeede, the roote is great and being cut in peeces ſerveth for the vſes aforeſayd. Thus farre *Pliny*. Now if you will compare the *Saponaria* with this deſcription, you ſhall finde that the *Saponaria*, hath no Olive like leafe, but rather like a Plantane, it hath no ferulous nor woolly ſtalke but ſmooth and joynted, it hath no prickly leaves but ſmooth nor no great roote but ſmall and creeping; it beareth neyther ſent nor ſeede, as *Pliny* ſaith *Struthium* doth: ſo that it is wonderfull that any ſhould make them both one, for one qualities ſake onely of ſcowring or cleanſing, when ſo many delineations are abſolutely contrary: and therefore doth *Matthiolus* contrary *Fuchſius* plainely as alſo thoſe that took the *Lunaria*, or *Lunula herba* to be *Struthium* which he therefore called *Pſeudo Struthium*. Divers alſo in taking it to be *Struthium*, reſted in the *Radicula* the *Arabians*, which is thought to be the *Struthium* of the Greekes, and have applyed and uſed it for all the purpoſes whereunto they have appropriated their *Conditi* unto: but *Bellonenſis* giveth the deſcription of *Conditi* in theſe words: It is the roote of a plant (that hath prickly leaves like a Thiſtle) of the thickneſſe of ones thumbe ſomewhat yellowiſh on the inſide and blacke without, ſharpe both in tent and taſte (*Strapo* out of *Dioſcorides* ſaith) the roote is long and round, and of a quicke ſharpe taſte, which words are wanting in *Dioſcorides* (ſaith in the printed Latine copies) with the decoction thereof they uſe to cleanſe both woolll and cloathes; and as ſweete ointment makers in *Damaſco*, doe put it into their confections that are made of honey, and boyled with which giveth them ſuch a whitenelle that they ſeeme as if they were made of Sugar, and ſtarch: with the roote cut into peeces, the *Syrians* uſe to waſh the filth out of their garments or ſhirts inſtead of Sope or Lye. I have beene ſomewhat tedious in declaring theſe things, that others might underſtand what *Struthium* and *Conditi* is, and that neither *Saponaria* nor *Lunaria* can be it, for there is no beate or ſharpeneſſe in either of them, beſide their differing forme: the firſt is generally called *Saponaria* by all writers except *Tragus* who called it *Lychnoſlis*, and *Fuchſius*, who as is ſayd called it *Struthium*: the other *Gerard* called *Gentiana ſaponaria*, and placed next unto them, thinking it a *ſpecies* thereof, but it is plainely ſeene and knowne to agree with the *Saponaria* both in rootes leaves, and flowers, and not with *Gentian* but in the bitternelle. It is uſually called in *Engliſh* Sopewort, and of ſome Bruiſewort: the country people in *Kent* and *Suſſex* call it Cill run by the latter.

The Vertues.

The Country people in divers places doe uſe to bruiſe the leaves of Sopewort, and lay it to their ſwolne hands or legges, when they are out to heale them up againe. Some make great boaſt thereof, that it is diuretique, provoke urine, and thereby to expell gravell, and the ſtone in the reines or kidnies: and account it alſo ſingular good to avoyd Hydropicall waters, thereby to cure the diſeaſe, but their practicke is not I thinke ſo authentike, upon their theory or ſpeculation, to inforce beleefe that it will cleanſe the inward parts, as experience it is found to doe the outward of womens treſſes and pewter veſſels: they no leſſe extoll it to be an abſolute cure in *Lues Venerea*, then either *Sarſaparilla*, *Guaiacum*, or *China* can doe: which how true it is others judge, that have judgement upon the knowledge of the truth; for my ſelfe, I cannot be induced to beleeve the one halfe, untill more evident proofes doe convince me.

CHAP.

Chap. LXXX.

Trachelium sive Cervicaria, Throatewort.

Vnder the name of *Trachelium*, (which is a kinde of *Campanula* or Bellflower) may all the reſt of the Bellflowers be comprehended, whereof ſome I have already ſet forth in my former booke, but becauſe there are ſo many, I thinke it beſt to diſtribute them into ſeverall Chapters, that ſo they may be better conceived by me, and apprehended and retained by you, and diſtinguiſhed to all. In this Chapter I will onely mention the reſt of them that have rough or hayry leaves, and in the next thoſe that have ſmooth.

1. *Trachelium maius Belgarum.* Great Throatewort.

The great Throatewort hath very tall and great hayrie ſtalkes and leaves of the faſhion of the other ſort, (for I have ſet it in my other booke, there called the greater *Canterbury* bells, but greater than it, both in ſtalke and leafe) the flower is of a purpliſh blue colour, almoſt as large as thoſe of the *Coventry* bels, in all other things it agreeth with the other.

2. *Trachelium petræum maius globoſum.* The great globe rocke Throatewort.

The roote of the two rocke Throatewoorts, riſeth up with brownish or reddiſh ſtraked hayrie ſtalkes, about two foote high, bearing thereon divers rough or hayrie darke greene leaves on the upper ſide, and paler underneath, of a round forme, and a little dented about the edges with ſome ſmaller leaves ſet at the joynts with them: at the toppes of the ſtalkes eſpecially, grow many flowers, cluſtring together in a round faſhion, and ſome at the joynts alſo with the leaves, but not ſo many, and ſome alſo under them at the lower joynts, but ſtill fewer and fewer, being all of them, of the forme of the former Throatewort, but of a white colour, and ſmaller than the ſmalleſt of *Canary* ſort, and ending in five, ſixe, or ſometimes in ſeven points, having in the middle many yellow ſtrings, and one greater than the reſt, crooked at the end when it is blowen, and which becommeth biforked, and alſo long after, the flowers abide long before they fall, but the ſeede hath not beene obſerved: the roote is knobbed, great and woodily, rugged on the outſide and reddiſh, but white within, and more aſtringent than any of the reſt.

3. *Trachelium petræum minus globoſum.* The leſſer globe like rocke Throatewort.

The leaſer of theſe Throatewoorts, hath the firſt leaves ſomewhat long and not dented on the edges but pointed, and alſo thoſe that grow divers others that are round, and cut in on the edges, ſtanding on long foote ſtalkes, an hand breadth long at the leaſt, ſomewhat like unto thoſe of *Cymbalaria Ithacæ hirſuta*, the Ivie like leafe, or *Hedera terreſtris*, but not ſo thicke, fuller of ribbes and veines, deeplier cut in on the edges, and of a darke greene colour, from which riſe divers naked or bare ſlender ſtalkes, about halfe a foote high, which uſually have one or

1. *Trachelium maius Belgarum.*
Great Throatewort.

2. *Trachelium petræum maius globoſum.*
The great globe rocke Throatewort.

...ares about the middle of them, with little or no stalke at all to them, somewhat deepely dented about the edges, at the toppes of the stalkes stand foure or five long and narrow greene leaves like unto those that grow at the middle of the stalkes, but lesser, narrower and more jagged compassing them at the heads, and from the middle of them start forth divers small flowers, set in a tuft together, of a darke blewish purple colour, with very short footestalkes under them, and are fashioned somewhat like a bigge bellyed bottle, with a small long necke, opening at the brimmes into five points, somewhat deepely cut downe, with divers threds in the middle one being longer and longer then all the rest, issuing a good way beyond the necke, which in the ripening time turneth to a small feede vessell, bifurked like the other: the roote is very rugged, thicke, and woodily.

2. *Trachelium montanum majus.* The greater mountaine Throatwort.

This greater mountaine Throatwort sendeth forth from a long blackish roote, thicke at the head and growing smaller and smaller towards, with many small fibres set thereat, and some bigger, a number of long and narrower leaves, somewhat like those of Alkanet, set at the bottome of the slender round reddish stalke, which is above a foote or more high, with very few leaves thereon, at the toppes whereof grow a few long flowers, somewhat like unto the ordinary sort, of a pale purplish colour, with a long pestell in the middle.

3. *Trachelium montanum Polygoni folijs.* Narrow leafed Throatwort.

This Throatwort hath sundry narrow long leaves lying next the ground, somewhat resembling those of Coutch grasse, the flowers at the toppes of the stalke are bell fashion and somewhat small, of a bluish colour the seede that followeth is small like the rest.

4. *Trachelium saxatile spicatum.* The rocke spiked Throatwort.

This spiked Throatwort sendeth forth from a white great roote full of bunches or knots on the outside, as it doth grow old, and spreading under ground many branches with fibres thereat, sundry round and crooked hoary edged stalkes, of an unequall height, some being a foote and more or lesse high, with broad leaves set thereon without order, not greatly unlike, but yet at a joynt, but sometimes two unevenly placed, jagged at the edges, somewhat like the leaves of *Perennis*, or as that herbe is called by some *Pulmonaria Gallorum*, by others *Pulmonaria arbor*, and *Chondrilla arborea*, and we in *England* as I have shewed you in my former booke Grim the collier and hony, especially underneath: from the middle of the stalkes upwards come forth some flowers at the joynts with the leaves, but especially at the toppes many together spike fashion, one above another, which are small and of a blewish purple colour, but like in forme unto the ordinary Rampion, a Throatwort: after which come such like seede vessells and seed contained in them as is in the smaller Throatwort: this as the rest giveth milke both stalkes and rootes, which is no lesse pleasant and edible than the rest, and endureth many yeares, although the stalkes dye & wast every yeare.

4. *Trachelium foliis Echij.*
White Buglosse leafed Throatwort.

5. *Trachelium Graecum tenuifolium.* Thinne leafed Throatwort with spiked heads.

This thinne leafed Throatwort hath many long and narrow hoary greene leaves, somewhat like unto those of wilde Basill, but much smaller, betweene which riseth up a strong round hollow stalke, about a foote high or more, somewhat straked and of the bignesse of a finger, set with narrower leaves and longer, from the bottome to the middle of the stalke and from thence up to the toppe come forth small whitish coloured flowers, standing at the joynts with the leaves, enclosing long sinked flowers and leaves, set thicke together very orderly: after the flowers are past commeth small heads, containing very small brownish seede: the roote is thicke and white, a finger or more, and rugged on the outside, with some threds set thereat.

6. *Trachelium umbelliferum creticum.* Umbelliferous blew Throatwort.

This Throatwort groweth with a number of small fibres set at the roote, from whence riseth up a stalke about two foote high, being of a low hard rough greene, and somewhat long leaves set one above another, very like unto the ordinary sort, and dented about the edges in the same manner: in the middle of the stalke upward at the joynts it sendeth forth branches set with such like leaves as grow below, but lesser and narrower, every branch being bare or naked of leaves for a little space, next under the toppe, where it is beautified with small narrow leaves, and from thence rise many small perfect blew flowers, set upon little foote stalkes in manner of an umbell or tuft, all of them in a manner standing at an equall height, somewhat like unto the ordinary sort, the heads and seede are like the rest: all the whole plant giveth milke, and is of an hoary greene colour, but is very impatient of cold and therefore must have some extraordinary care bestowed upon it in the winter to preserve it in the winter.

7. *Trachelium montanum humile Alpinum.* Small Mountaine Throatewort.

This small Throatwort hath many leaves rising from the roote, like the common small sort (whose figure I have given you before, in my former booke) every one standing upon a long foote stalke, among which doth rise a round stalke diversely branched, having all the leaves that grow thereon, narrower and longer than those below, and without any stalke to compasse the branches at their lower ends; at the toppe of every

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

every one standeth a reasonable large flower in fashion like the ordinary, ending in five points, of a pale blewish almost asheecolour in some, but of a deeper blewish purple colour in others: after the flowers are past the heads wherein the small whitish seede lyeth, turne downewards when they are ripe, and are three square. The roote is white and great, for the proportion of the plant, having divers heads at the toppe the rest from the leaves shoote forth: the whole plant hath a soft downe somewhat whitish upon it, and grieth milke as the rest doe.

10. *Trachelium folijs Echij.* Wild Bugloss leaved Throatewort.

The lower leaves of this Throatewort or Bell-flower, are many, long, very rough and narrow, lying upon ground, like unto *Vipers Bugloss* but broader and shorter, whose stalke that riseth up amongst them, is a foote high, round and rough also, set with few leaves but smaller, at the toppe whereof stand five or six fayre flowers bell-fashion, upon short footestalkes hanging downe their heads, whose brimmes are also cut, wherein the flowers stand have some hayrie downe set upon them. There is a lesser of this sort as *Matthias* saith, which hath hayrie shorter leaves and lesser flowers, found on the hils among the *Bushes*.

11. *Trachelium serotinum, sive Viola Calabriana forte Gerardi.* The late flowring Throatewort.

This late flowring Throatewort hath the lower leaves very like for forme unto the *Campanula Pyramidalis* or fleecie Bell-flower but softer in handling, the stalkes rise a yard high being soft or almost woolly, the leaves cut & divided into some brimbles at the rope, bearing many Bell fashioned flowers like the ordinary great ones but smaller and of a pale blewish or purplish ash colour, which by reason of their late flowring gave me no knowledge, the roote is thicke and bushie.

12. *Rapunculus Scabiosæ capitulo cæruleo.* Rampions with Scabious like heads.

I was long in suspence with my selfe and unresolved, whether I should set this plant in this place next to finding good authors to set it forth as a Scabious, and *Columna* onely and *Bauhine* that followeth him, differing from them all make it a *Rapuntium*, first, because it giveth milke which no Scabious doth, secondly because having altogether Rapontium like, wherein I would judge of a plant most materially, I could not upon those reasons joyne it with the rest of the Scabious, but place it here according to the stile with this description. It hath many smelled stalkes, somewhat reddish at the bottome, rising up to be a foote high, from a long white lying root, some milke with many small narrow, and somewhat long leaves, whose edges are somewhat dented, or rather cut and wriched, thereon set in, standing thick thereon, without order on all sides, and covered with hayrie downe hayrinesse, unto the toppes almost, yet leaving a good spare bare stile flowers stand in a round heady head of narrow short blue leaves, the middle part formed into white starres and standing in greene husks cut into five or seven points, and a long pointell in the middle, which flowers are long at the first, and like Scabiouses, long falling away when others are beginning to open themselves; all of them when they are past and fallen leave a greene husk standing like a starre, in the middle whereof groweth a small head, containing small like small browne seede as the others have.

13. *Campanula Dodonæi minor folijs.* Bellflowers with small dented leaves.

The leaves of this Bellflower are rough or hairy, greene and small, about an inch long, and halfe an inch broad, snipt about the edges and pointed at the ends, standing on each side of the hairy stalkes that are foure or five high, without foote stalkes: the flowers are but few, of a meane size, formed like Bellflowers, but ending in corners or points, of a pale wish colour set upon long footestalkes: the roote is white and long like the *Rampion*.

14. *Viola Mariana peregrina.* The *Syrian* Coventry Bell.

Unto these kind of plants may very well sort the Coventry Bell, as being much unto them, and therefore I thought it not amisse to joyne this unto them, in this Chapter, set forth by divers, after *Bauhine* who first declared it, as he found it at the foote of Mount *Libanus* in *Syria*, in the shadowy woods. It hath long and narrow leaves, rising from the roote which is somewhat great and long, very like those of the lesse Bellflower Plantaine: but more cut unevenly on the edges, and hairy also, but upon the stalkes those leaves are smaller, and not cut in at all, bearing the flowers at the joynts with them up to the toppes, which are long and more open then the ordinary sort, and parted into seaven or eight corners of a pale purplish colour, the seed he could not observe, being not the time of ripening.

15. *Trachelium subrotundâ folijs.* Round leaved Throatwort.

From a small creeping roote a stalke or halfe a foote high being a little hairy risethup, with a few unevenly round leaves set thereon, hairy or rough also, of about two inches broad, and as long, and little dented about the edges, at the toppe whereof stand a few small blew pendulous flowers like unto the others.

The Place.

These grow naturally in divers places, as some in *Candy*, some upon Mount *Baldus*, and others of the *Alpes*, *Germany*, in *Italy* also and in *Naples*, as *Clusius* and *Columna* hath set it downe, onely the last have one more is afore-said, and the last was sent *Bauhino* from *Helmstadt*.

The Time.

They all flower in the Summer Moneths of *June* and *July*, but yet some of them flower not untill all the rest are past, and scarce perfect their seede, but are encreased by their roote.

The Names.

It is called τραχηλιον, *Trachelium* both in Greeke and Latin, or *Cervicaria*, for that it helpeth the sores of the throate, either inward or outward; it is also called *Pandaria*, because it helpeth the *Pandæ* the palate of the mouth (which hath the diminutive from *Pan*) for the likenesse unto a grape, when it is swollen and fallen down: others call them *Campanulæ* of the likenesse of the flowers unto Bells, and therefore called Bellflowers by which generall name not onely these but the others in the next Chapter, and many other plants are also called. Some also call them, *Rosa Silvestres gentes*, but improperly, and *Rapunculus* or *Rapuntium*, Rampions, because they are like unto Rampions, and many of them edible as they are. *Cæsalpinus* onely as I take it, calleth the great ordinary sort to be *Strobiangelia*: the *French* call them *Gantelettes* and *Gant de nostre Dame*, the *Throate of our Lady*, the *Dutch Halsekruit*, and we in *English Canterbury Bells*, and Throatwort, or some Haskewort: the reason set forth is that sort that *Lobel* called, *Trachelium majus Belgarum*, and *Bauhinus* to vary the name *Campanula folijs latissimis*: the second and third is set forth by *Pona*. in the description of Mount *Baldus*.

Original from UNIVERSITY OF MICHIGAN

whereof *Lobelius* calleth *Campanula Alpina sphærocephalos* and the leaſſer *Rapunculus Alpinus cornicularum*, which is his *Phyteuma*, and *Matthiolus* he called *Rapunculus Alpinus ſpicatus ſimilis*; but having obtained a more exact knowledge thereof from *Pona*, he altered the title and gave both the deſcription and figure more plainely: the fourth is called *Trachelium montanum* of *Lugdunenſis*, which *Bauhinus* calleth *Campanula frigis Anchuſæ floribus alterius*: the fifth *Columna* calleth *Trachelium montanum*, and *Cluſius Trachelium Tragopogi folijs*; but *Bauhinus* taking all the *Trachelia* almoſt to *Campanulas* calleth it *Campanula Alpina Tragopogi folijs*: the laſt *Cluſius* fourth ſorth to the *Occidentalibus*, having received it from *Gregorius de Reggio* a Chirographer of *Piſa* in *Italy*, by the name of *Pyramidalis villoſa ſaxatilis latifolia*; and *Cluſius* upon conſidering it with others of the like kinde, ſaith it may be called either *Rapunculus ſaxatilis montanus Dioſcoridis folijs*, or *Rapunculus montanus Columnæ Cæruleus flore*, and *Trachelii flore*. *Bauhinus* diverſifieth it to *Trachelium ſpicatum folijs Pulmonariæ cæruleum*: the ſeaventh *Cluſius* calleth *Trachelium Dioſcoridis*, and *Thalium* in *Hercynia Phyteuma Cæruleum major tenuifolium*. *Lugdunenſis* ſetteth it forth by the name of *Echium montanum Dalechampii*, and ſaith ſome called it *Alpinum verum*, but as *Cluſius* there ſaith, that though the leaves bee like unto *Echium*, yet in are not the flowers haire, nor ſeede roſtelle, and therefore cannot ſo properly be referred unto *Echium* as to *Trachelium*. *Bauhinus* calleth it *Campanula folijs Echij*, in the Chapter of *Trachelium*, and in the Chapter of *Echium* hee calleth it *Echium Alpeſtre luteum*, and referreth it likewiſe to his *Trachelium Thyrſoides* of *Cluſius*. *Lugdunenſis* figure of *Echium montanum Cluſij* alloweth of to be his *Trachelium Thyrſoides*, but it cannot bee *Echium luteum* alſo, as any one may eaſily finde and know; but this muſt be accounted but one of the ſlippes of memory (for the firſt *Campanula Echij folijs* is likely to be the figure of *Lugdunenſis* his *Trachelium montanum* indeede) and yet he ſaith it not the ſame, but ſaith in his *Prodromus* he giveth the figure thereof becauſe *Cluſius* gave none, and yet the toppe of flowers doth not carry that ſhew of a *thyrſus* or bush as *Cluſius* ſaith his doth. The eighth *Tragoselinum* in his *Italian* deſcription of Mount *Baldus*, maketh mention of by the ſame name is in the title, having received it from Signor *Contarini*, a *Magiſtrato* of *Venice*, brought to him from *Candy*, as it is thought; which *Bauhinus* calleth *Campanula Valerianoides cærulea*: the ninth *Cluſius* calleth *Trachelium pumilum Alpinum*, and *Bauhinus Campanulæ Alpinæ ſimilis lanuginoſa*: the tenth is called by *Rechinger Campanula folijs Echij ſpinoſis*. The eleventh *Cæſalpinus* calleth *Viola Calabriana*, the true Calabrian Violet, upon what good ground I know not, for all Authors that have written of it ſince *Pliny* his time, who firſt gave the name have reiected it to bee of the Autumne *Gentians* (and himſelfe doth ſo likewiſe among the *Gentians*) except *Dalechampius* who tooke the *Digitalis lutea* to be it; yet maketh the ſame *Gentian* or *Gentianella eſtiva* to be it alſo, calling it *Thyſelinum minus*, but I thinke he would not to have written, ſeeing himſelfe both knew and ſet it downe for a Throatwort, had he not herein beene led by his owne or ſome others willfull judgement, as it is moſt probable. I have as you ſee given it another title, moſt anſwerable in my judgement thereunto, and the deſcription moſt proper as it grew with me, the colour of whole flower I never ſaw, other then a pale blewiſh or purpliſh wheelour, and never ſay bright purple as he ſaith it is: the twelfth as I ſayd, divers did take to be a ſmall or ſheepes Scabious, as *Belon*, *Dodonæus*, *Lonicerus*, and *Lobel*, but *Columna* conteſting there againſt ſheweth by thoſe properties before ſpoken of, that it cannot be any ſort of Scabious but a *Rapuntium*, and calleth it *Rapuntium montanum capitatum hyacinthoides*, and *Bauhinus* as it is in the title: the thirteenth *Bauhinus* only mencioneth in his *Pinax* and *Prodromus* by the ſame name that I doe the 14. *Rauwolfius* in his journall treats thereth, & calleth *Medium Dioſcoridis*, and *Alcibium Rheſi*, and from him *Lugdunenſis* and *Camerarius* upon *Matthiolus* ſo call it. *Bauhinus* calleth it *Viola Martiana laciniata foliis peregrina*. The laſt *Bauhinus* only mencioneth in his *Prodromus* and *Pinax*.

The Vertues.

Although the rootes of many of theſe be ſweete in taſte, and therefore eaten in Sallets, eyther raw or ſtewed as both the greater and ſmaller ordinary ſorts of Rampions, ſet forth in the next Chapter, yet ſome of them here delivered as well as the greater ſorts, ſet forth in my former booke, are not ſo pleaſant but rather more aſtringent; by which qualitie they are found to be effectuall, not onely in all Vlcers of the mouth or throat, to gargle and waſh them, or for the *Vvula* or the palate of the mouth, when it is ſwollen and falſen downe; but for all other ſores, whether in the ſecret parts of man or woman to be uſed in decoction with honey, wine and allome, or in any other part of the body; for by the faculty of drying and binding, they are very profitable for old ſores, to reſtraine the moyſt and ſharpe humours which fret the place, and keepe them from healing, and for greene wounds and ulcers to glute up the lippes of them ſpeedily.

Chap. LXXXI.

Rapuncli ſive Campanulæ gibbæ. Rampions or wild Bellflowers.

IN the former Chapter I ſhewed you thoſe ſorts of Bell-flowers that had hoary, rough, or hayrie leaves, which as I ſayd are uſually called *Trachelia*, and *Cervicaria*: ſo the other whole leaved ſorts both ſmooth and not hayrie or very little, are either called *Rapuncli* Rampions, ſome being of old nurſed up in Gardens, for daily uſe and to be neere at hand, or growing wilde, and onely uſed as they may bee found, or *Campanulæ* Bell-flowers, being like unto them in ſome things, although that quality of bitternes and healing bee wanting, yet not to be diſpraiſed.

1. *Rapunculus ſcariolæ vulgaris.* Garden Rampions.

The Rampions that are uſually kept in gardens, are accounted a better kinde than many of the others that grow wilde and long upon the ground, with divers ſmall and long round pointed pale greene leaves, before it ſhoots up to ſtalke, which ſpread divers ſuch leaves thereon, but ſmaller to the toppe, where breake forth, many ſmall pale purple flowers, ending in five points like unto the former Throatwoorts, but much ſmaller, growing thick like heads, with ſmall brownish ſeede therein: the roote is ſmall and white, and giveth milke forth when as all the reſt of the plant doth; ſhooting two or three branches almoſt of an equall bigneſſe, which

1. *Ranunculus hortensis vulgaris.* Garden Ranpions.

2. *Ranunculus spicatus Alopecuroides.* Long Foxtaile Rampions.

is sweete in taste, and therefore much used to be eaten.

2. *Ranunculus spicatus Alopecuroides.* Long Foxtaile Rampions.

The lower leaves of this *Rampion* are somewhat broad and round, yet ending in a point, dented about the edges, of a darke greene colour, in some places spotted with blacke spots, and standing upon small long footstalkes, but those that grow upon the stalkes are somewhat longer and narrower, yet but sparingly set there, leaving the toppe bare, where standeth a small spiked head or bush of flowers, seeming like those whereof it tooke the name; at the first of a darke greenish colour, for so are the husks and the flowers which breake out of them, being long and small, like unto hornes, bigger below and smaller above, ending in two or sometimes in five points, of a blewish purple colour, in some paler in others deeper, and in some of a white colour, which being past there appeare in their places, small round heads, a little cornered, with brownish seed therein: the roote is white greater than the former, but as full of milke, and as sweete and as to be eaten especially when it is boyled, and after stewed with butter, &c.

3. *Ranunculus Alopecuroides orbicularis.* Round Foxtaile Rampions.

This kinde of Rampion differeth little in shew, from the rocke Throatewoorts, described in the Chapter before, but that the roote hereof is more full of milke, tenderer and smaller, nor so hard or woodily: the next leaves at the bottome are pointed and smooth, not hayrie or hoary: it shooteth a foote high or more, sometimes crested having narrower and longer leaves on them than the lower, and two or seven standing together at the toppe, under the spiked but round head of flowers, which are long and crooked, like unto those of the rocke Throatewoorts, with five pointed ends, of a deepe purple colour in some, and white in others, and some with stripes in the middle, the heads and seede are like the other Rampions.

4. *Ranunculus sylvestris umbellatus trium specierum.* Bush headed Rampions of three sorts.

The three differences in these Rampions are that the one having somewhat broade and long leaves, little or nothing dented about the edges, and standing one above another, upon the slender low stalkes, bearing at the toppe small open flowers, like unto the garden Rampions, but of a bluer colour, many set together in a bush: it groweth higher, but hath narrower leaves and more dented, and flowers at the toppes standing thicke together but much smaller than the former, of a blewish colour also: the third is the least of all, having lower and narrower leaves thereon than any, being almost like grasse; the flowers likewise be little or none at all, but ending in a head at the end, and of a pale blewish colour.

5. *Peltromenta Cretica sive Ranunculus Creticus.* Candy Rampions.

The first leaves that spring up from the seede of these Rampions, are round like unto Violet leaves, having nothing dented about the edges, which is alwaies the first yeare, but those that rise afterward are very much different from them, being much cut in and deeper into severall parts, set on both sides of the middle rib, the end being longest: all of them dented, of a darke greene colour on the upper side, and reddish underneath; from among which rise up diverse crested stalkes, two or three foote high, bearing such

4. Rapunculus Orbicularis Rapunculus Cretensis. Candy Rampions.

5. Rapunculus Oleraceus. Rapuntia. Rapuntia Cretensis. Candy Rampions.

outwards below, but smaller from the middle of them to the toppes, stored abundantly with many reddish small purple flowers, and sometimes white, one above another in a long spike, which are very like unto Rampions, but somewhat longer, and are divided into the corners, and each part turning it selfe a little backe againe: after which come very small brownish seede in heads, both of them like unto the other Rampions: the roote is long and white, parted into many branches, giving milke as the leaves and stalkes also doe, and abideth many yeeres although the stalkes and leaves perish every yeare, fresh springing up before winter againe: thus is hardy enough, and requireth to be a little defended and preserved in the winter with us.

3. *Rapunculus sive Campanula Pyramidalis minor.* The lesser steeple Bell-flower.

The small Rampion or Bell-flower, call it which you will, hath from a small long white almost transparent root, not into that of the smaller garden Rampions, and long abiding, many long and somewhat broade leaves a little cutted about the edges, set on each side of the single round stalke, rising about a yard high or more, broad at the bottome with leaves below, and smaller outwards bearing at the toppe a spiked head or bush with small Bell-like flowers, one above another, smaller below than above, of a hoe delayed blew with colour, and a little pointed at the edges, with a long stile or pointell, growing out of the middle of every one, and smelling pretty well: the leaves and roote are like the other Peachleafed Bell-flowers. *Alpinus* suspected some venemous quality to be in this roote, upon the clammie taste therein, and doubted whether it might not be the *Aconitum folio Lactucæ* of Theophrastus, mentioned in his 9. booke, and 14. chap.

7. *Rapunculus sylvestris.* Wood Rampions.

The wood Rampion hath the lowest leaves somewhat long and dented about the edges, yet not so long as those that come after them, which are very long and dented also, standing upon short stalkes with some small leaves at the joints with them, the flowers are like the other Rampions, of a pale watchet colour: the roote small, white and long, but not so tender as the other.

8. *Rapunculus sylvestris major flore.* Wood Rampions with great flowers.

The lower leaves of this Wood Rampion are small, somewhat long and round at the ends: the other following are somewhat broader upon the stalkes are narrower and longer and pointed also, the flowers are longer then the other, of a pale purple colour, with purple veines in them, many standing together like unto the ordinary Rampions, and of the same fashion with five points, of a deeper colour then the flower: the roote is somewhat like unto that of a Radish in colour and tasting to red, full of milke, being sweete and as fit to be eaten, and more delightful than many others.

9. *Campanula Alpina latifolia major flore.* Sutton broad leafed Bell flower.

This hath divers small tender stalkes, scarce an handbreadth high, set to the middle on both sides with small broad leaves about an inch broad, and somewhat round withall; slightly dented about the edges, of a pale greene colour, and bare without leaves from the middle to the toppes, where usually stan-

6. 15. *Campanula Pyrenaica minor & Rapunculus pyrenæi.* Rocke Rampions, and the little Steeple Bell-flower.

9. *Rapunculus sylvestris.* Wood Rampions.

deth but one flower, of a meane size, that is neither so great as many others of the following Bellflowers are, yet so small as the littlenesse of the plant might seeme to promise, of a fallen darke purple colour: the leaves & roote are answerable to the Peach leafed Bellflower, which as I sayd is extant in my former booke, and the figure thereof here exhibited.

10. *Campanula rotundifolia minima.* The least broad leafed Bellflower.

This little plant hath divers leaves rising from a small, long, white, threddy roote, which are somewhat broad and round, a little dented and hard, each set on a small foote-stalke, among which rise up two or three slender small reddish stalkes, not an handbreadth high, for the most part without any leaves upon them, at the upper whereof grow usually but one small blewish flower, fashioned like the other lately Bellflowers, ending in five or six corners with a pointell in the middle: the seede is small like the rest.

11. *Campanula minor sylvestris rotundifolia.* Wilde field Bellflowers.

The lower leaves of this kind of Bellflower, that lye upon the ground are alwayes round and small, somewhat like unto a Violet leafe, but rounder, snipped or dented, from whence rise divers weake slender stalkes, about a foote high, set from the bottomes to the toppes, with many very small long and narrow leaves, where the flowers stand upon severall small long stalkes, very like in fashion and bignesse, unto the small Garden Rampions, of a perfect blew colour, and sometimes white, as hath beene observed in some places, yet very seldome: the small seede followeth in small heads like those of the Rampions: the roote is small and threddy.

12. *Campanula minima sylvestris.* Small wilde Bellflowers.

This Bellflower differeth little from the last, but in the slender stalkes, which having very few leaves thereon or none at all, are notstored with more flowers on them usually then one, but of as perfect a blew colour as the former, and almost as large.

13. *Campanula linifolia carulea.* Flax leafed Bellflower.

All the leaves of this Bellflower, as well the lowest as those upon the slender weake stalkes, (unable to sustaine themselves, are small, narrow and long like unto Line or Flax: the flowers are of a pale blew purple colour, like in forme unto the other of the small Bellflowers, and so are both seeds and roote.

14. *Campanula lutea linifolia.* Small yellow Bellflowers.

This is also in most things like the last, saving that the lower leaves are a little larger, yet long, and not dented about the edges: in the forme of the flowers or manner of growing this differeth not, but in the colour, which is of a pale yellow.

15. *Campanula Serpilli folia.* Time leafed Bellflowers.

This small Bellflower hath many slender weake brownish branches, rising from a small threddy roote which creepe and shoote forth rootes as they lye upon the ground, divided into other smaller branches, very like Wilde Time, or Mother of Time, having many small leaves of a pale greene colour underneath, somewhat round, set by couples one against another, along the middle ribbe, some of them being greater, like unto the small Money wort, and others like the wilde Time but dented: the flowers grow at the ends of the branches sometimes from the joynts with the leaves, standing upon slender short foote stalkes, sometimes two

hanging downe their head, like in forme and bignesse unto these tall Bell-flowers, but of a reddish purple colour: the whole Plant doth so resemble wild Time, that but the flowers onely can well doe distinguish them.

16. *Campanula Cymbalariæ folio.* Ivie leafed Bell-flower.

The stalkes of this Bell-flower rise up to be scarce halfe a foote high, yet leane downe wards upon what standes next it, and bringeth forth from the bottome almost, set very sparingly and without order, whitish round indented leaves, unevenly dented about the edges, like unto those of ground Ivie, or the *Cymbalaria*, which are somewhat like it, every one upon a small long footestalke: at the toppes of the stalkes, and sometimes at the sides of them, stand somewhat long blue flowers, like unto the other Bell-flowers, upon long footestalkes.

17. *Rapunculus petræus.* Rocke Rampions.

The roote of this Rampion is long, white and of a fingers thickenesse, growing so tall into the Rocke that with much labour it can be drawne out whole, being of a sweetish and sharpe taste, often tasted as a sallet: hath divers thicke, and somewhat broade leaves, ending in a point, from whence rise two or three slender stalkes scarce a foote high, having narrower and longer leaves on them set opposite, at the toppes whereof stand round heads, of many bluish flowers set together without smell, after which follow very small pointed seede, as bigge as Poppie seede. There is another with thinner leaves and smaller flowers.

The Place.

Many of these are strangers to us not growing wilde in our Land that I can heare of, but some in many others in *Italy*, and some in *Germany*, &c. yet some of them in divers places of this Land, as the first, second, third, eleventh, and twelfth.

The Time.

They flower all the Summer long, some abiding long, and lasting untill the Autumne cold dewes doe weare them away, others sooner spent.

The Names.

Some call these *Rapunculi*, and *Rapuntia*, *Gesner*, *Dodonæus* and others call them *Rapa sylvestria*, having little likenesse at all with *Rapum* the Turnep, but in the ediblenesse of the roote, although the name be a diminutive thereof. Others call them *Campanulæ* of the forme of the flowers, being like little Bells. *Cæsalpinus* taketh the *Rapunculus minor*, to be *Erinus* of *Nicander* and *Dioscorides*, and the other *Rapunculi* to be kindes thereof. *Matthiolus* taketh the *Campanula prænestæ folia*, to be *Phyteuma* of *Dioscorides*; and *Cæsalpinus* calleth the *Campanula spicata flore Alopecuroides*, *Phyteuma folio Rapunculi*, chiefely because the heades with seede naturally hang them, as *Dioscorides* saith the seede of his *Phyteuma* hath. The first is called *Rapunculus* and *Rapuntium* also by *Matthiolus*, *Camerarius*, *Dodonæus*, and others. *Tragus* calleth it *Rapunculum vulgare*, and *Lobel Rapunculum parvum sive Pes lacertæ Anserinæ*. The second is called *Rapunculum sylvestre* by *Tragus*, and by *Dodonæus Rapum sylvestre majus*, and *Rapunculum Alopecuron*, by *Lobel Rapuntium majus Alopecuroides caule flore*, &c. *Rapunculus Alopecuroides longa spica*, by *Tabernæmontanus Rapunculus sylvestris spicatus*, and by *Tabernæmontanus Rapunculus nemorosus primus*: the third is called by *Clusius Rapunculus Alopecuroides orbiculari pene spica*, by *Columna Rapum sinuatum corniculatum montanum*: the first of the fourth kinde *Thalius* calleth *Rapunculus sylvestris cæruleus umbellatus minor*, and is the second *Rapunculus umbellatus* in *Camerarius* his figures, at the end of his *hortus medicus*: *Bauhinus* calleth *Rapunculus umbellatus latifolius*: the second of the fourth kinde, as the first with those three figures of *Camerarius*, and is the *Rapunculus sylvestris cæruleus umbellatus major* of *Thalius*, which *Bauhinus* calleth *umbellatus angustifolius*; and the third of the layd fourth kinde, is the seventh mentioned with *Thalius*, and the third of *Camerarius* his figures, which *Columna* calleth *Rapuntium alterum angustifolium*, and *Bauhinus Rapunculus umbellatus folio gramineo*: the fifth is *Perromarina*, *seu Lactuca petræa*, mentioned by *Honorius Belluc*, in his first Epistle to *Clusius*, and by *Pona* in his *Adonis Babilon*, and by *Fortunius* in his generall History, which thereupon *Bauhinus* calleth *Rapunculus Creticus*, *seu Pyramidalis altera*: the sixth called by *Bauhinus Rapunculus Alpinus seu Pyramidalis minor*, and thinketh it to be the *Campanula foliis serratis* of *Lobelius* in *horto Eystettensi*. The seventh is called by *Thalius Rapunculus Campanulæ Nerviliensis*, and by *Tabermontanus Rapunculus nemorosus*. The eighth is called by *Columna Rapuntium seu Erinus*, and by *Bauhinus Rapunculus nemorosus magno flore minor*. The ninth and tenth are so called by *Bauhinus* as they are in their titles: *Anguillara* taketh the eleventh to be *Campanula Plini*, and *Cæsalpinus Rapunculus omnis flore, in summo caulículo*, and is also the *Campanula minor rotundifolia* of *Lobel*, or *Alpina rotundifolia*, but *imis foliis* of *Clusius*, which *Bauhinus* would distinguish, and thereupon hath given us he saith, another of that *Alpina rotundifolia minor*, but assuredly they cannot differ, otherwise than the place may give it, for I have seene and gathered both these sorts, with the differences specified, in one and the same ground. The twelfth is called by *Tabermontanus Rapunculus sylvestris flore ex purpureo cæruleo*, and by *Gesner Rapunculus minor, altus & nudus*, for that they grow usually on the barren dry Heath of *Hampstead*, and other places under the bushes. The thirteenth is called by *Bauhinus Campanula Alpina Gesneri folio serratæ*, the same *Tabermontanus Rapunculus nemorosus tertius*, and by *Bauhinus Rapunculus nemorosus angustifolius*, which is the same with *Gerards Campanula Pyrenæi folio*. The fifteenth and sixteenth are so named as the Authors demonstrate them by *Bauhinus*, who onely remembreth them: the last is remembred by *Alpinus* in his *Exotics*.

The Vertues.

The roots of all the sorts of Rampions, and so likewise some of the Bell-flowers, especially of the greater, whose roots, than the ordinary stringie ones, are used for sallets either cold with vineger, oyle, and pepper, or boyled and stewed with butter or oyle, and sugar, blacke or long pepper cast on them; either way are good, for they are familiar to the stomacke, stirring up the appetite, and by reason of their temperature causing good digestion, and engendreth store of milke in nurses breasts; the roots beaten small, and mixed with the meale of *Lupines*, cleanseth the skinne from spots, markes, or other discolourings. The distilled water of the whole plants, roots and all, performeth the same, and maketh the face very splendent and cleare.

Chap. LXXXII.

Digitalis. Foxglove.

Although I have set forth in my former booke many sorts of Foxgloves, being all of them pretty ornaments to a Garden that is kept for delight, yet there is one remaining to bee spoken of, being commonly knowne to grow wilde in our land, in every countrey almost, so that it is not thought worthy a place in our Gardens (although in other countries beyond the Seas, where it is not so familiar, it is as greatly desired as any other within us, that is common with them) but I thinke not amisse to expresse the names of them I have formerly set forth, that so you may see all the sorte in one place; *Digitalis maxima ferruginea*, Dun coloured Foxgloves, *Digitalis major flore carneo*, Bluish coloured Foxgloves. *Digitalis media flore luteo rubente*, Orenge tawny Foxgloves. *Digitalis major alba*, The greater white Foxglove. *Digitalis alba altera, seu minor*, The lesser white Foxglove. *Digitalis major lutea flore ample*; The greater yellow Foxglove, whose figure I give you here with the common; and *Digitalis minor lutea, flore pallida*, The small pale yellow Foxglove.

Digitalis purpurea vulgaris. Common purple Foxglove.

This common Foxglove hath many long and broad leaves lying upon the ground, dented about the edges, a little rough or woolly, and of a kind of hoary greene colour, among which rise up sundry stalkes sometimes, and but one very often, bearing such leaves thereon, from the bottome to the middle; from whence to the top it is stored with large and long hollow reddish purple flowers, a little more long and eminent at the lower edge, with some white spots within them one above another with small greene leaves at every one, but all of them turning their heads one way, and hanging downewards, having some threds also in the middle, from whence rise round cods pointed sharpe at the ends, wherein small browne seede lyeth: the rooces are many small huskie fibres, and some greater strings among them; the flower hath no sent, but the leaves have a bitter hot taste.

The Place.

It groweth in dry sandy grounds for the most part, and as well on the higher as lower places under hedge sides, in every countrey almost of this Land.

The Time.

It flowreth in June before *July*, and the seede is ripe in *August*.

The Names.

It was not knowne unto any of the ancient Greek or Latin writers, for it hath scarse attained a Latin name other then *Digitalis* from the hollow forme of the flowers, which are like finger stalles: Some have taken it to bee a kinde of *Verbascum*. *Cesalpinus* calleth it *Virga regia major flore purpureo*, *Altheæ* also and *Damasonium*, and *Pistolochia pastoris*. *Tragus* calleth it *Campanula sylvestris, flore purpureo*, and *flore luteo*: *Columna* taketh it to bee the *Ephemerum* of *Dioscorides*, and *Dalechampius* upon *Pliny* taketh it to bee *Celsia* or *Viola Plinij*, as I sayd be-

so e: the *Indians* call it *Arabis* as *Camerarius* saith, the *French* call it *Gant de nostre Dame*, and *Dutch* & *Germanes* call it *Fingerhort* and *Fingerkrant*, the *Dutch* *Foxtyvinds*, and we in *English* Foxgloves.

The Vertues

The *Italians* have an usuall proverbe with them concerning this herbe, called by them *Arabis* which is as much *vuole piaghe salda*; *Arabis* healeth all sores: for they use it familiarly to heale any fresh or greene wound or sore the leaves being but bruised and bound too, and sometimes also they use the juyce in old sores to clense them dry up their moysture, and heale them the more speedily, which is performeth by the bitter quality therein whereby it is found to be heating and drying, and cleansing withall; so that whensoever there is needs of a consolidating or exterminating of thicke tough flegme and vitious humours troubling the chest or stomacke; the decoction or the herbe made up with some Sugar or honey is available, as also to clense and purge the body both upwards and downewards sometimes, of tough flegme and clammy humours, and to open the obstructions of the Liver and Spleene; and yet notwithstanding that these qualities are found to bee in it, there are but few Physitions in our times that put it to these uses, but is in a manner wholly neglected: It hath beene found by late experience to be available for the Kings Evill, the herbe heated and applyed to the place, or the juice made up for an ointment and used thereon: And it hath beene of later experience found also to be effectuall against the Yellowenesse, that divers have beene cured thereby; for after the taking of the decoction of two handfuls thereof and foure ounces of *Polipody*, of the oake bruised made in Ale, they that have beene troubled with the disease 16. yeares and have fallen once in a weeke or two or three times in a moneth, have not fallen one of 4. 5. moneths, that is until the writing hereof, which I thinke may be sayd to be an absolute cure, nor is to be feared that after so long stay it should returne againe.

Chap. LXXXIII.

Helenium sive Enula Campana. Elecampane.

Although *Dioscorides Theophrastus* and *Pliny* that followeth them did in ancient times account divers to bee called *Helenium*, which were much differing one from another, and which are so well known as yeelt at by us in these times, what they are, as that *Heleneum Theophrasti* is handled in this Chapter of *Helenium*, and that *Helenium Campanum*, with which name I know not how it should be addressed, as the latin in this Chapter of *Costus*, if they be not both one; and that *Helenium* of *Dioscorides* is to bee handled and set a matter pertained among the sweete herbes put into Garlands, which may also be the same with that *Inula Pamphilium* of *Dioscorides*; and although *Serapion* in diverse places maketh a difference the *Inula* and the varieties thereof which I for some whereof I have spoken in my former booke, yet meaning not to speake of any of them in this Chapter, but of the most ordinary sort, even the kind of *Dioscorides*, which is most usually called *Enula campana*, Elecampane; and of that which is thought to be *Dioscorides* but *Helenium Egyptium* in the next; the description of which you shall have in this manner. It shooteth forth many large leaves lying neare the ground which are long and broad, small at both ends, somewhat soft in handling, of a whitish greene on the upper side, and gray underneath, each set upon a short foote-stalke; from among which rise up divers great and strong hairy stalkes, three or foure foote high, with some leaves thereon compassing them about at the lower ends, and are branched towards the toppes, bearing divers great and large flowers, like unto those of the Corne Marigold, both the border of leaves, and the middle thrumbe being yellow, which turne downe, with some long small brownish seede among it, and is carryed away with the windes: the rootes is great and thicke, branched forth divers waies, blackish on the outside, and white within, of a very bitter taste but good scent, especially when they are dryed, no part else of the plant having any smell.

Helenium sive Enula Campana.
Elecampane.

The Place.

It groweth in the moyst grounds and shadowy places oftner then in the dry, and open borders of fields and lanes, and in other waste places almost in every countrey of the Land.

The Time.

It flowreth in the end of *June* and *July*, and the seede is ripe in *August*, the rootes are gathered for use, as well in the Spring before the leaves come forth, as in Autumne or Winter.

The Names.

It is called in Greeke ἕλενιον, *Helenium* also in Latine, and of some *Inula*, and *Enula*, and *Enula Campana*: some thinke it tooke the name from the teares of *Helen*, from whence it sprung which is a fable; others that they had

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

the Moon fell in love with her, when Pan carried her away: others say it was so called, because Helen first found it growing in the prints and stingings of venemous beasts; and others thinke that it tooke the name from the Island Helena, where the first was found to grow: the Arabians call it Sufin, and Rasis, the Italians Enula, and Enula campana, the Spaniards Raiz de alle, the French Aunee and herbe Aunee, the Germans Alant, and Alantwurtz, the Dutch Alandt, and Galandwortel and we in English Elecampane generally, yet in some countries of our kingdom, as Worcestershire and Herefordshire Angelica and Cordus take it to be Petite Consoude, or Petite Comfrey.

The Vertues.

The dried roots of Elecampane preserved with Sugar, or made into a syrupe or conserve, are very effectuall to warme a cold & windy stomach, and the pricking and stitches therein, or in the sides caused by the Spleene, and to helpe a cough, hotnesse of breath, and wheesling in the Lunges: the dryed roots made into powder mixed with Sugar and taken, serves to the same purposes, and is also profitable for those that have their urine or their menstruous flux, those that are troubled with the mother, or are pained with the stone in the reines, kidneys or bladder, ruptures or bursten, and stayeth the breeding of the venome of serpents, &c. as also of corrupt and pestilentiall fevers, and the Plague it selfe; for which purpose it is put into treakles, and other medicines for that disease. Sextus Empiricus writeth in his 19. Booke and 5. Chapter, no day passe without eating some of the roote of Enula campana, which it may be thought did to helpe digestion, evacuate melancholy and sorrowe, and to cause mirth, and to move the belly downe wards: for all which they are also effectuall: the roote and herbe boyled and put into new Ale or Beare instead of wine as they use in Germany, Italy and other places, and daily drunke of them that have weake and dim sighes, cleare the sight, strengtheneth and quickneth the sight of the eyes wonderfully, the decoction of the roote in wine, or the juice taken therein, killeth and driveth forth all manner of wormes in the belly, bladder, reines, and gargled in the mouth, or the roote chewed taketh foule sores in, and helpeth to keepe them from putrefaction: the same also drunke is good for those that spit blood, helpeth to reincorporate Crampes or Convulsions, and the paines of the Gouts, and the luckie bone or hip-gout called the Sciatica, the bolsterlie and paines in the joynts, or those members that are out of joynt, by cold or moysture happening to them, applyed outwardly as well as inwardly, and is good also for those that are inclined or have any inward bruise: the roote boyled well in vinegar, beaten afterwards, and made into an ointment, with Hogs fleet or oyle of trotters, & a little salt and vinegar in powder added thereto, is a most soveraigne remedy for any scabs or itch, in young or old; the places also bathed or washed with the decoction of the same roote, the same also helpeth all sorts of old sores, or filthy sores or Cankers whersoever. In the roote and herbe (which is the chiefe effect for all the vertues before said), yet the leaves are sometimes also used to good purpose: And the distilled water of them and the roote together is used also in the like manner, and besides is very profitable to cleanse the skinne of the face or other parts from any morphew, spots, or blemishes therein, and causeth it to be cleare.

Chap. LXXXIIII.

Helianthemum Dioscoridis, sive Helianthemum, Dwarfe Cistus or small Sunflower.

According as many good Authors doe, I account this herbe for the second *Helianthemum* of *Dioscorides*, although it hath received other names by divers writers, and therefore joyne it next thereunto, and because it much resembleth some other sorts of Cistus. I thinke it fit to entreate of them in the succeeding Chapters, and not mingle them together, for of these kinds there are many sorts, some whereof I have set forth in my former bookes, which are the *Cistus Frisicus*, the Dwarfe Holly Rose of *Friseland*, and the *Cistus ferax* the Holy Rose of 2 yeare, which I shall not needs to describe againe in this place, but where you shall finde them, yet I will here give you their names.

1. *Helianthemum vulgare, sive Chamæcistus flore luteo & Plantagini quæ rendam.*

The ordinary yellow Dwarfe Cistus or small Sunflower.

The roote of Dwarfe Cistus creepeth forth from a hard woodie brownish root growing in time to be somewhat great, of a reasonable long, and divided into small branches at the lower end, sundry small and weake, yet hard and almost woodie branches, lying for the most part round about the head of the roote, upon the ground, wherein are very many small and somewhat long leaves, a little soft or hairy, with other small leaves also growing upon the tops of the tuppes whereof stand three or foure small pale yellow and sometimes gold yellow flowers, consisting of five round pointed leaves a peece, with some yellow threds in the middle, of a pretty fine bone place, but little or none in others; after which follow small round heads, containing certain small yellowish seed, this dyeth not but abideth many yeares, increasing in branches, which yeeld a wholesome smelling sent like unto Comfrey, and is of an austere and astringent taste.

2. *Helianthemum flore albo,* White Dwarfe Cistus or small Sunflower.

This Cistus differeth little from the former, but that it riseth somewhat higher, the leaves being a little whiter or greyer, and rather to wards together: the flower also is somewhat longer and white, in some places having a little yellow, but little or nothing at all, but an astringent taste like the other.

3. *Helianthemum Sabaudicum,* The Savay small Sunflower or Dwarfe Cistus.

This is another of the same kind, differing very little from them, having like side but much reddish branches somewhat more upright, and divided into other lesser, with foure small narrow leaves much lesse than the rest, yet like the flowers are like the others, being in some yellow, in others white; the seed and roote are not unlike.

4. *Helianthemum Anglicum latifolium.* Narrow leafed small Sunflower or Dwarfe Cistus.

This small kind of Dwarfe Cistus is likewise a small plant, having most of the branches lying on the ground, the leaves growing in like sort from all the rest, that is confusedly, for they are very many, long, narrow and in a manner hoary or white; at the tops of the stalkes rise up small whitish or pale yellow flowers, like in forme unto the other with small threds in the middle: the heads that follow are small and three square like unto those of Line or Flax, with reddish seede in them; the roote is woodie and fibrous.

5. *Cham æ-*

1. *Helianthemum vulgare.*
The ordinary dwarfe Cistus or small Sunflower.

5. *Helianthemum Canadense.*
The Canada Dwarfe Cistus.

Chamæcistus Frisica. The Dwarfe Cistus of Friesland.

5. *Chamæcistus Latifolius.* Broad leafed small Sunflower or Dwarfe Cistus.

The small branches of this low or Dwarfe Cistus doe lye on the ground, but the leaves are somewhat broader then in any of the former, nearest in forme unto small Mirtle leaves, and pointed at the ends: above the leaves on a small stalke stand foure or five small yellow flowers like the rest; the heads for seede are three square, and the seede within them somewhat rough and reddish; the roote is like the rest abiding long.

6. *Chamæcistus hirsutus.* Dwarfe Cistus with rough leaves.

The stalkes of this low Cistus grow more upright then the former, more blacke also and more woody, about halfe a foote in length, having so many small, rough and hairy darke greene leaves set thereon, somewhat like the last, and so thicke that they seeme to have foure at a joynt at the toppes of the stalkes and branches for they are divided into smaller ones, stand usually but one somewhat large flower, and sometimes two, consisting but of one leafe, yet cut in so deepe that it seemeth to be five round pointed leaves, of a pale purple or light bluish colour, with a long purplish stile, or pointell in the middle, compassed about with ten small chives, dot with blackish chives, after which come five square round heads containing small yellow seede: the root is woody and spreading.

7. *Chamæcistus Ericæfolius.* Heath leafed Dwarfe Cistus.

This Dwarfe Cistus is like unto a small plant, having most of the branches lying on the ground, and some bearing themselves upright, which are of two sorts, the one with very short leaves, which is the lower, and in the other which riseth higher much longer, set both so small that they are most like unto the leaves of Heath, or Tamariske, with small

yellow flowers at the toppes of them, like unto the former, after which come small heads that swell out in the middle, are knobbed and yellowish, & containe within them small round seede like Millet, but greater: the roote perisheth, hath a big hard and wooddy, blackish rin the outside with divers long fibres thereat.

2. *Chamæcistus Serpilli folio flore luteo.* Yellow Dwarfe Cistus with wilde Time leaves.

The Dwarfe Cistus creepeth upon the ground, like unto wild Time, with such like small leaves set upon the wooddish branches very thicke, or as it were in a double row, of a darke greene colour, and a little hairy withall, but greener and whiter next unto the flowers, which stand three or foure together, every one on a pretty long hairy foote stalke; consisting of five small yellow leaves like unto the other and somewhat sweete: the roote very long or much spread under ground.

3. *Chamæcistus Serpilli folio flore rubeo.* The great Dwarfe Cistus with wilde Time leaves.

This wilde Time leafed Cistus hath creeping blackish branches, farther extended upon the ground then the earlier, being about a foote in length, and taking roote as they creepe, having such like but small leaves set thereon by couples, of a dad greene colour on the upper side, and grayish underneath: at the ends of the branches stand three or foure flowers together, made of five leaves a peece, of a kind of bluish colour: the heads wherein the seede are five square, and open themselves at the toppes shewing very small seede; the roote is small and wooddy: all these sorts of Dwarfe Cistus or Sunflowers are durable, not perishing in the Winter.

The Place.

The first and second grow in divers places of this land, but especially in *Kent*, in every tract thereof through-out, which in some places is greater then in others, yet that with the white flower is more rare to finde then the other: the third according to the title in *Surrey*: the fourth *Clusius* saith he found on the hills about the Spaw of *Tongres*: the fifth he likewise saith groweth plentifully on the Alpes of *Austria* and *Hungary*: the sixt also upon the lower hill of the Alpes: the seaventh on the open sunny sandy hills in divers places of *France*, *Spaine*, and *Italy*: the eighth *Clusius* saith hee never found but upon the highest Alpes of *Austria* and *Styria*; and as some thinke is the first is most usuall with us here in *England*: the last also on the stonie hills of the Alpes.

The Time.

All these sorts of Dwarfe Cistus doe flower in the Summer, some earlier and later then other by a moneth, yet most of them are so soone biding, that their flowers endure but a day or two, and perfect their seede soone after.

The Names.

I am verily perswaded that *Dioscorides* hath made mention of this herbe in two sundry places of his worke, the one in the Chapter of *Helenium*, which he saith *Crateuas* called *Herbe Nigromantica Helcatæ Ægyptiorum*, and grew like *Serpillum*, unto which *Pliny* also in his 20. Booke and 10. Chap. consenteth, saying *Helenium* is layd to grow at *Helicatæ*, and the best to grow in the Iland *Helena*: it is a small slender lying on the ground, with leaves like unto *Serpillum* or mother of Time. And in the 23. Chap. of the same Booke hee remembreth it againe, and giveth the vertues thereof, which are differing from the other *Helenium* or Elecampane: for he there saith, that the iuice thereof is sweete, and being drunke in wine is a furtherer of mirth, and may be held to be the *Nepenthe*, whereof *Homer* speaketh, that putteth away all sorrowes: but some thinke that this differeth from the *Helenium* of *Theophrastus*, because he numbreth it still among sweete herbes that were used in Garlands, as *Serpillum*, *Sisymbrium*, and *Abrotanum*, and therefore judge it to be *Abrotanum*, or herbe Mallicke: the other place in *Dioscorides* is in his Chapter of *Panax*, and called *Heracleum sagacis Panax*, and *Panaces Chironium*, which hee there saith hath leaves like unto *Amaracus* or Marjerome and yellow flowers, and a small roote, all know the leaves of Marjerome doe not much differ from *Serpillum* in the forme, but in the largenesse and hoary whitenesse: and therefore divers Authors doe call it diversly; some, as *Lagus* calleth it *Helenium minus Dioscoridis*, and others *Helenium alterum*, *sive Ægyptium*, and some *Panax*, and *Panaces Chironium* as *Matthiolus* and others that follow him, or *Chironium* as *Cæsalpinus*: some also take it to be *Hedionthe* of *Pliny*, which *Cordus* calleth *Herba terrestris*, *or flos Solis*, and so doe *Lobel*, *Tabernæmontanus* and divers others: *Gesner* in horto in Germania calleth it *Herba Dei*, or *Hyssopoides*, for the likenesse of the leaves, which deceived both him and *Tragus*, who called it *Stœchas cærulea altera*, and *Lonicerus* who called it *Hyssopus montana*, *sive sylvestris*, which all follow the common opinions of their countries. *Cordus* saith it was called by divers in his time, *Consolida minor* & so saith *Clusius* also: but he would rather referre all these sorts to the family of the female Cistus, and make them of his third order of sorts, calling them *Chamæcistus*, because they are like unto them, both in face and properties. *Lobel* in his *Icones* would rather referre it to the *Centaurium luteum*, whereunto as he saith it is both in face and vertues alike: the fifth which is as usuall with us as in *Germany* is called of the *Germans Hayden Tysel*, that is, *Heathen Thistle*, we may call it in *English*, and so the rest, either small Sunflower or Dwarfe Cistus: the third is numbered by *Tabernæmontanus* under the same title, it is expressed here: the fourth is the first *Chamæcistus* of *Clusius*, the second in his third *Chamæcistus* in his History of Plants, but are the first and second in his *Pannonicke* observations, and there called *Asphodelus* and *Latifolius*, as *Bauhinus* doth allow the first: the sixt is *Clusius* his eighth *Chamæcistus*, and called by *Tabernæmontanus* *Cistus humilis Austriacus*, by *Bauhinus Chamæcistus hirsuta*: the seventh is called by *Tabernæmontanus* *Cistus humilis*, and by *Bauhinus Chamæcistus Rosæ folio latens*, who judgeth it to bee the *Cistus humilis tertia* of *Cæsalpinus*, and the *Cistus Dioscoridis* of *Gualandinus*: the eighth is the second *Cistus humilis* of *Clusius*, which *Tabernæmontanus* calleth *Cistus humilis Serpillifolia*, and I thinke may bee the *Helianthemum* in the Appendix of *Penæ* and *Lobel*, which *Lobel* afterwards in his *Icones* calleth *Cistus minor*, and *Bauhinus* maketh to be a *Cistus femina*, numbring it among them: the last *Clusius* in his *Pannonicke* observations, was not well resolved by what name to call it, as partaking both with *Cistus Matthioli*, &c. and therefore left it there as an *Anonyma*, without name, but considering afterwards better upon it, placeth it in his history of Plants as his seventh *Chamæcistus*, *Lobelius* calleth it *Chamæcistus Serpilli folio minimo*, and taketh it to be the *Herba Alpina altera folio minimo* of *Gesner in hort.* and the *Alpina altera* of *Lobel*.

The Vertues.

The leaves are of a drie and binding or astringent, with some bitternesse joyned thereto, especially in some of them more then others, and not without some small sent also: the decoction of this herbe and roote, is singular good

for

for them that spit blood, and to stay all bleedings, either inward or outward, as also all fluxes of the abundance of womens courses: the same also is very effectuall to wash sore mouthes, and the Ulcers that happen in the privy parts of man or woman; it is no lesse profitable in other Ulcers of the body or members, long kept from healing, by a defluxion of moist and sharpe humours falling upon them, which it mollifies and dryeth up, thereby causing the sores to heale the more speedily; it likewise soldereth and knitteth fresh wounds, for it is very powerfull in consolidating, binding, and strengthning any part, and is as good as all or any Comfrey for burstings, the strengthning of weake joynts, or any other binding properties whereunto any Comfrey may be applied: being bruised and applyed to the biting or sting of any venemous creature, it driveth the venome from further spreading, and healeth the party quickly; especially if they take also of the juice or the decoction thereof in wine: the distilled water of the herbe is held to beautifie the skinne of the face, or any other part of the body.

Chap. LXXXV.

Cistus mas, The male Holly, or Sage Rose.

BEcause I entreated in the last Chapter of the small or Dwarfe Cistus, which upon good ground as I take it I referred to the *Helenium alterum* of *Dioscorides*; I thinke it not amisse here to intreate of the other kinds of Cistus, whereof there are two principall, one that beareth the sweete Gum *Ladanum*, and another that doth not, according as some doe distinguish them; or as others doe two sorts of a female; yet some make three kinds, and the Cistus *Ledon* to be the third, but it may bee comprehended under the female kind, in that it beareth white flowers as the female doth, the male always bearing red flowers: because there is so much varietie in every of them, I will distribute them into their severall Chapters, according to speake of those here, I have spoke of in my former booke; which is one of either of the two first sorts, and two or three of the last, yet if I give you their figures, it shall be no there you the more satisfied.

1. *Cistus mas angustifolius.* Narrow leafed male Cistus.

This small Cistus groweth like a small shrubbe or bush, with divers woodly branches thereon, set with two on each side two together, which are longer and narrower, softer also, and not altogether so hoary or woolly as that sort which I have already set forth, else not differing from it, for the flowers are like unto the bud the wild Eglantine or Brier Rose, of a fine delayed reddish colour, like unto the other, as the leaves and seedes also; this roote is woodly and groweth not deepe: this is somewhat more tender to keepe, and will ill brook the injuries of our Winter frosts then the former.

2. *Cistus mas folio subrotundo.* Round leafed Male Cistus.

This other Cistus is somewhat more woolly then the former, and his leaves are larger, rounder and more red

Cistus mas vulgaris
The more ordinary male Cistus.

1. *Cistus mas angustifolius*
Narrow leafed male Cistus.

Original from UNIVERSITY OF MICHIGAN

Cistus mas breviore folio.
Small leafed male Cistus.

leaves; the flowers also are somewhat larger and of a deeper colour, and the heads of seede bigger, hard and hairy as the other, with seede in seede in them, and herein consisteth the chiefest difference from them.

Cistus mas folio brevi flore. Small leafed male Cistus.

The small Cistus for so I may call it, as well in respect of the growing lower, and the branches slenderer, then in any of the other is that the leaves hereof are smaller and shorter then in the other here set forth, and are also greener, and rougher and more hairy and sweete also then any male Cistus: the flowers are of a like forme unto the other, but somewhat smaller and weaker, which is not found in any other of this sort, and the huskes or seede huskes before they fall; in other things it differeth not.

Cistus mas humilis. The low male Cistus.

The Cistus groweth lower, bending downe his many branches from the roote almost to the ground, not much above halfe a foot long, the leaves that are not set by couples, as in the other sorts of Cistus are small and crumpled, unevenly waved as it were on the edges white and hairy: the flowers that stand at the end of the branches are many set together of an equall height, in forme of an umbell, or tuft, or nosegay, but smaller, yet of a bright red with purple, then are in the second sort here set forth: the seede, which remaine blackish seede, are smaller then in the other, and wrapped up in the small huskes that hold them.

The Place.

All these sorts grow in *Spaine* and *Portugall*, and some of them in *France* and *Italy*.

The Time.

They all doe flower in *May* in their naturall places, but about Midsommer with us, and some times earlier.

The Names.

It is called in Greeke κίστος ἄρρην, *Cistus* and *Cisthus* which the Latines also doe hold, not having any other name whereby to expresse it: some also call it κίσθος and κισσὸς ἄγριος, *Cisthus* and *Cissus agrestis*, not peradventure derived from αἰγὸς *Cissus Hedera*, which caused *Pliny* his error, for in writing of *Hedera* in his 16. Booke and 34. Chap. hee saith it is of two sorts, male and female &c. which in his 24. Booke and 10. Chap. hee saith the Cistus hath: but it may bee *Pliny* was herein deceived by a false copy of *Theophrastus*, which hee followed which had ἄρρεν instead of ἐρυθρὸν for *Gaza* in translating of *Theophrastus*, doth fall into the same errour with *Pliny*, making *Hedera* to bee male and female, with flowers like Roses but assuredly unlesse the copies were falsely written, which bred that errour, we cannot judge that *Theophrastus*, who had written so exactly in another place of the severall sorts of Ivie, should be so much overseen in this, to say Ivie hath flowers like Roses, &c. Some call it *Rosa Sylvatica*: the *Arabians* call it *Ramil Alhori*, *Hasisalhir* the *Italians Cisto maschio*: the *Spaniards Cornatos* and *Esfopa*: the *Portugall Rosella*: the *French* and *Dutch Ciste*, and we in *English* male Cistus likewise or the Sage Rose, because the leaves of the one sort are rugged and hoary like Sage leaves, and the flowers like single Roses, but why *Gerard* should call it the Holly Rose I see no reason, having no resemblance unto Holly, but because that name hath beene long imposed upon it I will let it so passe. All these sorts of Male Cistus, with the other set forth in my other booke, are remembred by *Clusius* in his History of Plants, and needs not further amplification.

The Vertues.

The Male Cistus is drying and astringent, and not without some hearte, yet some thinke it to bee cold, and a very moveable to stay bleedings at the mouth or nose, vomitings, and weaknesse of the stomacke, and fluxes of blood or humours in man or woman, as the Laske, the Bloody flix, and all other extraordinary scowrings or loosenesse of the belly, and womens inordinate courses: the flowers saith *Dioscorides* and *Galen* are the most effectuall for those purposes, to be drunke in red wine, yet the leaves and young shoots or buddes may bee used with good successe; and these applyed in a feruze to any scalding or burning of fire or water doth heale them quickly: they also bruised and layd to any greene wound, closeth the lippes thereof and refraineth the bleeding, the leaves also and the young shootes boyled in wine, and filthy or old Vlcers washed with the decoction thereof, yea although they be cankerous, eating or spreading Vlcers, will wonderfully and quickly stay the fretting thereof, heale and dry, and heale them: the distilled water of the leaves and flowers is of the like efficacie, and is also very effectuall with drying, binding and strengthning, this is to very good purpose applied.

Cistus

Chap. LXXXVI.

Cistus femina. The female Cistus.

THe female Cistus as I sayd before is distinguished from the male, in that it beareth not red flowers like it, but white or yellow, whereof there are many sorts as the succeeding descriptions do declare not intending to set downe in this place that sort that is expressed in my former booke, and the first of *Clusius* in his History of Plants, although I shew you the figure thereof.

1. *Cistus femina folio Halimi major.* The greater Sea Purslane leafed Cistus.

This kinde of Cistus groweth up with slender hoary brittle branches, two or three foote high usually in the top plentifully flored with thicke hoary leaves, very like unto Sea Purslane, somewhat round pointed, two alwayes set at a joynt, one opposite to another as is usuall in all the sorts of Cistus; the toppes of the branches are furnished with many yellowish flowers lesser then those of the first female Cistus, with some yellow threds in the middle of them, after which come somewhat long and three square heads containing within their small brownish seede.

2. *Cistus femina folio Halimi minor.* The lesser Sea Purslane leafed female Cistus.

This other Cistus riseth up more high and upright then the former, but no lesse hoary, and set with somewhat narrower and longer leaves then the former, and more pointed at the ends, the middle ribbe at the backe of the hoary leaves, being greater then in the other, yet both of an austere, sharpe, and binding taste, the flowers have not beene observed by *Clusius* who first set it forth, and from whom all others have expressed it.

3. *Cistus femina folio Sampsuchi.* Marjerome leafed Cistus.

The slender weake branched stalkes of this Cistus are thicke set with many small hoary leaves, very like unto Marjerome, but somewhat lesser, and with a thicker ribbe on the backe of every leafe, two together as in all in the rest: the flowers are small and white, compassed of five round pointed leaves, with a purple spot at the bottome of every leafe, with divers yellow shreds in the middle; the seede hereof is grayish, that followeth in small three square heads.

4. *Cistus femina Lavendulæ folio.* Lavender leafed Cistus.

The chiefest difference in this Cistus from the last is in the leaves, being small and long like unto Lavender, so like that as *Clusius* saith he verily thought them plants to be Lavender that he first saw, and forsaken them untill seeing the flowers upon them which were wholly white, without any spot in them, he plainly perceived that it was a kinde of Cistus.

5. *Cistus femina folio Thymi.* Time leafed Cistus.

The stalkes of this Cistus are brownish and woodly, rising a foote high for the most part without any leaves

Cistus femina vulgaris.
The ordinary female Cistus.

1. *Cistus femina Halimi folio major.*
The greater Sea Purslane leafed female Cistus.

upon them but toward the toppes there stand many small greene leaves at a joynt very like unto those of Thymo the flowers are smaller then in the other, and wholly white like unto the rest.

6. *Cisto similis frutex exoticus.* The Cistus like strange shrubbe.

I must needes joyne this shrubbe unto the rest, seeing *Lobel* who first set it out did so account it, and all other that have mentioned it since him doe referre it thereto, although it have small likenesse but in the leaves unto any of the rest, for as I have sayd before, and the rule is most certaine, the flowers and seede of any plant doe best demonstrate under what genus any *plant* is to be referred, which in this is farthest remote, having round woolly heads) and I thinke none of me yet saw the plant, but as *Lobel* saith it hath woodie branches like unto a Cistus, with rugged long leaves thereon, like unto those of Sage or Mints, and round woolly heads at the toppes like unto Plantree heads.

7. *Cistus annuus folio salicis.* Willow leafed annuall Cistus.

The Willow leafed Cistus of 5 yeare (for I have given another of this sort in my former booke whose figure I here give you) hath divers small hairy leaves lying upon the ground somewhat like in forme to Olive or Willow leaves, but much smaller, among which rise up hairy stalkes about a foote and a halfe high, set with two leaves at a joynt, much smaller then those below, at the toppes whereof grow many small pale yellow flowers, and sometime more white one above another without any spots on the leaves, as in that other is set forth already, which do scarce abide a day but suddenly fall, the seede vessels that are skinny and three square, containing small seede appeare quickly after.

8. *Cistus annuus folio Ledi.* Ledum leafed annuall Cistus.

This other Cistus riseth higher with greater stemmes but not selfe hairy then the other, having two or three leaves set at the severall joynts, longer and narrower then the last, and smaller pointed, somewhat rough, and of a deeper greene colour: the flowers fade as quickly, and grow singly towards the toppes, with the leaves as large as the last, and of a faire pale yellow colour; with heads and seede succeeding in the like manner and yearely perishing also, yet is hath sometimes abiden a Winter in my Garden when it hath not flowred with me in the Summer before.

8. *Cistus annuus folio Ledi.*
Ledum leafed annuall Cistus.

The Place.

Some of these grow in *Spaine*, and some upon the cold Alpes and Mountaines in *Germany*.

The Time.

They flower some in *April* and *May*, or sooner in their naturall places, but not untill *June* with us, or in *July*.

The Names.

Their names are sufficiently expressed in their titles, as they are used to be called of those that have written them; onely I would give you to know thus much, that the *Spaniards* as *Clusius* and *Lugdunensis* now alive doe say, doe call the annuall Cistus, as well that which hath spots, as that which hath none on the flowers, by name of *Turmera*, from *Turmus* which signifieth *Tubera*, those *Spanish* or outlandish puffes that are also to be eaten; because where that shrub groweth they usually finde those puffes doe breede, and therefore *Lugdunensis* calleth it *Tuberaria*, and both *Clusius* and he doe thinke it may be the *Hydrospathos* of *Pena* in his name, because it shewed where those puffes doe grow.

The Vertues.

The female Cistus are no lesse drying and astringent then the male, and are used with as good successe in all the purposes before recited, wherunto the male kinds are applied, and therefore it shall not need to repeate the same things againe.

CHAP. LXXXVII.

Cistus Ledon. The sweete Gum Cistus.

There are many varieties of this sweete or Gum Cistus then of both the other sorts before mentioned, differing in growth & leaves, yet all of them smelling some what sweet of that viscous or clammie gum that is upon them. Vnto them also are to be referred some other plants for the likenesse sake, of some whereof I have expressed in my former booke, and therefore needs not here to be repeated.

1. *Cistus Ledon latifolius.* Broad leafed sweete Cistus.

The broad leafed sweete Cistus riseth up with divers woodie branches five or six foote high, spreading into other smaller branches, whereon are set two leaves at a joynt one against another, somewhat broader then

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

more forward bushie, roaming neare to the forme of Bay leaves, of a darke shining greene colour on the upper side, and grayish underneath, which are clammy in feeling as the young shoote and stalkes are also, and of a strong sweet scent to be felt a great way off, especially in the hot Summer time, & in the naturall places, much more then in these countries: at the toppes of every branch come forth single white flowers, made of five broad round pointed leaves, sometimes without any spots in them, as is also to bee seene in that other with narrow leaves formerly described, and sometimes having a darke purple spot at the bottome of every leafe pointed upward, which in some are greater in others lesser, with divers yellow threds in the middle: after the flowers are past there come in their places somewhat round great hard heads, containing within them small brownish seede; the whole shrub woody, and spreadeth many branches but not very deep. *Lobel* maketh mention of a sort hereof which he calleth *Ledon foliosum* or *Myrtifolium*, which hath sundry leaves comming forth together in other things little differing from the former. *Myrtifolium Lobelij.*

2. *Cistus Ledon Populifolia fronde major.* The greater sweete Cistus with Poplar like leaves.

The greater sweete Cistus riseth not so high as the former, but about three foote, the brittle branches have two leaves set on them in the same manner that they are in the former, that is two at a joynt one against another, but no other like in any sort of Cistus, being like unto the leaves of Ivie, or the blacke Poplar tree, broadest at the foote, and pointed long at the end, greene on the upper side and grayish underneath, somewhat thicke and rough in handling, not having while they are young any clammines or sweetenesse on them at all, but onely when they are growne old: the flowers are wholly white, and smaller then in eyther of the former, yeelding five square pointed heads, with small blackish seede in them.

3. *Cistus Ledon Populifolia fronde minor.* The smaller sweet Cistus with Poplar leaves.

The other Cistus is in all things like the last, but that it groweth much lower, and the leaves although of the same forme, yet much smaller.

4. *Cistus Ladanifera Cypria.* The sweete Gum bearing Cistus of *Cyprus*.

This Candy kinde of sweete Gum Cistus groweth with his blackish spreading branches not much above two foote high, whole blackish greene leaves are not so large as the first here set forth, nor so narrow as that kind which is expressed in my former booke but betweene them both, plentifully stored (no doubt) in the naturall country with that sweete clammy dew or gum that is in the others of this kind, although nothing so much as those other Transalpine countries: the flowers are white like unto the second sort here expressed, and so are both heads and seede.

5. *Cistus Ledon hirsutum five quartum Clusij.* The sweete Gum Cistus with hairy leaves.

The leaves of this Cistus are softer then in others, and somewhat hairy, being long and narrow, but round pointed, from the tender weake branches that are scarce two foote high, but as full of that clammy gumminesse, as any other, as well when they are young as old: the flowers are small and white like unto those of the female Cistus: the seede that followeth them in great skinny heads is black but larger then in any of the rest.

Other Cistus with Spotted leaves.
Lobels broad leaved Gum Cistus.

Cistus Ledon Myrtifolium Lobelij.
Lobels narrow leaved sweete Gum Cistus.

6. *Cistus Ledon Olex folio.* The sweete Cistus with Olive like leaves.

This Cistus hath stronger woodie blackish branches then the rest, whose flat and clammy leaves are long and narrower then those of the Olive tree; the flowers hereof are white, but the smallest of any of this kind, the seede is small and browne.

7. *Cistus Ledon angustifolius.* Narrow leated sweete Cistus.

This sweete Cistus is very like the first, but that the leaves are narrower then they and the white flowers larger, the branches and leaves have such sweete Gum on them, as is on the others of this kinde.

8. *Cistus Ledon leptinum Clusii, sive Rosmarinis hispidè foliis.* Sweete Cistus with hoary rough leaves.

The many branches of this sweete Cistus are of an ash colour, plentifully stored with long and narrow leaves like Rosemary, all hoary, and rough withall, yet clammie with that sweet Gum upon them as is in the former; the flowers are many small and white like the rest.

9. *Cistus Ledon oblongum, sive Rosmarinum folio subtus incano.* Hoary Rosemary leafed sweete Cistus.

The branches of this Cistus are not much greater but more spread abroad then the last; the leaves are thinner but long and narrow, greene above and whitish underneath, like as the ordinary Rosemary hath, clammy with that sweete Gum as others; the flowers are many, small and yellow that stand all along on the stalkes, and the toppes of the branches; the seed is of a blackish gray colour.

10. *Cistus Ledon Rosmarini folio subtus non incano.* Rosemary leafed sweete Cistus not hoary.

As the small narrow leaves of the last were greene above and gray under, so this Cistus hath them wholly greene, and not gray on the under side, but are somewhat larger then it, and more thinnely or

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

sparedly set on the dry lopsided branches, which are lower then it and more Gummy whereon the flowers stand.

12. *Cistus Ledon folio Thymi.* Time leafed sweete Cistus.

This Cistus beareth small leaves not much unlike Time leaves on the clammy blackish small branches, of about a foote high; the flowers hereof were not seene no more then in the last, but the heads of this were many standing together upon long footestalkes, without any seede in them.

13. *Myrto Cistus Pennæi.* Dr. *Penny* his Mirtle like Cistus.

The Mirtle like Cistus of Dr. *Penny* his finding, is a shrubbe of foure or five foote high, whose slender branches are covered with a rugged barke, set as it were with knobbes or bunches, which quickly fall away from the elder branches; the leaves are very like Mirtle leaves, and are no lesse rugged then the barke, yet grow smooth in time, and are set one against another at every joyne, bedewed with that sweete clammy moisture as in others; the flowers are small and yellow, consisting of five long leaves, with many yellow threds in the middle, after the flowers are pass, come somewhat long five square heads with small seede therein.

13. *Cistus Ladaniferus Creticus verus.* The true sweete Gum Cistus of Candy.

Although I sayd in the beginning of the Chapter of male Cistus that the male kind onely bare red flowers, and the female white, including the Ledons under them, which as I sayd alwayes bore white flowers, yet this generall rule admitteth some exception, as of this plant here doe shew you, which groweth in Candy and Spaine abundantly; and from whence also onely the Candiots gather *Ladanum* as *Belonius* being there truly observed, and not from the other sorts of *Ledon*, and *Alpinus* saith the same by the relation of others, who hath thus described it. It groweth to a cubits height or more, with sundry long woody branches, with two and sometimes more leaves set thereon together at severall spaces one against another, being greater then those of the male Cistus, somewhat like unto Sage leaves, and bedewed very much with that sweete clammy humour or Gum, called *Ladanum* especially in the Summer time, the flowers that grow at the toppes of the branches are like the male Cistus, and of a purplish colour, but greater then they, after which come small long and round hard, woodie heads, containing small seede within them. *Alpinus* joyneth hereunto two other sorts of bastard Cistus Ledon, the one whereof is not as he conceiveth it to bee called Cistus, having little or no resemblance to any, having woodie stalkes and branches with a few small long leaves like unto Privet, set at certaine long distances one from another, with white flowers at their toppes, much lesser then those of Cistus, without any scent, and small seede in blacke pods afterwards. The other bastard sort hath many soft stalkes with soft woolly leaves thereon, in forme like Mirtle leaves of lesser, two or foure standing at a place by distances, the flowers are white and small, the seede vessels be of the bignesse of Cicher pease, and the small seede yellow within.

Bastard Cistus alia duo.

The Place.

All these sorts of Cistus grow onely in the warmer countries of *France*, *Spaine*, *Portugall*, *Italy*, *Candy* and the other Easterne parts, and not in any of these colder countries that ever I could learne: the twelfth Mirtle like Cistus Dr. *Penny* a famous Physition of *London* in his time, found in the Iland *Majorca*, and shewed to Clusius the dryed plant, which he kept by him and gave him the description of it, which he published with the other in his last: and the two bastard sorts grow in *Candy*, from whence we had the knowledge of them.

The Time.

All these sorts of sweete Cistus doe flower earlier by much in their naturall countries then they doe in ours, for they never are in flower in our countries until *July* or *August*, and seldome doe give any ripe seede.

The Names.

It is called in Greeke λήδον *Ledon*, and λάδανον *Ladanon*, quia (*forsan*) folia non secus ac ovibus lanæ, sed pinguia, hirta & pannosa, the Latins keepe the Greeke name, and call it *Ledum*, because they all have that clammy sweete humour on them more or lesse, and *Ladanum*, from whence commeth the name of *Ladanum*, which is the sweete gumme is gathered from the leaves and branches of but one sort as *Matthiolus* and *Cesalpinus* seeme to write, and *Belonius* averreth in his 8 booke of observations and seventh Chap. but others say from many of them as is most used now adayes in perfumes to smell unto, and to burne, yet sometimes Physically also: the manner of gathering whereof in these dayes is some what like one of those wayes was used in *Dioscorides* and *Pliny* time, which was that they used to fasten long Ropes, but wee now long Thongs of raw or uncanned Leather to the poale or sticke made like a Rake, without teeth, which by drawing them over the bushes, gather the sweete gum that is upon them, and in the heate of the day, and Sun, they scrape it from their Thongs, and make it into balls or lumpes: the other was to combe of that sweete gum from the beards and haunches of the Goats that brouzed and rubbed themselves on those bushes that grew in the Ile of *Cyprus*: the Arabians call it *Chasis*, and the gumme *Ledon* and *Ladon*, the Spaniards call the wild sort *Xara*, *Xaramo*, and *Xaramago*, and *Xara estepa*, as *Clusius* saith: but the fourth kind of *Cistus* which is the best here, he saith they call *Ansarina*: other Christian nations I thinke follow the Greeke and Latine name, with such dissonance as their Dialect doth; wee as I sayd only call it *Ledum* as others doe, or the sweete Cistus, or sweete Gum Cistus: which you will: it needeth not to make any long repetition of references of every one of these having the like as are *Cistus* his relations, and may easily bee found by any which is which.

The Vertues.

Because all or most of these sweete Cistus are more hot then the former sorts, yet not so dry as some then any of them, they are used to warme and dry up all cold distillations of the braine, and colde rheumes: gum *Ladanum* is hot in the end of the first degree, almost entring into the second, and hath some drynesse in it: furthermore it is of a thinne substance, whereby it is mollifying and molderating digesting, and doth very effectuall in the hardnesse and other diseases of the mother, to raise the pulses thereof, and to heale Vlcers that happen therein; by the taking of the fume thereof underneath, or applyed to in the fashion made up with *Storax* and honey, in a *Lohoch* or Electuary, it is very profitable for the Cough of the Lungs: being taken inwardly it provoketh Vrine, and slayeth the stone or gravell in the kidnies, and easeth the griping paines thereof proceeding from sholleriek sharpe humours, it is very good for all sores being used in an ointment with Mirrhe, oyle of Mirtles and Wine, it staieth the falling of the haire, and blacknesse thereupon: it helpeth also the paines in the eares, being used with some oyle of Roses being [illegible] wine, and the places washed therewith that have any scarre or deformitie thereon, it doth wonderfully [illegible]

sweet sauce to light thereon, and maketh them to be well coloured againe: eyther the gummie or the leaves and flowers boyled in vyne and the head washed therewith doth cleanse it from scabbes, scurfe, or dandriffe growing thereon, and easeth also old running and watering sores and Vlcers in the Legges or other parts of the body: the syrupe made thereof worketh to the like effects.

Chap. LXXXVIII.

Hypocistis. The Vndergrowth or Excrescence of the Cistus.

I thinke it fitteth to entreate of this Excrescence proper onely to the sorts of Cistus by it selfe, and not to joyne it with the history and descriptions of them, or among the other Rapes or excrescences of other Plants: it is of divers colours according to the kinds of Cistus, under which and from whose roots it doth arise groweth and springeth as the broome Rape, and other excrescences doe from the abundance of superfluitie of moisture, causing putrefaction; but this is of a peculiar fashion: It riseth up (as well from the roots of the male Cistus as female; as also from many sorts of the *Ledon* or sweete Cistus) with divers upright stalkes, covered with small leaves thicke set thereon (eyther neare or under the stemme of the Cistus, or somewhat farther off, in divers places as the roots doe spread) scarse a foote high, having many flowers growing at the toppes full of juice, the whole plant rising from the male Cistus at the first springing up, being of an orient bright crimson colour, but much paler afterwards, and the flowers whitish at the last, which (standing altogether at the toppes of the stalkes, are every one fashioned somewhat like unto the buds and flowers of the Pomegranate tree, or rather like unto the woodden nossell of a Candlesticke, which passe away, leaving seede as small as dust in the hard heads of seede vessells, which are unprofitable or produce the like plant, as the berries of the Misseroe are, being as it is but an excrescence, growing as I sayd from superfluitie of moisture and putrefaction. That which riseth from the roots of the female Cistus, especially that with sage leaves, is of a yellow colour. And that which springeth from the *Ledon* or sweete gum Cistus, is of divers colours, being intermixt with purplish and greene stalkes or veines on the pale coloured stalkes of leaves and flowers, as Clusius hath observed and set it downe, but such as *Dioscorides* relateth to bee some white or greene, especially greene hee observed not in any.

Hypocistis. The vndergrowth or Excrescence of the Cistus.

The Place.

It alwayes groweth from the roots of the Cistus in the naturall places, and not in any Gardens whereunto they are transplanted.

The Time.

It budeth fresh many Winters after it is risen, but is in its chiefe vigour at the Spring, and in his full strength in the beginning of Summer, which is the fittest time to gather the juice.

The Names.

It is usually called in Greeke ὑποκιστις *Hypocistis*, but *Dioscorides* Interpreters call it in his time *Rhagadiolum* and *Cytinus*, *Clusius* calleth that kind which groweth on the *Ledon* and *Ledon* sive *Cistus mas*, and *Dodonæus Limodori quoddam genus*: the Latines keepe the Greeke name, and call both the plant and the juice drawne from it *Hypocistis*; but as *Matthiolus* saith the *Arabians* were the cause of the errors of the Apothecaries and others in former times; who calling Cistus by the name of *Succorisoli*, induced them to beleeve that *Hypocistis* was made of the juice of the roots of *Tragopogon* called *Barba Hirci*, or *Consolida*, so that such counterfeit *Hypocistis* was usually sold for it: but they farre to understand the true *Hypocistis*, and to prepare it for use, which is performed two manner of wayes. The first way is to expresse the juice from the fresh herbe when it is in full strength: the other is to steepe the dryed stalkes and leaves in hot water, which steepe they are pressed is to be consentate (eyther juice or decoction) by evaporation in the Sunne or by the fire, in the same sort that *Lycium* was wont to be made, as *Dioscorides* saith. *Fuchsius* tooke the *Hypocistis* to be a fungus or *Mushrome*, but *Matthiolus* taxeth him for it and sheweth how it springeth.

The Vertues.

The juice called *Hypocistis* is much more binding then any other part of any Cistus: it is a most certaine approved rule medicine to stay all flixes of blood or humours, that is to say the spitting of blood, womens courses, the laske and bloodie flux: it is mixed with those things that are applyed to the stomacke for the same purposes, and so strengthen it when it is growen weake, as also with those things that strengthen the matrice, be they eyther inwardly or outwardly: it is also availeable for clammy moist humours that fall upon the sinewes, thereby causing a weakenesse of nerves, and a solution of them; to use this therefore in such a worthy worke is wonderfully helpe to dry, and binde, and corroborate the parts; it is put into great Antidotes, not for any speciall propertie it hath to resist the venome, but to con-

temperate

fora peace and strengtheneth the body: it is held to be a very good substitute for *Assa*, which all Christian countries doe much want through their over negligence, for if they would not so much affect fashions they might have the true for a reasonable and dying more decent.

Chap. LXXXIX.

Senecio. Ragwort.

We have ten sorts of Ragwort growing wilde with us in many places, for *Dioscorides* hath found no lesse, other plants whereto he referreth the cunto, and there are also some of this sort growing by the Sea side, which I thinke is to adjoyne to the reste.

1. *Senecio vulgaris maior.* The greater common Ragwort.

The greater common Ragwort hath many large and long darke greene leaves lying on the ground, very much cut and torne on the sides into many peeces, from among which ariseth up sometimes one, sometimes two or three square or rivelled, blackish or browneth stalkes three or foure foot high, diversly branched, bearing divers such like leaves upon them at severall distances unto the toppes, where they are *Corymbus* wise stalked, bearing yellow flowers, consisting of divers leaves set in a pale or scaly cup with a yellow thrum in the middle, which doe abide a great while, but in the end growing full ripe are carried away with the wind, the roote is made of many fibres, some greater and others lesse whereby it is firmely fastned into the ground, and abideth many yeares.

2. *Senecio vulgaris minor.* The lesser common Ragwort.

The Ragwort is very like the former, so that many that are not skilfull or curious in the contemplation of plants doe verily take it to be the same with the former: the chiefest differences are these, it usually riseth not so tall, the leaves are more finely jagged, not of so fad a greene colour, but rather somewhat whitish, and usually all the flowers are wholly paler, yet in many alike.

3. *Senecio latifolia Pannonica prima.* The first Hungarie broad leafed Ragwort.

The first leaves of this Ragwort that lye next the roote upon the ground are round, small, and ugly, but those that grow upon the stalke, which have many small peeces or jagges at the bottomes of them, whole and are larger and not so round, and still more jagged as they grow up higher, and the highest most jagged, very like unto the highest leaves of the Ragwort, yet all of them notched or dented about the edges, as they are that which is about two foote high, breake forth many branches of flowers greater then in the former, but yellow in the same manner, and give such seede that is carried away with the downe: the roote is great and white, with many fibres dividing as well as the first.

Original from UNIVERSITY OF MICHIGAN

4. *Iacobæa latifolia Pannonica altera.* The other broad leafed *Hungarian* Ragwort.

This Ragwort is somewhat like the other as *Clusius* saith, but greater, having larger leaves and more downie, whitish or hoary underneath and with fewer peeces of leaves or eares at the bottome of them, and more finely dented about the edges: the flowers are large and yellow like the other.

5. *Iacobæa angustifolia Pannonica non laciniata.* Smooth leafed Ragwort.

This unjagged Ragwort hath somewhat broad and long leaves, lying next the roote, not jagged or divided at all, but slightly dented on the edges, of a pale greene colour, soft and a little woolly withall; but those that grow on the crested cubit high stalke are narrower and longer compassing it at the foote of them: the highest leaves are smallest and narrowest, where the flowers standing above them are set as it were in a tuft or umbell, three or five together, which while they are buds, and not blowne open, are of a darke reddish colour, but being blowne open the pale or border of leaves are of a yellowish red or orenge colour on the upperside, and reddish underneath, parted or dented at the ends, the middle thrum being of a faire gold yellow colour, which turned into downe and together with the seede is carried away with the winde: the roote is like the other, and perisheth also.

6. *Iacobæa rotundifolia incana.* Round leafed hoary Ragwort.

The roote of this Ragwort is brownish, and composed of long strings as the other forts are, from whence rise divers thicke and somewhat round leaves, greene on the upperside, but very hairy, and hoary whitish underneath of two inches long a peece, and an inch and halfe broad, with a short footestalke underneath and dented about the edges: the stalke which is about a foote high, hath but few leaves thereon, and those very narrow and long; at the toppes whereof stand large yellow flowers, like unto the *Scorzonera* or Viperagrasse: the seede hath not beene observed.

7. *Iacobæa marina sive Cineraria vulgaris.* The common Sea Ragwort.

The Ragwort that groweth in our land neare the Sea side, hath hard crested stalkes about two foote high, all hoary or white, whereon grow hoary white leaves, much jagged or cut into divers parts, yet each part of them broader then any of our wild Ragworts, and somewhat stiffe, but yet soft in handling: the toppes of the stalkes are furnished with divers flowers, whose cups or huskes are hoary as the rest of the plant is, but the flowers selfe is of a pale yellow colour, with a brownish thrum in the middle, which turne into downe, and with the seede is carryed away with the winde: the foot is long and more wooddy then the other, with divers small fibres thereat.

8. *Iacobæa marina altera sive minor.* The lesser Sea Ragwort.

The other Sea Ragwort groweth lesser and lower then the former, yet the leaves are longer and more divided or cut into many jagged leaves, each jagge being rounder pointed then the other, of a grayish or hoary colour above, and very white underneath: the flowers are many that grow at the toppes of the hard wooddy hoary white stalkes, which are three or foure foote high sometimes, and branched, but smaller and of a dun or darker colour then the other, and the middle thrum browner also, which abide in flower two whole moneths at the least, ere they fall away, turning at the last into downe as the others: the roote is somewhat great and wooddy like the other.

9. *Iacobæa maritima sive Cineraria latifolia.* Broad leafed Sea Ragwort.

This Sea Ragwort sendeth from the roote divers round stalkes about a foote and a halfe high, very hoary woolly, divided into divers branches, the lower leaves whereof are somewhat round and jagged or cut, each part being as it were waved about the edges, and each leafe longe, four inches broad, and set by together with the footestalke of a darke greene colour on the upper side, and hoary white underneath and soft to handling: the flowers grow at the tops of the branches upon longer and slenderer footestalkes, whose cups or huskes are hoary, and the flowers themselves greater and paler then in the former sorts, the middle thrum being of a gold yellow colour, which after they are ripe are turned into downe, and with the seede blowne away with the winde.

The Place.

The two first sorts grow wilde in pasture and untilled grounds in many places, and both together in one ofttimes; the three next grow in *Hungary* and *Austria*, the first grew in some parts of *France*, but it is not so pressed where; the seventh groweth on our owne coasts, not farre from the Sea in the Iles of *Sheppy* and *Thanet*, and along the *Kentish* shore in many places: the eighth groweth on the Mediterranean Sea shore at *Italy* and other places, but *Dodonæus* saith by the Sea side in *Zeland*, the last is not mentioned by *Bauhine* where it groweth.

The Time.

These flower in *June* and *July* and the seede is ripe in *August*.

The Names.

Being an herbe of later knowledge, it is not mentioned by any ancient Greeke or Latine Author, unlesse we would as some doe, referre it to the [illegible], *Eupatorium* of *Dioscorides*, which the Latines call *Senecio*, and so doth *Lobel* call it *Iacobæa Senecio*. *Tragus*, *Matthiolus* and others call it *Flos Sancti Iacobi*, and *Herba Sancti Iacobi*, *Dodonæus Iacobæa*, *Camerarius* and others *Senecio major*, *Gesner in hortis* calleth the fourth *Hieracium coloso* of *Cæsalpinus Conyza Alpina grandis*, and *Conyza montana* in another place. Some have taken the first for *Artemisia marina*, or a species of it, because the division of the leaves is somewhat like, the *Artemisia* of others call it *Cineraria* and *Argentea* from the whitenesse of the leaves which shew like silver, or as though they were covered with ashes, and is usually with us called *Iacobæa marina*, and *maritima*: the first is common well in other countries as in ours: the second is not remembred by any author that I know, unlesse it be the *Iacobæa Pannonica* of *Clusius*: the third is *Clusius* his *Iacobæa Pannonica tertia, sive latifolia grandis*, as for the fourth his *Iacobæa Pannonica quarta*, and *latifolia secunda*: the fift is his *Iacobæa Pannonica secunda*: the sixt is his *Iacobæa Latifolia minor*: the seventh is the *Cineraria* of *Dodonæus*, and *Iacobæa marina* of [illegible] *Anguillara* and others, and the *Abrotanabiar* or *Artemisia marina*, of *Alpinus* [illegible] *Ægypt*, and *Iacobæa marina* of *Lugdunensis* as *Bauhine* thinketh, but surely then the figure is farre awry: The eighth is the *Cineraria* of *Lobel*, and is called by most Herbarists *Cineraria altera*, and *Iacobæa altera marina* of *Dodonæus* and *Lugdunensis*: the last is called by *Bauhine Iacobæa maritima sive Cineraria latifolia*. It is called by the Italians *Senecio* [illegible]

Germanie, and *Spatula foetida* in many places; by the *Spaniards Jamonzo*, *Romero de Inglaterra*; by the *Germans*, *Jacobs Kraut*; by the *Dutch*, *Jacobs cruyt*, and *effenbreeder*, and we in *English* Ragwort and Ragwort.

The Vertues.

Ragwort is hot and dry in the second degree as some thinke, with some astringencie joyned therewith, and therefore cleanseth, digesteth, and discusseth: the decoction of the herbe is much commended to wash the mouth or throat that have Vlcers and sores therein, and for swellings, hardnesse or inflammations, for it thoroughly cleanseth and healeth them, as also the squinsie and the Kings Evill: it doth helpe to stay catarrhes, thinne rheumes and distillations from the head into the eyes, nose or lungs: the juice is found by common experience to be sufficient, taken or drunke, to heale greene wounds, and to cleanse and heale all old and filthy Vlcers, as well in the privities and in other parts of the body, and inward wounds and Vlcers also, and stayeth the malignitie of fretting or running Cankers and hollow Fistulaes, not suffering them to spread further: it is much commended also to helpe aches and pains either in the fleshy parts, or in the nerves and sinewes, as also the Sciatica or paine of the hippes or huckle bone, to bathe the places with the decoction of the herbe, or to annoint them with an ointment made of the herbe boyled and boyled in *Axungia* or old Hogs Soet, with some Mastick and *Olibanum* in powder added thereto after it is strayned forth and not before as *Gerard* saith, for so it were to no purpose to put them in: it is held also to be a sovereigne remedie to helpe the Staggers in Horses.

CHAP. LXXXX.

Senecio, Groundsell.

Besides those *Dioscorides* and *Pliny* and the other ancients have made mention, but of one sort of *Senecio* or Groundsell: but this later age hath found out divers other sorts (shall be presently declared; but in that respect which might else have beene placed among the *Sonchuses*, or *Chondrilles*, whereof it is a kinde, it was to joyne it with the *Jacobea* going before, to whom unto it is likest in name, face and property.

1. *Senecio vulgaris.* Common Groundsell.

Our common Groundsell hath a round greene and sometimes browne stalke, spread toward the toppe into some branches set with long and somewhat narrow greene leaves cut in on the edges almost like unto Rocket, or rather as Oaken leaves, but smaller and round at the ends, at the toppes of the stalkes and branches stand many small greene knappes or heads, out of which grow small yellow threds or thrums which are the flowers, which continue many dayes flowne in that manner before it passe away into downe, and with the seede is carryed away in the winde: the roots is small and threddy and soone perisheth, but from the seede that is shed it soone

2. *Senecio vulgaris.* Common Groundsell.

riseth up againe, so that it may bee seene many moneths in the yeare, both greene and in flower and seede, for it will bring seede twice in a yeare at the least if it be suffered in a Garden.

2. *Senecio montanus.* Mountaine Groundsell.

Of this kind there is another sort that groweth not altogether so high, whose leaves are greater and more cut in on the edges, in all things else like the ordinary sort.

3. *Senecio folio non laciniato Mysoni.*
Mysonis Spanish Groundsell.

The leaves that grow upon the hard stalkes of this Groundsell are whole and not divided or cut in on the edges as the rest are, but onely dented like unto Geeranium leaves, and grow singly one above another thereon: the flowers are larger but yellow, and as soone as they are turning into downe as the other, the roote is tuberous or more hard and woodily.

4. *Senecio arvensis sive Erigeron vernalis flore.*
Corne or Garden Groundsell.

This Corne or Groundsell hath much larger leaves, and more cut or jagged in some on the edges then the other aforementioned, of a grayish or ashe colour soft and hairy: the stalkes are higher and greater, bearing at the top fine yellow flowers upon them which soone seede and turning into downe almost as the other: the roote is small and full of fibres.

5. *Senecio latifolius.* Broad leaved Groundsell.

This Groundsell hath many faire large and greene leaves lying on the ground very much cut in on the edges into many sections: somewhat like unto *Senecio Cretensis*, which some have called *Senecio Creticus*, and is altogether very hairy, being almost as white as Camomile, for the leaves will leave a white dust upon the fingers as *Senecio* that touch them, and one leafe growing another hardly to be pulled asunder, lasting long and of small use, (not unpleasantly

1. *Senecio folio non laciniato hirsuto.* Hairy Groundsell.

2. *Senecio Lanatus.* Stinking Groundsell.

saith *Clusius*, but as others say like *Scrophularia* or *Flos nigellæ* from among which arise up hairy crested stalkes set a foote and a halfe high, divided into sundry branches, bearing at the toppes fewer flowers, like unto a yellow or saffron dye then the common sort, and upon longer foote stalkes, which quickly fade and come into down like the other: the roote is very fibrous yet falleth not after foode time, but perisheth at the first frost, and springeth againe of the shed or fallen seede.

6. *Senecio odoratus.* Sweet smelling Groundsell.

This Groundsell is some what like the last sort in the soft and woolly leaves but not so much as it, whose smell is somewhat sweete like unto *Ambrosia*, or Oake of Jerusalem, or the middle sort of Tansie, the flowers are like the rest, and is soone growing old and hoary at downe.

The Place.

The first is found every where almost, as well on the toppes of walls as at the foote among rubbish and tilled grounds: but especially in Gardens: the second is found upon hills and on untilled: the third upon *Mycenis* in *Spaine* and sent to *Lyons*: the fourth groweth by wood sides, the borders of fields, and upon walls in many places: the fift groweth in lopped woods of *Hertfordshire* and *Surrey*, as *Clusius* saith, and in moist and untilled places: the last was sent to *Camerarius* out of *Italy*.

The Time.

The time of the first we have in flower already set downe in the description, which is almost every where: the second and fourth doe both come some what neare unto the other, but are not so quicke in their growing and flowring doe flowers onely in Summer.

The Names.

It is called in Greeke ἡ Senecio Ecbyrsum quasi ἐκβύρσιον sonitus: the Latins call it *Senecio*, quasi *Senilis*, for the cause of *Theophrastus*, in his seventh booke and seventh and eighth Chapters, speaking of every kind, which is more bitter and called *Petrosa* by *Alexander Tersonensis*, as he saith in naming the small sea Cabbages, the Succory like herbes, which it doth in some sort well resemble for the soone flowring and perishing: but I finde in the seventh and eighth Chappers of his said seventh booke, more than so as well as *Galen*, which plainely convinceth *Tragus*, that *Senecio* cannot be *Sonchus*, for there are set down for two herbes: and besides *Dalechampius* in *Lugdunensis* hath given us an *Adversaria* on the eighth Chapter even the *Hieronymus* in *Theophrastum* have taken it to be *Cacalia* but *Tragus* refuteth the one and *Matthiolus* the other: the *Italians* call it *Senecione* and *Senecione salvatico*: some also for the often flowring of it *Fior d'ogni mese*: the *Spaniards* *Cardo mariæ*, and *Herbamora*: the *French* *Senesson*: the *Germans* *Creutzwurtz*: the *Low Germans* *Kruyt*: the *English* Groundsell and Grundsell: the first is called by all Authors *Senecio*, and *Senecio* and *Senecio* came as I said they call the *Jacobæa* *Senecio major* & *Erigeron*, some also after the *Italian* name *Senecione*. I verily believe should be that herbe was appointed to be put into the composition of the *Unguentum*

Tussilago. ...as it is appointed in the *Pharmacopœia Londinensis*: the second is the *Senecio* 2. ...stalked *Cardui Benedicti* of *Tabernæmontanus* and the fifth *Erigeron* in the old *Gerard* very well expressing it: the third is set ...drawne by *Lugdunensis* under *Ricotes* name: the fourth is the second *Senecio* with *Trayus*: *Lobel* his figure of ...*Erigeron viscosum*, as also the *Erigeron creticum* of *Dodonæus*, as not the true figures of this plant, as *Dodonæus* ...himselfe acknowledgeth, but rather as others called it *Cinerarium fœtidum*, and *Lugdunensis* hath observed it like- ...wise, but the difference chiefly is in the common sorte out in the hoarinesse and largenesse as well of the whole ...plant as the leaves: the fift is called by *Lobel Erigeron tomentosum alterum*, by *Thalius Erigeron fœtidum sive ...viscosum*, by *Fuchsius* and by *Lugdunensis Senecio fœtidus*, by *Clusius Jacobæa Pannonica prima* as *Ruellius* ...doth by him *Scopria vocatum*, but the last is mentioned onely by *Camerarius in horto*, who saith he received ...it by the name of *Senecio flore albo* from *Iosephe de Casa bona*, the great Duke of *Tuscane*, or *Florence* his Herbarist.

The Vertues.

Coltsfoot is cold and moist as *Fuchsius* saith, and therefore seldome used inwardly. *Galen* saith in *6. simpl.* it hath in it astringent qualities both cooling and a little digesting: the decoction of the herbe saith *Dioscorides*, made with wine and drunke helpeth the paines in the stomacke proceeding of choller (which it may well doe by a vomit, with the help of the juice of the herbe, the juice hereof taken in drinke, or the decoction of the herbe in Ale greatly performeth) *Pliny* addeth from others report that it is good against the laundies and falling sickenesse, being drunke in wine, as also to helpe the paine of the bladder, that is in making water when it is stopped, which it provoketh, as also to expell gravell in the reines or kidneyes, a dram thereof given to *Oxymel*, after some ...before it bring the body: it helpeth the Sciatica also and the griping paines in the belly, or the Collicke: ...the same doth *Vinacea* as *Pallas*, accounting it good for the sickenesse of the heart, and to helpe the de- ...fects thereof: it is said also to provoke womens courses, and some say also that it loseth the whites, which ...*Camerarius* hath declared to be so, in that the one quality is contrary to the other: The fresh herbe ...bruised and made into a Pultis and applied to the breasts of women that are swollen with paine and heate, as ...also to the priuie parts of a woman, the Seate or fundament, or the Arteries, Joynts and Sinewes, when ...they are swollen: the like doth much ease them, and used with some salt helpeth to dissolve the knots or ...kernels that happen in any part of the body: the juice of the herbe or as *Dioscorides* saith, the leaves and flow- ...ers with some frankincense in powder, used in wounds, whether of the body or of the nerves and sinewes ...doth singularly helpe to heale them. The downe of the heads (saith hee) used with Vinegar doth the like, but if ...the same downe be taken in drinke it will choake any: the distilled water of the herbe performeth well all the ...aforesaid properties, but especially for the inflammations of the eyes, and watering of them, by reason of the ...distillation of the humours into them. *Pliny* reporteth a ridiculous fable to helpe the toothach, to digge up the ...plant without any iron toole, and then to touch the aking tooth five times therewith, and to spit three times ...after every touch, and afterwards to set the herbe againe in the same place, so that it may grow: will ease ...the paines (saith he) as fabulous and ridiculous as that, is this, which some have set downe, that glaire being ...mixed with the juice of Groundsell, and the blood of a Ramme or Goare, will become as soft as wax, fit to bee ...made into any forme, which being put into cold water will come to be hard againe.

Chap. XCI.

Tripolium. Sea Starrewort.

Although *Dioscorides* and *Galen* knew but of one *Tripolium*, yet because *Lobel* hath set forth another that is lesse, and *Camerarius* accounteth another herbe also to be a little sort thereof, I thinke it not amisse to make mention of them also in this place, and some others of later knowledge.

1. *Tripolium majus sive vulgare.* The greater Sea Starrewort.

Our ordinary Sea Starrewort hath many long and somewhat broad leaves, rising from the roote ...next the ground, smooth, fat and thicke, and of a blewish greene colour, somewhat like unto the leaves of *Dorias* ...*Cretensis*, but smaller, from among which riseth up a smooth hollow or flethy greene stalke, two or three ...foote high, branched towards the toppes into divers smaller branches, with such like leaves on them as grow ...below on stalkes: the flowers that stand at the toppes of them are somewhat larger and greater then of the other ...Sea Starrewort, here before set forth among the *Asters* and almost of the same colour, having a blewish purple ...border of leaves standing about a yellow middle thrum, which after it hath done flowring, turneth into downe, ...and the small seede therewith is blowne away at the will of the winde: the roote hath divers greater strings, and ...many smaller fibres thereat, which grow deepe and sticke fast in the mudde of the marshie ditches where it ...groweth.

2. *Tripolium minus.* The lesser Sea Starrewort.

The lesser Sea Starre is in all things like the greater, but lesser and lower, both in roote, leafe, stalke and flower, ...as in the seare all places observed not to exceede the greatnesse of the small *Conyza* or Fleabane.

3. *Tripolium minus Germanicum.* Small Sea Starrewort of *Germany*.

This also is very like unto the last, but lesse then it, having a shorter stalke and narrower leaves, the flower ...of a small deale a more purplish colour.

Camerarius maketh mention that *Matthiolus* had in his Garden one hereof with yellow flowers, but I rather ...suppose it was some other kinde of herbe, and therefore I make no further mention of it here.

4. *Tripolium Lychnitis Camerarii folio & alterum Fœniculi folio.* Starrewort with Rose Campion like leaves, and another with Fennell like leaves.

The former of these two kindes of Starre worts I received from Signor *Rosi* from *Lithane*, but they sprang not ...up: but as easy as that with Fennell like leaves was the *Ageratum fœniculaceum* of *Lugdunensis*.

The Place.

The first groweth as I said before to the ditches of the salt Marshes, neare the Sea coasts in many places of this ...Land, so that you shall hardly misse it in any salt Marsh in some place or other if you looke well for it: the se-

cond groweth as *Lobel* saith neare the mouth of the River *Po*; the third saith *Cordus* groweth in the salt Marshes that are nigh unto the Lake of brackish water, which is by *Stassfort* in *Germany*, and so doe the other two as hee saith also.

The Time.

They flower in *June* and *July* for the most part.

The Names.

It is called in Greeke τριπόλιον *Tripolion*, which name the Farmers keepe and change not, and as *Dioscorides* reciteth was so called, because the flowers did change their colours three times a day, which was but a false information or a negligent consideration. *Serapio* called it *Turbith*, but *Lobel* and *Pena* dispute it, as I said before in the Chapter of *Tithymales* or Spurges: for the roote of this purgeth not (say they) either the juice in decoction: *Pliny* in mistaking *Tripolium* maketh *Pelium* to have the same nature, that *Theophrastus* in the ninth booke and 21. Chap. giveth to *Tripolium*: and *Gesner* following *Pliny* his error, transferreth it *Polium* also; the first is called *Tripolium* of all that have written thereof, except *Cordus*, who in *Observationes Plantarum* calleth it *Amellus minor*, as he doth the second *Amellus maior*, and the last *Amellus Creticus*: and *Matthiolus* who calleth the first *Aconis species pulcherrima*, as *Lobel* before him gave him the occasion, who saith it doth more fitly and orderly expresse the *Amellus* of *Virgil*, then that *Aster Trachelium*, or *mauvais pourpre* which we doe account to be it: yet I may say by *Lobels* leave, that the *Aster* before said doth more properly grow *prope flumina* as *Virgil* saith his *Amellus* doth, then in *agro Hierosolymitano* as *Tripolium* doth.

The Vertues.

Dioscorides saith that the roote is sweete in smell, and hot in taste, that two drammes thereof given in wine to drinke purgeth the belly, (which as is before said *Pena* and *Lobel* doe deny) from watery humours, and by Vrine. *Galen* saith the roote is sharpe in taste and hot in the third degree. *Dioscorides* further addeth that it is put into Antidotes against venome and poyson. It is found by experience to be singular good to heale all fresh wounds, the leaves onely bruised and bound to the place, the juice dropped into them; as also for other hurts or inward bruises, and as effectuall also as any ointment whatsoever, for any old Vlcers or sores.

CHAP. XCII.

Verbena. Vervaine.

THis herbe hath bred much doubt among many of our moderne writers, what it should be that *Dioscorides*, *Galen* and *Pliny* make mention of, some supposing one herbe, some another, as you shall heare by and by; but unto those two sorts that *Dioscorides* speaketh of, and *Pliny* calleth *mas* and *femina* and others *recta* and *supina*, wee are to adde one or two more knowne in these later times and set forth by some.

1. *Verbena mas erecta & vulgaris.* Common or upright Vervaine.

The common Vervaine that is familiar to our Countrey hath divers somewhat long and broad leaves next ground, deeply gashed at the bottome of them, the other part being deeply dented about the edges, and not onely deeply dented, or cut all alike, of a blackish greene colour on the upperside, and somewhat grayish underneath: the stalke is square and branched into divers parts, rising to bee about two foote high, at which are put thereto the long spike of flowers at the toppes, which are set on all sides thereof one above another, sometimes two or three together, being small and gaping, of a purplish blew colour, and white intermixed, which come small round seede, in small and somewhat long heads: the roote is fibrous and long and of no use.

2. *Verbena supina sive femina.* Bending or female Vervaine.

This other Vervaine hath divers smaller and weaker square stalkes, leaning or bending downe to the ground and almost lying thereon, not standing upright like the other, parted into many more and smaller branches, and having such like leaves growing on them at the severall joynts, but much smaller, and more divided or cut, making them seeme to be many leaves, set on both sides the middle ribbes, of a grayish greene above and hoary underneath: the flowers grow in the same manner that the other doth, in small long spikes, being of a paler blew colour then the other, otherwise in forme not unlike: the seeds that follow is like it also and likewise both perishing after seede time, and raising it selfe of its owne sowing.

3. *Verbena Peruana.* Vervaine of *Peru*.

This Vervaine is like unto the last Vervaine, but growing greater, and abiding greene in Winter as well as Summer, as many of those Accidentall plants doe, which will not in these Europæan parts, yea it hath been

Public Domain / http://www.hathitrust.org/access_use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

never the whole plants that naturally abide not greene all Winter, but those parts, being carried thither have remained greene all the Winter, contrary to their custome here.

4. *Verbena spontanea nobilior.* Round headed Vervaine.

The round headed Vervaine hath from a small fibrous root a long square, smooth trayling joynted stalke, whereon grow small leaves almost round, yet pointed at the end, and dented from the middle of them forwards, at each joynt also with the leaves come forth two or three branches, and a bare small stalke, bearing at the upper end a long round head, from whence stand forth such like small flowers as are in the other forts, and such like seede also following them.

The Place.

The first groweth generally throughout the Land in many places, by the hedges and way sides, and other like grounds: the second is not found in our Land, although *Gerard* saith it; for it will not endure a Winter but before it seede with us: the third is of the *West Indies*, and the last is naturall of *Naples*.

The Time.

The first flowreth about *July*, and the seede is ripe some time, and sometimes the last sometimes; but the rest as I said with it become flower before the Winter wither, and therefore cannot bring his seede to perfection, but in the warmest places it flowreth not untill the end of *July*, and in *August*.

The Names.

It is called in Greeke ἱερὰ βοτάνη, id est, *sacra herba*, and περιστερεὼν *Peristereon* quod *Columbis in nidificando usitatum*, and ἱερὰ βοτάνη *sacra herba* apud *Plinium*, quod *Tarquinius Priscus bello abiturus, familiæ lustrationem, lenimenta, & aræ fieri, & epulas verrebatur, & facilia ut sacra fierent, jubebat, Ita verrebatur, vel ne Diis inferiis quidem verbenæ combustæ, & ita*

5. Verbena supina procumbens.
Trayling or lowly Vervaine.

1. Verbena vulgaris.
Common Vervaine.

4. Verbena spontanea nobilior.
Round headed Vervaine.

Sacra more gentis &c. It was also called *Sagmen alia herba, but all grasses and herbs so dried, were sometimes called, quodes pene bellique ritibus habebantur, or Sagmina in publicum munditiæ causa adhibita.* It is called in Latine *Verbena quasi Herbena*, or *herba bona, Matricalis, Verbenaca*, and *Columbaria, or Columbaris, Columbaria, Chamæpitis*, and *Hemionitis*, as also *Peristeria* from the *Germane* word *Eisenkraut*, or *Eisenkraut*, as I said. The *Italians* call it *Berbena* and *Verbenaca*, the *Spaniard Verbena*, the *French Verveine*, the *Dutch Vervein* and *Herbers*, and we in *English* Vervaine, and in some countries Pigeons grasse, and Holy herbe, as I said others *Mercurialis* mans blood, and *Iron herbe*. These two last sorts of Vervaine have beene much controverted as I said before by the later Herbarists, and writers some doubting whether they should be any peculiar herbes, in that they thinke that any grasse or herbe that was cast on the Altar, was called *Verbena*, and for it they alleage *Terence in Eunuco*, where he saith *Ex ara sumebat forte*, wherein *Donatus* speaketh after his conceite thus (for *Asconius* hath *Herbas*, out of whom this was translated) and understanded such herbes as lay there, and not Vervaine onely. Some also as *Fuchsius* and *Dragus* make *Lysimachia vulgaris flore luteo* to be *Verbena*: so as *Dragus* hath called one kind of *Pennella*, *Verbena*; and *Dragus* besides maketh his third *Verbena femina* to be the *Cunabulus aquaticus folio imperato*. *Dodonæus* formerly made the two sorts of wilde Germander to be *Hiera botane mas*, and *femina*, and *Cesalpinus* tooke the *Sideritis prima Matthioli*, or *Alectorolophon tertium* to be *Verbena alterum genus*, who also called it *Verbena femina*, which all others call *mas*, and *vulg.* the *Sideritis* is called *femina* by them all.

The Vertues.

Vervaine is hot and dry, bitter and binding, and is an opener of obstructions, cleanseth and healeth, for which purpose the yellow Iaundies, the Dropsie and the Gowte, as also the defects of the Reines and Lungs, and generally all the inward paines and torments of the body: the leaves being buryed and drunke, the same helpe very much against the biting of serpents and venemous beasts, and the Plague or Pestilence, against both *quotidian* and *tertian* Agues, killeth and expelleth the Wormes in the belly, and causeth a good colour in the face and body, strengtheneth as well as corrected the diseases of the Liver and Spleene, is very effectuall in all the diseases of the Stomacke and Lungs, as Coughes, shortnesse of breath and wheezings, and is singuler good against the Dropsie, to be drunke with some Honey seedes, bruised and put thereto, and is no lesse precious for the diseases of the Reines and Bladder, to cleanse them of that viscous and slimy humour which ingendreth the stone, and helpeth to breake it being consumed, and so expell the gravell: it consolidateth and healeth also all wounds, both inward or outward, and stayeth bleedings, and used with some honey, healeth all old Vlcers, and Fistulaes in the Legs or other parts of the body, as also those Vlcers that happen in the mouth, or used with *Aloe* gargleth helpeth the swellings and paines of the secret parts of man or woman, as also for the piles or hæmorrhoides, applyed with some oyle of Roses and Vinegar unto the forehead and temples, it helpeth to ease the invenom paines and ache of the head, and is good also for those that are fallen into a frenzy: the leaves bruised the juice of them mixed with some Vinegar, doth wonderfully cleanse the skinne, and taketh away all redness, freckles, pustulaes, or other such like inflammations, and determines of the skinne in any part of the body. The distilled water of the herbe when it is in his full strength, dropped into the eyes, cleanseth them from films clouds or mist that darken the sight, and wonderfully comforteth the optick veines. The said water is very powerfull in all the diseases aforesayd, either inward or outward, whether they bee old corroding sores or greene wounds. The female Vervaine is held to be the more powerfull for all the purposes before spoken of, but that of *Peru* goeth farre beyond them both for *Monardus* reporteth divers very admirable cures which the herbe hath performed in the *West-Indies*; as of a certaine noble woman, who having used the helpe of divers Physitians in vaine, an *Indian* Physitian very skilfull in herbes, gave her the juice of this Vervaine to drinke with some Sugar mixed therewith, for to allay somewhat of the bitternesse thereof, by whose use shee avoided in few dayes a thicke long worme (which shee called a Snake) being hairy, of a foot in length, and double forked at the taile, after which shee grew well; the same noble woman commended the same medicine to another noble woman in *Peru*, who had not beene well of a long time, who having taken it in the same manner for certaine dayes avoided many small and long wormes, and among the rest, one very long, like unto a long white gristle after which time shee became well againe. Which medicine was by advice given to many others that complained of Wormes, and they were all soone holpen by avoyding wormes, either done or little, and long roules or balls of haire, and other things: it is held also to bee no lesse effectuall against all poyson, as also none of dangerous beasts and serpents, as also against bewitched drinkes or the like. Many other wonderfull cures *Monardus* setteth downe which are too long here to reeue, seeing these are sufficient to shew how powerfull that herbe is for many diseases.

Chap. XCIII.

Hedera terrestris. Ground Ivie or Alehoofe.

VNto the common Ground Ivie, which is not found to vary with us, yet observed by forrain writers some differences, I must adde another sort set forth by *Lobel*, which agreeth very well therewith in face and outward forme, whatsoever it doe in the inward qualities.

1. *Hedera terrestris vulgaris.* Common Ground Ivie or Alehoofe.

This common and well knowne herbe lyeth spreadeth, and creepeth upon the ground, and in the shooting forth roots at the joynts of the covered render stalkes, set all along with leaves and leaves at every joynt, some what hairy and crumpled as it were, and unevenly dented about the edges, with round leaves at the joynts like wise with the leaves toward the ends of the branches some furth trollow long flowers, growing at the ends, of a blewish purple colour, with small white spots upon the Label or lippe that being downe in the mouth or jawes: the roote is small with fibres.

2. *Hedera terrestris minor.* The lesser Alehoofe.

The lesser Alehoofe is altogether like the former sort, but that the trayling branches creepe not by [illegible]

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

ing smoother, and growing somewhat more upright: the leaves also are somewhat smaller, and the flowers of a paler blew colour.

Hedera terrestris montana, Mountaine Alehoofe.

The tall Alehoofe was smaller then the ordinary sort in all the parts thereof, as branches, leaves and flowers, the leaves also being more rough and hairy, and the flowers of a deeper purple colour.

Hedera terrestris saxatilis Lobelij.

Stone Alehoofe.

The Stone Alehoofe creepeth also and spreadeth with his slender weake branches, all about upon the ground, with roundish leaves, set at the joynts by couples, as in the former, but larger, and more unevenly dented or rather cut'd in the edges: the flowers that stand at the joynts with the leaves are larger and longer, and of a paler purplish colour then the former.

The place.

The first groweth and is found under the hedges and sides of fields and ditches, under house sides, and in shadowed lanes, and other waste grounds in every part of the Land almost: the second is found on the fleece of old trees in some countries of the world: the third is found to grow on hills and mountaines: the last in *Narbone*, and *Provence* in *France*, and diverse places of *Germany*, as *Lobel* quoted it among the plants which came to my hands.

The Time.

They flower somewhat early, and abide for a great while, the leaves keeping their verdure unto the Winter, and sometimes abiding it the cold too extreme and sharpe.

The Names.

It is thought to be the *Hedera terrestris* or *Chamecissus* of *Dioscorides*, although there be some doubt in the Text, by the transposition of words and the resemblance, both which are easily discovered and this plant by the opinion of the most judicious is accounted for true and right *Chamecissus* of *Dioscorides*, no other being found that can come so neare it in face and properties, besides the neerenesse of the name, for the Latines *Hedera humilis* is the same with *Chamecissus*, and *Hedera terrestris* is not farre from it. Some call it *Corona terrea*, because it spreadeth and is like a Garland upon the ground. All writers generally call it *Hedera terrestris*, yet *Cordus* in his history of Plants calleth it *Chamehedera*, and *Hieronymus* misliking it, made it his fourth *Elatine*. *Lugdunensis* out of the *Geoponicks* calleth it *Malachoides*, and *Malachoides*, which most properly agreeth unto this, and some also call it *Hedera alsinoides*, but on what rule I know not. *Lobel* calleth the tall *Alsine* and *Hederula saxatilis*, and *Alsine petræa Saxifraga*, and *Saxifraga nova*. The *Arabian Serapio* putteth it under *Cissus* the Ivie, and calleth it *Cecos*. The *Italians Hedera terrestre*, the *French Lierre terrestre*, the *Germans Gundelreb*, or *Grundereb*, that is *terra repens*, the *Dutch Eyenloof*, and *Eyenwortel*, in *English* according to the several countries appellations, Gill creeper by the ground, Catsfoote, Haymaids and Alehoofe most generally, or *Tunehoofe*, because the country people use it much in their Ale, and sometimes as frequently although *Lobel* judgeth the *Hederula saxatilis*, or stone Ivie, more properly to deserve the name, as you shall heare by and by.

The Vertues.

Gill is cold in the second, drie and sharp in the third, and thereby is found to be hot and dry, it openeth also, cleanseth and digesteth, and is a singular good wound herbe for all inward wounds, as also for exulcerated Lungs or other parts, either by receiving it with other the like herbes boyled together, and so drinking it, or else by the juice of it alone: it is also good against all stopping paines of windie or cholleriche humours in the stomacke, Pleurisie or bolts, doth easily drive them out of the place, likewise helpeth the yellow Jaundies by opening the obstruction of the Gall, Liver and Spleen, it expelleth venome or poison, and the Plague also: it procureth Urine and womens courses, and (say they that have tried it) it helpeth the stone, for the decoction of the herbe in wine being drunke for some time together doth expell it, it helpeth also the Sciatica or Hippe Goute, as also the Graine in the hands, knees, or feete, it helpeth to discusse all impostumes, the peccant humours, and to procure ease: the same decoction is excellent good to gargle any sore of the mouth, putting thereto some Honey and a little burnt Allome, as also to wash the sores and Vlcers of the secret parts in man or woman: it speedily healeth greene wounds being bound thereto: and the juice of it with Honey and Verdigrese doth wonderfully cleanse fistulaes, and hollow Vlcers, and stayeth the spreading or eating Cancers and Vlcers: it helpeth also the itch, scabbes, wheales, and other eruptions in the skinne in any part of the body: the juice of *Celandine*, field Daisies and ground Ivie (all or any of them) dissolved therein, dropped into the eyes is a soveraigne remedy for all the paines, redde and watrie eyes, the pinne, and webbe, skinnes or films growing over the sight, or whatsoever else hurteth the same: it helpeth heales as well as mans: the juice dropped into the eares doth wonderfully help the noise and ringing of them, and helpeth their hearing that is decayed. The country people use it much in their Ale, and some in wine with their drinke, not onely for the especiall good vertues therein, but for that it will also cleare their drinke: and some doe affirme that an handfull put into drinke that is thicke, will cleare it in foure and twenty houres by they say, and make it more fit to be drunke.

Hedera terrestris saxatilis.
Gill creeper and mountaine Alehoofe.

CHAP. XCIIII.

Hedera. Ivie.

THE Ancient Greeke and Latine writers of herbes, as *Dioscorides*, *Theophrastus* and *Plinie* have set downe many varieties of Ivie, (besides the *Hedera sterilis* which is *Smilax aspera* described before in this worke) which were observed in their times, partly in the leaves and flowers, but chiefly in the berries, yet make but three principall kinds, *alba, nigra* and *helix*: and yet more exactly we finde, *alba quæ in arborem assurgit*, and *alba quæ humi repit*, whose differences seeme proper, they are divided each of them against into their *species* or sorts, whereof we know but few, for that onely which climbeth upon trees, walls, &c. and beareth blacke berries, and the other baren kind that creepeth upon the ground yet so the clasping branches will take hold of whatsoever is next unto it, are here knowne to us, the other bearing white or yellow berries are seldome seene in these Christian parts, yet I will shew you in the Chapter the nature that *Theophrastus* speaketh of which they had in former times, joyning thereto some few I could yet learne.

1. *Hedera arborea foliis fœtidis & Corymbo nigro.* The ordinary climing Ivie.

The climing Ivie groweth to with a thicke woody trunke or body, sometimes as bigge as ones arme, sprouting forth on all sides many woodily branches, and groweth sometimes alone by it selfe into a tree like a tree, as I have seene in two or three places in this countrey, but usually climeth up by trees, and as she ascendeth forth divers small strings issue out of the body, or branches of the tree whereby it climeth up, as also at the joynts of those with, wherewith it runneth so strongly, fastning them therein, that in drawing the woodbine out of the tree and thereby killeth it by consuming the life and moisture thereof, and by drinking it into the abundance of the shadow and moysture of his branches, and evergreene leaves (which may seeme to be ordained therefore by nature) when it is defaced, but in the end the bane and utter ruin of it) which branches also having once joyned their roots into the tree or wall will live thereby upwards, if any shall cut away the roots of any of them, as well as if it were not taken away at all, but by setting the roots into the wall, and also growing over, they often so wracke it that it will in time also ruine it utterly: while the tree is young the leaves of most are covered, but when it groweth elder, it hath no couers on the sides, and onely round or roundish long, and pointed at the end, the young leaves that spring forth from the branches, keeping often times the same order, and are a darke shining greene colour above, and somewhat of a yellowish greene under neath, some whole and sometimes with red spots, abiding fresh and greene Winter and Summer: from the joints of the branches and tops of the branches grow forth upon short stalkes small mosse yellow flowers, standing in an order like a round tuft, after which come small round berries, greene untill they grow ripe, and then blacke, with a small point at the end of every one, in which is contained usually foure seedes, three square in a manner, &c.

1. *Hedera arborea vulgaris.*
Our ordinary Ivie.

2. *Hedera Helix pro ea, quæ humi repit.*
Britaine Ivie.

Original from UNIVERSITY OF MICHIGAN

[illegible] the [illegible]. It yeeldeth in the [illegible] a certain [illegible], Gum of a strange sent which is [illegible] [illegible] to [illegible] inwardly, being [illegible] [illegible] is [illegible] for outward [illegible].

[illegible] [illegible]. White [illegible] Ivie.

This [illegible] growth in the same manner that the other doth, without any great diversitie that hath [illegible] [illegible] time, and is chiefly distinguished in that the [illegible] are thinner and finer, and of a lighter greene colour, and the berries of a whitish or grayish colour, [illegible] when they are ripe.

3. *Hedera Dioscoridis, fructu luteo sive purpureo.*

Yellow berried Ivie.

The leaves of this Ivie are seldome cornered on the sides but smooth, and onely pointed at the ends, of a fresher greene colour, or not so blacke as the first, thicker also and fuller of veines, and more thinly or sparcely growing on the branches: the berries are greater then in them, and of a gold yellow colour, declining to bee more browne when they are ripe.

4. *Hedera arborea.* Barren Ivie.

The barren Ivie sendeth forth divers slender woody woody branches, straying upon the ground, and for the most part lying thereon, but sometimes it is found to winde it selfe, and climbe up the bushes and hedges under which it groweth, with the small tendrells it putteth forth at the severall joynts of the branches, whot the leaves come forth, being somewhat lesser then the former, and of a darker shining greene colour, smoothe formed into three corners, yet some times with two: at the joynt with the leafe underneath, whot hath also small white fibres or roots, whereby it taketh hold as it creepeth: this beareth neither flowers nor seede.

5. *Hedera arborea Lusitanica.* Treefoile Ivie of Portugall.

The roote of this plant doth shoote underground, and

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

send forth young woodily stalkes whereof some will stand upright, others lye downe and take roote where they spread, as also in any wall they stand nigh unto, like unto our barren Ivie: the leaves are fayed to stand three always set together upon a long footestalke: at the joynts with the leaves come forth the pale flowers in a loose knit or cluster, which turne into pale yellow berries, with small hard, round stones therein, wrinkled in sides or husks, without any moisture at all in them, this plant yeeldeth a white milke with it, salte, being broken in any part thereof, which after it hath abidden a while will change to bee as blacke as Jet, and is therefore held fit to colour the haire or any other thing.

3. *Hedera quinquefolia Virginensis*, Virginian Ivie.

I have described this in my former booke under the title of *Vitis seu potius Hedera Virginensis*, so exactly that were needlesse labour to doe it here againe, I shall therefore referre you thereunto for it, only shew you the figure of a branch thereof with the other.

4. *Hedera crecta folijs planis Lobelij*, *Lobels* Ivie leafed plant.

Not finding a fitter place then this, let me with *Bauhinus* set it with the Ivies for the leaves take although he calleth it *Cyclaminos Indica folijs*. This plant (saith he) hath stalkes about a cubit long or better which are soft and slender, having Ivie like leaves upon them: the flowers are long and hoodded, of a pale purple colour. It is found on the hills in passing through *Italy*.

The Place.

The first is well knowne to every child almost, to grow in woods upon the trees, and upon the lower walls of Churches, houses, &c. or sometimes to grow alone of it selfe, as is before sayd. yet very seldome: the second is sayd to grow in *France* and some places of *Turkey*, and some say in *Naples* also: the third *Pena* and *Lobel* say grow in *Campania* and *Apulia*, and yet I have seen in gardens of *Italy* and also of *Germany*: the fourth groweth in moist and shadowie places for the most part, under hedges and the corner of waste grounds, lanes and the like: the fift next grow in the Northwest parts of *America*, where our *English Colonies* are planted, the last as is before noted.

The Time.

Our Ivie flowreth not untill *July*, and the berries are not ripe usually untill about *Christmas*, that they serve for the winter frolicks of the other two we can say no more, then that wee have little acquaintance with them, yet *Gesner* in *horto* saith, that he saw that with yellow berries in *Germany*, the *American* sorts are very late ripe.

The Names.

It is called in Greeke κισσος and κιττος *Cissus* and *Cittus*, *quorum Cissi nomen fabulantur Graeci a Cissa Liberi* (quem *Nysam* in *Arabia* ab illo *Cisso*; *Athenienses* enim *Cittum Bacchum* ipsum *Cissum*, ut qui semper *Cissa* ornatus, quia ea illi perpetua virent: but *Pena* and *Lobel* say they thinke it is rather derived from κισσαω, *Veneris*, quia *Cissus* hederamque arbores, plenum impetum amoris concubitusque omnes complexa inuenit, & exedit ac denudat truncum, or from κισσαω *pomum sive potusus loco*, quia ut illi aquam, sic hi lignum excavatum porrigebant, quo vinum transmitterent, unde Catone & Varrone *Cissibium* quasi *hederaceum* est, and *Cessus* from thence it is likely saith, that a cup made of Ivie wood will not hold any wine therein, in Latine *Hedera*. *Hederam vero Pompeius de Gamonensibus*, *quod hederas odora parte, aut quia ut adhaerent edit & emittit*: the *Arabians* call it *Cassus*, the *Italians Hedera*, the *Spaniards Edra*, the *French Lierre*, the *Germans Egen*, the *Dutch Vyel*, and we in English Ivie. The first is called of all writers either *Hedera nigra*, or *Hedera arborea*, especially that which groweth alone by it selfe, which therefore the ancients called *Hedera sterilis*, *Hedera mitis*, of some *Coronalis*, (and of *Pliny Hedera vigens* and *frondens* by some to distinguish it from the other sort of Ivie) or *viridis*, to shew the difference from the second called *alba*, white or gray: such was that in his *Adversaria* were the words set *Pisis*, which *Theophrastus* speaking of the diversities in fruits of trees, and *Pliny* from him say differ, some having white leaves as well as berries, which made *Virgil* to call *Candida cygni colla* white necks, then Swanne more lovely, or then the white Ivie, some also having roundie and thicke bunches of Berries which he called *Corymbi*, or *Hedera Corymbifera*, and some having greater berries and thinne branches called *Radicantia*: the third is called as *Pliny* saith *Nissa* and *Bacchica*, of the *Athenians Athenaica*, of the *Grecians Chrysocarpos*, which *Dioscorides* and *Diosbanpius* as *Lacydonensis* saith call *Dionysia*, wherewith the Poets were wont to be crowned, and yet the blacke berried Ivie, whereof it is a *species*, is more likely called *Dionysia*: all the fourth is called *Hedera Helix* and *sterilis* by all our moderne writers, and *Lobel* in *Pannonia Hedera Helix*, and taken to be the *Helix* of *Dioscorides*, *Theophrastus*, *Pliny* and the rest, which they say is the third *species* of their climing kinds, but we have not seene it to climbe up in that manner, as the other doe in our country, lying as I sayd for the most part on the ground, although some times it will climb up (and therefore *Pena* & *Lobel* in *Adversaria* say that it should more properly be called *Hedera arborea*, then the former taken to be the *Helix* of *Dioscorides*: (but it is but his bare opinion without good advise) yet *Iohannes Thalius* in *Hercynia* saith that he there found it climing as well upon trees, as creeping upon old walls & hedges. Of this sort *Theophrastus* and *Pliny* record divers sorts, some whole leaves were white, some greene, & others of divers colours, which they called *Poecilia*, some also differ in the length of the smaller branches, (saith *Theophrastus*) in length of couples betweene the joynts, saith *Pliny*) and in each of these againe are certaine differences, as in the greene some had longer, some thicker & some thinner leaves, and in others smaller, and in the white sort, some had great & others lesser leaves, and in the party-coloured sort, some whole leaves were thicker or thinner, or more parted, yet in this it chiefly differeth not say they, that it is barren in all, not bringing any fruit, whether it was rather for want of age, in that in time it did beare, and turne into the other sort, doth say *Pliny*, with many more things too long to insert here: they that are disposed to reade the Authors themselves may be informed of the particulars. *Bauhinus* maketh the *Hederula* of *Tragus* to be a differing sort from the other, calling it *Hedera humi repens*, which yet *Tragus* himselfe distinguisheth not, saying that that Ivie which while it is young bringeth no fruite, when it is growne older doth, and there is no difference in his two sorts, *Hedera* and *Hederula* but in the age: the two *American* sorts are so termed by us as they are in their naturall.

The Vertues.

Galen sheweth that Ivie is of divers qualities, some sharpe and hot, others hot, and some cooling and astringent; being therefore such an inconstant *Vertue*, it is the more carefully to be applyed and chiefly in curing barrennesse in man or woman, if they shall take too often thereof, and preserveth

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

...ed in the braines, and leaves: A Pugill of the flowers (that is as much as one may take up with their three fingers together) which may be about a dramme, taken *Diascordium*, drunke twice a day in red wine, helpeth the Iaundice and Yellowby like. It is an enemy to the nerves and sinewes being taken much inwardly, but leveth the chollick if they being applied outwardly: *Pliny* saith that the yellow berries of wood against the Iaundice, if a certain number be let to drinke hard will keepe him from drunkennesse, and helpeth those that spit blood: but the white berries being taken inwardly killeth the worms of the belly, or applied outwardly the juice of the roote, is good to be taken against the biting of the *Phalangium*, or deadly spider: the berries are held by some Empericks Quacksalvers and Unthriftions to be a soveraigne remedy both to prevent the Plague or pestilence if it be taken, as also to keep them from it, that have got it, by drinking the berries made in powder by two or three dayes together, they being taken in wine do by certain help to breake the stone, provoke urine and women to their purgations: yea so powerfull they are in those parts, that a bath made of the leaves and berries, as women to sit in, or over the fumes, or a pessarie made of them and put up doth mightily prevaile to the same effect, and so draw forth the dead birth and secundines or afterbirth, but this is to be cautelously used, and not but upon necessitie. The extremities of the leaves of Ivie while they are fresh, boyled in Vinegar, and applyed warme to the eares of those that are phrenetick, or troubled with the phrensie, ache or pitch in the same, doth ease them much: the same also applyed with some Rose water and oyle of Roses to the foreheads and temples, doth ease the headach although it be of long continuance: the fresh leaves boyled in wine, and old filthy Sores and Vlcers that are hard to bee cured washed therewith, doth wonderfully helpe to cleanse and drie them, and also effectuall for greene wounds to heale them quickly and soder up the lippes thereof: the same also is effectuall to heale scaldings of water, and burnings by fire, and the exulcerations that happen thereby, or upon the sharpenesse of sale flegme, and hot humours in other parts of the body: the juice of the leaves or berries being licked up into the nose purgeth the head and braine of thinne rheume, which maketh defluxions into the eyes and nose, and cureth the Vlcers and stench therein: the same dropped into the eares, doth helpe the old and running sores of them: five of the yellow berries bruised and heated with oyle of Roses in a Pomegrannet made and dropped into the eare of such as have the toothache, on the contrary side of the paine, easeth them therof: the berries or the leaves used causeth the haire to grow blacke. The fresh leaves are commonly used to be layd upon sores wheresoever, in the armes legges, &c. to keepe them open, and to draw forth the humours that fall under the Gum of the Ivie, which in the hot countries is gathered from the body and branches, is exceeding sharpe and hot, burning and exulcerating the skinne, yet it is used (being dissolved to take away superfluous hayre in any place, and also destroy Nits and Lice wheresoever: the same dissolved in Vinegar and put into hollow stone teeth doth ease the same, and being often used will cause them to fall out: some doe use it as a paste with other things to kill both: the wood made into a cup, and those that are troubled with the Splene shall finde ease, and have much holpen thereof, if they continually drinke out of it, so as the drinke may stand some small time in the same before it be drunke. *Cato* writeth an experiment how to finde out the deceit of Vintners and others that put water to their wine, which is this, that if you suspect your wine, you shall put some thereof into such a cup or dish made of Ivie wood, and that if there be any water therein it will remaine in the cup, and the wine will goe through: for the nature of Ivie wood saith he and *Pliny*, is not to hold any wine, so great an antipathy there is betweene them: the fume of Ivie branches being burned driveth away Gnattes and Batts, and all other hurtfull and noysome creatures.

Chap. XCV.

Cymbalaria Italica Hederacea. The *Italian Gondelo* or Ivie like leafe.

This small herbe creepeth on the ground with slender threddy branches all about taking hold on walls or any thing it meeteth, by small fibrous roots, which it shooteth out at the joynts as it runneth: at the severall joynts grow small broad, and almost round leaves, cut in on the edges into corners, somewhat like unto a cornered Ivie leafe, each standing upon a very small and slender stalke: at the joynts likewise stand severall small flowers upon slender foote stalkes, fashioned like unto a Snapdragon or Toadflax flower, with a taile or spurre behind it, mixed of yellow whitish and purple colours, and the lower lip were washed over with a purplish also: in whose places after they are fallen come small round heads containing small blackish seede.

The Place.

It groweth naturally in divers places of our Land, although forraine it hath not beene knowne to bee: but in Gardens about *Hampton* in *Worcestershire*, both in their Gardens and other places that are shadie upon the ground, for there it will alwayes best like to grow, as also upon the thatched houses in the North parts, as I am informed, and most abundantly in *Lancashire*, and in my Garden where it runneth up from the ground over the wall a great height.

The Time.

It flowreth from about the end of *July*, and in *August*, but continueth with mee in flower untill the great frosts destroy it, and the seede ripe some after the flowers doe shed.

The Names.

This herbe hath not yet (to my knowledge) any Greeke Author to give it a name, although the name *Cymbalaria* by the Latines is derived from the Greeke word κύμβος *Cymbos*, a boat, cut from the herbe κοτυληδὼν *Cymbalion*, which *Dioscorides* gives a name given to his *Cotyledon*, or *Umbilicus Veneris alter*, whereof divers would make this to be one, as I have set it, and also upon gave it the name of *Cymbalaria*, or *Cymbalaria*: the Apothecaries of *Venice*, and divers other places in *Italy*, where it familiarly groweth upon their mudde walles, &c. take it, and (ignorantly not knowing the right, or by penury not having the right) for *Cotyledon* or *Umbilicus Veneris*, and so use it in their *Vnguenta Popaleon*, as *Matthiolus* saith, and therefore *Lobelius* calleth it

Umbilicus

Umbilicus Veneris officinarum. *Lobel* calleth it *Cymbalaria Italica foliacea folio*, and *Columna Linaria hedera folio*; for he in this as in all other herbes saith the flowers and seede doe most truly demonstrate the *species* of every *genus*, which I hold to be the best *indicium* an Herbarist can use, and therefore I would make it a *species* of the *Elatine* that is *pyramidalis formosa*, rather then *Linaria*, every part herein, and not one as in *Linaria* being answerable thereunto: wee may call it in *English* either Iviewort or the Ivie like leafe as it is in the title, or from *Cymbalum*, the *Italian Gondola*, untill a more fit name may be given it.

Cymbalaria Hederæ folio. The Ivie leafed.

The Vertues.

It is held to be cold and moist (and therefore the *Italians* thought it a fit substitute for *Umbilicus Veneris* (which I hold is farre better) then that kind of *Ranunculus*, called *Ficaria aquatica*, which our Apothecaries use in stead thereof, because it is not sharpe and exulcerating, which are quite contrary to the qualities of that herbe they use it for, although the forme of the leafe being round, caused the name of *Ficaria* to bee given it) yet hath it some astriction also, whereby as *Matthiolus* saith it is very profitable for women that have the whites, to stay them, being eaten often in Sallats, as the manner of the *Italians* and other Nations is, more then of ours, and therefore a Conserve made of the leaves, or Syrupe made of the juice, we may use in stead of their Sallats: It is held as *Matthiolus* saith with divers, to have some properties that the true *Umbilicus Veneris* hath, which you shall finde related in the due place: this is with many held, and some found by good experience to cure wounds, and to stay the bleeding of them, the juice thereof being dropped into them, or tents dipped therein and put into them: the herbe bruised and applyed outwardly ripeneth impostumes: The distilled water of the herbe serveth well for all the uses aforesayd.

CHAP. XCVI.

Leontopetalon. Lyon leafed Turnep or blacke Turnep.

Leontopetalon. Lyon leafed Blacke Turnep.

THe roote of this herbe is uberous, somewhat like a Turnep or Sowbread, or great Earth Chestnut roote, being of a blackish gray colour, with divers small bunches or knobbes on the sides, from whence spring up divers large and long leaves, much divided or cut into divers parts (*Dioscorides* saith like unto Coleworts or Poppies, *Fuchs* and *Lobel* say more like unto Peony leaves, but wee finde that they are more jagged or cut in) of a darke yellowish greene colour (with us, but it may be of a darker yellow colour in the naturall places, neare unto the colour of a Lyons haire, and therefore tooke the name of Lyon leafe, as I take it:) from whence ariseth up a straked stalke, spotted with pale purplish lines and blakes, divided into many branches, set at the joynts with smaller leaves and lesser cut in: on the toppes whereof stand divers small flowers, made of five leaves a peece, of a darke or brownish yellow colour (red like an Anemone, and therefore called of some *Anemone* saith *Dioscorides*, and those that follow his Text onely) on the outside, and yellow on the inside: after which come small podicles, thicker and shorter then those of *Radix Cava*, or *Fumaria bulbosa*. Hollow roote, else somewhat like as the whole plant doth in some sort resemble it, with small round seede therein.

The Place.

It groweth in the fields about *Aleppo* in *Syria*, in *Gracia* also, *Candy* and *Naples*: the roote and seede have been set sometimes to us, but we could seldome have it to live above a Summer, or the greater roote once in winter with us.

The Time.

It flowreth in the Winter time in *Candy* as *Bellonius* saith; but very late if at all with us.

The Names.

The Greekes call it Λεοντοπεταλον, and the Latines *Leontopetalon*

Original from UNIVERSITY OF MICHIGAN

also, for the cause shewed in the description as I thinke: divers other Greeke names it hath neadelesse to be remembred here, and Latine also, as *Kapesium*, *Papaveraculum*, *Semen Leoninum*, *Remedia*, and *Pes Leoninus*, and *Pentaphyllum*; but yet there is another *Pars Ioannis* called *Alchymilla*, as wee have shewed before. *Camerarius* from *Rauwolfius* saith, that they about *Aleppo* call it *Affak*. *Apuleius* calleth it *Leontopodium*, and so doth *Cato* also, in attributing the same qualities to his *Leontopodium*, that *Dioscorides* and *Galen* doe, unto the *Leontopetalon*: *Oribasius* also saying that *Leontopetalon* was called *Leontopodion* in his time. We may call it in *English* either as it is in the roote, according to the forme, Blacke *Syrian* Codded, or *Syrian* blacke tubed Fumitory, for both *Anguillara* and *Columna* doe make the *Radix Cassa* of *Fumaria bulbosa*, to be *Leontopetalum Alterum*, and *Leontopetalon genuinum*, but I plead inepte, to distinguish it from the next that is like it also.

The Vertues.

It is withall hot and dry in the third degree, and that it hath a digesting quality therein also; *Dioscorides* saith, it is the most powerfull remedy speedily to helpe those that are bitten by any Serpent, if the roote bee given in wine: the same also is very effectuall to helpe the Sciatica, not onely to be put into glisters that are made for the purpose, but also to be applied outwardly. and by the digesting facility it hath to cleare and heale old filthy Vlcers. *Rauwolfius* in his *Itinerary*, or *Iournall* of the East Countries, reporteth that the inhabitants about and in *Aleppo* doe use the powder of the old and greater roots of this herbe, to take out Spots out of the faces of women by rubbing them therewith.

Chap. XCVII.

Chrysogonum. Oaken leased blacke Turnep.

This Plant so like unto the last hath caused me to joyne it next unto it, whose description according to the best authors that have seene it and set it forth, and mine owne observation of their figures, you shall have in this manner. It hath a tuberous roote like unto *Leontopetalon*, or the Earth Chestnut, called *Balanocastanon*, or *Bulbocastanum*, of a browne colour on the outside and very red within, sending forth three or foure long winged leaves, lying on the ground. *Rauwolfius* saith he never observed so few as three, standing upon a very small and slender stalke or rode, and are made of many leaves, standing oppositе one unto another, at spaces or joynts, and long at the ends, every one whereof is small at the bottome, and broad at the point, where it is cut into some divisions, making them seeme like unto Oaken leaves, but much lesser (*Rauwolfius* figure seemeth to expresse but five leaves at a space, *Alpinus* figure two or six yet smaller) of a very darke greene, from among which leaves riseth up a stalke a cubit high, without any leafe upon it, divided at the toppe into many small sprigs or branches, bearing every one a yellow flower, made of five leaves a peece, longer then those of the last: after which come small thort pods, small at the further end, with a little round knobbe, wherein lye the seede (like the other as I thinke.)

Chrysogonum. Oaken leased blacke Turnep.

The Place.

It groweth in the fields among the corne in *Syria*, as *Rauwolfius* hath, who there found it.

The Time.

The time of the flowering is not expressed, but it is likely to bring it like the former, should flower about the same time.

The Names.

Dioscorides onely of the ancient Greeke Authors maketh mention of it, and calleth it χρυσογονον *Chrysogonum*, which the Latines also follow, and if wee delicant upon the name or Etimologie, it is a yellow knee or joynt, which it is likely although he not expressed in the description the stalkes have. *Rauwolfius* onely and *Pona* in his *Italian Baldus* of the late writers have set forth the figure of it, for *Durantes* hath nothing but the text of *Dioscorides*, *Lugdunensis* in his Appendix hath the same *Rauwolfius*, and *Bauhinus* hath it from them, and *Pona* who had it from *Fabius Columna*, President of the Garden at *Pisa*. I have in this as in the former given it an *English* name, according to the forme that in my minde it beareth, either of which may stand untill a more proper may be given it.

The Vertues.

This as the former is appropriated by *Dioscorides* (for I cannot finde that *Galen* hath made mention of it) to heale the bitings of venemous beasts, and especially the Shrew mouse or Mouldi Mouse: and thereby may bee conjectured to bee of the same facultie in the other things with the former.

Chap.

Chap. XCVIII.

Leontopodium, Lyons foote, or Mountaine Cottonweede.

Because the *Leontopodium* was called *Leontopodium* also by divers, I thinke it fittest to bring it next to consideration, and because it is a kind of Cottenweede or Cudwort, I will in the next Chapter handle the other sorts of Cudworts, Golden Tufts, and Mouseare, as being nearest in forme and vertues one unto another.

1. *Leontopodium majus*. The greater Lyons foote or Mountaine Cottenweede.

This greater (for so I call it in regard of the next which is smaller then it) Lyons foote or Mountaine Cottonweede, hath divers small and somewhat narrow leaves lying upon the ground, hoary or woolly all over, more hairy white underneath then above: the stalkes rise up about halfe a foote or more high, set with such like leaves thereon unto the toppes, where standeth one great browne head apeece, compassed about with woolly or hoary white leaves, representing the hairy foote of a Lyon, Hare or Dove, or such like beast, whereof it tooke the name: out of which head come forth many short threds, which make the flowers seeme to stand therein, wherein lyeth afterwards small brownish seede, wrapped in so much downe, that it is hardly to be found or seene: the roote is small and long and somewhat wooddy, with divers strings and fibres thereat.

2. *Leontopodium minus*. The lesser Lyons foote.

The lesser Lyons foote riseth up with one small stalke for the most part, with divers leaves thereon, somewhat longer, but not broader then the former, at the toppes whereof stand divers woolly leaves, and in the middest them three or foure or more heads of flowers, like unto the other small Cudworts consisting of thrums, of a pale yellow colour, with some blacke haires among them: the seede is like the other and so is the roote also.

The Place.

The first is found on the Alpes of *Germany*, and *Italie* of *Italy*: the second on divers mountaines of *Germany* and *Italy* also.

The Time.

They flower in *July* and sometimes in *August*.

The Names.

It is called in Greeke λεοντοπόδιον *Leontopodium*, and so in Latine also, which is as much as *Pes Leonis*, Lyons foote, for the causes declared in the descriptions, and κύνος *Cynos*, as it is among the other names set given it as *Dioscorides* saith; yet some affirme that the title of *Leontopodium* is not found in some copies of *Dioscorides*, but *Cynos* or *Canis*, so that *Cynos* and *Leontopodium* be one thing, and therefore *Pliny* in his 27. booke and 8. Chap. speaking of *Cynocephale*, which was onely used about love matters, saith, that for the same cause

1. *Leontopodium majus.*
The greater Lyons foote or Mountaine Cottonweede.

2. *Leontopodium minus.*
The lesser Lyons foote.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

...he would lay nothing of it. There is alſo controverſie among writers about *Leontopodium* ...ſome thinking the right ſome accounting one plant and ſome another, and ſome accounting none that are extant ...*Matthiolus* and *Lobel* ſet forth theirs, which is the full here expreſſed, which *Cluſius* refuſeth, accounting it a kind of *Gnaphalium*, or Cudweede, calling it *Gnaphalium Alpinum*; as though *Leontopodium* were ...differing from *Gnaphalium*, that there were little or no likeneſſe betweene them:) *Lonicerus* hath his ...which is the *Eriſimum Scorpioides* ſemine of *Bauhinus*, or *Myoſotis Scorpioides* of *Lobel*, *Apuleius*, ... and *Oribaſius* (as I ſhewed before in the Chapter of *Leontopetalon*, that it was called *Leontopodium*, ...taketh the *Auricula*, which the Hollanders beyond Sea called *Pata Leonis*, to bee *Leontopodium*, which *Matthiolus* noteth as an error in him. *Iohannes de Caſa bona* in *Cluſius* faith in his Hiſtory of Plants, ſent him ...ſome dryed plants received out of *Candy*, by the name of *Leontopodium*, which hee judgeth rather to belong to ...the kind of ſmall Plantaines, yet *Cluſius* himſelfe ſetteth it forth under the name of *Leontopodium Creticum*; ...which ſhee alſo, as he ſaith *Corvinus* ſent him, by *Catanance*. *Honorius Bellus* in *Cluſius* ſaith there alſo ſent him ...ſeverall, and the figure alſo drawne of the ſame or the like herbe, which hee calleth *Leontopodium Creticum* ...alſo, which as the other he judgeth but a *ſpecies* of the Rilwort Plantaine: all which ſorts of *Cluſius* are here ...ſeverally placed in the twelfe Chap. of this Booke. *Bauhinus* ſetteth downe no herbe peculiar for the true *Leontopodium* of *Dioſcorides*, but together with *Lonicerus* thinketh that *Pliny* his *Leontopodium* doth much differ ...from that of *Dioſcorides*, and maketh the *Leontopodium* of *Matthiolus*, *Lobel* and others, to be but *ſpecies* of *Gnaphalium*; yet becauſe I cannot ſee but that the firſt may as properly belong unto *Leontopodium* of *Dioſcorides*, as unto *Gnaphalium*, I have as you ſee ſet it downe by it ſelfe, *ſuum cuique judicium eſto*: the ſecond is the *Leontopodium verum* of *Lobel* and others, which *Dodonæus* calleth *Piloſella minor altera*, and is ſcorned his *Gnaphalium Alpinum*.

The Vertues.

The ſole herbe being aſtringent and drying with ſome bitterneſſe in it alſo, doth teſtifie it is very availeable for all fluxes of blood or humors, as alſo effectuall for all ſores, eyther greene wounds or old ulcers, and conducible for whatſoever cures the other Cudweede may perforce; but becauſe I have no author that expreſſeth the properties, nor any experience of my owne or others, to what diſeaſe or greefe it is a remedy, I forbeare to play the Phyſitian, and appoint the poſſible any further, *penes ſapientes*.

Chap. XCIX.

Gnaphalium. Cudweede or Cottonweede.

There be divers ſorts of theſe Cudweedes or Cottonworts, ſome of much beauty (whereof I have given you the knowledge of in my former booke, as the *Gnaphalium Americanum*, Live long, or Life everlaſting, *Gnaphalium montanum flore albo & purpureo*, White and Purple Catsfoote; *Gnaphalium Roſeum*, the Cotton Roſe, which I joyned to other plants of like beauty, forme and quality, whereof I ſhall not needes to make further mention) others that are of more vertue then beauty I purpoſe to entreate of in this Chapter, onely the figure of ſome of them I ſhall here inſert.

1. *Gnaphalium Anglicum vulgare majus.*
The greater Common Cudweede.

The common Cudweede that groweth every where almoſt in this Land, eſpecially in dry ſandy grounds, ſhooteth up but with one ſtalke ſometimes, and ſometimes two or three, ſtalkes ſet on all ſides with ſmall long and narrow whitiſh or woolly leaves, ſomewhat more of the ſtalke almoſt up to the toppe; with every leafe ſtandeth a ſmall flower, of a dun or brownish yellow colour, more yellow in others: in which heads after the flowers are fallen, come ſmall ſeede wrapped up with the downe therein, and is carried away with the winde: the roote is ſmall and thready.

1. *Gnaphalium minus ſeu herba Impia.*
The leſſer Cudweed or herbe Impious.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. *Filago vulgo.* The leſſer Cudweede.

2. *Gnaphalium ſylvaticum vulgo ſive.* Small leaved Cudweede.

2. *Gnaphalium majus Germanicum.* The greater *Germane* Cudweede.

This is in all things like the former, but that it groweth larger in ſtalkes, leaves, flowers and roote: And there is another ſort alſo of the ſame ſize that beareth the flowers not all along the ſtalkes, as the former doe, but at the toppes onely, not differing elſe in any thing, except the leaves may ſeeme to be ſomewhat ſhorter and a little more white and hoary then they.

Alterum.

3. *Gnaphalium minus ſive herba Impia.* The leſſer Cudweede or herbe Impious.

The leſſer Cudweede groweth up with a ſhorter ſtalke, and ſet with ſhorter leaves alſo, but ſomewhat more white or hoary, and a little broader; at the toppes whereof ſtanderh a larger and more open flower then in the former, and of a paler yellow colour, from the ſides of this ſtalke ſpring forth divers ſhort branches, beſet with ſuch like but ſmaller leaves then thoſe that grow below, with ſuch a like yellow flower as the other. The branches with their flowers doe alwayes riſe higher then the middle ſtalke, and the flower upon it: ſometimes alſo the branches will have other ſmall branches ſpring from them, bearing leaves on them, and flowers on the toppes of each, and theſe alſo riſing above the branches with their flowers in the ſaid manner, even as the branches did unto the maine ſtalke: the ſeede that followeth theſe flowers is carryed away with the winde as the reſt are.

4. *Filago minor.* The leſſer Cudweede.

This ſmall Cudweede ſhooteth forth a ſmall hoary ſtalke, full of branches from the very ground almoſt, with divers ſmaller, ſhorter and narrower leaves thereon, of a more duskie hoary colour then the former ſorts, and ſtanding ſingly, but ſome more at a ſpace, or joynt. the flowers hereof ſtand at the toppes of the ſtalkes and branches onely, and not all along as ſome of the former ſorts, or one branch above another as in the laſt: but all of them riſing almoſt to an even height, and are of an overworne yellow colour: the ſeede and roote are like the reſt.

5. *Gnaphalium minus latioribus foliis.* The leſſer broad leafed Cudweede.

Somewhat like unto the laſt is this ſmall Cudweede, whoſe ſtalke branccheth forth upwards, with ſmall leaves thereon toward the bottome without order, and on the joynts of the branches two or three, which are all ſomewhat broad, ſoft and hoary, compaſſing the ſtalke at the bottome, and at the joynts with them divers ſmall hoary yellow heads of flowers, ſome in tufts upon a ſhort ſtalke, and ſome cloſe at the joynts, and ſome at the toppes of the branches wherein is contained ſmall ſeede, which falling away, ſpringeth up againe every yeare, for the roote periſheth after ſeede time.

6. *Gnaphalium ſupinum oblongo folio.* Small leaning Cudweede.

This ſmall leaning Cudweede ſpringeth forth with divers round hoary ſtalkes, not much above an handfull high, ſome whereof ſtand upright, and others leane downe to the ground, as though they would reſt themſelves as they lye; whereon grow divers hoary, ſoft, and long leaves one above another without order, compaſſing the ſtalkes at the bottome, and ſmall pointed at the ends: the toppes of the ſtalkes are ſtored with many ſmall hoary heads, ſtanding in tufts together, with a yellow thrumme in the middle.

7. *Gnaphalium*

7. *Gnaphalium minimum repens.* Small creeping Cudweede.

This little Cudweede (which is sometimes found not above two or three inches high) hath a small hoary stalke full of branches, about halfe a foote high or lesse, whereon grow smaller leaves then in any of the former, even almost as small as Southernwood leaves, but hoary as the rest are: the flowers very small and yellow in small tufts or heads.

8. *Gnaphalium arborescens sive Lanarium.* Tree Cudweede or Cotton weede.

This Cotton weede riseth up with divers small and very hoary white stalkes, about halfe a foote high, set with long and narrow white leaves, but very soft and hoary, or woolly all over, as though they were covered with Cotton, bearing at their toppes some small hoary heads, with a yellow flowre breaking out of them, the seede inside within is somewhat longer then the other: the roote is long and woody, but perisheth yearely as divers of the other sorts doe.

The Place.

They love the third and fourth doe grow in barren dry sandy and gravelly grounds, in most places generally of the Land: the rest are found in the like places beyond the Seas, onely the last is found upon the west Sea coasts of Italy and in divers places, as well as in others, although smaller, which maketh it seeme another sort.

The Time.

They do all flower about July, some earlier and some later, and their seede is ripe in August.

The Names.

It is called in Greeke [illegible] *Gnaphalium*, and so likewise in Latine *quod illis commune pro omnibus fere nominibus*; and in the shoppes *arquebusiers arquebusade Latin.* It hath also divers other Latine names, as *Centunculus* and *Centunculus minor, Pubinervia, Tussilago* and *Tomentitia, Cotton weede sive Bombax succisa*, especially the Sea kind. *Filago* and *Herba impia*, Herbe Impious, especially the third sort here set forth, for that as I said with the branches and flowers thereof the middle stalke, or else as the faith, because no beast or other creature eateth thereof: he also thinketh that it was also called *Chamæ cedrus* (as the Greekes have it) or rather *Cedrus chamæ*, the low Bombast or Cotton tree, and *Abrotonum* from the whitenesse. The fifth is called by *Matthiolus Leontopodium alterum vulgare*, and *Pseudodictamnus*. By *Lobel Gnaphalium angustum sive Belgicum folio longiore*; by *Dodoens Helichrysum fyl. angusto*, by *Lugdunenses Chrysocome lanuginosa*, and *Impia sterilis*, by *Johannes Theodorus Cruce, alterum vulgare minus*, by *Dodonæus Filago sterilis altera*: the second is called by *Lobel, Filago*, and *Chrysocome Germanica*, and by *Dodonæus Corymbifera* and *Chrysitis*: It receiveth also with the *Greekes* the same name that the former doth: the third is generally called with us *Herba Impia* and *Filago*, a false or vain *Gnaphalium* of *Matthiolus*, and *Anutolius* (although he disprove him for so calling it) *Lobel, Lugdunenses* and others of *Anguillara* Certaldese. The fourth is the *Gnaphalium vulgare* with us, which *Dodonæus* and *Lobel* call *Filago minor*, and *Tabernæmontanus Gnaphalium montanum*, the great *Germane* kind, which (the second here described) is a *species* hereof, but growing somewhat larger with them: the fift is the third *Gnaphalium alterum*, or the second of *Plinius*, which *Fuchsius* calleth *Gnaphalium magno latioribus folijs*: the last is *Clusius* his second *Gnaphalium*, or first of *Plinius*, called by *Lobel Gnaphalium minus latioribus folijs*: the seventh is called by *Lobel Gnaphalium tomentosum*, by *Tabernæmontanus Gnaphalium minus*, and by *Ruellius Gnaphalium minus cinereum*: the last is generally called *Gnaphalium marinum* and *maritimum*, and *Legitimum* of *Clusius*: by *Lugdunenses Gnaphalium marinum tomentosum*, because her hath another *Gnaphalium maritimum Dalechamps*, which *Bauhinus* taketh to be the *Stœchas citrina tertia* of *Lobel*, and he himselfe calleth it *Helichrysum sylvestre foemineum*, as I shewed you before among the *Germanes*: the *Italians* call the *Gnaphalium, Gnaphalio, Filago*, and *Cottofilago*: the *French Pretz verons*: the *Germans Ruehrkraut*, and *Hirschkraut*, the *Dutch Ruehrwort* and *Rommelkruyt*.

The Vertues.

These herbes are all astringent, or binding and drying, and therefore are profitable for defluxions of rheume, from the head into any other part, and to stay fluxes of blood wheresoever, either at the nose or mouth, or by any wound in the bloodily flix, and easeth the torments that come thereby, the decoction being made into red wine and drunke, or else the powder taken therein: it stayeth also the immoderate courses of women, and is also profitable to heal or outward wounds, hurts and bruises, as the Welsh men country people doe daily finde by experience, and killeth the little worm of lustlings and the wormes, as the disease called *Tenesmus*, which is an ulcer in the fundament or the hole and doing nothing, to be either drunke or injected or other wise: the greene leaves bruised and layd or bound to any greene wound, layeth the bleeding and healeth it up quickly: the decoction or juice dried doth the same, and doth helpe all old and filthy sores quickly: most of them also serve for a wound herbe, &c. to burne, but especially that which groweth by the sea side. *Plinie* saith that the juice of the leaves of the same taken in wine and milke, is a soveraigne remedy against the Squinzies and Squinsie, and further saith that it is of such vertue as is reported of it that whosoever is all rake it shall never be troubled with the Squinzies, &c. and therefore they give it their swine for the same purpose, and that which sweet of them will not agree with already die thereof.

Chap. C.

Chrysocome. Golden Tufts.

In the first booke of this History there was mention made of *Stœchas Citrina* and *Helichrysum* called *Chrysocome* in the fifth *Classe* of this worke and 23. Chapter where I treated at the large what herbe the *Chrysocome* of *Dioscorides*, and the controversie betweene *Lobel* and *Matthiolus* thereof did consist: I proceed in this Chapter to shew you the true *Chrysocome* of *Dioscorides*, in my judgement and of others also heretofore, or at the least the nearest yet published by any before them and me.

Chrysocome vertior sive Comarum Germanica & Noribergensis.

The truer Goldilockes of *Dioscorides*.

The plant which in my judgement is neerest to be the *Chrysocome of Dioscorides*, shooteth forth sundry

timely hard, round ſtalkes halfe a yard high, ſomewhat thicke ſet unorderly with narrow, long greene leaves upon the toppes, where they branch forth into divers ſmall ſprigs, with ſmaller and ſhorter, leaves thereon then below, and bearing round heads of flowers compoſed of gold yellow threddy riſing from the middle of a few greene leaves which are as a huske to each of them, and abiding a long time in flower, and in their beauty, but *Columna* ſaith, four a moneth till in the end they turne into downe, which with the ſmall yellow ſeede, grayiſh faith *Columna*, flyeth away in the winde: the roote is hard and woodily at the head ſhooting therehence many, bladdith fibres into the ground: the ſtalkes die downe yearely, and new ones riſe againe in the Spring.

The figures of theſe three following were overſlipped to be inſerted in their due place, which is the 23. Chap. of the firſt Tome of this booke, and therefore I thought it fitter to give you them here, and referre each of them by their number where into they doe belong then quite to neglect them and leave them out.

8. *Chryſocome ſive Stoechas Citrina Cretica.* Candy golden *Caſſidony* or Goldilocks.

The figure of this pertaineth to the eighth deſcription and number in the ſaid 23. Chapter of *Stoechas Citrina* in the firſt Tome of this Booke.

9. *Chryſocome peregrina ſecunda Cluſii, ſive Cretica altera.* Spaniſh or Candy Caſſidony or Tufts.

The figure of this belongeth to the ninth number in the ſaid Chapter, for the ninth there is miſſet for the tenth and laſt herein.

12. *Stoechas Citrina ſylveſtrior.* Wilde yellow Caſſidonie.

Let this be referred alſo to the ſame place, and to be the twelfth in Number.

The Place and Time.

This doth growth in divers places of *Germany*, in the moiſt ſandy borders of unmanured fields as *Tragus* ſaith, in *Narbona* alſo as *Lobel* ſaith, and in *Naples* as *Columna* ſaith, and flowreth in *July* and *Auguſt* or later.

The Names.

Tragus maketh it his third kind of *Linaria* and ſuppoſeth it to be the *Helleborine* of *Dioſcorides*, calling it in his owne Language *Groſſ Rheinfahren ideſt, Amazonitius ſuccus ſtupet*, and is called by many other writers ſince *Linaria aurea Tragi*, by *Camerarius Linaria Auſtriaca*, by *Cluſius Oſyris Auſtriaca*: by *Lobel Linaſtrum napelliformis*, but *Guilandinus* and *Columna* take it to be *Chryſocome* of *Dioſcorides* and *Pliny*, as you ſee I do here, for comparing all the parts, I cannot finde any other authors plant to come ſo neare to the right as this: & two ſo famous & worthy judicious Herbariſts being my guides, make me the more confident in my opinion. Let who will compare *Dioſcorides* his Text and the delineaments thereof, with *Columna* his *Animadverſaria* and amend it if he can: *Guilandinus* alſo tooke it to be the Hyſſope of *Dioſcorides*, and therefore called it *Hyſſopus montellifera*, but erroniouſly, for he ſaith the leafe of *Origanum* is like unto Hyſſope, but *Origanum* leaves are ſmall and round like Marjerome, and not long and narrow as this.

The Vertues.

This ſaith *Lobel* is ſharpe in taſte, glutinous or clammy, and ſomewhat bitter like unto *Sena* and neare unto *Thapſia*. *Tragus* writeth thus of it: the herbe with the flowers boiled in wine and drunke expelleth loves enchantments and all other poiſons, and helpeth Crampes and Raptures, as alſo to diſcuſſe congealed blood in the body: it procureth womens courſes and expelleth the afterbirth: two drams of the dryed flowers in pouder taken in wine faſting, ſtayeth the cold Catarrhes or Diſtillations from the head: a bathe made of the flowers to ſweate therewith, or to ſit over the warme fumes, giveth much eaſe to thoſe that are troubled with the ſtone in the kidnies, with paines of the mother, or the Sciatica: it is alſo layd in Cheſts and Wardrobes to preſerve Veſtments, &c. from Mouths.

Chap. CI.

Peloſella ſive Auricula Muris. Mouſeare.

Wee have alſo in my former booke given you the knowledge of ſome of the Mouſeares, as they may be moſt properly called under the name of *Gnaphalium montanum album* and *purpureum*, white & purple Cattſtones, and *Gnaphalium Roſeum*, the Cotton Roſe, both which ſhall not againe bee deſcribed here, although I will ſhew you the figures of them.

1. *Peloſella minor vulgaris repens.* The common ſmall creeping Mouſeare.

The common Mouſeare that is more hairy then the other, is a low herbe creeping upon the ground by ſmall ſtrings like the Strawberry plant, whereby it ſhooteth forth ſmall rootes, whereat grow upon the ground many ſmall ſomewhat ſhort leaves ſet in a round formie together, hollowiſh in the middle, where they are broadeſt, of a hoary colour all over as well above as below, and very hairy, which being broken doe give a white milke, amongſt theſe leaves ſpring up two or three ſmall hoary ſtalkes about a ſpanne high, with a few ſmaller leaves thereon at the toppes whereof ſtandeth uſually but one flower, conſiſting of many pale yellow leaves, round at the points, and a little dented in, ſet in three or foure rowes, the greater outermoſt, and the leaſt innermoſt, very like a Dandelion flower and a little reddiſh underneath about the edges eſpecially if it grow in dry waſte and moſſy ground, which after they have ſtood long in flower, doe turne into downe, which with the ſeede is carried away with the winde.

2. *Peloſella Indica odorata.* Sweete *Indian* Mouſeare.

This Mouſeare hath a fleſhy roote creeping under ground, not growing deepe, with many fibres thereto, from which ſpring divers ſomewhat long leaves, ſet with very long haires: the hairy ſtalke that riſeth from them, groweth to be halfe a foote high, at the toppe whereof ſtand 7. or 8. faire flowers like the ordinary Mouſeare, but of a paler yellow or Orenge colour, ſmelling very ſweete like Muſke.

3. *Peloſella media vulgaris erecta.* Common upright Mouſeare.

This other Mouſeare is very like the former, the difference betweene them conſiſteth in this, that the leaves are longer and greener on the upperſide, and ſomewhat hoary underneath, ſofter in handling, and not ſo much hairy,

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

hairy, the ſtalkes of flowers ſtanding more upright and higher, this doth give milke if a leafe or ſtalke be broken as the former doth.

4. *Piloſella minima.* The ſmalleſt Mouſeare.

This alſo is in all things like the laſt, but that it creepeth not by ſtrings as the firſt doth, and is ſmaller a great deale both in leafe and flower.

5. *Piloſella altera erecta.* Another upright Mouſeare.

This upright Mouſeare hath a few hoary and hairy broad and long leaves lying upon the ground, among which riſeth up a ſlender hairy ſtalke, bearing longer and narrower leaves thereon, and at the toppe two or three ſmall pale yellow flowers, like in faſhion unto the former, which turne into downe as they doe ripen: the ſeede is ſmall rough and fiſtrous.

6. *Piloſella montana parvo flore.* Mountaine Mouſeare with many ſmall flowers upon a ſtalke.

The roote of this Mouſeare groweth not downewards, but tyeth under the upper croſt of the ground, ſhooting forth divers long white fibres therein, whereby it is faſtned; it hath thoſe leaves that lye next to the roote ſmaller then thoſe that come up after, greene on the upperſide, but with very long white haires thereon, making them ſeeme rough and underneath white, but leſſe hairy, from among which riſeth up a long round hollow ſomewhat ſtalke three foote high, ſmooth at the bottome and hairy at the toppe, having two or three ſuch leaves ſet thereon: at the toppes whereof ſtand many ſmall flowers, as it were in an umbell, but every one on a very long foote ſtalke being yellow, and like in forme unto the former Mouſeares, as the ſeede is alſo which is carried away with the downe: this giveth milke likewiſe in the ſame manner that the others doe.

7. *Piloſella maxima Syriaca.* Aſſyrian Mouſeare.

I have ſo little acquaintance with this Mouſeare, that I can tell you no more of it, then *Lobel* hath ſet downe, whom I muſt follow line by line. And he ſaith it hath greater leaves then the former, many ſet together upon the roote, being thicke and hoary white, feeling like Velvet; it ſendeth forth three or foure ſquare joynted ſtalkes about a foote high, the flowers were not ſeene; the roote is hard and woodily with fibres thereat.

8. *Myoſotis Scorpioides hirſuta.* Blew Mouſeare with a turning toppe.

Let me joyne unto theſe Mouſeares three other ſmall wilde plants, becauſe they are generally called Mouſeares, although as you ſhall heare by and by, divers authors have diverſly entitled them. This riſeth up with one ſtalke uſually, and ſeldome with any more, which is round hairy and about halfe a yard high, or better, at the bottome whereof grow ſomewhat long and broad hairy leaves, very like both for roughneſſe, ſhape and colour unto the wilde Borrage leaves: the ſtalke is ſometimes alſo branched and ſometimes not, with divers ſuch like leaves but leſſer and leſſer thereon up to the toppes of flowers, which turneth or winderh it ſelfe one and, like unto a Scorpions taile, or the herbe *Heliotropium* the Sun turner: the flowers which conſiſt of five ſmall round leaves apiece are of a pale blew colour, very much reſembling the flowers of Bugloſſe or wilde Borrage, with a yellow ſpot or eye in the middle, and ſtand all on one ſide of the ſtalke and branches: after they are paſt there come in their places ſmall rough flat heads, wherein the ſeede is contained: the roote is ſmall and threddy.

9. *Myoſotis Scorpioides repens.* Small creeping blew Mouſeare.

This other is very like the laſt Mouſeare, but that it is ſmaller, moſt uſually having leſſer leaves and flowers on the branches, which doe not ſtand ſo upright, but trayle or creepe on the ground: the flowers alſo ſtand on one ſide, but on both and open by degrees: the turning top (which is like the other) doth grow up and diſcloſe it ſelfe, and are of a blew colour, and ſome more purple, with a yellow eye in the middle.

10. *Myoſotis Scorpioides minor flore ex flavo luteo.* Small Scorpion Mouſeare with yellow flowers.

The ſtalkes of this Mouſeare are very ſmall and hairy, not above an hand breadth high, with little leaves thereon upon long foote ſtalkes: the toppes with flowers doe twine themſelves like the two laſt, each of them conſiſting of five leaves a peece, and are of a gold yellow colour wholly. The numbers in the figures differed from the firſt according to theſe of the deſcriptions.

The Place.

The firſt and third grow promiſcuouſly on ditch bankes and ſometimes neare or in the ditches, if they be dry, and in ſandy grounds: the ſecond in *America*: the fourth upon dry barren heathes, eſpecially upon Hownſlow heath in that plenty that one can hardly ſet a foot but upon the heads of it: the laſt is more rare and laſt now and then to bee met with in our Land, but more eaſily in *Germany*: the firſt *Fabius Columna* found upon the hill *Equiceli* in the Kingdome of *Naples*: the ſeventh was brought out of *Syria* into *Lobel* as hee ſaith: the eight and ninth grow in dry and barren grounds in many places of this kingdome: the former of the two I found the backe cloſe of Sr. *John Tunſtall* his houſe a little beyond *Croydon*. The laſt *Bauhine* ſaith groweth in *Hampſhire* on the moiſt Vallies of *Hortus Dei*.

The Time.

They doe all flower about *June* and *July*, and abide greene all the Winter.

The Names.

Mouſeare in Greeke is *Auricula muris* in Latine, from whence theſe herbes are generally called *Myoſotis*, eſpecially two of the laſt, which are thought to be ſomewhat anſwerable to *Dioſcorides* his *Myoſeris*, becauſe they have blew flowers: *Lobel* calleth them *Alſine Myoſotis, Auricula muris*, and *Myoſotis Scorpioides*: referring them to the kinds of Chickweeds. *Dodonæus* calleth the former of the *Scorpioides*, *Myoſotis Scorpioides* and ſome his third kind. *Bauhine* confoundeth the two ſorts of *Myoſotis Scorpioides* together, taking the laſt for a kinde of the water, whereof *Gefner* his *Scorpioides aquaticum* and *Thalius* his *Lotus paluſtris* alſo *Lonicerus* but he is therein deceived, he calleth this *ſeventh* and the other *paluſtre*. *Caeſalpinus* doth call it *Hedyſarum alterum*, becauſe the head twining with flowers is ſo like thereunto, and *Oſyris Heliotropium verum* calleth it *Echium minimum, vel Bugloſſum*, which cauſed *Bauhine* to call them *Echium Scorpioides*, ranking them rather unto that kindred, then unto any other. *Tragus* maketh the former of the three laſt his *Auricula muris, Piloſella ſpica*, alſo, and *Euphraſia quarta* as he doth the other alſo, *Euphraſia verna*. *Lonicerus* and ſome in his time would perſwade him they did belong to that family. The moderne Writers call the ſorts *Piloſella* from the hairineſſe of the leaves and ſtalkes, and *Auricula muris*, both from the form and likeneſſe of them: ſome doe call the firſt & third *Piloſella major*, becauſe their *Piloſella minor* is the ſeventh and

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

...and purpurascens, some also call them *Fibrifolia minora*, in regard of the greater kinde that is called *Millefolium vulgare*, or *Auricula muris major* by *Tragus* and others, which is set forth in my former booke, and *Millefolium rubrum*. *Lacuna* called the first *Halefolium*, *Coronaria* the second as it is in the title, and saith that it is the *Herculanea Iudaica*; and *Cornarius in lucis* calleth the third *Ladiscella fylvestris repens*: *Tabernæmontanus* nameth the first and *Columna* the first and last: the *Italians* call it *Pedicella* and *Piafsini*, the *French* *Pietit* and *Petite de vaches*, *Flouris* and *Velvette*, the *Germanes* *Negelkyaut* and *Meusser*, the *Dutch* *Naghelkraut* and *Marjoram*, and we in *English* Mouleare.

The Vertues.

The ordinary Moulesre is hot and dry, although some write that it is cold, but the bitter taste therein sheweth it to be of a clensing, binding and consolidating quality: the juice hereof taken in wine, or the decoction the rof drunke doth helpe the Iaundies, although of long continuance, to drinke thereof morning and evening and abstaining from other drinke two or three houres after, it is often used as a speciall remedy against the stone and to expell the torments that arise thereof, as also other tortures or griping paines of the bowells, the decoction thereof with Succory and Centory, is held very effectuall to helpe the dropsie, and them that are enclining thereto, and the diseases of the mult and spleene: it stayeth the fluxes of blood, either at the mouth or nose, and inward bleedings also, for it is a singular wound herbe, for either inward or outward wounds: it helpeth the bloody flux, and stayeth the abundance of womens courses: the juice or decoction of the herbe taken before the fit of a quotane Ague, is sayd to keepe backe or much to lessen the fit, and by the use of it to take it quite away. There is a syrope made of the juice and Sugar, by the Apothecaries of *Italy* and other places, which is of much account with them, to be given to those that are troubled with the cough or tisicke, which is a consumption of the whole body, as well as of the lungs; the same also is singular good for ruptures or burstings: the greene herbe bruised and presently bound to any fresh cut or wound, doth quickly solder the lippes thereof, and the juice, decoction or powder of the dryed herbe is most singular to stay the malignitie of spreading or fretting Cankers or Vlcers wheresoever, as well those in the mouth as secret parts of men or women: the distilled water of the plant is sealded also in all the diseases aforesaid, and for wounds and sores that are outward to wash them therewith, and to apply tents or cloths wet therein. It is sayd to be so powerfull to harden iron or steele, that if any edged or pointed toole shall be often quenched in the juice thereof, it will cut all other iron, steele or stone very easily, without turning edge or point. The old All-go-mille, I should say Alchimists did much commend the juice of the herbe, that it would congeale and fix Mercury, but all these fancies are in these times quite dispersed and driven away I thinke. Many skilfull Shepheards in the country doe avoyd as much as they can to suffer their sheepe long to feede in any such pastures and places where Mouleare groweth in any plenty: least they being bound therewith should grow sicke, and leane, and die quickly after. It is said that if it be given any way to an horse it will ease that he shall not be hurt by the Smith that shooeth him.

Chap. CII.

Synonyma Millefolium & Achillea Sideritis. Yarrow and Achilles Woundwort.

Although I confesse have fitly set these herbes next unto the *Sideritides* or Ironworts for their neare affinitie in name and nature, but accept them in this place seeing they are not placed there.

1. *Millefolium vulgare.* Common Yarrow or Millfoile.

The ordinary Yarrow hath many leaves spread upon the ground which are long, and finely cut into many small parts that it excelleth the fine leaves of Tansey, among which rise two or three round greene stalkes with such like winged leaves as grow below, but smaller and finer up to the toppes, where stand many small white flowers in a Tuft or Vmbell close together, each flower consisting of five small round pointed leaves with a little yellow thrumme in the middle, and smell somewhat strong, yet not unpleasant being rubbed in the hand: the roote is made of many long white strings spreading deepe and far. There is some variatie observed in the flowers hereof, some being more white then others, as also thicker set together, and greater or smaller then others, one also with a round or tuberous roote, as bigge as an Hasle nut, wherein hath beene found a worme so small that the eye is scarce able to discerne it.

2. *Millefolium majus album.* Great white Yarrow or Millfoile.

The great white Yarrow differeth not much in the forme of leaves or flowers from the former wilde Yarrow, but in the greatnesse of the stalkes and leaves, the greene leaves being as large almost as those of Tansey, and in the flowers being greater standing in a larger umbell, the smell whereof is a little more strong then in the ordinary.

3. *Millefolium rubrum vulgare.* Common red flowred Yarrow.

This Yarrow differeth not in leaves from the first or common sort, nor in the manner of growing but in the colour of the flowers, being of a deeper or paler red, or almost blush colour, yet with a yellow spot or thrumme in the middle.

4. *Millefolium flore rubro maximum.* Great red Millfoile.

This great red Yarrow hath as large and great winged greene leaves as the great white Yarrow, but more finely cut in the fibres: the stalkes are as great and high branching forth at the toppe, and stored with large umbels of flowers like unto them, but of a faire bright reddish colour, and in some paler, with pale yellow thrums in the middle, which are of a fine small sent.

5. *Achillea Sideritis lutea.* Achilles yellow Woundwort.

This yellow Woundwort riseth up somewhat high and creepeth not, the leaves whereof are long and very finely cut into many peeces, somewhat like unto Sothernwood but more sappy and hoary also: the flowers stand on it in like sort, and of a faire gold yellow colour: the seede is small and long like unto Tansey: and herein consisteth the difference betweene this and the two next yellow sorts.

6. *Millefolium luteum sive Achillea lutea.* Yellow Millfoile.

This yellow Millfoile or Yarrow hath hoary and short stalkes scarce a foote high sometimes, creeping along by the

the ground and taking roote as it creepeth, the hoary leaves are long and much divided, but smaller and softer then the common white kinde: the flowers at the toppes of the stalkes are of a pale yellow colour, as well the outer rewes as inner florets, standing many together in tufts, and rising out from hoary white huskes: the roote is small and long with divers fibres thereat.

7. *Millefolium pecinnatum Creticum.* Yellow Candy Millfoile.

The *Cretan* Millfoile groweth with round hoary stalkes a foote high, whereon are set long, narrow, hoary, dented leaves somewhat like unto the leaves of Lavender cotton, the toppes of the stalkes branch forth into many a-like tufts of pale yellow flowers of a fine small sent: the roote is stringy and creepeth as the last.

8. *Stratiotes millefolia Cretica.* White candy Yarrow.

The Millfoile riseth up from a long white roote, with many long stalkes a little bending downe, covered with an hoary downe, having divers winged leaves set at spaces, each whereof consist of small long leaves set thicke together on both sides of the ribbes, which are hoary also, but not so much as the stalkes, at the toppes whereof stand small nubells of white flowers somewhat like to those of Tansey.

9. *Achillea Sideritis sive nobilis odorata.* *Achillea* sweete Woundwort.

The woundwort (or Yarrow for therein to it is most like) hath many large thinne cut leaves next the ground, deeply and deepely cut in unto the middle ribbe, and each part divided also, which maketh it to differ from the first, from whence rise up more and taller stalkes with divers finer leaves set thereon, and at the toppes many flowers made together, being both more in number and larger then is the bill or common sort, of a whitish or reddish colour and yellow in the middle: the whole plant smelleth very sweete: the roote perisheth every yeare after seeding hot, and requireth a good ground and a rich to prosper in.

10. *Millefolium Alpinum incanum,* Small mountaine Millfoile.

This small Millfoile hath many small winged leaves, as finely cut in on the edges as the last, and somewhat hoary also, set on the stalkes that spread on the ground, and there take roote againe, among which rise up short stalkes not above a foote high, with some finer leaves on them to the toppe, where they beare many tufts of small flowers thicke stuft together, of a pale reddish or shining bluish colour: the roote creepeth like the common sort.

The Place.

The first with the varieties except that with a tuberous roote is very frequent in pastures medowes &c. The third is but much more rare: the second *Matthiolus* saith groweth in *Italy* and so doe many of the other: *Penna* saith the first is found onely upon the high hills in *Narbone*, and *Lobel* saith he found the last on the hills in *Styria*.

The Time.

They doe all flower in the end of Summer and in *August*.

The Names.

Yarrow is called in Greeke [illegible] *Stratiotes Chiliophyllos*, that is *Straiotes* or *Militaris millefolium*, and the English is called in Greeke *Achillea Sideritis Stratiotes* or *Militaris* because it was of much use in the Campes of Souldiers to heale their wounds, and *Pliny* saith in the third Chap. of his 25. Booke that *Achilles* tooke the name from *Achilles* the scholler or followee of *Chiron* who healed her with the wounds of *Telephus*: it is called *Millefolium* in Latine a *foliorum multitudine*, *Supercilium Veneris* also, *Acrum* and *Acrum Sylvaticum*. The *Arabians* call the *Achillea Egilos*, the *Italians Achillea* and the *Millefolium Millefoglio*, the *Spaniards Milhoja yerva*, the *French Millefeuille* and *L'herbe Militaire*, the *Germans Garb, Garben, Garwen* and *Schaffripp*, the *Dutch Germe*, and we in *English* Millfoile, Yarrow, and of some Nosebleede from making the nose bleede if it be put into it, but assuredly it will stay the bleeding of it. Divers doe thinke that *Achillea* and *Millefolium* is but one herbe, because divers authors have promiscuously called them so. The first is called *Millefolium* alone and *Serpens* by some, and *Stratiotes terrestris*, *Stratiotes Millefolia*, *Achillea* and *Militaris* by others; the second is encountered by *Matthiolus*, *Lobelius* and *Penna*: the third is that of our Land and differeth from the fourth which is greater and redder, set forth by *Clusius* under the name of *Millefolium rubro flore*, and by *Matthiolus* and others *Millefolium maximum*: the fift is called by *Penna Achillea montana, tetramisfolio crassiore facie*, by *Matthiolus*, *Lonicerus* and others, *Helichrysum*, and *Elichrysum* by others, and in *South Lancashire* they call the first is called by *Penna Stratiotes millefolio flavo flore*, by *Gesner* and *Camerarius Millefolium floribus luteis*, by *Matthiolus Hispanicum Indicum*, and by *Tabernæmontanus Millefolium tomentosum luteum*, which thinke that to be the *Tomentosum Lanatum* of *Lobelius*; but as I said in the Chapter of Tansey he rather seemeth deceived as I thinke: the seventh is called by *Hieronymus Bellus* that sent it from *Candy* to *Clusius Stratiotes candida*, but saith it commeth neere to the description of *Dioscorides*, called by the *Candiots* [illegible] *Matthiolus*, the eighth is called by *Tragus Millefolium nobile* and *Stratiotes vera*, by *Gesner* as both *Stratiotes* and *Millefolium sylvestre*, by *Tabernæmontanus Achillea sive Millefolium nobile*, by *Matthiolus* and *Lacuna*, *Cretica* or *Violacea* and *Matthiolus* of *Tanacetum* and *Dracunculus*, *Scordilonius* by *Lobelius Achillea Sideritis*, by *Dalechampius* upon *Pliny Stratiotes Plinij*, but *Lobelius* taketh it to be the *Ptarmica minus flore albo* of *Dodonæus*, calling it *Ptarmica Germanica

shedding of the haire: the decoction thereof made in wine and drunke is good for them that cannot retaine their meate in their stomacke: it is accounted a good remedy for a quartaine Ague to drinke a draught of the decoction of wine before the fit, and to lie two or three fits together: the juice of the herbe and flowers adiected to Cataracts milke or in the distilled water of the herbe, stayeth the running of the reines in men and the whites in women: but it will be the more effectuall if a little powder of Corall Amber and Ivory be put thereto. Some doth wonderfully commend the powder of the dryed herbe and flowers against the pissing of blood, for some ounce of the herbe a dram of fine Indian monacke beeten, and taken three dayes together falling in a draught of milke: the roote of the greene leaves chewed in the mouth is said to ease the paines in the teeth.

CHAP. CIII.

Polygonatum sive Sigillum Salomonis. Solomons Seale.

THere are diverse sorts of *Salomons* Seale, some anciently knowne and set forth, others of later time: three greater and lesser, both from *Virginia* and *Brasil*, as shall be specified in this Chapter following.

1. *Polygonatum vulgare.* Common *Salomons* Seale.

The common *Salomons* Seale shooteth up with a round stalke, about halfe a yard high, bowing and reclining downe the toppe, set with single leaves one above another, which are somewhat large, and like unto the leaves of the Lilly Convally, or May Lilly, and of the same colour, that is, with an eye of blewnesse upon a greene with some veines like the reine and more yellowish underneath: at the foote of every leafe almost there hangeth one or two small long stalkes, some set with small long white and hollow pendulous flowers, somewhat like the bowes of the Lilly Convally, but ending in five longer points, for the most part two together, whereunto succeed small round berries, red when they are ripe, and on some stalkes two stalkes with flowers at the foote of a leafe, which are somewhat lesse in all and stand all on the one side of the stalke, after they are past some in the ripening turn all round about the stem of the stalke, and blackish greene tending to blewnesse when they are ripe: the roote is small white hard and knotty like *Corallina*: *Camerarius* in his Epitome citing *Matthiolus* as his Author saith that it is sometimes found with red berries and with purple: the roote is of the thicknesse of ones finger or thereabout, white and knobbed in some places with a darke round circle, representing a Seale whereof it tooke the name, lying alwayes under the upper face of the ground and not growing downeward but with many fibres underneath.

2. *Polygonatum majus.* Great *Salomons* Seale.

This other *Salomons* Seale is in all things like the former, but in the bignesse of the leaves and height of the stalkes, bearing larger flowers upon shorter footestalkes, and more store set together at a knee and larger roote.

2. *Polygonatum majus flore majore.* The great flowred *Salomons* Seale.

This great flowred *Salomons* seale hath shorter stalkes, not above a foote high, and standing more upright and

7. *Polygonatum Virginianum*, Virginian Seale of Virginia.

8. *Polygonatum foemineum maculosum*, Clouded like a Salomons Seale or annulata.

branched about a foote or halfe a yard high, but not of so fad a greene colour nor thicke set with leaves as the former, and at the very toppe of the ſtalke many being ſet together, which are whiter and ſmaller, and nothing ſo long nor pendulous, ending in fine ſmall pointed leaves: and laſtly in the berries which in this are ſmaller then in the former, and of a moſt orient red or ſcarlet colour, (which made them at the firſt to be taken for Cherries or Scarlet berries where they are naturall, and thought fit to dye withall, but found improfitable) which when they are white, and before they become ripe have ſix blacke ſtrakes on every of them equally diſtant, but are worne out being ripe, within which are contained white, hard, ſtony graines or ſeedes like the other: *Cæſalpinus* of *Parma* in his *Cenſura plantarum hiſtoria* maketh hereof two ſorts, one he calleth *Fœmina*, the other *Sterile*, when as they are both but one ſort; however happening one may be more apt to beare berries then the other, for that which I have in my Garden that never bore berries, roſe from the ſeede of thoſe berries that were brought us from *New-England*.

3. *Polygonatum racemoſum Americanum*. Chiſler like *Salomons* Seale of *America*.

This plant ſhooteth up a round brownish ſingle ſtalke, and ſometimes parted or branched, about two or three foote high ſet with many very faire broad leaves, ſome ribbes being of a reddiſh others of a fad green colour, harder then others, and compaſſed about the edges with a rougher and darker hilt: at the toppes of the ſtalkes ſtand in open cluſters many ſmall pale coloured threds like unto the Vine Bloſſomes, which falling there doe ſucceede ſundry ſmall berries, compoſed like a cluſter of Grapes, and each of the bignesse of a Juniper berry, reſembling before they be ripe, and finely ſpotted with blood red ſpeckles, which after they have long ſtood are worne out by the ripening of them, and change red like a Cherry, whoſe pulpe or juice is ſweet, containe within them ſmall white roundish ſeede: the roote is thicke, white, tuberous, long and jointed as it were at diſtances, with ſundry fibres thereon.

9. *Polygonatum perfoliatum Braſilianum*. *Salomons* Seale of *Braſill*.

The *Salomons* Seale of *Braſill* hath an upright ſtraked ſtalke about a cubit high, whereon are ſet ſundry leaves one above another, very large, about foure inches long and two inches broad, of a pale greene colour, full of ribbes, long and not hard, which compaſſe the ſtalke at the lower end, where it is broadeſt like unto *Thoroughwaxe*, but the ſtalke ſeemeth to goe thorough them: the flowers alſo (which ſtand in the ſame manner that the former doe) are much larger then any of the former, conſiſting of five narrow white leaves two inches long or more, ſtanding at the ends of very ſmall and long footeſtalkes: the berries and rootes are not ſet forth by mine author.

10. *Polygonatum ramoſum perfoliatum flore luteo majus & minus Americanum*.

The greater and leſſer thorough leafed yellow *Salomons* Seale of *America*.

This *Salomons* Seale hath a ſlender ſmooth ſtalke or two, halfe a foote high, parted about the middle into two branches, and each of them againe into others, the greater ſort having faire, broad and long very pale green winged leaves, compaſſing the ſtalke wholly at the bottome, the ſmaller ſort much narrower and ſmaller: the whole

10. *Polygonatum ramoſum perfoliatum flore luteo majus & minus Americanum*.
The greater and leſſe thorough leafed yellow *Salomons* Seale of *America*.

11. *Polygonatum angu[illegible]*
Narrow leaved *Salomons* [illegible]

Original from UNIVERSITY OF MICHIGAN

the leaues with his leaues, and at the toppes also stand the flowers singly in each sort, composed of six long and narrow yellow leaues hanging downe-wards, in the middle whereof is a crooked head or horne, compassed with sixe yellow threds or chiues; when the flower is fallen the foote-stalke thereof riseth up, bearing that crooked or horned fruict lesse thicke, skinny and in the end, leaving whitish seede within it: the roote is nothing so much as white as the eyche, but tufted by many strings in the ground.

11. *Polygonatum angustifolium.* Narrow leafed *Salomons* Seale.

The narrow leafed *Salomons* Seale shooteth forth diuers upright stalkes, about a foote high, bending downe-ward with the toppes without any branches at all upon them, whereon stand at seuerall ioynts and spaces, foure or fiue and sometimes six long and narrower greene leaues then they of the former, being smooth and ribbed or fouled as it were as the first ioynts with the leaues come forth two or three short stalkes, with whitish greene flowers at the ende of them like vnto the first, after which come round berries red when they are ripe, more pulpie then those of the last, containing hard white kernells within them like the rest: the roote is ruberous like the former, growing long, and sending forth at the sides like them.

12. *Polygonatum multifolium ramosum.* Branched small *Salomons* Seale.

The small *Salomons* Seale is in most things like the last, as in rootes, leaues, flowers and berries, the chiefest difference consisteth in this, that it branches forth at euery ioynt on the maine stalke on both sides thereof, and his leaues somewhat smaller and narrower, yet set in the same manner, and the flowers somewhat smaller also, standing on short foote stalkes.

The Place.

The first is frequent in diuers places of our Land, as beside those that *Gerard* hath named, is groweth in a wood two miles from *Canterbury* by Fishpoole hill, as also in a bushie Close belonging to the Personage of *Aldeburgh* neare *Harwich*, two miles from *Salisbury*, the next Close thereunto is called *apoles*, and in *Chilton* wood, on *Corston* hill betweene *Newington* and *Sittingbourne* in *Kent*: the other six following it, and the two last grow in *Germany*, *Austria*, and the parts thereabout: the seuenth was brought both out of *Virginia* and *New-England*, by some Mariners that had thought they had beene the Searlet or Kermes berries as I sayd before, from whose seede I haue growne the first, as I thinke in this kingdome, and brought such plants as I haue expressed in the description: the eighth and ninth were brought from *Canada* by the *French*: the ninth groweth in *Brasill*, and from thence brought, and communicated to *Bauhine* by Dr. *Burserus*.

The Time.

They flower about *May*, and the *Virginia*, *Brasill* and *Canadian* sorts not vntill *June* and *July*, the berries of the *Virginia* sorte are ripe in *September*, and continue on the stalkes vntill the frosts rot the stalkes, and they fall downe, and perish with all vpon the ground, the roote abiding safe, and shooting a new every yeare: the *Virginian* sorte with fiue leaues are expressed in the description, but it never bore berries in our Land that I know of: but the other sixe haue borne berries about *September*.

The Names.

It is called in Greeke εἰναρὸν ἄνθος *Polygonatum*, and so in Latine also, *Arabica geniculorum frequentium radix*, of the many ioints and knots in the roote: it is vsually called *Sigillum Salomonis*, for the caules set downe in the description of the first, and of some *Seals vulgi*. *Ioannes Manardus* tooke it to bee *Serapis* of the *Arabians*, but without all shew of reason thereof: the *Italians* in some places call it *Polygonato*, and *Genocchiera* in others, and in *Florence* *Canne Fracide*, but for what respect I know not, nor having any likenesse or affinitie with *Fracastorius*, from whence the name should be deriued: the *French Genicelliere* of ioints, and *Seau*, or *Signet de Salomon* of the markes in the roote, *Sceau de Salomon*, of the *Dutch Salomons Seghel*, and wee in *English Salomons Seale* most vsually, but in some countries the people call it Ladder to Heauen, according to the Latine name *Scala*, which was anciently knowne in the Apothecaries shoppes, from the forme of the stalke of leaues, one being set aboue another. The first is called *Polygonatum* generally by all writers almost, some calling it *Latifolium*, *latifolium maius* and foure square, and some *Sigillum Salomonis*, *Angulatum Camerarium* and *Calfter Duranten* following their owne country names, call it *Brassicella*, confounding it with the *Dissitamum album*, which is called *Fuscula* like vnto it: the second is the first *Polygonatum latifolium* of *Clusius*, which *Camerarius* in *horto* calleth *Polygonatum latifolium*, the third is *Clusius* his second *Polygonatum latiore folio*, which *Cordus* in his Historie of plants calleth *Polygonatum tertium*, the fourth is the third *Polygonatum Laurea folio* of *Clusius*, which *Bauhine* calleth *Polygonatum latifolium Lobelii alterum*, the fift *Bauhinus* in his *Pinax* and *Prodromus* calleth *Polygonatum latifolium minus tertium*. The sixt is diuersly called; *Matthiolus* setteth it forth for *Laurus Alexandrina*, whom *Camerarius* followeth, and *Clusius* reproueth in that it answereth not thereunto, as you shall heare more amply in the next Chapter, both in the description and explication. *Iohannes Bauhinus* that set forth the great herball of *Dalechampius* generally called, *Lugdunensis*, taketh it to be *Hippoglossum* of *Dioscorides*; whom *Clusius* also taxeth for the same, but howsoeuer the Text of *Dioscorides* (it corrupted) be amended, yet this cannot be it, because it hath not small tongues, that are growing vpon the leaues of *Hippoglossum*, as you shall heare by and by, and also is not perpetually greene as the *Hippoglossum*, but dyeth downe to the roote every yeare, shooting forth in Winter in the Spring, and therefore *Clusius* saith that it cannot be better referred then vnto the kinds of *Polygonatum*, whereto he saith it might be the *Iuxta radix* of *Dioscorides*, wherein as he saith because he is so much vncertaine, I dare not be confirmed for certaine; yet I certainely thinke it answereth very fitly thereunto, both in the roote and leaues. *Lobel* calleth it in his obseruations *Polygonato affinis planta*, and *Calsalpinus Radix affinis tertia*, but he maketh two seuerall kinds thereof, and two descriptions, as if they were two seuerall plants, which are his fourth and fift, the one being the figure of *Matthiolus* his *Laurea Alexandrina*, and the other of *Dodonæus*, for they expresse but one plant, no other diuersitie thereof to bee found that I know of. *Bauhine* calleth it *Polygonatum latifolium maius*: the seuenth is as I sayd of mine owne nothing differing from the sixth, and are so called by *Camerarius* as they are in the tables: the ninth *Bauhinus* in his *Pinax* calleth *Polygonatum latifolium perfoliatum Brasilianum*: the eleuenth is called *Polygonatum minus* of *Dodonæus*, *Polygonatum angustifolium*, and *semifolium* by all others. *Thalius* calleth this *Polygonatum angustifolium*, as he doth the last *semifolium minus*, which *Clusius* and *Bauhinus* call *Polygonatum*

The Vertues.

The roote of *Solomons* Seale is of chiefest vse, and hath a mixt property as *Galen* saith, having partly a binding, and partly a sharpe or biting quality, as also a kinde of loathsome bitternesse therein, hardly to be spied, whereby it is of litle vse in inward medecines; which sharpenesse and loathsomenesse we hardly perceive to those that grow with vs: yet some authors doe affirme that the powder of the herbe or of the white pouder Begme and vitious humors very forcibly, both vpward and downeward; it is said also that the roote chewed in the mouth drawes downe much rheume out of the head, and put vp into the nostrills causeth sneezing as it serveth as he and *Dioscorides* both say, and all experience doth confirme, for wounds, hurts and outward sores to heale and close up the lippes of those that are greene and fresh made, and to helpe to dry vp the moisture and restraine the flux of humors of those that are old: it is singular good to stay vomitings and all bleedings whatsoever, as also all fluxes in man or woman, whether it be the whits or reds, or the running of the reines in man: to knit any ioynt that doth grow by weakenesse, to be often out of place, or by some cause slayeth out sundrie therein when it is set; as also to knit and ioyne broken bones in any place of the body, the roote being bruised applyed to the place, yea it hath by late experience beene found that the decoction of the roote in wine, or the bruised roote put in wine or other drinke, and after a nights infusion strayned hard forth and drunke, hath wrought both man and beast whose bones have beene broken by any occasion, which is the most speedie way of helpe to the people in divers countries of this Land, that they can have: it is no lesse effectuall to helpe aposthumes and burstings, to be both inwardly taken, the decoction in wine, or the powder in broth or drinke, and outwardly applyed to the place: the same also is availeable for inward or outward bruises, falls or beatings, both to dispell the congealed blood, and to take away both the paines and the blacke and blew markes that arise after the hurt: the same also or the distilled water of the whole plant used to the face or other part of the skinne, cleareth it from morphew, freckles, spots or markes whatsoever, leaving the place fresh, faire and lovely, which the *Italian* dames as it is said doe much vse.

Chap. CIIII.

Laurus Alexandrina. The Laurel of *Alexandria.*

There hath beene so great varietie of opinions among our moderne writers concerning the Laurell of *Alexandria*, what plant should be the right of *Dioscorides*, some shewing one and some another for feare one the true, that I much doubt whether this that I shall here shew you in this Chapter, will be taken and judged to be the genuine plant by many, who peradventure can blame me for that I may thinke me sooner to erre and be deceived, then so many learned men before me, that have set contrary opinions, but notwithstanding the diversity of conceits in many, I will endevour to enrich the treasury of the Physicall Commonwealth, with my small two poore mites, (*cupiat qui capere possit*) praying and beseeching

1. *Laurus Alexandrina genuina.* The true Laurell of *Alexandria.*

2. *Laurus Alexandrina altera Dioscoridis.* The true Laurell of *Alexandria.*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

by the daily conversation among plants, the chiefest I want to enable my judgement. I must likewise in this chapter shew you another plant being like unto it, which *Matthiolus* setteth forth for another sort of *Laurus Alexandrina*, but I entitle *Chamædaphne vera Dioscoridis*, being much controverted also, for such reasons as you shall heare of anon by.

1. *Laurus Alexandrina vulgaris.* The true Laurell of *Alexandria*.

The true Laurell of *Alexandria* is very like the *Hippoglossum* of *Dioscorides*, Horse tongue or double tongue, in the manner of growing, rising up from an hard stringy roote knotted at the head, with many greene stalkes of leaves standing on both sides thereof, the lower being larger then the upper, which are somewhat broad and round pointed at the end with many ribbes therein, and of a paler greene colour then the Horse tongue, but almost like unto it in bowling: from the middle rib of the leafe about the midst of it on the upper side, there shooteth forth a small whitish greene flower starre fashion, standing upon so short a foorestalke that it seemeth to have none, which being past a small round berrie succeedeth in the place, which will bee very red when it is ripe, wherein is contained a white hard seede like unto those of the butchers Broome.

2. *Chamædaphne vera Dioscoridis.* The true Dwarfe Laurell of *Dioscorides*.

This Dwarfe Laurell groweth up with divers stalkes and leaves set thereon one above another in the same manner that the former doth, but the leaves hereof are not so broad and short as they, but longer and narrower, and of a little deeper greene colour on the upper side, and paler underneath, full of ribbes or vernes also, without any small leafe or tongue such as the Horse tongue hath, else somewhat like to it: this hath flowers and red berries in the middle of the leafe, and upon as short a stalke as the former, but on the under side of the leafe for the most part, which may well make it seeme another sort of the *Laurus Alexandrina*; and for that cause I thinke *Dioscorides* joyneth the *Ruscus*, and *Chamædaphne* so neare unto the *Laurus Alexandrina*, the one before it the other after, for the likenesse the one unto the other.

The Place.

Both these grow naturally on certaine hills in *Italy*, and for their rarity and use brought into their gardens there, from whence we have received them: the first I had by the meanes of *Dr. Find*, one of the Phisitions of our *London* Colledge, who among many other rare plants he gathered in the garden of the great Duke of *Florence* at *Pisa* and else where: had this also: the other I had by the meanes of my good friend Master *John Bradshaw* with whom it groweth having longer and not so broad round leaves as the former.

The Time.

These sorts beare flower much lesse fruit in our Land, but in the warmer countries, they flower in *June*, and the berries are ripe in the end of *September*.

The Names.

Dioscorides calleth the first in Greeke Δάφνη Ἀλεξανδρινὴ, *Idæa*, *Daphne Alexandria* and *Idæa*, and the Latines retaine *Laurus Alexandrina* and *Idæa*, because it is likely it grew upon the mount *Ida*, which is nigh unto the *Rhoeteum* of *Troy*. *Marcellus* thought it took that name from *Alexander* the great, who at his victories wore it on his head, but that is but his bare opinion without ground or reason: the *Idæa radix* is another differing herbe (as before this many Chapters, which I have shewed you in the last Chapter, most fully to agree with the *Pentagonolatifolius quartus Clusii*. Divers have thought that the *Laurus Alexandrina* and *Hippoglossum* of *Dioscorides* were both one plant, among whom *Gardus* on *Dioscorides* is one, but *Matthiolus* and *Cornarius* doe both confute that opinion, but for that it were a needelesse thing in *Dioscorides* to write two Chapters of one herbe, then that *Dioscorides* maketh no mention of tongues in the *Laurus Alexandrina*, which hee speaketh of in the *Hippoglossum*, yet *Matthiolus* falleth into as foule an error himselfe, in taking that plant to be *Laurus Alexandrina*, which *Clusius* calleth *Polygonatum latifolium quartum*, as is shewed in the Chapter before, but I know his with that whether he meane his *Polygonatum* or any other plant by the figure which he exhibiteth for it, it cannot be *Laurus Alexandrina* which by *Dioscorides* his Text is a plant whose berries grow *in medio* in the middle of the leaves (and *Matthiolus* quoteth his owne Copie in the Margent to bee so) which that plant hath not, for *Theophrastus lib. 1. cap. 10.* and *lib. 3. cap. 17.* expresseth it more fully by the Greeke word ἐπιπολαίους: the figure of this *Laurus Alexandrina* is extant in no other author that I know of, but in *Lobel* his *Appendix* to the *Icones*, who as he there acknowledgeth had it from one (as he had many other plants alse) which he there set forth, and I am fully perswaded is the true *Laurus Alexandrina* of *Dioscorides*, who maketh the leafe thereof to be like those of *Ruscus*, whereunto the leaves of this is more like then of the next (the second which) here set downe for the *Chamædaphne vera* of *Dioscorides*, is the *Laurus Alexandrina altera* of *Matthiolus* and *Laurus Alexandrina* of *Columna*, whom *Lugdunensis*, *Tabernæmontanus* and *Clusius* follow: and *Bauhinus* calling it so also, from the use of *Lobel* and this to be both one, which his eyes might bee judges, the one having a rounder the other longer leafe are divers. The *Matthiolus* of *Bauhinus* sheweth for *Chamædaphne* that plant which he calleth in his *Pinax Tithymalus Chamædaphnoides folio latifolio* or *Delphinium baccinum* of *Lobel*, but quoteth it there to see further, whereas his *Icones* of *Matthiolus* setteth forth another figure for his *Chamædaphne* which is much differing from divers to be counterfeit, a section of *Matthiolus* owne braine (many such tricks he useth in his workes) for such sort being known to *Calalpinus* calleth it *Ruscus alter alterâ*. *Gmelandinus* and *Columna* tooke *Chamædaphne* of *Dioscorides* and his *Laurus Alexandrina* to be both one, when as his descriptions doe evidently vary, expressing two severall herbes, the leafe hereof he compareth to a Bay leafe, wherunto it hath more resemblance then the former, for that is not so broad and short as it, but longer and narrower as the bay leafe is: further *Dioscorides* saith, it beareth *flores ad summa folia*, which cannot be better understood to bee joyned to the leaves, then growing upon them. I doe confesse that in my former booke I did somewhat adhere to *Lobels* opinion that this might be the *Chamædaphne* of *Dioscorides*, yet I there shewed some reason why it could not be: upon better consideration and examination of the particulars, both for me and vertues, I cannot make any other or better choice then this. Let the critick carper examine the reasons, but let the judicious convince me and I will yeeld.

Their Vertues.

Dioscorides saith that *Laurus Alexandrina* is of a hot temperature sharpe and somewhat bitter in taste, and being drunke provoketh Vrine and womens courses, *Dioscorides* saith it helpeth the hard and lothe travailes

of women in childbearing: a decoction made of the herbe and rootes in wine, is very good for women over the hot fittes: also to have it injected, or the places bathed for the falling downe of the mother: to it in the sighe place against the said decoction, or the powder of the herbe and rootes are accounted mightie to dry up the moisture of old Vlcers of long and hard curation, to cleanse them and the more speedily to procure their healing: the facultyes of the other are by *Galen* judgement like to those of the former, and thereby hath it power to open the pores of the head, and the heart burning, easith the torments of the belly, causeth drunke by wine, and provoketh urine and womens courses.

CHAP. CV.

Hippoglossum sive Bilingua. Horse tongue or double tongue.

THe Horse tongue or double tongue is very like unto the former two plants, for both in the first year, for the manner of growing, for this shooteth forth divers hard stalkes with leaves set one above another as they doe, and much about the same length: the leaves likewise for the most part little differing, being somewhat harder in handling, narrower & longer, and sharper pointed, with ribs running through them: but this hath a smaller leafe or tongue, growing upon the greater from the middle ribbe, and about the middle of the leafe on the upperside, which maketh it to differ from all other plants that grow upon the ground that I know, and from thence tooke the name of double tongue: under the smaller leafe at the bottome where it joyneth to the greater, commeth forth one small whitish greene flower, and sometimes two, standing upon short foothstalkes, where afterward stand the berries, which when they are ripe are very red, very like unto the berries of the Yew tree, wherein is a white hard seede like the other: the roote consisteth of many long hard whitish strings growing from a head. *Fabius Columna* maketh mention of another sort with larger tongues upon the leaves then the former, which is as he saith much more rare to finde.

Hippoglossum sive Bilingua.
Horse tongue or double tongue.

Matthiolus Bilingua.

The place.

It groweth upon hills and in woods in divers places both of *Italy* and *Germany*, but is onely cherished in gardens with us.

The Time.

It floweth in *June*, and the berries are ripe in the end of *September* in the naturall places as in the warmer countries, but I could never know that any hath seene it beare his fruit in our Land.

The Names.

It is called in Greeke ἱππόγλωσσον, *Hippoglossum*, *Ruellius* *Hippoglossum, sive sepissime magno plantis inter, sed quia duplicem linguam imitatur vel gerulæ*, but others think it should be more truely called βιγλωσσον *Hyperglossum*, because of the small leaves like small tongues, growing upon the greater: the Latines keepe the name and call it *Hippoglossum* or *Hippoglossum*, and some to expresse the Greeke name more fully in Latine *Bilingua*, two tongues or double tongue, some *Lingua Passeris*, and of *Apuleius Violariola*: it is called also *Bonifacia* by *Augustus*, and *Cynoglossa* by *Brunfelsius*, *Tragus*, *Tabernæmontanus* and others. *Matthiolus* calleth it *Daphne Alexandrina*, and *Laurus Alexandrina*, as *Tragus* and divers others doe, and *Gesner* himselfe confesseth he knew no other *Laurus Alexandrina*, untill *Simon de Tovar*, a Spanish Philition did send him a branch, which the berries of the right *Laurus Alexandrina* to see, which had no tongues of small leaves at all, and were as I take it the *Thymelæa* (as shewed you before), and therefore he called this *Laurus Alexandrina Theophrasti secunda*. *Fabius Columna* *Ruscus affinis minor*. *Columna* maketh it to bee *Idea radix Dioscoridis*, and *Dalechampius* to bee *Laurus Tertia Plinij*, which to be so, he contendeth very seriously, as it is set downe by *Lyndanus*, that *Plinius* in the 15. and 30. Chap. numbereth up the severall sorts of true Bayes, and then mentioneth three that are to differ of the Greeke or Latines from some likenesse of the leaves, as *Laurus Tinus*, *Laurus Tusca*, *Cham-daphne*, *Laurus Cerasifera*, and *Laurus Alexandrina*, but *Matthiolus* thinketh that in stead of *Laurus Tusca*, *Laurus Sylvestris* or *Laurus* should be read, against which he contesteth, and sheweth that no author ever made mention of such Bay, and that *Plinius* in the place before cited, giveth a speciall note of *Laurus Tusca*, that it is to be trailes or borders in Gardens, and that it hath a small leafe like unto a jagge or some peece of a leafe growing the middle of the other leafe: and further that the appellation or name doth not agree therewith, for Bay from the berrie of the leafe, and *Tusca* from the red berries like unto those of the Yew tree called I have related to shew his judgement and reasons, that others may allow or disallow thereof, as cause, but for mine owne part, I thinke that *Plinius* in this as in divers other plants giveth two scriptions of one and the same herbe, following the severall authors hee read, as *Dioscorides*, others, and often misunderstandeth them, and often also addeth or detracteth of his owne minde, where in his time what he thought good, for in his 37. Booke and 11. Chapter hee maketh

…leaves which he saith hath leaves like unto the wild Myrtle, having a small leafe like a tongue shining from them, which doth reach thus *Hyoglossum* as plainely as may be, and as I said before there is not knowne any herbe but this, that hath such small leaves or peeces of leaves growing upon the greater; *Lugdunensis* sheweth that *Dale*… doth account it to be the *Chamæleon* of *Dioscorides*, upon this ground peradventure that *Dioscorides* maketh no mention of *Hyoglossum*, but if he had so meant, he could not have forgotten these small leaves or tongues upon the greater: the *Italians* call it *Bulagni* and *Bonifacio*, the *Spaniards Lengua de vaca*, the *French Bistorte*, the *Russian Zapiuk*, and, the *Dutch Tongenblade*, and wee in *English* Horle tongue and double tongue.

The Vertues.

…thought to be hot and dry in the second degree. It is held to be the most powerfull herbe that …the inflammations and other diseases of the mother, to take the powder of the dryed leaves or roots in …wine, broth, or other drinke, for it will speedily give ease: three or foure drammes of the said powder taken in …procureth a speedy delivery, and driveth forth the afterbirth, provoketh the courses and Urine …stopped, and expelleth the stone in the reines and kidneys: if a dramme or two of the said powder …drinke it with wine or broth for some certaine dayes together, it will helpe those that have a rupture or …bursten, and for this purpose it is accounted by divers that there is no helpe better, but although it may bring …paines at the first takings, yet by continuance it will knit and heale the part, yet they must use their trusse …while after, as well as during the cure: it is also good for those that have some imperfection in their …speech, if it be not naturall: it helpeth also the sores in the mouth and throat, and to settle the palate of the …in place that is subject often to fall downe by reason of too much moisture: it is likewise of singular …old and filthy ulcers, in any part of the body, to dry up the moisture, and to bring them on the more …to be healed, either the powder of the leaves or roots to bee used alone, or with other things put unto …or the decoction to wash them or inject into them.

Chap. CVI.

Geranium. Cranes bill or Stockes bill.

Dioscorides setteth forth but two sorts of Cranes bills, *Pliny* addeth a third, *Matthiolus* hath five, others have encreased the number still more and more; but our age hath found out many more, whereof I have shewed you in my former booke divers sorts, such as are of most delight and beauty, fit to furnish such Gardens as you there finde them; of none of these doe I intend to speake againe, having given you …descriptions, &c. in that place, I will onely give you some of their figures which shall suffice. There are …sorts to bee knowne, which shall follow in this place, and because I would observe the same method I

1. *Geranium sylvaticum Dilleni. Pratense.* Wilde meadow Cranes bill.

2. *Geranium sylvaticum,* Knotted Cranes bill.

have formerly done, I will distribute them into three rankes or orders, the first shall be of those that beare broad leaves, like the Aconites or Crowfoot: the next shall be of such as have round leaves like unto Mallowes, and the last of those that have their leaves much cut in and jagged.

Gerania Batrachia. Crowfoote Cranes bill.

1. *Geranium bulbosum Pennæ sive grumosa radice.* Doctor *Penny* his bulbous Cranes bill.

This Cranes bill hath for the roote many small long bulbes or kernells tilling from a long whitish roote, and divers small fibres set both above them and at their ends: the stalke is about a cubit high, with joynts or knees in severall places, at each whereof come forth small short and pointed leaves, as also two great leaves upon long footestalkes, divided into five parts, each of them cut in somewhat on the edges; at the toppes of the stalkes and branches, and from the upper joynts likewise come forth divers flowers together, each standing on short footstalkes, consisting of five leaves a peece, of a reddish purple or rose colour, not so large as those of the Crowfoote Cranes bill.

2. *Geranium nodosum.* Knotted Cranes bill.

The knotted Cranes bill sendeth forth certaine leaves upon long footstalkes from the roote, which is knotted and jointed, with divers long fibres growing therefrom, among which rise up two or three slender stalkes foure high, with great joynts like knees standing forth, and reddish; toward the bottome there usually have two leaves upon long footestalkes, at a joynt cut into three parts, yet shewing to bee five, for that the two lowest are cut in a little: from the uppermost joynt of leaves come forth two flowers (or the most pert and no more) standing upon longer footestalkes made of five leaves a peece, dented in the middle like a Mallow, of a purple colour, with veines of a deeper purple running there through, having a reddish umbone in the middle, cut into five parts at the toppe, which being past there come in their places long beake heads, somewhat great at the bottome, wherein the seeds are set, as in the other sort of Cranes bills.

3. *Geranium pullo flore.* Darke red Cranes bill.

The darke red Cranes bill hath divers broad spread, soft, and somewhat hairy leaves rising immediately from the roote, upon long footestalkes cut into five or six or seven deepe gashes or divisions, with a blackish spot at the bottome of every one of them, and dented also about their edges: the stalke riseth up about two foote high, spotted with many bloody spots, and is strong somewhat hairy, and parted into three or foure branches with leafe like leaves on them but lesser, and at their ends two or three flowers a peece, each of them consisting of five leaves cut in on the edges (which is a fashion different from all other Cranes bills) of a deepe red colour about the brimme, and in the middle a long stile with many writhed threds about it the seede that followeth is browne, & like unto the other sorts: the roote hath great reddish heads above, and many long strings and fibres descending from it.

4. *Geranium Batrachioides minus.* Small Crowfoote Cranes bill.

This Crowfoote Cranes bill is somewhat like the other described in my former booke, having large round and hairy leaves upon long footestalkes, cut in more deepely on the edges, and dented also round about, the stalkes

3. *Geranium pullo flore.* Red Cranes bill.

Geranium fuscum. Spotted Cranes bill.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

foote and a halfe high, branched into divers parts, with lesser divided leaves at the joints up to the toppes, where the flowers stand very like unto the other, but lesser, and of a reddish purple colour: the seede that followeth is like the other, but standeth upright and turneth not downewards: the roote is somewhat thicke and reddish at the head with divers strings and fibres thereat.

5. *Geranium Moscoviticum purpureum.* Purple Cranes bill of *Moscovy.*

The purple Cranes bill hath broad leaves divided into five parts or divisions for the most part, and dented like saw about the edges, somewhat resembling *Geranium fuscum*, but not fully so large, or rather like the *Geranium Romanum versicolor* but of a deeper greene colour, and with some blacke spots also like them at the bottome of the diuisions of the leafe. The stalke riseth about two foote high, with sundry tufts of large purplish blew flowers growing toward the toppe of the stalke, the seede that followeth is almost as small as that of the *Romane* stripped Iuncke: the roote shooteth forth diuers heads whereby it is increased, but looseth all his leaves in winter which the others doe not.

6. *Geranium Batrachoides alterum longiori radice Lobelij.* Long rooted Crowfoot Cranes bill.

The leaves of this Cranes bill are somewhat large but yet lesse then the other *Batrachoides*, else very like among which he sundry stalkes bearing faire and beautifull red flowers of a more excellent red colour then those of the former Cranes bill. Smelling very sweet like Muske, and seede succeeding like the other: the roote is very long and great, with small fibres thereat.

7. *Geranium parvum Salmanticense.* Small *Spanish* Cranes bill.

The small Cranes bill hath leaves like the ordinary Crowfoot, and small purple flowers, with great heads like the long Cranes bill, and a small abroue roote.

The Place.

The first or *Clusius* saith grew in *Denmarke*: in the country of *Holland*: the naturall place of the second is not reported: the third or *Clusius* saith groweth in some parte of *Hungarie*: the fourth in other places of *Germany*: the fifth as *Clusius* saith is brought to vs by *Master John Tradescant*: the sixt on Mount *Baldus*, and the last on the stony [illegible] in *Spaine*.

The Time.

They flourish in *June* and *July*, and their seede is ripe quickly after.

The Names.

The Greeke [illegible] and *Geranium*, and so doe the Latines also, but so expresse it the more plainely *Chamæmelis*, [illegible] from the forme of the seedes like a Storke or Cranes bill: the *Italians* [illegible] and *Becco di gru*, the *Spaniards Pica de cigueña*, the *French bec de cigogne*, the *Germanes* [illegible] and we in *English* Storkes bill or Cranes bill. The first is *Clusius* his *Geranium Moschatum Pometi*, and *Bauhinus Geranium pumilo radice*: the second is *Geranium triste* and *tuberosum Plateau* also, for they are both but one plant, as he sheweth [illegible] and I thinke is very like, if not the same with the *Geranium Romanum versicolor sive ferrugineum*, which is [illegible] in my former booke: the third *Clusius* calleth *Geranium pullo flore*, which it is likely *Gesner* in *Appendice* maketh

maketh mention of the fourth *Camerarius* and *Clusius* call *Geranium Batrachoides minus*, and *Matthiolus* had not beene published by any that I know, although we have had it long time in our Gardens called by *Lobel Geranium Batrachoides longius radicatum*, which *Camerarius* calleth *Geranium Batrachoides*, and *Dodonæus Stinck Flore* by some as he saith of *Matthiolus Batrachoides alterum*: the last is called by *Clusius Geranium [illegible] vel Salmaticense rotundifolium*, or *Bauhine Geranium parvum folijs Ranunculi*.

The Vertues.

All the kinds of Cranes bills are drying, binding, and a little hot withall, and are found to be effectuall both to inward and outward wounds, to stay bleedings, vomitings and fluxes, either the decoction of the herbe, or the powder of the leaves and roots applied as the cause requireth.

CHAP. CVII.

Geranium Malvæfolium. Round or Mallow leafed Cranes bills.

The second kind of Cranes bills to be entreated of, is of those that beare round or Mallow like leaves, which shall follow.

1. *Geranium tuberosum minus Camerarij.* Small tuberous Cranes bill.

This small Cranes bill hath divers round leaves very like the ordinary Doves foote, but each lobe is the flowers likewise are very small and reddish like the former, and so are the heads wherein the seede also: the roote is round, of the bignesse of an Hasle nut, without any fibres growing from it, drawing the nourishment out of the earth by certaine little mouthes, which are like small hoofes of the ox, not abiding to be taken out of the naturall place of its growing, which is in mod walls or the borders into gardens, for as I remember such having often tryed it, it will decay by little and little.

2. *Geranium Columbinum vulgare.* The common Doves foote or Cranes bill.

The common Doves foote or Cranes bill hath divers small round pale greene leaves, cut in about the edges much like unto Mallowes, standing upon long reddish hairy stalkes, lying in a round compasse upon the ground, among which rise up two or three or more reddish jointed, slender, weake and hairy stalkes, with lesse such like leaves thereon but smaller, and more cut in up to the tops, where grow many very small bright red flowers, of five leaves a peece, after which follow small heads, with small short beakes pointing forth, as all other sorts of the kinds of herbes doe, whereby they are knowne to be of this family, how variable soever their size or forme of leaves, &c. be.

3. *Geranium Malvæfolio laciniatum sive Columbinum alterum.* The other Doves foote.

Of this kind there is another sort, whose leaves are greener, not so round, and some what more cut in, &c.

2. Geranium Columbinum vulgare.
The common Doves foote or Cranes bill.

Geranium Columbinum vulgare.
The common Doves foote or Cranes bill.

Original from UNIVERSITY OF MICHIGAN

edges, making the leafe seeme of divers parts more then the former, or like the Vervaine Mallow but somewhat lesser, otherwise like it in flowers, weake leaning stalkes, &c.

3. *Geranium Adelteoides seu Columbinum minimum.* The least Doves foote.

This is another also very small, not rising above two or three inches with his stalkes; the leaves also flowers, and seede are of a like sort all to the rest, that is very small.

4. *Geranium Adelteoides, sive Columbinum tenuius facinatum.* Doves foote with thin cut leaves.

This also is but a small plant not above an handbreadth high, whose leaves are round of the bignesse of ones nayle, cut in at the edges into foure divisions, and each of them somewhat cut in also, standing upon long foote stalkes; the flowers are small, two for the most part and no more standing together, small and reddish like the other, and so the seede and roote.

5. *Geranium Alchemilloides maius.* The greatest Marsh Mallow leafed Cranes bill.

The first leaves of this Cranes bill are more round then the other that follow, which are somewhat long, with sharpe edges like unto the Marsh Mallowes, somewhat roundly but a little deepely cut in on the edges, soft and hairy, of a whitish greene colour almost woolly, the stalkes are more upright and hairy, with such leaves thereon but smaller longer and a little more cut in on the edges, on the toppes whereof stand small purplish flowers, and after them small beake heads like unto others; the roote is somewhat long and wooddy dying every yeare, and rising againe of it owne sowing.

6. *Geranium Alchemilloides minus.* The lesser Marsh Mallow leafed Cranes bill.

This other Cranes bill is like the other in all things but smaller and lower, the leaves being a little whiter, the flowers small and of like sort, that oftentimes were scarce finde it.

7. *Geranium Althææ Veneris folijs.* Venice Mallow leafed Cranes bill.

This fourth Cranes bill groweth to stand very large with long slender branches, whereon are set at certaine distances many leaves like unto the *Venice* Mallow but more divided, the flowers are small and purplish, after which follow the seede contained in small vessells; the roote perisheth every yeare. This and the third among a number of other seeds were brought me by *Guillaume Boel* which he gathered in *Spaine* upon my charge, however Mr. *Goodyer* getting the seede from Mr. *Coys*, sauded it and divers other things to bee published in his name, which hearing I told him the charge was mine that procured it and many other.

8. *Geranium Saxatile.* Rocke Cranes bill.

This other Cranes bill is a lesser plant then the ordinary Doves foot, having many small leaves, somewhat cut in and very greene in shewing so like unto a small Sanicle leafe, that it may deceive one, set on reddish stalkes; flowering greene all the Autumne, Winter and Spring untill the Summer, that the stalkes rise up about a span high or somewhat more, bearing a few leaves on them, and very small purplish red flowers, tough and wooddy when

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

then the Doves foote, which giveth very small leede, like of the fashion of the rest; yet *Cæsalpinus* in *Thalius* description that the leede is yellow like *Chamelæa* English Wormeleede, but without any taste, of a sort he is much mistaken. For how could it be *Geranium* then, as both he and *Thalius* call it; and moreover *Cæsalpinus* in describing it sheweth what manner of bills or beake heads it beareth: the roote is small and woodish, yet divided and perisheth not, but encreaseth plentifully enough of the leede in my Garden.

The Place.

The first groweth as *Camerarius* saith out of round walls in divers places of *Germany*, the second commonly in pasture grounds, and by the path side every where, and will be in many gardens also: the third is found in such pastures also, but not frequent: the fourth in the fields about *Rhinsmagum* or *Rain* in *Nassaw*: the fifth in woods about *Gottingen* in the Inne on Mount *Badium*, about *Hampsher* also, & in other places: the seventh in Spaine, whence I had seede brought me: the last in stony grounds in *Hungaria* (*Hirta*), as *Camerarius* and *Thalius* say: about *Nyce* as *Clusius* saith, but found also in our owne countrey by *Mr. John Gerarde*, a great lover and searcher of plants, who beside this hath found in our countrey many other plants, not imagined to grow in our Land. I wish there were many more of his minde, that not hindering their affaires at home, would be industrious to search out and know what the ground bringeth forth, where their creations are to be.

The Time.

They all flower in the Summer moneths of *June*, *July* and *August*, some more early then other, and decay as they quickly after.

The Names.

The first is called by *Camerarius* *Geranium tuberosum minimum*: the next two sorts are called generally *Geranium*, and *Geranium Cantabrigiense*: and some *Rostrum Cygni* and *Geranium*, the *Rostrum Ciconiæ*, *Gallinaceum*, yet for any *Geranium* and others more, as *Geranium Malacoides*, and *Balsamitæ*, and *Moschatum*, as *Camerarius* saith, especially the greater sort as *Matthiolus* saith from the *Balsamite* or tansie it resembleth, as doth also the taste, although *Lobel* taxeth him for so saying, whose similitude is more easily perceived, in my judgement, touching the second sort for the first here expressed. The common Dove foote generally called the second *Geranium* of *Dioscorides*, although *Brasauolus* as *Matthiolus* saith that was rather drawn into the first: and is called *Rubra* in *Cæsalpinus*, and *Cruenta*, the *Spaniards Pico de gigante*, the *French Bec de grue*, and *Becco di gru*, the *Germane Storchschnabel* and *Storchkraut*, the *Dutch Ooievoet*, and with us Dove foote, Cranes bill, and storkes bill: the fourth and fift are of *Matthiolus* addition by the same epithets here the first, called *Geranium Malacoides* of *Lobel*, and *Malvæfolio* of *Camerarius*, wherein as I said before he is much mistaken in taking *Malacoides* for *Moschatum*, the *Germane Moschatum*, and of *Brasauolus Geranium* that smelleth and fairly flowreth most like agree with the second *Geranium* of *Dioscorides* which hath as he saith more white or woolly leaves then a Mallow: the seventh and eighth are of mine owne naming no doubt the *Spanish* leede and sithing of neare affinitie receive also their name correspondent to the last is called by *Camerarius* *Geranium Sanguineum*, but not knowne as he saith before his time. *Thalius* mentioneth it in Hercynia hauing the name of *Geranium sanguineum*, and *Columna Geranium alterum montanum sanguineum folium*, and *Geranium acidum* Tragi.

The Vertues.

The ordinary Doves foote is found by good experience, and *Lobel* and others note it also to be singular good for the greene Collicks and paines thereof in the lower belly, as also to expell the stone and gravell in the kidnies, the decoction thereof to be drunke, let your fit as in a bath thereto, or as is to be ministred hereafter: the decoction thereof in wine is an excellent good wound drinke for any to take that have either new wounds or bruises, both by drinking the decoction and expell the congealed blood, and to heale the sores, & also outward sores ulcers & sinuses perfectly to cleanse and heale them, and for greene wounds, many times untile the herbe and apply it to the place where it lyes, and it will quickly heale them: the same decoction in wine fomented to any place pained with the Goute giveth much ease: it doth the same also to all sorts of pains of the sinewes. *Gerardus* experience to be singular in ruptures or burstings (for so we at his owne house is knowne most universally) whether you take the powder or the decoction of the herbe, for sometimes together, and helpeth as well young as old folkes, if they continue it the longer.

Chap. CVIII.

Geranium tuberosum. Cranes bills with jagged leaves.

THe third and last kind of Cranes bills, is as I ordered it at the first, of such sorts that have their leaves more jagged then the former, as shall be shewed.

Geranium moschatum. Musked Cranes bill.

The Musked or sweet smelling Cranes bill hath divers long winged leaves growing next the ground, yet somewhat vnlyke by the haires that are thereon cut more deeply into many parts or leaves, and cut in on the edges, among which rise up weake tender stalkes, scarce three handfuls high, with some such like leaves upon them as grow below, but smaller and finer cut in at the tops, and more the nearer vnto the toppes: at the tops stand many very small red or crimson flowers, after which come long beakes or bills with seede at the bottome, as all the rest of the Cranes bills have, which are small: the whole plant is somewhat hoary with divers fibres thereat: the whole plant and every part thereof shewe the ground hath a pleasant fine weake sent, which some extend to musk, whereunto I cannot fasten, but the sent of it is good: Musk is much differing from it.

Geranium moschatum inodorum. Vnsavory Musked Cranes bill.

There is little difference to be discerned betweene this and the former Cranes bill, either in growth or forme of the leaves and flowers, but chiefly differing in this that it hath no sent at all, wherein it doth differ not the onely difference: Of the sort also one hath beene found to beare white flowers differing in nothing

Original from UNIVERSITY OF MICHIGAN

3. *Geranium Apulum odorum.* *Italian* Muske Cranes bill.

4. *Geranium fœtidum.* Strong tented Cranes bill.

3. *Geranium Apulum odorum.* *Italian* Muske Cranes bill.

The *Italian* Muske Cranes bill hath divers long leaves, and somewhat hairy lying on the ground, cut in on the edges somewhat like the divisions of the lower leaves of the *Candy* Cranes bill, standing upon reddish foote stalkes, the two lowest jagges being greater then the rest, but those that rise up with the stalke are more cut in, somewhat like unto the lower leaves of Coriander, or Fetherfew, but with rounder dents, of a sweete sent, as the first, whereof it is thought to bee a *species*: the stalke is jointed and kneed, with two such like leaves at them, but more finely jagged, and at the toppe diverse small flowers, of a pale blewish purple colour, each standing in a greene hairy huske, wherein afterwards stand the heads of seeds very like unto the *Candy* kinde, great below and small above: the roote is small and yellow, lifting the head a little above the ground.

4. *Geranium fœtidum.* Strong tented Cranes bill.

This Cranes bill hath divers hoary greene leaves, finely cut in on the edges into many parts from among which rise two or three slender hairy stalkes set at the joynts with a few small leaves, and three or foure somewhat large reddish flowers above, like unto the other sorts, smelling somewhat sweete in our Gardens by the transposition, but strong in the naturall warmer places, after which come the seede somewhat long, strong and stiffe: the roote groweth downe deepe, of a reddish colour on the outside and white within, which smelleth much stronger then leaves or flowers, and shooteth forth sundry heads of leaves at the toppe.

5. *Geranium triste sive Indicum nectu olens.* Sweete *Indian* Cranes bill.

The leaves of this Cranes bill are tuberous or Asphodill like, from whence rise foure or five long and large sad greene leaves, diversly cut into many parts, each part jagged on both sides somewhat resembling the leaves of *Pimpinella* but softer, the middle ribbe being reddish and the rest sad greene: the stalke is jointed or kneede with the like leaves cling with it, and at the toppe a tuft of many flowers, like for forme unto those of other Cranes bill, and of a Buglike yellow colour, each leafe having two purple spots on them, which being fallen there come long slender seeds in the former with reddish seede on them, the flowers smell very sweete like Muske in the night onely, and not at all in the day time, as refusing the Sunnes influence, but delighteth in the Moones aspect: the taste is reddish somewhat sower, and both roote and leaves are Lettice for the *Indians* lippes.

6. *Geranium Monspeliacum laciniatum.* *French* jagged Cranes bill.

The French jagged Cranes bill riseth up with sundry rough hairy stalkes, three or foure foote high, jointed and branched in divers places, with divers leaves thereon cut on both sides, very like unto those of the Muske Cranes bill: the flowers that stand at the toppes of the stalkes and branches are small, of a pale purple colour, after which come the seede, out of the same huske wherein the flowers stood before, as is common to all the kinds whatsoever, but the beake heads here of are very long and hairy, even five inches long, which twist themselves when they grow ripe, and so fall into the ground.

7. *Geranium Alpinum longis radicibus Pona.* Mountaine Cranes bill with long roots.

The Mountaine Cranes bill hath a very long downe right roote, parted upwards into two or three branched great heads, standing forth many leaves, divided into five or six parts, each whereof is dented with three deepe gashes at the end, soft also and woolly, standing on very long foote stalkes, covered with fine like downe, the flowers stand at the toppes of naked stalkes, two or three together somewhat large and round, yet a little round withall, of a pale purplish colour with divers reddish lines therein, and divers threds in the middle: the seede is small and standing on short beake heads.

8. *Geranium Robertianum vulgare.* The common herbe Robert.

The herbe Robert that is much common with us, riseth up with a reddish stalke, usually two foot high, having leaves thereon upon very long and reddish foote stalkes, divided at the ends into three or five divisions, and each of them cut in on the edges, some with deeper cuts then others, and all dented likewise about the edges

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

with diuers stemmes turne reddish at the toppes of the stalke come forth diuers flowers, made of five leaues, much lesser then the Meadow Cranes bill or Doues foote; Lobel maketh a difference in the flowres some to be larger then other, and of a more reddish colour: after which come beake heads vp in clusters, which are not small nor very great, the roote is small and threddy, and fasteneth as the whole plant elfe doth, very strong almost to kill.

2. *Geranium Robertianum purpureum.* The greater herbe Robert.

The herbe Robert riseth vp with diuers slender hairy reddish stalkes three foote high, at the ioynts whereof stand set vpon shorter yet reddish footstalkes, deuided at the ends most vsually but into three parts, as large or rather larger then the former, and turning red likewise: the flowers are purplish red, and of the same bignesse and forme for seede and beake heads, the roote is wholly red both within and without, not smelling so strong as the other.

The Place.

These doe grow wilde in many places of this Land, as well in medowes as wall grounds, the first is cherished for his vse to Gardens more then the other, which is found sometimes vpon Heathe, and dry gravelly places, but yet not so then in the better grounds: the third was found by *Columna* in *Naples* vpon the hills there: the fourth at the north side of *Mount Iuga* by *Mompelier*: the fift in the *Indies*: the first by *Mompelier* also: the seuenth in mount *Baldus*: the eighth is frequent every where by way sides, vpon ditch banks and waste grounds euerywhere the yeare, but the last is not so frequent as the other, yet often seene and found.

The Time.

They flower in Iune and July chiefely, and their seede is soone ripe after.

The Names.

This is called *Geranium Moschatum*, *Acus moschata*, and *Acus pastoris* of some, although the *Scandix*, or *Pecten Veneris*, is so called also, of some also *Rostrum Ciconie*, and taken to be the *Myrrhis Plinij*: *Gesnerus* maketh it his third *Geranium* in his first Edition, but the first in his former by the name of *Cicutæ folio Pedunculo Geranij longissimo*, and *Pastinaca Geranium Cicutæ folio Moschatum*: the second is called *Geranium purpureum* by *Dodonæus*, and *minus* in *Fuchsius* and *Tabernæmontanus*, and by others *vulgatum maiorum*, and *Moschatum indorum*: the third is called by *Columna Geranium Apulum Coriandri folio altera odorum*: the fourth is called by those of *Mompelier* as it is in the title: the fift *Geranium* called *Geranium Indicum*: the first is called by *Bauhinus*, *Geranium Cicutæ folio & longissimo*: the seuenth is called by *Fuchs Geranium Alpinum longum odoratum*: the eighth is generally called *Geranium Robertianum* and *Robertiana*, and *herba Roberti* or *Roperti*, *Anguillara* calleth it *Pennæ Herculeum*: it is certainely taken of many the best of our moderne writers to be the *Sideritis tertia Dioscoridis*, which *Cruserius* he saith called *Veronica*, whose leaues are like those of *Germander*, yet *Columna* calleth the *Diapensia Sanicle* to be it: the last is called by *Lobel Geranij Roberti altera species*, by *Dodonæus Geranium geniculatum*, and is the *Geranium Violaceum* of *Gerard*, and *Tabernæmontanus* whom he followeth, the *Geranium* all this *Bloodwort*, *Herbe Robert*, *Sanguinaria radix*.

The Vertues.

These kinds of Cranes bills are neere the temperature of the former, and may performe all the properties found to them, but the two first sorts here expressed are held more available for the mother to vse it in the place where it is fallen downe. Herbe Robert is not onely commended against the stone, but to stay blood, where or howsoeuer flowing, and so is the last also, as also speedily to heale all greene wounds, and is effectuall also in old vlcers, in the fowle as well as in the other parts.

Chap. CIX.

Tabacco Anglicum. *English* Tabacco.

HAue in my former booke giuen you the knowledge of diuers sorts of Tabacco, such as for their flowres like might be sit to be nourished vp in gardens: there remaineth one sort more, which is planted more for the vse of Phisicke and Chirurgery then for any other respect whereof I meane to speake in this Chapter. It riseth vp with a thicke round stalke, about two foote high, whereon doe grow thicke, fat and fleshy greene leaues, nothing so large as the other *Indian* kinds, neither for breadth or length, hauing what round pointed also and nothing dented about the edges: the stalke branches forth, and at the tops of the branches diuers flowres set in greene huskes like the other, but they are nothing so large, fearce standing aboue the huskes, round pointed also, and of a greenish yellow colour: the seede that followeth is not blacke, but larger then it, contained in the like, and as great heads: the rootes are neither so great or woody and perish euery yeare, with the deepe frosts in winter, but riseth generally of the seede that is sufficed to shed it selfe.

The Place.

This came as it is thought from some part of *Brasile* and is more familiar to our countrey then the other *Indian* kinds, euery giuing ripe seede when as the others seldome doe.

The Time.

It flowreth in Iune sometimes about the end of *August* or later, and the seede ripeneth in the meane time.

The Names.

The name *Petum* whereby it is called, as properly from *Brasile*, as I am given to vnderstand, and yet some haue affirmed that this herbe, the *Indians* there so called, were receiued it by that name which is continued. It is thought also to be one that *Iohn Nicot* the French man, being agent in *Portugall* for the *French* King sent into France of Tabacco and not any other to the *French* Queene, and is called thereupon *herba Regina*, and *herba facilis*, *Nicotiana*, which is probable because the *Portugalls* and not the *Spaniards* were maisters of *Brasile*

as that time: the *Indian* names of *Pawle* and *Tobacco* are more proper as I take it to the other *Indian* kinds: wee doe vsually call it in *England* English *Tobacco* (not that it is naturall of *England* but because it is manurely commonly growing in every countrey garden almost. and better endureth then the other: *Lobel* and others accepted it, as well as the other sorts an *Hyoscyamus*, and called it *Hyoscyamus luteus*, and *Dodon.* and *Gesnerus* also have called it in *English* yellow Henbane.

The Vertues.

This kind of Tabacco although it be not thought to strong, or sweete for such as take it by the pipe, (and I have knowne Sr. *Walter Raleigh*, when he was prisoner in the Tower, make shift of this sort to make his Tobacco of, which he knew so rightly to cure as they call it, that it was held almost as good as that which came from the *Indies*, and fully as good as any other made in *England*:) yet not yet so effectuall for inward diseases, because it is not so much vsed as the other, yet it is available by good experience for to expectorate tough flegme out of the stomacke, cheft and lungs, that doth offend them: the juice thereof being made into a syrupe, or the distilled water of the herbe drunke with some Sugar, or without as one will, or else the smoake taken by a pipe as is *vsuall*, but fasting. The same also helpeth to expell wormes in the stomacke and belly, as also to apply a leafe to the belly, and to ease the paines of the head, or the Megrime, and the griping paines in the bowells, although to some it may seeme, to bring or cause more trouble in the stomacke and bowells for a time: it is also profitable for those that are troubled with the stone in the kidneyes, both to ease paines, and by provoking vrine to expell gravell and the stone engendred therein, of that viscous matter, and to heale the parts; and hath beene found very effectuall to suppresse the malignitie and expell the windy and other offensive matters, which cause the strangling of the mother: the seede hereof is much more effectuall to ease the paines of the toothach, then any Henbane seede, and the ashes of the burnt herbe to cleanse the gummes and teeth and make them white: it hath beene thought not to have beene safe for weake bodies and constitutions, nor for old men, but of both sorts I have seene the experience that it hath bin profitable being taken in a due manner, that is fasting, and to bed ward and before meate. *Thevet* saith that the Women in *America* forbeare the taking of Tobacco, because that they have beene taught that it will hinder conception and bodily luft: the herbe bruised and applyed to the place of the Kings Evill, helpeth it in nine or ten dayes effectually: it is said also to bee effectuall to cure the dropsie, by taking foure or five ounces of the juice fasting, which will strongly purge the body both upwards and downewards. *Matthiolus* saith it is an *Alexipharmacum* or Counterpoison, for the biting of any venemous creature, and to apply the herbe also outwardly to the hurt place. The distilled water is often given with some Sugar before the fit of an Ague, both to lessen the fits and to alter them: and take them quite away in three or foure times vsing; which water above many other will taste of the sharpenesse of the herbe it selfe, but will yeeld no oyle or nocturne for instance, as most other herbes will doe, although divers have boailed to make an oyle thereof; if the distilled water of the herbe having beene bruised before the distillation, and not distilled dry be set in some cellar, to digest 14. dayes, and afterwards hung up in a bagge in a wine Sellar, that liquor that distilleth therefrom is singular good to vse for Cramps, Aches, the Gout and Sciatica, and to heale itches, scabbes and running Vlcers, Cancers and foule sores whatsoever: the juice also is good for all the said greefes, and likewise to kill lice in childrens heads: the greene herbe bruised and applyed to any greene wound is commonly knowne to many folkes, to cure any fresh wound or cut whatsoever: and the juice put into old sores both cleanseth and healeth them, to which purpose many doe make a singular good salve hereof in this manner. Take of the greene herbe two or foure handfulls, bruise it and put it into a quart of good oyle of Olives, boile them on a gentle fire vntill the herbe grow dry and the oyle will bubble no longer, then straine it both hard and fast on the fire againe, adding thereto Wax, Rosen and Sheepes Tallow, or Deares Suet which you will, of each a quarter of a pound. Turpentine two ounces, which being melted put it up for your vse: Some will adde hereunto of the powder of *Aristolochia rotunda*, round Birthwort, and of *Olibanum* that is, white Frankincense of each halfe an ounce, of six drams, which are to bee put in when it is nigh cold, and well stirred together: this salve likewise will helpe impostumes, hard tumors, and other swellings by blowes or falls.

Tabacco Anglicum. Englift Tobacco.

Chap. CX.

Pedicularis seu Filipendula. Rattle grasse.

The Rattle grasse there are two especiall kinds, the one with red flowers, the other with yellow, and each of them several sorts as shall be shewed.

1. *Pedicularis pratensis rubra vulgaris.* Common red Rattle.

This hath sundry reddish hollow stalkes and sometimes greene rising from the roote, lying for the most part on the ground, yet some growing more upright with many small reddish or greenish leaves set on both sides of a middle rib, finely dented about the edges: the flowers stand at the toppes of the stalkes and are of a fine purplish red colour, like small gaping hoods after which come flat blackish seede in small huskes which being shaken will Rattle with shaking: the seede consisteth of two or three small whitish flattish kernels.

2. *Pedicularis major Alpina.* The greater mountaine Rattle grasse.

This riseth up neere halfe a yard high with a thicke reeded stalke set somewhat thicke, with long stalkes of winged leaves made like the manner of Ferne, notched about the edges one above another, the flowers are like the former but of a whitish colour growing in a long spike, after which doth follow broader huskes containing the seede therein like unto Madwort: the roote is long, thicke and blacke.

3. *Pedicularis minor Alpina.* The lesser mountaine red Rattle.

This lesser sort groweth much lower then the last, and with fewer leaves on the stalkes, which are slender also but not so like unto them: the flowers likewise are smaller and set on a shorter spike, but of a brave fine red colour: the huskes that follow are greater then the first, with long beakes at their ends, having corniered seede within them: the roote is long and white of the bignesse of ones finger, with some great fibres thereat.

4. *Pedicularis seu Crista gallí lutea.* Yellow Rattle, or Coxcombe.

The common yellow Rattle hath seldome above one round greene stalke rising from the roote about halfe a yard or two foote high and with but few branches thereon, having two long and somewhat broad leaves set at a joynt deeply dented or cut in on the edges, resembling therein the rolls or combe of a Cocke, but smaller set to the stalke and smaller to the end: the flowers grow at the toppes of the stalkes with some thereto leaves with them being hooded after the same manner that the others are, but of a faire yellow colour in most, or else in some pale and in some white: the seede is conteined in large huskes, and being ripe will rattle or make a noyse with lying loose in them: the roote is small and slender perishing every yeare.

5. *Pedicularis Alpina lutea.* Mountaine Yellow Rattle.

The stalke hereof groweth halfe a yard high, set with long winged leaves, compoted of many small finely

3. *Pedicularis prima sive vulgatior.* Common red Rattle.

4. *Pedicularis seu Crista Galli lutea.* Yellow Rattle, or Coxcombe.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

dented leaves up to the toppes of them, where they are bare of leaves and beare long spikes of gaping yellowe ded yellow flowers, which yeeld afterwards small long huskes like those of Snapdragon with small seede in them: the roote is made of divers long blackish fibrous strings.

6. *Crista galli lutea umbellata.* Yellow Rattle with flowers in tufts.

This hath but few and narrow leaves of an inch long a peece, rising from a slender small roote and stalkes rise among them little more then an handbreadth high, having many yellow flowers set together at the toppes as were in an umbell or tuft, fashioned like the other, but three times longer then those of the common sort, and with great broad huskes containing the seede after them.

7. *Crista Galli angustifolia montana.* Mountaine narrow leafed yellow Rattle.

This yellow Rattle hath two long and narrow pointed greene leaves dented about the edges set one against another upon the stalke, which is a cubit high, from betweene which rise other smaller leaves and a small spike likewise an inch or two long, with very small leaves thereon, and small pale yellow flowers like the former but smaller, with that seede in small huskes following them.

The Place and Time.

Some of both these kinds grow in our medowes and woods generally through the land, where they are rather a plague or annoyance to it, then of any good use for the cattle, but the best in *Germany* (except that which is of *Spaine*) and are in flower from Midsomer untill *August* be past sometimes.

The Names.

The later writers (for none of the ancients have remembred any of them as farre as can be understood) call them *Pedicularis* and *Pedicularia*, because that sheepe feeding thereon will breede lice, it is called also *Fistulosa* of the hollownesse of the stalkes and *Crista Galli* or *Gallinacea*, because the flowers as some thinke stand like a Cockes Combe at the toppes of the stalkes: others thinke it to be so called of the leaves especially, of the yellow whose dentings on the edges resemble the Combe or crest of a Cocke: some also call them *Alectorolophos* of *Lin.* whose description commeth nearest unto this, above any other herbe that is knowne: some also name it to be the *Alectoronion herba* of *Pliny lib. 18 cap. 28.* which as he saith is the worst herbe in a field, but surely either the word of *Pliny* should rather be *Nummulus* for *Nummularia*. The first is called by all these names of the sundry authors that have written thereof, and *Lugdunensis* besides calleth it *Crista galli altera sive Pedicularis*: the second is called by *Lugdunensis* and Doe in the title *Pedicularis minor Alpina*, and *Bauhinus Pedicularis Alpina Ricij*, the same as he doth the third *Filicis folio minor*, and is the *Alectorolophos minor* of *Clusius*: the fourth is called *Pedicularis pratensis luteo rubens Crista Galli* by *Bauhinus*; and *Campestris* by *Tragus* or *Crista gallina Gallinacea* by *Lobelius*, *Dodonæus*, *Lobel Clusius*, &c. the fift is called by *Lugdunensis Filipendula Alpina*, and *Pedicularis Alpina lutea* by *Bauhinus*: the first and last are mentioned onely by *Bauhinus* with the same names as are in their rubs. The first is *Crestle decue*, the *Germans Beaves roote* and *geel wodet*, and some *Leusseyaus*, the *Dutch Ratele*, and we in *English* red or yellow Rattle, and Rattle grasse, Cockes combe and Louse wort.

The Vertues.

The red Rattle is accounted profitable to heale up Fistulaes and hollow Vlcers, and to stay the flux of humours to them, and also the abundance of womens courses, or any other flux of blood, to be boiled in wash or red wine and drunke. The yellow Rattle or Cocks Combe is likewise held to bee good for those that are troubled with cough or with dimnesse of sight, if the herbe being boiled with beanes and some honey put thereto be drunke or dropped into the eyes: the whole seede being put into the eyes doth draw forth any skinne, that so darkneth from the sight without trouble or paine. Some hold it to be of a cold and drying propertie.

CHAP. CXL

Balsamina mas. The Male Balsame Apple.

HAve in my former booke given you the knowledge of the female Balsame, it resteth in this to give you the male, which for the excellent healing properties of this as well as the other, deservedly have received the name of a Balsame, and therefore I thinke it not amisse to give you the figure also of the female and male altogether: the male may either be reckoned among the climers for the manner of his growing, or for a kind of Cowcumber as some authors doe, for the forme of the flowers and fruite. It groweth up with divers slender reddish stalkes and branches, shooting forth many claping tendrells like a Vine, whereby it taketh hold of any pale or other thing that standeth neare it (yet had needs of some binding thereto lest the winds blow it downe) having leaves thereon cut in on the edges into sundry divisions, like unto a Vine leafe, the white Bryony, but much smaller, tenderer and more divided: the flowers are yellowish white, like unto those of Cowcumber, stemming forth in the same manner, at the joints with the leaves: after which come the fruite which is somewhat long and round, pointed at both ends, and burneth forth on the outside in many the skin it selfe being smooth and very red, almost blacke when it is ripe, having a reddish pulpe within wherein lye divers rough and hard flat reddish seede, but of a grayish blacke colour, being dryed, somewhat like unto Citrull seedes for the forme and bignesse: the rootes are small and stringy, perishing with the first cold which it feeleth, and the whole herbe withereth presently.

The Place.

Wee have alwayes had the seede hereof from *Italy*, where also they nurse it up in their gardens, the naturall place of the growing being unknowne to them.

The Time.

It flowreth late with us and seldome or never giveth ripe fruit, our cold nights being over early, for it ripen before it feele them.

The Names.

This never found any Greeke appellation that I can heare of, but is called in Latine *Balsamina mas*, to distinguish it from the other that is called *femina*, and tooke the name from the *Balsamine* or healing properties of it,

Balsamina. The male Ballame Apple.

Balsamina femina. The female Ballame Apple.

yet is thought by some to be the plant that *Pliny* in his 23. booke and 5. Chap. saith the Grecians called *Cucurbita Simplex*. some calleth it *Viticella*, from the shew of a small vine it beareth, *Cordus* in his history of Plants calleth it *Cucumis pomiferus*, *Gesner Balsamina pomifera*, *Lobel Balsamina Cucumerina pomifera*, the *Italians* call it *Balsamina*, and *Carantea* (from whence came the name *Carantie*) and *Momordica* (yet differeth as *Matthiolus* noteth it from the greater kind of *Germander*, with Mallow like leaves so called also, whereof is spoken before) and some *Pomi di Hierosolima*, *Pomum Hierosolymitanum*, the *French Merveille* & *Pome de Merveilles*, *Pomum Mirabile*, the *Germane Ballamapffel*, and *Ballamkraut*, the *Dutch Ballame appel*, and we in *English* the Male Ballame Apple, and of some Apples of *Hierusalem*.

The Vertues.

The Ballame Apple is dry in the second degree, and temperately cold, a decoction of the leaves in wine, or the powder being drunke is layd to ease the griping paines of the bowells, and the collicke passion, as also of the mother if it be injected with a Syringe for the purpose the powder of the leaves taken in the distilled water of Horsetaile or Plantane is a singular remedy for the Rupture or burstling in children: the chiefest manner of using it is thus, to make an oyle of the fruit thereof, when it is ripe by infusing the Apples, the seede being first taken forth: and yet some make an oyle out of the inner kernell of the seede, by expression, in the same manner that oyle is drawne from Almonds: in oyle Olive are set in the Sunne for certaine dayes, or digested in *Balneo*, or *Bains Marie*, which is effectuall not onely for inward wounds or hurts whatsoever being drunke, (the powder of the seede doth the effectuall) but for all other outward wounds, be they fresh and greene, to soder the lips of them and to close them, or old and long rotten Vlcers to dry up the superfluous moisture, and deflaxion of humours hindering their healing, and to heale them quickly: the same oyle also is very profitable for all pricks or hurts in the tinewes, sinnewes or gristles, for cramps and convulsions, if the places bee therewith annointed, and to heale the Vlcers of the secret parts of men or women, or womens breasts that are sore or swollen: it helpeth also to ease the paines of the piles, it cureth also scaldings or burnings by fire or water: it taketh away the scarres that remaine of wounds and hurts being healed, it declinable take away the paines of the stingings of Bees and Waspes: it is said to be very profitable for women that are barren by correcting the superfluous humidity of the mother, and to make her apt to conceive, and thereby to make them fit to conceive.

Chap. CXII.

Trifolium odoratum, Sweet Trefoile.

Now the nature of Ballame mentioned in the last Chapter, causeth me to joyne this herbe next thereunto, being so called also of many, and the properties well worthy of that name, whereunto I thinke meete to joyne two or three other Trefoiles thereunto, this being of known properties, the other of lively,

1. *Trifolium*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access_use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. *Trifolium odoratum sive Lutea Ordeata.* Sweet Trefoile or Ballame.

The sweete Trefoile riseth up with one strong round whitish stalke, three or foure foote high, spreading into many branches on all sides, whereabout are set many leaves upon long foote-stalkes, three alwayes ioyned together, of a whitish greene colour, very soft, and somewhat dented about the edges, of the fashion of *Fenugreek*, which smelleth sweet, and is thought to alter seven times a day, and is but a fancy, at the toppes of the branches stand many flowers growing together, each of them like unto those of *Melilot* but larger, and of a bleake, or pale, yellow colour, after which come round white heads containing darke yellowish coloured seede: the roote is small white and threddy, perishing every yeare, and raising it selfe from the seede that falleth, or being sowen in the Spring.

2. *Trifolium Asphaltites sive bituminosum.* Strong smelling Clavers.

This kinde of Trefoile or Clavers hath his first leaves somewhat larger and rounder then those that grow upon the stalkes, three alwayes standing together upon a long foote-stalke, of a darke greene colour almost like to Rue, with some hairinesse thereon: the stalke is strong round and hairy also, rising to the height of two foote or more, whereon grow the leaves more long and pointed then the lower, branching from the bottome and growing to the toppe, where grow many large flowers in a head or tuft, thicke set together, of a blewish purple colour and somewhat hairy or hoary withall especially the huskes containing the flowers, which afterwards turne into hairy brownish broad cods containing every one but one seede, which is somewhat broad, rough and crooked at the one end: the roote perisheth with us every yeare, but abideth in the hotter countries where it is native. The smell of the leaves and whole plant is somewhat strong almost like Rue, or Herbegrace, especially when they are young, but much stronger when they are growne old, even of *Bitumen* whereof it tooke the name: but although it retaineth his scent in his naturall and hot places; yet with us I have observed the strong scent waxeth weaker every yeare then other, and after the second yeare is lyving to be almost without any scent at all: so much can doe (in this as in many other plants) the temperature and moisture of our countrey.

3. *Trifolium Bituminosum Americanum.* Strong smelling Clavers of *America*.

This other bituminous Clavers hath a slender, darke red, cubit high stalke, branching from the bottome to the toppe; set with long leaves which are hairy and clammy, three alwayes together on a long foote-stalke, not smelling so strong being bruised as gently touched, the young shoots smelling like Rue or Herbegrace, the elder like a Goate or Bitumen: the ends of the branches have purplish flowers on them like *Scrophularia*, the great Figwort, with three leaves standing out, and one turned inward, but white within: the greene pods that follow have the like hairy clammines with the leaves, being of a fingers length, and a small purplish edge at the end, wherein lye Kidney like seede: the roote is long and fibrous, whole taste is almost as sharpe as the Anemone, being *accounted* as *Cornutus* saith it is to be yearely sowen (but if it be *Galega Americana flore purpureo* as his owne faith some called it, and whereby *Robinus* of *Paris* sent mee a plant long since, it dyeth not but abideth one

1. *Trifolium odoratum.* Sweete Trefoile.

2. *Trifolium bituminosum.* Strong smelling Clavers.

yeare.

3. Trifolium Americanum, an America smelling Clover of America.

4. Trifolium Americanum, Trefoile of America.

greater did never come so flowring since I had it) in his booke likewise he laboureth sprightly to prove that this doth more nearer to the description of *Dioscorides* his *Trifolium Asphaltes*, then that other last described which is accounted the truest with all writers, his greatest reason being grounded from the colour of the flower, which in this received is not purple like the *Hiacinth* which is *Galens* note.

3. *Trifolium Americanum.* Clavet of *America.*

This strange Clover bringeth forth many round stalkes, leaning to the ground, spreading forth into many branches whereon are set in divers places three leaves upon long footestalkes, each whereof is somewhat round like the former, but larger, of a darke greene colour, more dented about the edges, but of a strong sent, much like thereunto; at the toppes of the stalkes and branches stand long spikie eares of whitish flowers, being somewhat smaller then those of that recited strong smelling Clover, after which come in their places small round and blackish seede: the roote is small and stringy, spreading divers ways.

The Place.

The first groweth not wilde in *Italy*, *France* or *Germany*, but with them all is onely sowen in their Gardens, and so it is with us; and even *Dioscorides* saith it grew in Gardens in his time, as not growing wilde in *Greece* or other places that he had heard of. The second groweth about *Montpelier* and *Marseilles* as *Pena* and *Lobel* say, and also stranger at *Venice* and other places of *Italy*, as well as in *Germany* and within, and onely to be found in the Gardens of those that are curious conservers of rare plants. The two last come from the West *Indies* called *America*, it is thought.

The Time.

The first groweth in *June* and *July*, and doth always perfect his seede, but the others because they flower late, the often misse to give good seede, whereby we are often to seeke for them againe.

The Names.

The Greeke name signifieth to be taken *a voluptate*, for so *Homer* saith it serveth *Deorum voluptati*. The first is of most of the best writers taken to be the Λωτὸς ἥμερος of *Dioscorides* in Latine *Lotus sativa* or *Urbana*, yet *Matthiolus* taketh it to be his *Lotus agrestis*, *Lotus sylvestris*, and to doe *Anguillara* and *Castor Durantes*, but *Fuchsius*, *Cordus*, *Camerarius* and *Dodonæus* call it *Lotus sativa*, *Lotus*, and *Trifolium Lotus urbana*; *Tragus* calleth it *Trifolium Dioscoridis*, for to *Dioscorides* saith his *Lotus sativa* was called. *Lobel* calleth it *Trifolium odoratum*, because he named the *Melilot* in the next Chapter to be *Trifolium odoratum*; *Lobel* calleth it *Lotus hortensis odora*, onely *Tabernamontanus* calleth it *Melilotus vera*, *Bauhine* calleth it *Lotus hortensis odora*, and it is *Melilotus sativa vulgaris* by *Fuchs*, in the description of *Melilotus Italica*. Most now a dayes call it *Trifolium Americanum*, and the Germanes of old time called it *Siben gezeit* (as *Tragus* and others set it downe) that is seaven times, meaning it lost his sent and gained it againe so many times in a day, which is but a fancy as I said before, but being gathered and kept dry in the house it doth keepe his sent a little, but will smell stronger against raine, whereby many desire to lay it in their chambers, to be as it were their Almanacke to shew them faire

Original from UNIVERSITY OF MICHIGAN

faire and fowle weather. It is called of many women now a dayes Ballame for the singular healing quality it hath: The other is called by all Authors *Trifolium Asphaltum*, or *Asphaltites* or *Bituminosum*, *Germania* calleth it *Oxyphyllum*, as *Dioscorides* saith some used to call it in his time and *Fuchsius*. The first is mentioned by *Iacobus Cornutus* in his booke of *Canada* plants. The last hath his name in his title, so much as convenient to know it by: yet *Bauhinus* taketh it to be the *Lonchitis grano lentis folium* of *Armenia* that *Plinie* mentioneth.

The Vertues.

The juice of the sweete Trefoile as *Dioscorides* saith is used with hony to be dropped into the eyes to heale the Vlcers that happen therein, and taketh away all manner of spots, as pin or haw, as also all skumes that grow over them to hinder the sight. *Galen* saith it is of a temperate quality, and that it is of a more drying then fatning, for it is of a meane propertie betweene heate and dryneſſe. The style made of the leaves and flowers hereof in the same manner as I said of the flowers of white Melilot, is so soveraigne a salve (many women calling it a Balme) for to dissolve all hard swellings, bunches or wennes in any part of the body, as also to asswage moderately all inflammations, and helpeth to digest all corrupt and rotten sores full of corruption, hasting them to runne, and healing them perfectly that it is to be admired: as also to heare what praises they say it hath, and how wonderfully they extoll it, for all sorts of greene wounds as well as old Vlcers, to ease the paines of the Gowte. It is said to be good for bruises and bastings of young children, for to asswage inflammations of joynts and sinewes, cramps, stitches, aches, and generally all other the like outward diseases whether they proceede of heate or cold. The distilled water is good to wash childrens heads that are troubled with scurfe or scabbes. They use to lay it in Chests and Presses to keepe Mothes from garments. The hay smelling Clover is of a drier and hotter temperature, the decoction thereof made in wine and drunke, easeth the paines of the sides commonly by distillation, and provoketh Vrine as *Hippocrates* saith, it helpeth women also after their delivery are not well purged or cleared of the afterbirth, it provoketh them courses also, and helpeth to expell the birth. *Dioscorides* saith it is very effectuall against all venemous creatures, as serpents or other, as it is reported saith hee, the decoction of the whole plant taketh away all the paines thereof. If the eyes be washed therewith, but if any that hath a sore shall wash it with that decoction, which hath helped such that have bin bitten or stung, it causeth the same paines in that party, which he had that was stung or bitten, so was cured thereby. *Galen* reporteth this matter a little otherwise, for hee saith that the decoction of roote of Trefoile that is like unto an Hyacinth, taken in the Spring time when it is fresh, and boiled in water cureth such as are bitten and stung by Serpents and other venemous creatures, if the places be washed therewith, but they that are found and not bitten shall bee washed with any of that decoction, (and doth not say as *Dioscorides* those that have a sore or that are washed with the same part of the decoction that the other that was bitten was washed with) they shall feele the same paines that he that was bitten felt, and further saith, the effect hereof is worthy of admiration that the same herbe should cure them that are bitten or stung, and cause a sound body or place to be alike evill affected, as if it were stung or bitten. *Pliny* also in his 22. booke and 25. Chapter saith that it is ill to beleeve, that it is venemous to a sound party to be washed therewith, because *Dioscorides* the Poet saith so, and that *Simon* an excellent Phisition affirmeth that the juice or decoction thereof applyed to one not stung or stung, procureth the same paines that he that is bitten or stung doth feele, and therefore perswadeth it not to be used but to those are bitten or stung by Serpents, &c. the flowers, leaves or seede either all together or each severally by it selfe being boiled in vineger, and a little hony added thereto being drunke is a speciall remedy for them that are stung or bitten by any venemous creature: the seede is of much force with *Galen* who appointeth it to be put into Trochiks that he caused to be made for divers persons: the seede also boiled in honied water and drunke is singular good for the Plurisie, provoketh Vrine and allayeth the heate thereof, and is good for the Strangury: it helpeth those that have the falling sickneſſe, and is singular good for women that have the rising and strangling of the mother, whereby they often seeme to be dead: the same decoction is also good for those that have the Dropsie, and taken before the fit of either *tertian* or *quartane* Ague, it is much for both of hot and cold, and by often using it doth quite take them away: three drammes of the seede, or foure of the leaves powthered and given in drinke provoketh womens monethly courses effectually. The second Clover of *Anguillara* by reason both of the forme of the leaves, and smell so neare thereunto may seeme to be of the same propertie, as I have not knowne any that have made triall of the effects.

Chap. CXIII.

Melilotus. Melilot, or Kings Clover.

THe *Lotus Vrbana* mentioned in the last Chapter causeth mee to joyne the Melilots next thereto both for the forme name and nature, being no lesse effectuall in healing then the other, and more common and knowne sorts to adde some more unknowne to close up this *Classis*.

1. *Melilotus vulgaris*, Common Melilot.

This Melilot which is most knowne and growing wilde in many places of this kingdome, hath many greene stalkes two or three foote high, rising from a tough long white roote which dyeth not every yeare, set round about the joynts with small and somewhat long, strong, well smelling leaves, three always together unevenly dented about the edges: the flowers are yellow and well smelling also, made like unto pease stalkes but small standing in long spikes one above another, for an hand breadth long or better, which afterward turne into long crooked cods wherein is contained flat seede somewhat browne.

2. *Melilotus flore albo.* White flowred Melilot.

This Melilot is very like the former, but hath more woodily stalkes rising up higher, greener, and more branched, greene leaves, smelling neare unto the former, but weaker: the flowers likewise grow in longer spikes one above another, of a white colour and smaller also, which turne into small round heads and not crooked cods as the

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

[illegible] white, and slender, perishing wholly after it hath given seede: the leaves are like unto the former, but lesser, growing the next yeare after the first sowing usually in May the seeding.

3. *Melilotus hortensis.* Garden Melilot.

This doth not yeeld one more then one stalke of long trailing roote, which quickly groweth whitish, and is easily rotted: set here and there with three leaves at a joint, which are much larger then the former, and of a deeper green colour, almost like unto Fenugreek, but lesser then the other two, somewhat inclining to a yellow colour, of a long almost round forme, yet somewhat more pleasant: at the toppes of the stalkes stand many flowers like fashion, but of a deepe yellow colour, and somewhat larger, all of them set in a round head with the heads turned one way like a tayle, wherein finally is but one seede contained: the roote is small long and woody, perishing yearely, and is done either of the shed seede, but must be new sowen every spring.

4. *Melilotus Syriaca.* Assyrian Melilot.

The Assyrian Melilot riseth up with divers stalkes about two foote high, set with joynts at every one of them: the leaves somewhat larger then the fifth, but not so large as the first, and a little cutted about the edges: the flowers grow forth row and tuft toppes, wherein stand many pale yellow flowers set in order one above another as the former, which turne into small long and somewhat flat cods, a little crooked at the ende like an Hawkes bill, wherein the seede is contained: the roote is woody and perisheth every yeare after it hath given seede: the whole plant as well flowers, leaves and seede did smell very sweete at their first bringing into Europe, but by degrees grew every yeare weaker, so that as it seemeth it hath not now neere the sweet smell as formerly it had: this kinde as *Prosper Alpinus* saith is used in *Italy* instead of the true Melilot, whereof they have small store growing with them.

5. *Melilotus Aegyptiaca.* Egyptian Melilot.

The small low Melilot riseth up with many slender weake stalkes, rather lying or leaning downe to the ground, then standing upright; whereon grow at the severall joynts three or foure, two small greene leaves, and from the stem likewise a small long stalke, bearing three small greene leaves at the end: the stalkes branch forth divers, having many small flowers standing at the toppes of them in like fashion like the rest, and of a deepe yellow colour, after which come small cods a little crooked at the ends, wherein is contained small round brown rough seede, smelling some what like unto Melilot, and of a sharpe and some what biting taste: the roote is small with some fibres or threads.

6. *Melilotus Hispanica folijs maculatis.* Spanish Melilot.

This kinde of Melilot hath divers small branches little more then a foote high, at the joynts whereof stand two small greene leaves, and likewise in the bosome thereof a small long foote stalke, bearing three small dark green leaves at the end somewhat round pointed, and having many white lines like veines running over every one of them: the flowers are small, of a pale yellow colour, standing at the toppes of the branches, like the other but smaller: the roote is small and stringy: this hath a small sweete scent some what like unto a Melilot, which hath caused it to be referred to that tribe or family.

4. *Melilotus Syriaca.*
The Assyrian white flowred Melilot.

5. *Melilotus Aegyptiaca.*
Egyptian Melilot.

7. *Melilotus*

Melilotus Indica Dioscoridis.

East *Indian* Melilot.

The East *Indian* Melilot is a small low plant, scarce rising above halfe a foote high, with small slender brownish stalkes beset in severall places with very small greene leaves, three always growing together like the rest, little or nothing dented about the edges: the toppes of the stalkes being not branched at all, are furnished with many very small flowers, of a deepe yellow colour; after which come small round heads, somewhat like unto the *Italian* Melilot, before spoken of, wherein is contained small brownish blacke seede, which hath a strong smell of Melilot, which the other sorts of Melilot have not, the herbe and flowers hereof having but a very small or no scent thereof: the roote is small and perisheth every yeare, and must be newe sowen in the Spring every yeare that you will have it.

The Place.

The first as I said is found in many places of this Land plentifully, as in the edge of *Suffolke*, and in *Essex* in divers places, as also at *Huntington* Shire and in other places more sparingly, but usually either in corne fields, or in corners of Medowes, and in worse places sometimes. The second groweth not in any place of this Land naturally but is very frequent in *Germany*, and is onely nursed up in Gardens with us: The third came to us from *Italy*, and by that *Italian* name wee hold it still: The fourth is said by *Rauw* and *Lobel* to come first from *Aleppo* in *Syria* to *Venice*; where being sowen it was found to be of an excellent smell, as I said before, but degenerated successively by degrees: The fift *Prosper Alpinus* saith is peculiar onely to *Egypt*, where they use no other sort of Melilot, as not having any others growing with them: The sixt *Bauhinus* saith was found on the Mountaines of *Cassiae* in great plenty. The last hath come first to us from *Italy*, among other strange seedes by that name, and therefore we must imagine untill it can bee disproved, as they say from the Palatine parts of *Asia major*, which usually wee call the East *Indies*.

The Time.

They doe all flowes in the Summer Moneths of *June* and *July*, and their seede is ripe quickly after.

The Names.

It is called in Greeke μέλιλωτος quasi *Mellita herba*, of *Lotus* that smelleth sweete like Honey. In Latine anciently it was called *Serpula Campana*, because the flowers growing in the fields at *Campana* were used to bee put into Garlands and *Corona regia*, because the yellow flowers doe crowne the toppes of the stalkes. Some have called it *Trifolium odoratum*, but we have another garden Trifolie more properly called by that name as you heard in the former Chapter. Some also call it *Trifolium equinum*, or *Caballinum*, because it is good pasture for horses, wherein they delight and thrive well with it: In English wee call it generally Sweet Clover as the chiefest of all other three leafed grasses, generally called Clovers or Clover grasses, and Melilot after the Latine name to be the more easily understood, yet in some places they call it Hares Clover, because as it grew was Staggers and Deere resort, they will greedily feede thereon. And in some places of *Essex* they call it Hartes, because as they thinke the feede thereof happening into their bread caused paines in the stomacke and belly which they usually call the Heart burne or paines of the heart. The first is called by most Authors *Melilotus* of the Greeke name: the old Latine name of *Serpa* or *Serpula Campana*, being quite lost. *Tragus* called it *Melilotus major vulgaris*, *Camerarius*, *Dodonæus* and *Lobel* call it *Melilotus Germanica*, and *Tabernæmontanus Trifolium odoratum*, *Matthiolus*, *Gesner* and *Lugdunensis* call it *Lotus urbana* and *sativa*, *Fuchsius* and *Lonicerus Sativum* and *altera*. The second is scarce mentioned but under the other, and is called by *Tragus Melilotus major* and of *Dalechampius Lotus Hispanica flore albo*. The third *Camerarius* calleth *Italica*, and *Bauhinus Melilotus Italica folliculis subrotundis*. The fourth is called by *Tragus tertia species Melilotus vulgaris*, who saith it is likely to be *Serapion*: but Melilot's *Fuchsius*, *Gesner*, *Dodonæus* and *Matthiolus*, make it to be *Melilotus Italica*: we have another more true *species*, called *Melilotus Italica* here set downe the next before this: and as you heard before called it *Melilotus Syriaca alba*, and that because it came from *Aleppo* as hee saith it is usually used in *Italy* for the true Melilot, and therefore called *Melilotus Italica*. *Bauhinus* called it *Lotus major*. The fift *Prosper Alpinus* saith is called in *Egypt Alchandech*, and is the onely Melilot they use. *Lobel* calleth it *Cyrenaica reflexa minor*. The sixt *Bauhinus* onely giveth the name, being brought to him out of *Italy*. The last hath his name in his title as it hath beene sent to us; which as I said doubtfull is untrue. There hath some controversie among our later writers, what herbe should be the true *Melilotus* or *Trifolium*: some take a kind of *Cassia* to be it, others a *Medica* or *Lupine* and others a kind of wilde *Lotus* without any, and such also doubting of his Melilot, holding it rather to be *Diosperides* his *Lotus urbana*: for as *Prosper Alpinus* saith, all Apothecaries in *Germany* were wont to use no other Melilot then the *Trifolium odoratum*, but time hath worne out all these opinions, and setled a more constant of this, and is now generally accepted [illegible]

[illegible] almost every country have a feverall Trefoile with yellow flowers to be their *Melilot*. The *Italians* call it *Stambuchich*, and the *Italians*, *Spaniards*, and *French Melilot*, the *Germans Erdtspeck*, the *Low Dutch Steenclaver*, and *Rhenish Melilot*; and in *English* as I have told before.

The Vertues.

Melilot hath all aftringent or binding qualitie. It mollifieth all hard tumours and inflammations, [illegible] the eyes or other parts of the body, as the stone or fundament, and the priuie parts of man or woman, being boyled in wine and laide to the place, and sometimes the yoalke of a roasted egge, or the powder of Fenegreeke, Linseede, or fine flower, or Poppie seede, or Endive is added unto it. It healeth those impostumes or swellings being applied with *vitellum ouj* and wine, and the spreading vlcers also in the head being washed and made thereof. It easeth the paines of the stomache, applied either fresh, or boyled with any other meate or seasoned things. It helpeth also the paines of the eares being dropped into them, and steeped in warme water it mitigateth the headach: Thus saith *Dioscorides*. *Galen* saith in his sixth Booke of simple Medicines, that Melilot is of a mixt qualitie, for it hath a little aftringent facultie in it, and yet it doth digeste [illegible] the meaning whose qualitie is more abundant therein then the cold. The *Arabian* Physitians doe appoint the herbe only to be used in medicines, and make no mention of flowers. The *Greeke* contrariwise doe will the seede only to be vsed, and never make vse of leede or rodds; and therefore as *Matthiolus* saith, it is no marvell that the compound plaister of Melilot, which the Apothecaries make, not having any of the seede of the true Melilot therein, doth not worke that effect that the Physitians doe expect, for this compound plaister is appointed to be used, to dissolve hardnesse, windinesse, tumours and swellings, both of the necke, and belly, as also mightily to ease the paine of them all, and to heale the *Hypochondria*, or sore [illegible] of the belly, under the shorter ribbes, when it is stretched or crackt by the swelling thereof; but there is another kinde called Melilot, which is much vsed to draw and heale all sores and wounds that neede cleansing, and is made of the juice of the greene young Melilot, boyled with Rosen, Wax, Sheepe tallow and some Turpentine, which if it be well made, will be almost as greene as the herbe it selfe, and smell very strong thereof, although it be two or three yeares old. The flowers of Melilot and Camomill are much vsed to be put together into pillows that are vsed to expell wynde, & to ease paines, as also into poltoles that are made for the same purpose, and to asswage swellings or tumors that happen either in the spleene or other parts, by the mollifying or dissolving qualitie that are in it. It helpeth also inflammations whether in the eyes or face, or other part of the body. The juice dropped into the eyes is a singular good medicine to take away any filme or skinne from them, that groweth and should so dimme the eyesight. It is effectuall to be applied to those that have sodainely lost their voices by any poticstone, as also to strengthen the memorie, to comfort the head and braines, and to preserve them from swimmes, and the feare of the Apoplexie, if the head be often washed, with the distilled water of the herbe and flowers, or a lye made therewith. The water also distilled serveth as a perfume, to wash course gloves or other things. The flowers and herbe of the white flowred Melilot, steeped in oyle Olive, and set into the Sunne amongst hot stone, and after being boyled in a Balneo of hot water, and strained forth, and other fresh flowers and herbes being put thereto, and Sunned, as before and strained, and so vsed at the second or third time, is accounted a most soveraine Balme, both for greene wounds and old sores, for swellings, inflammations, [illegible] paines, or aches whatsoever in any part of the body, whether it be in any fleshy or musculous part, or among the sinewes and veines. The *Italian* Melilot, is as effectuall as any of the other, and by some accounted to be of more efficacie and vertue. The *Egyptian* Melilot, as *Alpinus* saith, the seede thereof onely is vsed to clean, being boyled, and the places grieved, fomented and bathed with the warme decoction against paines of the sides, the Vicerike and *Peripneumonia*, as also the paines of the collicke and winde in the belly, the wringing or straining of the mother, or any griefes thereof to sit in the decoction thereof; and if Fenegreeke and Linseede, and Camomill flowers be added thereto, it helpeth all tumors or hard swellings thereof: and doth cause to provoke the monethly courses, and to open the obstructions of the veines, and afterwards to [illegible] the parts. The *Indian* Melilot, if wee would vse the seede, which as I said before doe helpe with stronger operation of the plant, hath no doubt the same qualitie that the former have, the smell and taste perswading plainly the same.

Many other herbes there are that might be referred to this Classis, some whereof are set forth in my former Booke, and some you shall finde specified as well in the precedent as subsequent Chapters of this Worke, which you may observe in the Vertues as you reade them.

PLANTÆ REFRIGERANTES ET INTVBACEÆ.

COOLING AND SVCCORY LIKE HERBES.

CLASSIS SEXTA, *THE SIXT TRIBE.*

CHAP. I.

Portulaca, Purſlane.

NTO the cooling Herbes let me, I pray adjoyne the *Iumbaia* or *Chinea* whereunto they may more fitly in my minde be added, then to any other, notwithſtanding the ſharpe taſte in ſome that argues ſome heate.

I have ſet forth the Garden Purſlane in my former Worke, there remaines now that to be ſpoken of here, and firſt of the wilde Purſlane.

1. *Portulaca ſylveſtris.* Wilde Purſlane.

The Wilde Purſlane ſpreadeth upon the ground ſeuen or eight ſlender ſtalkes ſet with thicke fat ſhining greene leaues like in all things vnto the garden kinde but ſmaller at the ioynes, with the leaues orderly about the end of the branches, ſome lower ſmall ſtarre-like yellowiſh greene flowers ſearle to be diſcerned, and ſpringing riſing way as the Garden kinde, and hath ſuch like hard huſkes wherein the ſeede is contained: the roote is threedes, and periſh with the firſt cold nights that come: the is ſomewhat more aſtringent in taſte (as for the moſt part all wilde herbes are) then the Garden kinde.

2. *Portulaca ex qua Camerar.* *Camerarius* his ſmall Purſlane.

This ſmall Purſlane alſo is like the other, but much ſmaller then it, having alwayes two leaues ſet together, a paler yellowiſh greene colour on the thicke round ſtalkes and branches which ſtand a little more upright or bend downe to the ground againe: the flowers are like the former, and ſo is the blacke ſeede, but the huſkes open themſelues before the ſeede is ripe, and ſtand vpon ſmaller and longer footeſtalkes, this hath little or no taſte but wateriſh or bitterly.

3. *Portulaca Cretica.* Candy Purſlane.

The *Candy* Purſlane (which in my iudgement might rather be referred to the kindred of the ſmall Houſeleeke as *Camerarius*, *Colonna* and *Bauhinus* doe, but that I would keepe the name whereby it was ſent, for he ſo ſent it) is a very ſmall low herbe, not paſt two or three inches high, having many ſmall heads of leaues finely round together, much like the head of a ſmall Houſeleeke, but each leafe ſet further in ſunder and more long which are very ſmall at the bottome, and ſodainely grow broad and round at the point, yet ſo ſmall as leafe is bigger than the naile of ones little finger, and of a pale greene colour, which ſo abide for the moſt the firſt Winter after the ſpringing up, if the extremitie thereof doe not vtterly periſh in the Summer ſeaſon ing it ſhooteth forth into branches with ſomewhat longer leaues on them, and at the vpper parts ſtand diuers ſmall white flowers, and after them appeare long pods a little crooked or pendant rogether in forme of a ſtarre, wherein is very ſmall blackiſh ſeede contained: the roote is ſmall and periſheth after ſeede time.

The Place.

The firſt groweth in Vineyards, Orchards, Gardens, and other rockie and ſtony places where it is eaſie to abide from it owne ſowing, that it will hardly be rid out againe: the ſecond *Camerarius* and *Dodonæus*, that he firſt before any other found it about *Leipſicke*: the laſt was ſent me from Canon of *Tenney* in *Flanders*, who it is likely either received it himſelfe or ſome other friend from *Candy*.

The Time.

The two firſt doe abide all the Summer, from the Spring that they riſe, which yet is late, vntill the doe nippe them, and cauſe them to periſh: the third, as I ſaid before, abideth the firſt Winter of it be leue, and ſeedeth the next Summer after the ſpringing.

1. Portulaca sativa & hortensis. Garden and wilde Purslane.

2. Portulaca Creetica. Candian or Cretick Purslane.

The Names.

It is called by *Dioscorides* in Greeke ἀγριοπορτουλάκη ἄμπελος, and by *Theophrastus* ἀδιάντου ἄμπελος, and so each of them also call the *Adiantum* or Strawberry tree, which some call *Portulaca arbor* in Latine, as they also call this herbe *Portulaca herba*, of the *Arabians*: *Rakle sucha*, and *Bachele alhamra*, the *Italians Porcellana* and *Porchacchia*, the *Spaniards Cerrafolio* and *Baldenegra*, the *French Pourpier Porchailles* and *Porcellaine*, the *Germans Burgel*, *Burtzel* & *Purslein*, and *Grentzel*, the *Dutch Porceleyne*, and we in *English Purslane*: The first is generally called *Portulaca sativa*, as *Cesalpine* and *Camerarius* call it *Portulaca minor*: *Columnius* and *Bauhinus Portulaca major*, and *Lobel* upon *Dioscorides* (such that *Capeo* is no other than the wilde Purslane) the second is called of *Camerarius Portulaca arvensis*, and by *Bauhinus Portulaca agrestis*: the last was tendred by the name of *Portulaca Cretica*, which as I find I am not willing to alter, although I know that *Camerarius* hath set it forth by the name of *Acosma peregrina*, and *Tabernæmontanus* by the name of *Semperviuum arvense Dioscoridis*, refuting that of others accounted, and *Lobelius* doth thereupon call it *Corylebon sedens*.

The Vertues.

Garden Purslane is cold in the third degree, and moist in the second as *Galen* saith, & is therefore good to coole any heate in the liver, head, stones and stomack, and in hot agues boyling it over it staieth also hot and cholericke fluxes of the belly, as also of womens courses, the whites & *gonorrhœa*, the exhalations from the head & the paines thereof, the paines of heate, watchings of sleepe, or the frenzie: the seede is more effectuall then the herbe, and is of singular use to stay the laske and sharpenesse of wine, and the outrageous lust of the body, venereous motions in the like, in so much that the over frequent use thereof extinguisheth the heate and vertue of procreation: the seede being taunted and boiled in wine, and given to children that have the wormes expelleth them: some doe more commend the seede of wilde Purslane for the wormes then the other: the juice of the herbe and seede doth for all the purposes afore said, as also to stay vomitings and taken with fine Sugar & Rose water, cooleth and draweth drouth, thirstinesse of breath and the hicke, and to stay an immoderate emit of seede: the distilled water of the herbe is used by many as the more pleasing to the patient, to the same effects. The juyce also is singular good in the inflammations of the matrix, fundament or woman, as also of the bowells and *hæmorrhoides* when there are ulcers in them. The herbe is sufficiently knowne to be used in sallets in the heate of the yeare, to coole the heate of the liver and faintning stomackes, and is good for them to use that have the falling sickenesse: the juyce mixed and applied to the forehead and temples, allayeth extreme heate therein causing want of sleepe, and applied to the eyes taketh away the redneſſe and inflammations in them, and those ulcers called pufics, whelkes, pimples, Saint *Anthonies* fire, and the like, breake forth, especially if a little Vinegar and honey be added to the same with as much of Galles & Linseede together taketh away the paines, heate and swellings in the same: the juyce also is used with oyle of Roses for the said causes, or for blastings or scorchings of powder, and for burnings by Gunpowder, or other wise, as also for womens sore breasts, upon

the like hot cauſes, and to allay the heate in all other ſores or burnes: it is ſaid alſo to ſtay the ſpreading of a malignant ſerpent: bitings, and to draw forth the poyſon applyed alſo to the Navell of children that ſtucke forth ſo hanges them, it is alſo good for ſore mouthes and for ſore gums when they are ſwollen, to faſten looſened teeth, and take away their paine when they are ſet on edge by eating ſower things: *Camerarius* ſaith that the children uſed by ſome rooke away the paine of their teeth when all other remedies failed, and that the inclined are made in pilles with the powder of gum *Tragacanth* and *Arabick*, and taken prevailed much to helpe thoſe that made a bloody water: applyed to the Goute it eaſeth the paines thereof, and helpeth the hardneſſe of ſinewes if it bee not cauſed by the contrary or in a cold cauſe. The wilde Purſlane is uſed as familiarly in ſallets in meates in many parts beyond the Seas where it groweth plentifully, as the Garden kinde, and they finde no leſſe effectuall a remedy for moſt of the diſeaſes aforeſaid, onely it cooleth not ſo ſtrongly, but is more aſtringent and drying for fluxes and the like.

CHAP. II.

Portulaca marina. Sea Purſlane.

THe Sea Purſlane might be entreated of with the other Sea plants in the proper place, but that I take it not meete to ſever it from the other going before, and hereunto for the neare likeneſſe and reſemblance to joyne two other ſorts of *Halimus*, which may be called Sea Purſlanes as well for growing in a hoter climate.

1. *Portulaca marina noſtras.* Sea Purſlane of our country.

The Sea Purſlane hath divers hoary and grayiſh purple ſtalkes ſomewhat wooddy, riſing from the roote about a foote or more long, lying for the moſt part upon the ground, bearing thereon many ſmall thicke fat and long leaves of a whitiſh greene colour ſet without order, at ſome joynts more and at ſome leſſe, branching forth here and there, and bearing at the toppes many long ſprigges or ſpiked ſtalkes, ſet round about with greenish purple flowers, which turne into whitiſh flat thinne ſeedes like unto thoſe of the Sea *Orache*, the roote is ſomewhat woodddy, with divers long ſtrings joyned thereto and abideth with the leaves on the branches all the Winter.

2. *Halimus latifolius ſive Portulaca marina arcana major.* The greater outlandiſh or hoary Sea Purſlane.

This hoary Sea Purſlane ſendeth forth divers thicke and woodddy hoary & brittle ſtalkes, foure or five foote high whereon are ſet many thicke leaves, without any order ſomewhat ſhort & broad, ſo hoary white that they ſhine gliſter: the flowers grow at the tops of the ſtalkes on divers long ſprigges, being moſſie like the Olive tree, and but of a purpliſh colour: after which come broad and flat whitiſh ſeede like unto thoſe of *Arache*: the roote is long laſting and woodddy enduring many yeares in the naturall places, but muſt bee ſomewhat defended in the

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

…wards as if you will have it preserved, yet bringeth not forth the leaves to hoary white with us.

…*Portulaca marina sive Portulaca marina incana minor.* The lesser outlandish or hoary Sea Purslane.

…The other hoary Sea Purslane hath very tender, weake, and somewhat hoary stalkes about two foote long, not able to stand upright, but for the most part fall downe and lye upon the ground; the leaves that grow on…ard long set in the same manner, that is without order, are narrower, longer and not so hoary white, the…lowest like the former, but of a more greenish colour growing at the toppes of the stalkes, and afterwards …with like seede as the former, but somewhat lesse: roote is woodily and endureth like the other.

…*Halimus minor Germanica.* The lesser Sea Purslane of *Germany*.

…This hath small hoary stalke an handfull high, rising from a small thredily roote leaning divers wayes, branch…ing forth many above the roote, set with small and somewhat round leaves, and those up higher with a yaln…ish colour, of an ash colour, the flowers are small greenish and mossie, yet yellow within, set on long stalkes; …after which are square huskes with small grey seede like unto kidneys in them.

The Place.

…The first groweth in the salt marshes of the Sea coasts of our owne land, in *Kent* and many other places: the second …may be found about *Lisbone* in *Portugall*, and the third as well in the kingdome of *Valentia* in *Spaine*, …as first from *Monspelius* and *Massilia* in *France*, and in the upland places about *Tholouse* as *Lugdunensis* …hath. The *Italian* be this as you shall heare by and by, the last about *Norimberg* in *Germany*.

The Time.

…They flower in July and their seede is ripe in August.

The Names.

Dioscorides and *Theophrastus* call it in Greeke Ἅλιμος *Halimus* with an aspiration, because it is a sea plant, …and is somewhat saltish, whom *Pliny* followeth and yet saith, a certaine herbe used to be eaten is so called …as though it were differing from *Halimus* which as *Dioscorides* and *Galen* say is used to bee eaten. *Solinus* …and others call it *Almus* without an aspiration, and say the name was taken from the effect it worketh …which is to expell hunger, for saith *Solinus*, the people in *Cares* say that that day they eate thereof they shall …not be hungry, if you will beleeve them. Divers herbes have beene taken for *Halimus* by divers writers, as …*Atriplex marina* by divers, the *Lignum vitæ* or *Privet* by *Lonicer*, and *Perdicium* (which *Wondelius* in *Tragus*, *Lugdunensis* setteth forth a plant by the name of *Halimus vera Dalechampij*, the true *Ha…limus* of *Dioscorides*, and saith it better agreeth thereto then those of *Clusius*, or any others, to whose *Clusius* name giveth credit, in that hee saith hee sheweth the true thereof to bee like unto *Ribes*, whom *Pena* followeth, and saith that he knew not what plant it should be, but reading the place to *Lugdunensis*, I take *Clusius* to be much mistaken, for in the description thereof he setteth downe these words *Semen producit lon…gum, crassum, rotundum, nigrum copiosum*, which broad white seede can no wayes agree with *Ribes*. And for *Lugdu…nensis* to make it a different plant from *Clusius* his second *Halimus* whereunto himselfe saith it is like, I leave him great reason, more then that it grew in the upland countries, and that his Figure shewth the leaves to grow one by another, together as a joynt. I have you see set the *Portulaca marina* with the *Halimus*, for in my judgement it differeth not so much from it, neither in forme of leaves or seede, which be (with me) is chiefe note of agreement or difference, nor yet in place, but that it may very well be accounted the *Halimus* of our country, and other these Northerne parts, the climates chiefly making the distinction if any be, and hereunto I am the more indu…ced because *Matthiolus* his first *Portulaca*, and *Clusius* his last be by them called *Halimus* which *Dodonæus* and *Bau…hine* call *Portulaca marina*. *Lobel* and *Pena* affirme that the discription of *Portulaca marina* doth better agree with the *Conringia* of *Dioscorides* then the *Fœniculum marinum* doth; first for that the leaves of *Conringia* are said to be white which in Sampire are greene, next they are compared to Garden Purslane leaves but thicker, longer and broader, which cannot agree to *Sampire* being small long and somewhat round, and againe *Cordus* in *Brasauolus* is said to be of a cubits height, but Sampire is little above an handbreadth or two high: these things considered did put some doubt in them and some others since whether our Sampire which is generally supposed to be the right *Conringia* of *Dioscorides* be so or no: but hereof I shall entreate more hereafter when I shall speake of *Sampire* in the Cliffes of Sea Plants; *Ruellius Lib.* 1. *Cap.* 85. taketh that plant to be *Halimus* with which the French in divers places make their hedges, and call it *Blanche espine*, but he is therein much deceived, this being *Rhamnus*; for I thinke he doth not make the *Peirne* to be it which yet they so call also: *Matthiolus* saith that the *Arabians* call *Halimus Malochia*, and that *Serapio* speaking thereof, saith that in *Babylon* it is carried in funerals and cryed in the streets, but I thinke *Matthiolus* is herein deceived, for it is the true *Malochia* and …saith here, that *Serapio* saith they cryed in the streets: the last is called *Halimus minor* in his *Pinax* and *Icones*: …the Italians as *Matthiolus* and *Lugdunensis* say call it *Bidone*, and *Clusius* saith the *Spaniards* call it *Mo…risol* and the *Portugals Salgadeiras*, and the *French* especially about *Tholouse Herbe de Masle*, *Aspi. Herba …Cinq*, & *Exilicre* herbe for the properties sake: we call it Sea Purslane, as the *Dutch* doe likewise.

The Vertues.

…The vertues of *Portulaca marina* (for as their formes so their properties are like) is used to be eaten as other …herbes are in all the places of their growing, for tasting somewhat saltish of the naturall soyle, being …nourished in other grounds, it much pleaseth the pallate, having a little *abstergent* reliish withall, whereby …it is found to be such to bee of different qualities, as well temperately hot sufficient to dissolve winde in the …over cold and grosse, and the paines of the Collicke speedily, by drinking of the decoction of the leaves in …wine, and so reduce the into urine and being boyled and eaten without oyle or butter, loosenesse the body, and yet …with a moderate astriction doth strengthen the loose or fluxible parts: the same also helpeth those that are trou…bled with Crampes or are lame inwardly: it causeth also plenty of milke, not only to Nurses for their chil…dren, but in Cattle also that feede thereon, or to whom it is given: it encreaseth also naturall seede; but that …which *Dioscorides* prescribeth to the roote is found sufficient effectuall in the leaves, the roote in these dayes …being seldome taken. Divers.

Chap. III.

Telephium sive Crassula. Orpine.

There be divers herbes exhibited by divers authors for the true *Telephium* of Dioscorides, some small, some tall some low, some of one fashion, and some of another, and yet none directly answer in all things the description thereof; but because all or most of them have given the name of *Telephium* to these herbes here expressed; let mee also if they have erred erre with them, and yet I shall shew you which of them commeth nearest unto the truth or true *Telephium*.

1. *Telephium sive Crassula major Hispanica.* The great *Spanish* Orpine.

The great *Spanish* Orpine hath divers weake round sappie stalkes rising two foote high, whereon are placed flowers two large and thicke broad leaves, very like unto the common Orpine, but much larger and lesser of colour oftentimes, and somewhat unevenly dented about the edges: at the toppes of the stalkes stand thick flowers, larger and more spread then in the ordinary sort, which consist of five small whitish leaves a peece, after which come small chaffie huskes with seede like dust in them: the roote are thick, white, and tuberous, longer and longer then those of the ordinary Orpine which abide all the Winter with the greene leaves on the stalkes that have not as yet flowred.

2. *Telephium sive Crassula major vulgaris.* Common Orpine.

Common Orpine riseth up with divers round brittle stalkes, thicke set with fat and fleshy leaves without any order, and little or nothing dented about the edges, lesser then the former, and of a paler greene colour: the flowers grow in lesser tufts, and are white or whitish in all that ever I saw, which afterwards bear such like seedes as the former: the roote are divers, thicke, round, white, glandulous or tuberous daggerlike as the former but lesser. This proveth smaller in divers fields and woods sides where it is found wilde.

Ditto sylvestre.

3. *Telephium floribus purpureis.* Purple flowred Orpine.

This Orpine differeth little from the last in manner of growing, but that the stalkes are more brittle and weake, and the leaves which stand without order are more finely dented about the edges, and the tufts of flowers at the toppes of the stalkes are of a reddish purple colour consisting of five small leaves a peece like the former, the roote is also tuberous like the last for the most part.

Ditto flore purpureo.

This also is found smaller in all the parts thereof not otherwise differing then in that the stalkes with all the leaves utterly perish every yeare to the roote, which every yeare sendeth forth new branches.

4. *Telephium minus repens sive Corpus Pauci.* Small creeping Orpine.

This small creeping Orpine sendeth forth divers weake round stalkes lying on the ground, and easily taking roote againe as they lye, thicke set with thicke fat leaves very like unto Purslane, but smaller and smaller upward, of a darke or ruthie greene colour, from among which the bare or naked weake stalkes, without any, or with

2. *Telephium sive Crassula major Hispanica.* The great Spanish Orpine.

3. *Telephium sive Crassula major vulgaris.* Common Orpine.

for fourteene dayes, at the toppes thereof ſtand ſmall tufts of purpliſh flowers like the other, the leaves hereof are narrower but ſtringie, yet doe endure with the greene leaves on them the greateſt extremitie of Winter although it loſe ſome of the lower leaves of the branches.

5. *Telephium legitimum Imperati.* *Imperates* of *Naples* his true Orpine.

This ſmall *Telephium* of *Imperatus* ſpreadeth upon the ground, with many ſmall and long trayling branches ſome foote or more long, whereof thoſe that will not flower that yeare have ſmaller and lowlier leaves on them, and thicker ſet together, but thoſe that will beare flower are ſet ſparſedly without order to the eye, and are leſſer in forme, and leſſe thicke and fappie then any of the other before, and of a lad ſkewith greene colour: at the toppes of the ſtalkes ſtand thicke clutters of white flowers of nine leaves a peece, and after ſmall cornered heads containing ſmall browniſh ſeede, the roote is ſmall and long of a fingers length or two with divers branches and ſmall fibres abiding with ſome branches of greene leaves thereon although thoſe that have mowed and ſeeded doe periſh.

6. *Orpus Matthioli.* *Matthiolus* his ſmall Orpine.

This ſmall Orpine of *Matthiolus* hath a ſmall weake ſtalke ſcarce a foote long lying almoſt upon the ground full of ſmall and tender branches, and they againe into other ſmaller ones, ſet with ſmall thicke long leaves without

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

one any order, and somewhat like unto Purslane: at the toppes of the branches stand many small white flowers in tufts, but more thinly or sparsedly set then in the former, consisting of five leaves a peece, after which come small heads like unto the Orpines containing small dustie seede, the roote is long and fibrous fibelling somewhat sweete like the Rote wort called in *Cornwall* faith, and perishing every yeare, so that if it rise not of the shed seede (which naturally it doth if it be suffered to fall) it must bee new sowne every yeare.

The Place.

The first *Telephium* hath bee found as well in *Spaine* as in *Hungarie* upon the Alpes; the second of both sorts, the greater and the lesse is frequent almost in every country of this land, the greater being generally cherished in Gardens, but yet is not a rake in the same with the lesser sort, that growes wilde (sayd to be) in the shadowie sides of fields and woods: the third is often founded divers places of *Germanie*, as *Tragus*, *Camerarius*, *Clusius* and others set downe: the fourth was first sent out of *Italy* by *Alphonsus Pancius* a worthy Herbarist and Phisition of *Ferrara*: the first came from *Imperatus* of *Naples*, from *Cornutus* and *Iosephus de Casabona*, of certain *Carthusian* Fathers he received the seede: the last is chiefly nourished up in the Gardens of those that are lovers of rare plants, and was first communicated from *Padua*.

The Time.

They doe all flower about *July*, and their seede is ripe in *August*.

The Names.

These herbes are referred to the Genus *Telephium* of *Dioscorides* for the forme sake, and so taken by divers writers, although none of them are found to have that cleansing qualitie that *Dioscorides* and *Galen* attribute unto their *Telephium*, it tooke the name as it is thought from *Telephus*, the King of *Mysia* whose wounds received from *Achilles*, and growne almost past cure were healed herewith, and from hence the medicines appointed for such purposes were called *Telephia*. The first is called *Telephium Hispanicum* of *Clusius* and others, and *Cassia maior Hispanica* of *Lobel* and others: the second is called *Scrophularia media vel aquatica* of *Dioscorides*, *Tabernæmontanus*, *Fuchsius* and *Tabernæmontanus* by divers, and to also by *Lobel*, *Telephium folijs lanceolatis* and *Crassula maior* by divers: also, as well as by *Dioscorides*, *Telephium crassifolium*, *Cotyledon* it *Serpentaria minor* and *Aizoon* taketh it to be *Anacampseros*, and *Matthiolus*, *Dodonæus*, *Clusius* and divers others call it *Telephium*, but *Cordus* it is most common in all these parts: the third is called *Scrophularia sive Cassia montana* by *Fuchsius* in his *Scholia*, and by *Telephium floribus purpureis* by *Lobel* and others, *Acetabulum alterum* prepared by *Tragus* in his *Scholia* and by *Telephium quintum* of *Clusius*, who thinketh that not to differ from that of *Lobel*, notwithstanding that the reasons cannot be expressed without others: *Crassula montana*, and *Columna* reckoneth it to be any *Telephium*: *Cordus* faith it is a *Fabaria*, and thereupon calleth it *Kapnium montanum*: the fourth is the *Telephium sextum* of *Clusius* who taketh it more nearely to resemble the true *Telephium* then any others, and called by him and others *Telephium Imperati* also *Crassa Pancii*, by *Dodonæus*, *Lobel* and others *Telephium minus*, and *Aizoon*, and *Semper vivum*, which *Matthiolus* calleth *Crassa maior*, by *Dodonæus*, *Lobel* and others *Telephium minus*, and *Aizoon*, and *Semper vivum*, which generally call this in English French Orpine: the first is called by *Clusius Cornarius* and all others that have had it *Telephium Imperati*, and *Telephium latifolium Imperati*: the last is called *Crassa* by *Matthiolus*, *Crassa maior* by some *Crassa marina*, but generally by all that since have written of it *Crassa Matthioli*. The Italians call it *Erba grassa*, the *French Orpin*, *Fève grasse*, *Fève épaisse*, and of some *Reprise* and *Jouharbe des toyers*, the *Dutch Wondkruit*, *Duypenkruit*, *Vetwein* and *Vetweyng*, the *Dutch Schmeerwortel* and *Vet in English* Orpine, and of some Livelong, because a branch of the greene leaves hung up in any place will keepe the verdure a long time which made *Tragus* to judge it the *Limpsicum* of *Dioscorides* or else an *Aizoon*.

The Vertues.

The qualities of our Orpine are as I sayd before differing from the *Telephium* of *Dioscorides*, in that they are cooling as Purslane is, especially the leaves, for the roote is more restringent or binding, and by reason of the much clamminesse therein it is somewhat astringent also, whereas the true *Telephium* of *Dioscorides* and *Galen* is somewhat hot, and of a cleansing drying qualitie, so that used with Vinegar it taketh away the blue spots, wanes and all other deformities in the skinne, and is good also for old foule Vlcers and fistulaes, cleanseth and scoureth them as they say *Dioscorides* and *Galen* of their *Telephium*, but divers have thought that the difference of qualities in them from the Clusians is as it doth in *Arum* which in some places of *Asia* and *Colchos* as *Galen* saith is eaten rosted, sodden as it is in these places of *Greece*, *Italy* and all Europe, and as it is tasted also in the leaves, stalkes and roots they lay is sharpe in some places but is not so found with us. Orpine is seldome used in any sore or wound with us, although *Tragus* hath from his countrey *Germanie* experience, that the distilled water thereof taken of those that have any gnawings or excoriations in their stomacke or bowells, or have Vlcers in the Kidneys or Liver or other inward parts, as also in the matrix or mother, and doth helpe all those diseases, being used for certaine dayes together, and that it stayeth the sharpenesse of humors in the bloudy flux, as also

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

other flixes of blood in the body or in the wounde: the roote thereof also performeth the same effect. It is used notably to coole any heate or inflammation upon any hurt or wound, and easeth the paines of them, as also to heale scaldings or burnings, the juyce thereof beaten with some greene fallet oyle and annointed, the leafe also bruised and laid to any greene wound in the hands or legges, doth heale them quickly, and as it is said, being bound to the throate of them that hath the Quinsie, doth helpe it very much: it helpeth ruptures or burstings, and bruisements, as *Tragus* saith, the *Germans* call it *Bruchwurtz* and *Knabenkraut*. The leaves are much used to make Garlands about Midsommer with the coine Marigold-flowers put upon strings to hang them up in their houses, upon bathes and May-poles, &c. *Tragus* sheweth a superstitious course in his country, that some use after Midsommer dayes is past, to hang it up over their chamber doores, or upon the walles, which will be fresh and greene at Christmas, and like the Aloe spring and shoote forth new leaves, with this perswasion, that they that have it so, shall feele no disease so long as that abideth greene.

Chap. IV.

Rhodia sive Rhodia radix. Rosewort.

Because this plant is so like unto an Orpine, both in leafe, flower, and manner of growing, I thinke it fit to joyne it next thereunto. It sendeth forth divers stalkes which are upright, thicke round and greene, about a foote thicke set with leaves up to the toppes, and are somewhat long and narrow, like unto those of Orpine, but smaller, yet as fat or thicke, and of the like pale greene colour, dented about the edges: the flowers are many small and yellow, set in a tuft or cluster, but smaller than Orpine, with seede in heads like unto it: also the roote is thicke and tuberous or knobbie at the head, and branched out, rising oftentimes above the ground, whereas it groweth somewhat reddish, and is long downward, with divers fibres annexed unto it, which being a little broken or bruised with it, is fresh, much more than when it is drie: smelleth like a Rose, from whence it tooke the name. Some doe affirme that there is an other sort hereof whose leaves are not dented, and the flowers more purplish than the other.

Rhodia radix. Rosewort.

The Place.

It groweth in the North parts of *England*, and no where else wilde in our Land as I can heare of, as upon the mountaines of *Pindle* and *Ingleborough*, oftentimes on the very raggiest places and most dangerous of them scarce accessible and so steepe, that they may loose rumble downe that very warily doe not looke to their footing, from whence hath beene sent me some rootes for my Garden.

The Time.

It flowreth about *July*, and the stalkes and leaves perisheth to the ground springing every yeare anew from the roote, which endureth none in all extremities of cold.

The Names.

It is called in Greek Ῥοδία ῥίζα *Rhodia radix* not from the Hand Rhode, but from the Rose, as I said, for the scent thereof: it hath other name with all authors than *Rhodia radix* or *Rosea radix* that I know.

The Vertues.

It is found by good experience to be cold and not hot, as some have taken it to be, and as *Galen* placeth it almost in the third degree: for even as red Roses, so this by the coldnesse is profitable to allwage the headeath, arising from an hot cause, and both *Dioscorides* and *Galen* appoint it for paines in the head, the juyce thereof with a little Rosewater applied to the forehead and temples which *Gerard* vindicateth to his owne invention.

Chap. V.

Aizoon Sedum sive Sempervivum majus. The greater Houseleeke.

There are so many sorts of Houseleeke properly and unproperly so called both great and small, with wholeome with divided leaves, some cooling and others heating or exulcerating, that without some methodicall division, I can neither expresse them conveniently, nor you apprehend them effectually: which that I may do, I will digest them into five Rankes and orders, that is to say, of all the great sorts in this Chapter, and of the smaller ones in the severall Chapters following, which because they are of much affinity, I omit the reference of those that grow upon muddie stone walles or houses, and upon drie sandie bankes and hilles in the second; thirdly, of those that grow upon rockes and mountaines or in stony places, and fourthly, of those that have divided leaves, and hilly, to accomplish the history of all the sorts of Houseleekes, I should set forth

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

form the forte of *Corticon* or Kidney Worts, but having entreated of many of them in my former Booke, I will here shew you the rest that remaine.

1. *Sedum Maius legitimum.* The true great Houseleeke.

The true great Houseleeke groweth great to the forme of a shrubbe or woody plant, of the height of two or three foote or more, sometimes in the naturall places which are the warme countries, whose stemme or body below is of the bignesse of foure fingers, and the other branches of ones thumme, of a grayish colour and full sported as it were round about, but they are the markes of the old leaves that are fallen, the like whereof may be seene in the stalke of the Wood Spurge, spreading timber smaller branches on all sides, and leaves at the ende of them, standing in a compasse like the heades of common houseleeke but nothing so close, every leafe almost somewhat like a congie, small at the bottome and broader toward the end where it is somewhat cloven and notched about the edges, and as it were a little hollow like a Spoone, thicke and full of juice, and of a pale greene colour, from the toppes of some of the branches thrusteth forth a long stalke divided into many parts, and some few small leaves on them, and at the ends of them divers starre like flowers, consisting of many small leaves of a pale yellowish colour, with sundry small threeds in the middle of them, the greater stalke beconing hard and smooth as the heads, with small blacke seede in them, grow ripe and utterly perishing after the seede is shed, but the other heades of greene leaves abide fresh all the yeare, which send forth the flowers the next yeare after, and may be taken before hand from the mayne stocke to be planted, and will take roote being put into the ground. *Matthiolus* hath set forth the figure hereof in another manner with more store of branches and leaves, and the same plant growing peradventure in a warmer and more temperate climate.

2. *Sedum maius marinum Anglicum,* Great *English* sea Houseleeke.

This kind of Houseleeke is like the former whose stemme is woodie, but neither so high nor with so many branches, the leaves also although somewhat like unto them, yet not so thicke or sappie, in these not much differing from the former.

3. *Sedum maius vulgare,* Our common great Houseleeke.

Our common Houseleeke sendeth forth on all sides divers heades of pale greene thicke fat broad leaves pointed at the ende, lying circlewise one close unto another upon the ground from the middle of some of the heads of leaves, riseth up a streight stalke two foote high, all covered with smaller and longer greene leaves unto the middle low, which often drie and fall away before the toppe thereof hath perfited the flowers which grow on many branches bending their ends downewards, with a single leafe at the foote of every one of them, and couched many leaves fashion, of a darke reddish colour, after which come heads with small blackish seede in them: the roote is fibrill and stringie, creeping all about, and from small strings multiplieth unto many heads of leaves round about, taking up thereby a good compasse.

4. *Sedum maius alterum flore subluteo.* An other smaller Houseleeke like the common.

This Houseleeke groweth in like manner as the common doth, with such heades of thicke and pointed leaves compassing one another, but they are deemed a little about the edges, and are much smaller than they, having

1. *Sedum maius legitimum.*
The true great Houseleeke.

2. *Sedum maius Marinum Anglicum.*
Great English sea Houseleeke.

Aizoum minus majus desiga folijs. Aizoum flore purpureo adorato.

upon longer ſtalkes that thruſt out from the roote: from the middle of the greateſt and chiefe head ſpringeth a ſtalke ſcarce a foote high, thicke ſet with ſmall leaves like the other, bearing flowers in the toppe growing larger, and conſiſting of ſixe leaves, onely of a white colour, after which come ſixe cornered heads containing ſmall blackiſh ſeede: the roote is ſmall and like the other, yet a little thicker. *Clusius* maketh mention of other ſort hereof, with leſſer leaves and more dented in on the edges in little eſſe differing. There are alſo kinds as other alike in all things, ſaving the flowers which are of a brighter red colour than the common.

5. *Sedum arborum tomentoſum.* Necked or Woolly Houſeleeke.

This rare Houſeleeke in the Autumne and Winter hath the hoary or aſh coloured head of leaves lying plaine, and open, like unto the ordinary ſorte, but when the Spring commeth on, it groweth overcreſted with a number of hoary or woolly threades like unto a net, that it drawes the leaves together, and ſometimes into formes, as triangles, quadrangles, quinquangles, & hexangles, the leaves themſelves being ſmaller and thicker than the ordinary ſorte but thicke and fleſhie: in Summer when the ſtalke riſeth to be halfe a foote high, they are pointed up Pyramis faſhion, thicke covered with that woollineſſe: upon the ſtalke are ſet more ſcarce and narrower leaves up to the toppe, which parteth into two, bearing on each ſundry large ſpread flowers of a deepe red Roſe colour, ending in tenne points, as if they were ſo many leaves, but before they open to the full ſtarre, are plaited into ten plaites, each plait or fould being of a deeper colour, having two eares that end in a point tipt with yellow, ſtanding about the middle umbone which becommeth the ſeede veſſell, and is cloſed in a paler hairy huske pointed alſo: the roote is very ſmall and threddy, yet thruſteth it ſelfe into the chinkes of the rockie and ſtony places, where ſcarce any earth is to be found.

6. *Sedum majus angustifolium.* Great narrow leafed Houſeleeke.

This kinde of Houſeleeke hath ſundry circles of leaves ſomewhat like the former ſort, but the leaves are narrower and longer, and a little rough or hairy withall; the ſtalke that riſeth from ſome of the leaves is ſmooth, and about a cubit high, ſet thicke with narrower and red pointed, fat thicke undented leaves up to the toppe, where it branches forth into ſome few, bearing each a flower of tenne or twelve long and narrow leaves laid open like a ſtarre, of a reddiſh purple colour; the ſeede that followeth in ſo many ſmall heads as there were leaves in the flowers, is as ſmall almoſt as duſt: the roote is reaſonable thicke, with divers ſtrings faſtened thereto.

7. *Vermicularis arborescens.* Tree Houſeleeke with ſmall leaves.

This kinde of Houſeleeke or Prickemadam, riſeth up to be five or ſixe foote high, as I have obſerved it to grow in Gardens, plentifully ſtored with branches from the bottome to the toppe, and with ſmall long and round greene leaves without any talle, very like to thoſe of the ſmall Houſeleeke called *Semper vivum*, or Prickemadame, (although *Lobel*, as I thinke ſaith it hath a ſaltiſh taſte) but leſſer and greener, the flowers grow at the toppes of the branches (ſmaller than in the next that followeth, and of a pale yellow colour: the roottes are long wooddy and ſpreading in the ground: the branches hereof ſlipped and put into the ground will quickly take roote and grow.

8. *Vermicularis frutescens altera.* Shrubby Prickemadam.

This other ſhrubby plant groweth nothing ſo high as the former, but being above a foote high full of branches covered with an aſh coloured barke, as limber and pliant as it, the leaves hereof are ſomewhat ſhorter and ſtronger than the other, of a more ſaltiſh taſte, and of a darker greene colour: the flowers as cleaving to the branches are larger, but fewer, and of a yellowiſh colour, the roote is hard and wooddy.

The Place.

The firſt groweth in *Greece*, *Italy*, *Portugall*, *Spaine*, *Illyria* or *Slavonia*, and ſome parts of the *Mediterranian* ſea, as *Sicily*, *Candia*, *Corſica*, &c. where it groweth naturally; but in divers places of *Italy*, *Portugall* and *Spaine*, it is kept, as *Clusius* ſaith, in pots, and carefully preſerved in the Winter, & in *Italy* they lay it upon the houſes as our common Houſeleeke: but will not endure the cold of the ſeverer Northern countries of Europe, with all the care that may be without a ſtove, ſuch as they uſe in *Germany* and other places more northerly; yet *Lobel* ſaith, he found it in the Iſland of *Holmes* by *Briſtow*: the ſecond groweth by the ſea ſide in many places of this Land, and in the Iſle of *Holmes* not farre from *Briſtow*: the third groweth naturally on the hills in *Germany*, but with us onely where it is planted upon houſe ſides, &c. and that in May eſpecially, for elſe in it will hardly thrive. The fourth, *Clusius* ſaith, he found very common on the hills neare *Vienna* in Auſtria, and ſince *Columna* found in *Naples*: the ſixt *Clusius* ſaith, he found on the Alpes neare *Salisburg* in Germany: the laſt groweth by the ſea ſide, and further off likewiſe where the ſalt will raiſe brackiſh as well as neare the ſea.

The Time.

The firſt flowreth in *Portugall*, as *Clusius* ſaith, in *November* and *December*, but never with us: the ſecond flowreth by the ſea ſide in *August*: the third, fourth, and ſixth, in *July*: the fifth in *May*: and the ſeventh very late alſo.

The Names.

It is called in Greeke Αἶζοον σπάνιον, *Aizoon magnum* or *majus*, of the ever living and growing: therefore *Gesner* tranſlateth it out of *Theophraſtus Semperviveum*, which is the ſame in ſignification, but of divers other names, for as *Pliny* ſaith, it was called *Sophthalmum Zoophthalmon*, and *Sempervivum* of ſome: ſome called it alſo, as he ſaith, *Oculus* and *Digitellum*: it is called by *Apuleius*, *Virga* and *Herba Virga*, uſually, *Sedum majus*: the *Arabians* call it *Arjubalabon* and *Hanibalabon*: the *Italians Semprevivo*, *Herba Sempreviva herba pennata*: the *French Grande Joubarbe*: the *Germans Hauswurtz* and *Hauslaub*: the *Dutch Donderbaert* and *Huyſlook*: we in *English* generally Houſeleeke; yet ſome call it *Sengreen* and ſome *Sengreen*, *Bullers Eye*, *Bullocks eye*, and *Jupiters* beard. *Clusius* and others do even onely diſtinguiſh the ordinary great Houſeleeke with the *Corylidon altera* of *Diſcorides*, and no one can diſprove their judgements. The firſt is the true *Aizoon magnum* of *Diſcorides* and others, and there is no doubt made thereof by *Matthiolus* and others, call it *Sempervivum arborescens*, and *Sedum arborescens* and *Aizoon* as alſo calleth it *Sedum majus hyemosum*: the ſecond *Lobel* maketh a kinde thereof, and calleth it *Sedum Iaudicum*: the third is moſt common with us, and is generally called *Sedum minus vulgare majus*, which as I ſaid, *Clusius* calleth *Corylidon altera Diſcoridis*, ſome alſo call it

which peradventure is more proper to the fruit tree, and *Trifolium pratense flore albo*, who also thought it to be the *Lagopus* of *Dioscorides*, but *Lobel* saith it may be called *Pilosella minor*, that is, *Pilosella humilis*; but *Solago* was called *Consolida media*, the lesser of *Absynthium* from which the leaves being bruised give out a juice, which the leaves being bruised give out a juice, which the leaves being bruised give out a juice,

1. *Dodmaularis fœc rassula minor vulgaris.*
Prickmadam or Stonecrop.

2. *Vermicularis scorpioides, Sedum scorpioides,*
Stonecrop with manifold heads and pittalls.

3. *Vermicularis minor.*
Small Stonecrop.

6. *Sedum agreste flore pallido luteum.*
Marsh or Field Stonecrop.

in tufts as the others doe: the roote in like manner creepeth about, sending forth many stalkes, which as they lye upon the ground take roote and spread farre: the taste hereof is very sharpe and hot upon the tongue, which chiefely distinguisheth it from all the rest, but it may also bee distinguished by the forme, being small and thicke set with round leaves.

2. *Illecebra insipida.*
Vnsavorie Wall-Pepper.

This Wall-Pepper is as small a plant as the last, growing altogether like it in leafe, stalke, and flowers, being yellowish, likewise, but the taste onely distinguisheth it from the other, which in this is nothing biting, but utterly unsavorie and without taste.

9. *Sedum minus flavum.*
Summer Houseleeke or Stonecrop.

This Summer sort hath many thicke round long leaves set together without order, on the small stalkes which branch themselves into

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

ny-flored, with many yellow flowers at the toppes: the roote is small and perishing.

The Place.

Although these sorts grow either on muddie or stone walls, or among rubbish, and in other sandy or gravelly places, and oftentimes also upon the sides of old tiled houses and penthouses, especially the two last sorts having one: but the first onely groweth in moyst Medowes and Marshes.

The Time.

They all flower in *June* and *July* and sometimes sooner, the leaves of many of them continuing greene all the Winter.

The Names.

These kindes of Houseleekes are called in Greeke Ἀείζωα τὰ μικρὰ *Aizoon minus*, that is, *Sempervivum minus*, in that they are alwaies greene, and are lesser then the former, yet some do call both Kinds *Aithales*, for that they are ever living, *Pliny* calleth this lesser kind *Telephium quartum florens* (but *Brunfelsius* referreth that name to the greater) and *Exithales* or *Exiphiades* and *Chrysithales*. The *Italians* call the first *Sempreviuo minore & Pegola*, the *French* petite Joubarbe and *Triquemadame*, the *Germans Klein Hauswurtz* and *Klein Donderbart*, the *Dutch Kinderkoosen* and *Cape cruydeme*, and wee in *English* Prickmadam, Stonecrop, or great Stonecrop (because we call two of the last sorts small or little flowering) Stonecrop and Houseleeke: The Wall-Pepper or common Pepper is called by the *Italians Granellata* and *Erba lua*, the *French Pain d'oyseau*, the *Germans* Mauerpfeffer that is *Piper murinum*, and *Catsenruyd*, that is, *Ruta felina* or *felium*: the *Dutch* Muerpepper. The first is called by *Lobel* in his *Adversaria Vermicularis* of the likenesse of the leaves unto wormes, and *Classius minor alterum genus Vermicularis minoris*, is the *Sempervivum minus primum* of *Dodonæus*, the *Sedum minus* of *Fuchsius*, and the *Sedum minus Hispanicum* of *Tabermontanus* and *Gerard*: the second is called by *Lobel* in his *Icones* and *Dutch Herball*, *Sedum Serpentinum*, and is the fourth *Sedum minus* of *Clusius*, and of *Camerarius* *Acuon minus flore luteo flavescente*: the third is the first *Sedum minus* of *Clusius*, the *Sempervivum minus alterum* of *Lobel*, and the *Aizoon medium* of *Thalius*: the fourth is the *Vermicularis flore albo* of *Camerarius*, the *Sedum minus Femina* of *Fuchsius*, *Lonicerus* and others, *Sempervivum minus album* of *Brunfelsius* and others, and is the first *Sedum minus* of *Clusius*: the fifth is the seventh *Sedum minus* of *Clusius*, called by *Lobel* *Aizoon Dactyliferum flore dasyfolium*: the sixt is the third *Sedum minus* of *Clusius*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

called by him *Sedum palustre*, and is the fourth *Sedum minus* with *Tragus*; which *Dodonæus* called *Sedum flore rubente*, although he would make it a differing sort from it: the seventh is the eighth *Sedum minus* by *Fuchsius* of *Clusius*, called *Illecebra minor* by *Lobel*, and *Semperviuum minimum*, and is taken by *Fuchsius* for *Tragus* 3. *Plinij*, and of *Columna* to be his *Dactylon* 2. *vel* 3. and because of the different qualities, he judgeth not fit to be accounted an *Aizoon* which are all cold: *Cordus* calleth it *Aizoon serre*, and *Thalius Aizoon serre vel serratum*, who also calleth the eight *Aizoon minus* and *Vermiculata inuitata*, and by *Cordus Aizoon secundum*, the last is onely mentioned by *Lobel*.

The Vertues.

All these kindes of small Houseleekes or Stonecrops, except the seventh are cooling like unto the greater Houseleeke, and in their qualities are referred thereunto being somewhat astringent withall: wherefore they are no lesse powerfull to allay the flowes and distillations, bleedings inward and outward, eruptions of the skin, cancerous and fretting sores and ulcers, and generally can doe and performe whatsoever is said of the greater kindes, and therefore in the want of the one, the other may safely and effectually be used: onely the last have a more fervent hot sharpe & subtile heate (as I said before) to the skin, and raising blisters if it be laid thereupon for a time, as forcibly as *Ranunculus* or Crowfoote will doe, and therefore it behoveth all that shall have occasion to use any of the cooling Stonecrops, that they doe not mistake this for some of them wherewith it is to be used with great heede without some other good properties, whereof good ale may be made, for it is said to procure vomiting, the juyce there of taken with vineger and some other drinke, and thereby driveth forth thicke flegmatike and cholericke humours whereby quartaine agues, and other of long continuance may be cured. And that taken in the same manner, it doth expell any poyson, or the force of venemous herbes and of the Aconites, which yet is restrained in some to the greater kindes: but *Caveat qui sumpserit*. *Dioscorides* saith, that being outwardly applied with *Suillum axungia*, that is Hoggs fuet, it will take away knottes and kernelle, as well in the necke and throate, which we call the Kings evill, as in any other part of the body, and applied by it selfe, or boyled in oyle of Roses, and the fore piles annointed therewith, doth ease the paines, and cure them of the griefe.

Chap. VII.

Aizoon, Sedum sive Semper vivum minimum petræum & montanum.
Rockie and Mountainous small Houseleekes.

The third kinde of small Houseleekes that I am to entreate of here, are of such as grow on hilles, stony, and mountainous places (of many whereof I have in my former Books given you the knowledge) which are the lest of all the rest formed into circles or eyes, as the common Houseleeke is, and as the forts of *Cotyledon altera* are also, whereunto they might be as well referred, but because other Authors have set them forth by the name of *Sedum minus*, I am content to let them so passe also.

1. *Sedum minimum Alpinum Muscoides*; Small Mosselike mountaine Houseleeke.

This small Houseleeke spreadeth with the many round circling heads of leaves like Houseleeke a great deale of ground so thicke lying thereon, as the Mosse it selfe doth: which leaves are very small, thicke, and of a deade greene colour: from the middle of divers of which heades spring up small slender stalkes, not above three inches high, bare or naked of leaves, for the most part unto the toppes, where stand two, three, and more flowers made of five leaves apeece, and some yellow threds in the middle of them: the roote is small and threaddy, but multiplieth it selfe into a number of heads.

2. *Sedum minimum Alpinum villosum*, Small hairy mountaine Houseleeke.

This is as small an Houseleeke as the former, growing in the same manner, and about the same height, hurtfull

1. *Sedum minimum Alpinum Muscoides.* Small mosselike mountaine Houseleeke.
2. *Sedum minimum Alpinum villosum.* Small hairie mountaine Houseleeke.
3. *Sedum montanum glareosum foliis rotundis.* Another sort of the lesse Rockie

Generated on 2021-10-19 16:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

somewhat greater and longer, and set with small haires round about the edges; the stalkes also are somewhat greater, and bare six or seven flowers a peece at the toppes which are white like the other, with a yellow bottome.

3. *Sedum minimum Alpinum graminifolio.* Grasselike small Houseleeke.

This Houseleeke groweth not much higher than either of the former, the leaves of whose heads are somewhat greater than the last, flatter also and greener, very like unto the leaves of grasse, from among which riseth up a stalke (or two) very small smooth and render, about three inches long, bearing one flower, and sometimes two at the toppe consisting of five white leaves, somewhat larger than the former, and their round ends dented in the middle, making every leafe seeme like a heart painted on the Cardes, the bottome of the flower being yellow.

3. *Sedum minimum graminifolio*
alterum,
Another Grasselike small Houseleeke.

The other small Houseleeke differeth not from the last in the manner of growing, fashion of the leaves, or height of the stalkes bearing flowers, but differeth in this point, that it beareth more leaves at the tops of the stalkes, not so much pointed, but whole, and of a yellow colour.

1. *Sedum petræum minimum luteum*
flore,
Small rocke Houseleeke with yellow flowers.

The small rocke Houseleeke hath divers heads of leaves lying upon the ground like the other, but harder, narrower, pointed also and somewhat hairy; the flowers being foure or five that stand together, about a thin naked stalkes about three or foure inches high, each of them small yellow leaves apeece, after which come the pointed seed vessels, somewhat like unto a Thlaspi, wherein is contained seed brownish that feedes.

6. *Sedum Alpinum grandiflorum;*
Small mountaine Houseleeke with great yellow flowers.

The small Houseleeke hath many small heads, of lesser leaves then those of the last, with small stalkes under them, from among which rise other stalkes set with leaves up to the toppe, where stand five or six pale yellow flowers, larger than the smallnesse of the

5. *Sedum minimum luteum*
flore,
Small mountaine Houseleeke
with pale flowers.

7. *Sedum montanum pes*
gallinæ tuberosa flore
luteo.
The small mountaine Houseleeke with yellow flowers.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

15. *Sedum alterum montanum foliis altissimis.* Another small mountaine Houseleeke.

The Pinnets feather, or torch in my Herbary Booke.

plant might seeme to give, being almost as great as those of the white Sanicle sage consisting of five leaves: from the roote ariseth in the ground and spreadeth with many heads.

7. *Sedum Alpinum flore pallido.* Small mountaine Houseleeke with pale yellow flowers.

The neare resemblance of this small Houseleeke unto the small Stonecrops in the last Chapter, might iustly have challenged the rompany: but because it is a mountaine kind, I thought better to place it here. It creepeth upon the ground with a number of small sappie branches of a hand breadth high, furnished round about with small long and pointed leaves, very like unto Stonecroppe, but somewhat fatter and not so thicke, and of very thicke taste, up to the toppes where stand many somewhat great flowers, yet each lesser than the last, of a pale yellow colour: the roote spreadeth much, whereby it greatly encreaseth.

8. *Sedum minus montanum flore rubro.* Small mountaine Houseleeke with red flowers.

This red flowred Houseleeke hath many small narrow and long leaves lying on the ground, among whereout riseth up a stalke about three or foure inches high, with a few leaves thereon, being longer and more pointed than those are below, and at the toppe divers large flowers made of many narrow and pointed leaves: of a reddish colour and yellow in the bottome, with a white line at the bottome of each leafe, which are sweeter in smell than in any other sort.

9. *Sedum saxatile hirsutum purpureum.* Small hairie purple flowred Houseleeke.

This small plant hath sundry small hairy leaves set together, each whereof is lesser than those of Lentils, the stalke that riseth is slender and hairy, as the leaves that grow on them to the toppe are also: which is divided into small branches bearing every one a small purplish flower: the roote is small and threaddy.

10. *Sedum Saxatile atrorubentibus floribus.* Rocke Houseleeke with darke red flowers.

This small Rocke Houseleeke shooteth forth some slender stalkes, about two inches high, with small fat leaves, set opposite thereon, and sundry flowers at the toppes of them, of a very darke red colour standing close together, as though they stood round in an umbell: the roote is small and long.

11. *Sedum montanum perpusillum luteolis floribus.* The least mountaine Houseleeke with yellowish flowers.

This least sort groweth into sundry small heads, very thickely stored with fine small leaves like Mosse upon the ground, from which rise small slender stalkes scarce appearing with their heads above the leaves, each of them bearing but one pale yellow flower thereon apeece, rising from out of a large greene huske: the leaves are long and slender, with many small fibres thereat: the whole plant above ground scarce attaineth unto two inches of height.

12. *Sedum saxatile variegato flore.* Small rocke Houseleeke with discoloured flowers.

Like unto the last small one is this variable coloured Houseleeke, being as small as it, the leaves in like heads also like Mosse upon the ground are small but somewhat round, and of a pale greene colour: the stalkes many that rise from among them, bearing every one a small flower of foure leaves apeece, of a pale yellow white purple and darke red colours very delectable.

13. *Sedum montanum Alpinum, villosum, luteum.* Another small hairy mountaine Houseleeke.

This small Houseleeke hath many heads of small long leaves set with small hairs about the edges, among which rise up small stalkes three or foure inches high, set with the like leaves, and three or foure small yellow flowers at the toppes.

The Place.

Most of these sorts grow upon the Alpes and *Pyrenæi* Mountaines in divers places, but withall very hardly endure the transplanting into Gardens.

The Time.

They flower in *June* and *July* in their naturall places, but earlier in Gardens when they will thrive there.

The Names.

All these have beene lately found out, and are not mentioned by any of the ancients, but later Writers, and

Original from UNIVERSITY OF MICHIGAN

may know whose each of them are: I will shew you their Authors. The fifth is the ninth *Sedum minus* of *Clusius* described and figured. whereof *Gesner in horto* maketh mention: *Bauhinus* thinketh it is the *Sedum semperuivum*, the third is *Clusius* his eleventh *Sedum minus*: the fourth hath not beene exhibited by any before, no not the very first *Sedum minus* of *Clusius*, and called *Sedum perenne vermiculatum* by *Lobel*, *Lugdunense tertium* by *Clusius*, *Stellatum Dalechampij*, *Sedum Stellatum* by both *Lobel* and *Clusius* for him for it: and before also mistaken by judgement that would make any of these small *Seda* to be *Phyllon* of *Dioscorides*: *Columna* also mistaken who would be accounted a *Sedum*, because the forme of the flowers and seede vessells doe differ from all other kindes of *Sedum*, which although they be both great inducements and especially the seede vessells being as I have shewed in many places of this worke a precise note to know into what *genus* the *species* of any herbe may be ranged, yet in regard the manner of growing of these Houseleekes is so differing from all other herbes, and likewise in the heads of leaves is so like unto them, I doe not see but that it may better be referred to a *Sedum* then to a *Sempervivum* as *Columna* doth, who calleth it *Sempervivum luteum minus Asiaticum montanum*, making it a Wall flower: and indeede *Clusius* observing the difference, giveth a note thereof, and saith that it agreeth not in all things to the small Houseleekes, and therefore leaveth it to other mens judgements, to call it by some fitter name then even this: the sixt is the *Sedum minus tertium* of *Lobel*, *Dodonæus* calleth it *Sedum serpens* as *Bauhinus* likewise doth: he also to be the *Sedum Alpinum quartum* of *Columna*, but calleth it himselfe *Sedum Alpinum Saxifragæ facie procumbens*, the seventh is the *Sedum minus sextum* of *Clusius*: the eighth is called *Aizoon montanum* by *Lugdunensis*, and by *Bauhinus Sedum Alpinum erectum majus*: the ninth and tenth are remembred onely by *Bauhinus* and I from him: the eleventh hath not beene set forth by any author that I know before: the twelfth called by *Bauhinus Sedum sexangulare variegatum flore*, but is not that *Sedum floribus parvis candidis persicæ folio* that *Lobel in horto Germaniæ* maketh mention of, for that I shall shew you by and by to be a *Corydalis* as his flowers, which are all greater Plants then any of these *Sedum minora*, the last also hath not beene remembred by any before. *Bauhinus* maketh mention of some more sorts of these small *Seda*, which I thinke are comprehended under some of the other sorts, and therefore not fit to be double repeated.

The Vertues.

All or most of these small Houseleekes being in taste drying and astringent, and some of them a little bitter withall doe affirme that they will well serve to helpe defluxions and rotting lookes and fluxes of blood or humors as well as any of the other sorts, but are not so cooling: but because I have no author that hath set downe the operations of any of them in Physicke, either for inward or outward diseases, the rarity of same now being such and for other reasons (that are not likely to have much experience of any of them in our land) we have said thus much.

Chap. VIII.

Sedum laciniatis foliis. Small Houseleeke with dyvided leaves.

Cannot be brought to be of *Bauhines* judgement, to make many sorts of this kinde of Houseleeke for I finde in my minde but forcibly drawen to other herbes to beare this title, which cannot fitly agree thereunto, as by the deserption of them in the precedent discourse, both in the second Chapter of the fifth Classis, and in the 40. Chapter of the fift Classis of this booke, and in other places you may more plainly perceive.

1. Sedum Alpinum laciniatis foliis. Small Mountaine Houseleeke with jagged leaves.

I finde not any more plants fitly in my minde to beare this title but this and another, and therefore I must leave the descriptions of these onely and leave *Bauhinus* or any one that will undertake to be his champion hereto, to maintaine his other sorts. This first shooteth forth on all sides many small heads of leaves from small strings like to the Houseleekes, each leafe whereof is long and narrow, cut in deeply into three divisions, one on each side the end longest, somewhat like the leaves of the sweete scabious, but thicker and greener, not having any hoarinesse on them, more sappy also to taste as much as any of the other: the stalkes are reddish, very slender and not two inches high (saith he, but mine were higher then this) bearing every one of them one small flower (or two at most with us) made of five leaves a peece, of a pale yellow colour (I know not whether *Indian*) but that which were had from me was of a pale whitish flowre with some yellow in the middle, round umbone: the roote is small but creeping much.

1. *Sedum Alpinum laciniatis foliis* Small Mountain Houseleeke with jagged leaves.

2. Sedum Alpinum laciniatis foliis Pyrenæum luteum.
The yellow jagged mountaine Houseleeke.

This jagged Houseleeke hath likewise divers heads of very small leaves set as deeply cut into two, or more, and subdivided into more, from among which rise up very many slender or foure inches high, with some few leaves placed every where into some branches, at the tops whereof stand divers flowers of five leaves a peece, of a pale yellow colour, in the middle: the roote is blacke and small.

The Place.

The first from *Clusius* growth on the Mountaine called *Sneberg* or *Snow hill* among the stones, but on the Mountaines

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

Alpes of Lausanne with us as Mr. Hosko told us, the other both upon Mount Lapis and Salève neare Geneva, and on the Pyrenean hills likewise.

The Time.

The first flowreth in August latter end, within a while after that the snow is dissolved, but in the mountains of Spaine and beginning of May with us, although somewhat later in the naturall place, and the other after thereabouts.

The Names.

The first is mentioned by Clusius who in his Pannonicke observations maketh it his seventh *Sedum minus flore albo*, and in his History of Plants setteth it for his *Sedum decimum tertium*: the other Bauhinus names both by the name of *Sedum medio foliatum Alpinum minus* and referreth it to the other sort of *Sedum alpestre tertium Gregorii de Reggio*, remembred by Columna, but so it cannot be, for he saith that that sort hath not leaves compact together as the other sede but dispersed.

The Vertues.

You have heard before of the taste and therefore you may judge of the qualities of these herbes, but I have no more to say of them, but that it is likely they be as effectuall for those causes that the last small sorts of Houseleeke are, &c.

Chap. IX.

Cotyledon pinnata sive Umbilicus Veneris. Kidneywort or Wall Pennywort.

THe last kinds of Houseleeke whereof I am to entreate, so to accomplish the whole family of all Kidneyworts, whereof the first sort of *Dioscorides* being different from the other I will first speake of, and then of the rest that I have not mentioned in my former booke.

1. *Umbilicus Veneris vulgaris.* Our ordinary Kidneywort or Wall Pennywort.

The great Kidneywort or Wall Pennywort that groweth with us hath many thicke rounde leaves growing from the roote, every one having a long footestalke fastned underneath about the middle thereof, and a little unevenly waved sometimes about the edges, of a pale greene colour, and somewhat hollow on the upper side like a spoone or sawcer, from among which rise one or more tender smooth hollow footestalkes a foote high, with two or three small leaves thereon usually not rounde as those below but somewhat long and divided at the edges: the tops are sometimes divided into long branches bearing a number of pendulous flowers set rounde about a long spike one above another, which are hollow and like a little bell, of a whitish greene colour, after which come small heads containing very small brownish seede, which falling on the ground doe plentifully spring up before winter if it have moysture: the roote is rounde somewhat like the last roote but

Orchis in Dioscorides, smaller, finally smooth yet sometimes rugged or knobbed, rayish within and white without, having small fibres at the head of the roote and bottome of the stalke, straighter like an Orchis wherewith I have not neerely resemble the roote thereunto Houseleeke, but I will once be singular although I speake of plants, herein follow others. Of this kinde wee have received from Doctor *Quelus* at *Lysbone* a greater *Maior Lusitanica.* sort, with paler greene leaves very beautifull, which Mr. *Tradescant* keepeth at *Lambeth*.

2. *Cotyledon sive Sedum montanum Lusitanicum serratum caule alto.*

Spotted Kidneywort, or the Princes feather.

The pretty kind of Houseleeke, or Kidneywort call it which you will is described in my former booke, where I call it the Princes feather, and therefore needeth not to be here againe repeated although I give you the figure of it among the rest, you shall finde the Figure hereof in folio 738.

3. *Cotyledon alter minor folio subrotundo.* Small Kidneywort with roundish leaves.

This other small Kidneywort hath much rounder and smaller leaves in the heads then the former, nor so big as the ends of ones finger, of a pale greene colour as it, or more white and dipped at the edges in the like manner, of an astringent taste like the other Houseleekes, from the middle of some of the heads yearely rise up divers but hard and rough stalkes about an handlength high, set with a few smaller and longer leaves thereon, at the toppes whereof appeare small flowers upon long foote stalkes, consisting of five and sometimes of six leaves a peece, sometimes wholly white, and sometimes spotted with red spots, and sometimes having three purple lines running downe the backe of every leafe, so that it maketh the whole leafe seeme purplish, in their places follow small heads with small seede: the roote is small and fibrous like the rest, letting of heads of the like leaves round about it.

4. *Cotyledon alter variegatis floribus.* Small Kidneywort with party coloured flowers.

This small Kidneywort groweth with many heads of small leaves circlewise like unto the last Kidneywort (whereof it is a peculiar sort) greater then the smallest and smaller then the greatest, each whereof is somewhat long and narrow of a whitish greene colour dented as it were about the edges, or rather set with white pearles about the edges making them seeme like white teeth (for as *Gesner* compareth them to the silver like eare of Pellitory) very pleasant to behold, for in the Winter when no flower appeareth but withe the last (and the first that I have expressed in my former booke, being all of one *genus*) giveth as much delight as when it is in flower, which are many standing on several foote stalkes, each roote whereof is part white and part purple, variably diversified in every one of them.

The Place.

The first groweth very plentifully in many places of this kingdome, but especially in all the west parts of this land, upon stone and mud walls, upon rockes also, and in many places upon the ground, at the bottome of old trees, and sometimes on the bodies of them that are decayed and rotten: the other of that sort in *Portugall* as is said, the second on the *Pyrenean* hills, the other two grow upon the rockes and among the very stones where there is scarce any earth for the rootes to abide, on the Alpes of the *Helvetians* or *Switzers*, and upon the hill called *Horrus Deo* neare *Montpelier*.

The Time.

The first doth usually flower sooner then the other, as at the beginning of *May*, and the seede ripening quickly after shedeth it selfe, so that about the end of *May* usually the leaves and stalke are withered dry and gone until *September* that the leaves spring up againe and so abide all Winter: the second about the middle of *May*, the other two sometime flower not until *June* and *July*, and their seede is ripe in *August*, their heads that bare stalke usually withering together, and the other that bare not abiding all the extremity of the Winter.

The Names.

The first is called in Greeke *κοτυληδων ὁ ἀστεβουλὴ ἡ μικρὰ ἰδέα*, and therefore the Latines call it *Cotyledon* as well as *Cotyledon* or *Umbilicus Veneris*; it hath also divers other names as *Sedum vile*, *Scutellum*, *Lens rotunda*, *Herba Veneris* and *Herba Coxendicum*: the Italians call it *Ombilico di Venere*, and some *Coppe-rella*, the *Spaniards Sendoses*, that is *Shields*, the *French Escuellier* and *Nombril de Venus*, the *Germans Lenskrout* and *Nawelkrout*, the *Dutch Navelcruyt*, and we in *English* of some Navelwort, or great Navelwort, Wall Pennywort, Hipwort, Kidneywort, *Venus* Navell and Navell of the earth. The other is called *Sempervivum* in Greeke *σεμπερβιβὸν ὁ Cotyledon alter* and *ἀειζωὸν δεύτερον*, but they are nothing related to the former great Houseleeke, which I have shewed you before, and is the true *Cotyledon*, also of *Dioscorides* by the judgement of *Clusius* and others, the second is usually called *Sedum serratum*, with most probability as I have as you see joyned it here as fittest I thinke, but the other two last sorte have obtained that name of *Cotyledon* from *Matthiolus* who first called them so, and is still kept and held currant with many, yet some do call them with many others for the likenesse unto *Sedum minus*, as with *Gesner*, *Lobel*, *Camerarius*, *Dodonæus* and others, who often call them *Sedo*, and very properly, but there is no herbe can so properly be called *Sedum* or *Sengreen* as such herbes the leaves placed circle wise, one within another as they have, but because the *Cotyledon* hath more it is said fully agreed a *Sedum*.

The Vertues.

The Wall Penny-wort as *Dioscorides* saith is of mixt qualities, that is, of moist and cold, somewhat astringent and a little bitter withall, very effectuall for all inflammations and intemperall heates either inwardly to coole a fainting hot stomacke or an hot liver, or the bowels or passages of the belly, juice or the distilled water, or else outwardly for pimples, redneile, Saint *Anthonie* fire, hot sores and inflammations, to apply the bruised herbe or to bathe the place with the juice or distilled water, the said juice or water helpeth much also to heale sore kidneys, borne or vexed by the stone or gravell within and easeth the paines: it provoketh Vrine likewise, and is available for the dropsie: it cooleth also the *Erysipelas*, and to coole the inflamed parts by the paines thereof, and other wringing paines of the joints and the *Gowt*, it is singular good for the painefull piles or hemorroidall veines, to coole and temper the heate and the abundance of blood in them, and to ease their paines, to use the juice as a bathe unto them, or make an ointment of it selfe or with Myrrhe or other things conducible thereunto: it is no lesse effectuall to restore to the hot goute, the Sciatica and the inflammations and swellings in the cods, and

stingeth

bringeth againe the prepuce: it likewise helpeth the Kernells or knots of the neeke and throate called the Kings Evill: it healeth Kibes and Chilblaines if they be bathed with the juice, or annointed with an ointment made thereof, and some of the skinne of the leafe laid upon them: it is used also in greene wounds to stay the bleed and to heale them quickly: The lesser sorts are held to be cooling and somewhat more binding then the great, and thereby availeable for those diseases whereunto those qualities are proper.

CHAP. X.

Acetosa sive Oxalis. Sorrell.

SOrrell is accounted a Docke, and called the soure Docke, and therefore might have beene brought under the generall title of the Dockes: but because none of the other Dockes are so cooling, nor growe in Gardens, I shall speake of those sorts severally hereafter, that I have not made mention of before in this Worke, or in my former Booke. The sorts of Sorrell are many more found out of late by the industrious searchers of Natures varieties, then formerly hath beene knowne, some growing naturally in our fields, some in our woods, some also in other countreis. Of the ordinary Sorrell nursed in Gardens, which yet groweth also wilde in our fields and medowes throughout the Land, I have already entreated at large in my former Booke, and shall not needs to speake thereof againe here, but of the other sorts, yet of the wood sorts I will speake in the next Chapter, although for their formes sake, they might have beene joyned with the rest of the Trefoiles, whereof they are species.

2. *Acetosa maxima Germanica.* Great Sorrell of Germany.

The great Sorrell of *Germany* groweth in the same manner that the ordinary Garden sort doth, and the leaves thereof are much larger, and sometime a little curled at the edges, the joynts of the stalkes are great and knobbie sticking out like knots, which being taken from the stalke and put into the ground, will take roote, and bring forth leaves like the mother plant, the seede and in all other things are large answerable to the great stemme and leaves. *Joannes Thalius* in *Hercynia silva*, maketh mention of a greater sort of Sorrell then ordinary called *Sorrel de bove*, of a great one received from *Spaine*, but neither of them speake of any tuberous joints they doe bear, for time it is probable, it is but onely the climate and soyle that produceth the tubers.

3. *Oxalis sativa Franca sive Romana rotundifolia.* Round leafed Sorrell.

In the leaves of this Sorrell consisteth a cheefe difference which are short and almost round in some, and in others they will have somewhat round pointed peeces on both sides, of a paler greene colour then the former, the stalkes are weaker not standing upright, but the flowers and seede differ not from the ordinary sort: the roote is small and thredy creeping about and shooting up heads of leaves round about the

talke is of a much more pleasant sharpenesse then the other, and therefore more desired of any that formerly hath tasted it.

4. Oxalis tuberosa radice. Tuberous rooted Sorrell.

The cheefe differences in this consist both in leaves and rootes, the leaves hereof being formed somewhat like the ordinary but larger and not so broad next the talke, the talkes, flowers and seede are answerable to the rest, but the rootes are many tuberous clogs fathened by strings to the head whence the leaves spring forth.

5. Oxalis bulbosa montana major. The greater bulbous Sorrell.

This bulbed Sorrell hath large greene leaves somewhat like the garden kirkle, but more round at the upper end, and more forked at the lower part next the talke, that it seemeth almost three square like unto a Trefoile, in the rest it agreeth with the ordinary sort but that the rootes are round and bulbous.

Bulbosa minor. There is another like hereunto, but that the leaves are lesser and rounder, the whole plant smaller and lower also.

6. Oxalis rotundifolia Alpina. Small Mountaine round leafed Sorrell.

This small Sorrell hath five or six small leaves standing upon very long and slender foote talkes, each leafe being no bigger then the palme of ones hand, and in a manner as round as the Violet leafe: the talke rising a foote high, bearing such like chaffie huskes and reddish, wherein the like seede unto the ordinary lyeth.

6. Oxalis foliata repens. Creeping Sorrell with small broad leaves.

This creeping Sorrell hath slender weake jointed branches trayling on the ground, foure or five inches long, whose leaves are small, of a nailes breadth, and of the fashion of a pointed shield, and pointed also at the ende, with very long foote talkes under them, the leaves being almost as long as the talkes, in the rest like the other small Sorrells.

7. Acetosa Creticæ foemine acutiore. Candy Sorrell.

The *Candy* Sorrell hath weake bending talkes and sometimes but one, branched forth on all sides, the leaves are small and long not broad or forked at the lower end as divers other Sorrells are, having long foote talkes under them: the toppes of the branches end in a long spike of small mossie flowers, which afterward turne to small thinne prickling huskes or skinnes wherein the seede lyeth, every one fathned with a crooked point.

8. Acetosa Neapolitana Orientis folio. Sorrell of *Naples*.

This Sorrell of *Naples* shooteth up a talke set with smaller thicke scaly leaves thereon than those were which are broadest in the middle, and smaller at both ends like the tail, the toppes of the talke endeth in a spike of greenish yellow flowers which turne into skinnie huskes, somewhat representing, as *Columna* saith, the head of an Oxe with hornes standing up, and eares hanging downe, wherein lie the small seede.

9. Acetosa Bacysmindi Calthæfolio. Marigold leafed Sorrell.

This Sorrell also hath no other difference therein from other Sorrells, but in the leaves which are somewhat gorged and somewhat long like a Marigold leafe without those eares or points that the common Sorrell hath.

10. Acetosa Indica.
Indian Sorrell.

This *Indian* Sorrell riseth up with a slender weake hollow talke, with a few long thicke leaves thereon, somewhat smaller than those at the foote thereof next the ground, small at both ends, and of a pale greene colour, of a delicate small sharpe taste: at the toppe of the talke grow sundry brownish smooth skinnes, with small seede in them, the roote perisheth yearely.

11. Acetosa vesicaria Americana.
Indian Sorrell with swollen huskes.

The *Indian* Sorrell hath slender fretted talkes, of a cubite high, leaning downe to the ground, spreading into many branches, somewhat reddish towards the toppes: the leaves are smooth and thicke of a reasonable size, somewhat like a Garden Sorrell leafe, but that the lower points are not so long, but rather short like an Arrache leafe

12. Acetosa angustifolia tenuifolia. Sheepe Sorrell.

13. Acetosa angustifolia maior. Tall narrow leaved sorrell.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

of a pale greene colour and somewhat mealy withall every one upon a very long foote stalke, and of a more sharpe sowre taste than our Sorrell: at the toppes of the stalkes and branches stand the flowers in a long spike, like that of dinary Sorrell, but greater and of a greenish red colour: after which come round yet cornered skinnie swollen huskes hanging downewards, of a reddish colour, striped with redder veines, very beautifull, wherein are contained two or three cornered browne and shining seede: the roote is small and threddie, perishing for the most part every yeare.

12. *Acetosa Cambro-Britannica montana.* Mountaine Welsh Sorrell.

This Welsh Sorrell groweth up with small stalkes branched forth diverily with round leaves set thereon, as also growing at the bottome of them every one upon a long foote stalke, in shape somewhat like the Wall Pennywort, saving that they are cut in at the lower part with ends on both sides, the flowers hereof are whitish, and not unlike unto the other: the huskes with seede that come afterwards are reddish, and containe browne shining three cornered seede like the rest, the roote is small and threddy, abiding many yeares.

13. *Acetosa minor Lanceolata.* Sheepes Sorrell.

This small Sorrell well knowne to many (growing in many medowes with us) not to differre from other small Sorrells, but in the leafe which is somewhat small and long broadest in the middle, and pointed at the forepart end, with two small eares at the lower end of a pale greene colour bunewhat whitish.

14. *Acetosa minima.* The smallest Sorrell.

The smallest Sorrell that groweth most usually on drie barren grounds is all together like the last, but smaller in each degree.

15. *Acetosa angustifolia elatior.* Tall narrow leafed Sorrell.

This small may by the figure soone declare the variation whose stalke is slender and tall, and the leaves narrow and long, yet formed like a Sorrell, as both flowers and seede.

The Place.

The most of these Sorrells beare in their titles or descriptions the places where they have beene found.

The Time.

All of them flower and seede in *May* and *June*, except the *Indian* sort, which flowreth not untill *July* for the most part, and the seede is ripe in *August*.

The Names.

It is called in Greeke *Lapathon Oxalis* of the sharpe taste, many of the Latine Writers keepe that name, in Latine also *acetosa*, and of some *Acetula* of the sowre taste thereof, others call it *Rumex hortensis*, and *Galen* calleth it *Rumex Dioscoridis*, *Lapathium acidum*, sowre Docke, yet with *Dioscorides Lapathium* is *Lapathium hortense*, our kinde of Docke whose leafe is more sharpe and pointed than others, and not for the sharpe taste to take that name, the Sheepes Sorrell, is called *Lanceolata* and *Acetosella* by divers. *Lobelius* maketh mention of the first great sort, and *Lobel*, *Dodonæus* and others of the second. *Lobel* gave both of all others knowledge of the third, and *Columna* of the fourth; *Bauhinus* of the fifth, sixt and seventh. *Columna* of the eight, *Prosper Alpinus* in his booke of *Egyptian* plants of the ninth, of the tenth and last none hath made any mention before now, *Lobel* in his *Icones* the eleventh by the name of *Acetosa orientalis peregrina*, which *Bauhinus* calleth *Acetosa Americana folijs longissime pedatis donata*; but of the twelfth sort (if it be not the same with the second, whereunto it is very like) no author ever made mention before now, and scarce is it knowne to the gentlemen of *Anglesey* called Mr. *Morris Lloyd* of *Penrise* neere that sound it on a mountaine in Wales, the shewed it to Dr. *Barbon* in his life: the thirteenth is called by *Matthiolus Trifolium* and so by *Lonicerus*, *Fuchsius*, *Tragus*, & almost all other writers of herbes in our later age, and called *Oxalis vera* by some of *Lobel* and *Dodonæus*, and *arvensis lanceolata* by *Bauhinus*; the fourteenth is remembered by *Matthiolus*, *Gerard*, and others, all of them deservedly have the name of Sorrell, because how coarse they are in new but different in their taste, yet they all agree in the sowre taste, although some more or lesse than others. The *Arabians* as *Serapio* call it *Hamadh*; the *Italians Acetosa*, the *Spaniards Acedera Agrecilla* and *Agrettas*; the *French Oseille*, *Sallerie*, *Surelle* and *Aigrette*; the *Germanes Sawrampffer*, the *Dutch Surickle* and *Suricky*; and in English Sorrell.

The Vertues.

Sorrell is cooling and drying in the second degree, and is prevalent in all hot diseases to coole any inflammation, heate of blood in agues pestilentiall or cholerick or other hot kindes and fainting, rising from heate, and to refresh the spirits with the violence of furious or fiery fits of agues, &c. to quench thirst, and to procure appetite in fainting or decaied stomackes; for it resisteth the putrefaction of the blood, killeth wormes, and is withall to the heart, which the seede doth more effectually, being more drying and binding, and therefore stayeth the fluxes of the menstrues, or of humours in the bloody flixe, or fluxe of the stomacke: the rootes also in a decoction or in powder, is effectuall for the said purposes: both rootes and seede, as well as the herbe, have power full to resist the poison of the Scorpion, so that he that shall eare thereof shall feele no harme: the decoction of the rootes is taken to helpe the jaundise, and to expell gravell: and the stone in the reines or kidneyes: a decoction of the flowers made with wine and drunke helpeth the blacke jaundice, and the inward ulcers of the body or bowells. A Syrupe made with the juyce of Sorrell and Fumitorie is a soveraigne helpe to kill the force of those sharpe humours that cause the itch: the juyce thereof with a little Vinegar doth well to use outwardly for the same cause, and is also profitable for scurfes and spottings of the skin, as also for scabbes, ringwormes, &c. it helpeth also to discusse the scrofulaes or kernells in the throate, if it be gargled in the mouth helpeth the sores therein: the leaves wrapped up in a Colewort leafe, and roasted under the embers, and applied to an hard emposthume, botch, bile, or plague sore, both ripeneth and breaketh it: the juyce of Sorrell dropped into the eares of such as are hard of hearing helpeth oftentimes: the distilled waters of the herbe is of much good use for all the purposes aforesaid. The leaves of wilde Sorrell, and to all the rest of the same qualitie, and are no lesse effectuall in all the diseases before spoken of.

CHAP. XI.

Oxys, Alleluja sive Trifolium acetosum. Wood Sorrell.

THere are two sorts of Wood Sorrell, the one familiar enough in many places of this Land, the other a stranger as yet to *England*, and only cherished in the Gardens of Herbarists: which I have as I said brought these two sorts from their family, where they might otherwise be ranged here among the Trefoiles for their properties and nature also to past.

1. *Trifolium acetosum vulgare, Common* Wood Sorrell.

The common Wood Sorrell groweth low upon the ground without any stalke rising from it having a number of leaves springing from the roote made of three leaves like a Trefoile or three leafed grasse, but broader at the ends, and cut in the middle, of a faint yellowish green colour, every one standing on a long foote-stalke, which at their first coming up are close folded together in the stalke, but opening themselves afterwards, and so lye bearing forth more leaves than many of the former Sorrels, and yielding a juyce, which without it be clarified, and made a bold damask cleare Syrup: among these leaves rise up divers slender naked stalkes not growing above them, with every one of them a flower at the top, consisting of five small and pale yellow leaves thrust fathom, of a white colour in most places, or in some dasht over with a russet shew of bluish, and in some but on the backe side only: of any other colour, although some have set down that it beareth deepe coloured flowers: I have not seene: after the flowers are past, follow small round heads, with small yellowish seede in them: the roote is nothing but threads or small strings fastened to the end of a small long peece, all of them being of a yellowish colour not perishing every yeare, but abiding with some leaves thereon in the Winter.

1. *Trifolium acetosum vulgare.* Common Wood Sorrell.

2. *Oxys lutea flore.*

Wood Sorrell with yellow flowers.

The Wood Sorrell shooteth forth divers slender weake reddish stalkes trailing upon the ground, and taking roote at the joynts as they lie, spread into many branches with many leaves on them, standing single one above another, and made of 3. leaves cut in at the toppe like the former, but are much smaller, and of a paler green colour at the joynts. With the leaves come forth three or more small flowers together, at the end of a long foote stalke, yet each separate from other, consisting of small and pointed leaves like the other, but of a yellow colour: the seede that followeth is brownish like a rice corne, but contained in smaller and longer heads like pods or horns, yet not crooked but pointed small which quickly fall away being touched when they are ripe, and spring againe all the yeare as it groweth, as doth the Winter with perishing, if it be not too violent, which then will recover perish. It must be very sowne againe.

2. *Oxys lutea flore.* Wood Sorrell with yellow flowers.

The Place.

The first, as I find, groweth plentifully in many places of this Land, in Woods, and Woodie hilly where they have lyen moist and shadowed, and in other places like are not too much vexed by the Sun: the other groweth in divers shadowie places about *Seville* in *Spaine*, and in Gardens at *Montpelier*.

The Time.

The first bringeth many in *April* and *May*, the other after *Midsummer*, and so continueth to flower till the *Autumne* ends, yeelding ripe seede in the meane time.

The Names.

It is generally taken to be the *Oxys* of *Pliny*, whereof he speaketh in his 27. Booke, and 13. Chapter, by the name *Oxytriphyllum*, although *Fragus* and *Lacuna* did so call it, because the name did somewhat agree: but that it is an other herbe whose sharpe pointed leaves, and not the sharpe taste caused the name to be given

Original from UNIVERSITY OF MICHIGAN

Acetosa would fignifie both sharpeneſſe in forme and in taſte, it is called *Trifolium acetoſum* of divers, which is the ſame in ſignification as I ſaid with *Oxytriphyllum*, and of ſome *Panis Cuculi*, Cuckowbreade, eyther becauſe the Cuckowes delight to feede thereon, or that it beginneth to bloſſome when the Cuckow begineth to utter her voyce; it is called by the Apothecaries in their ſhoppes *Alleluia* and *Lupula*, the one becauſe about that time it is in flower when *Alleluia* in antient times was wont to bee ſung in the Churches, the other becauſe it grows in *Italie* as they of *Calabria* in *Naples* doe call it, as *Scaliger* upon *Theophraſtus* declareth plainly: yet it is there ſet downe *Alleluia*, but I thinke it rather ſhould be *Lupula*. The other is called in high Dutch, *Haſen Klee*, and *Oxyflores circulata repens* of *Lobel*, and of *Bauhinus Trifolium acetoſum vernale minus*. The Italians call it *Trifolio acetoſo Pan cuculi* and *Alleluja*, the *French Pain-lovain*, the *Germans Sawer Klee*, and *Brodklee*, and we in *English* Wood Sorrell, Wood ſower, Stubbe wort, and Sorrell *diuers*.

The Vertues.

Wood Sorrell is cold and dry as the other Sorrells are, and leaveth to all the purpoſes that they doe, being as effectuall if not more, eſpecially in hindring the putrefaction of blood and ulcers in the mouth and body, and in cooling and tempering diſtempered heate and inflammations, to quench thirſt, to ſtrengthen a weake ſtomacke, to procure appetite, to ſtay vomiting, and moſt ſingularly excellent in any contagious ſickneſſe or peſtilentiall fever, the ſyrupe made of the juice is effectuall in all the cauſes aforeſaid, and ſo is the diſtilled water of the herbe alſo: ſpunges or linnen cloches wet in the juice and applyed outwardly to any hot tumors and inflammations doth exceedingly coole and helpe them: the ſame juice taken into the mouth and cleane gargled for ſome time, and after ſpit forth and freſh taken, will wonderfully helpe a ſtinking ſoule Canker or Vlcer there: it is alſo ſingular good in wounds, punctures, thruſts and ſtabbes into the body, to ſtay the bleeding and to cleanſe and heale the wounds ſpeedily, and helpeth well alſo to ſtay any hot defluxions or rheumes upon the Throat and Lungs.

Chap. XII.

Atriplex ſylveſtris. Wilde Arrache.

Of the two ſorts of garden Arrache are already ſet forth in my former booke, there remaine divers other ſorts to be declared, as well ſuch as for their rarity and beauty were nurſt up in our Gardens as grow wilde, whereunto I would alſo joyne the Sea plant to ſet them all together.

1. *Atriplex baccifera rubra.* The red berried Arrache.

This beautifull ſmall plant ſendeth forth divers ſlender branches ſomewhat woodily, about a foote high or more or leſſe as the place where it groweth will produce, with a ſmall cornered leafe like the broad leafe wilde Arrache, ſet at the joynts one above another, and at every of the ſaid joynts with the leafe from the ſtalke ſtandeth a ſmall red berry, cluſter faſhion, that is many ſmall graynes ſet together like a Mulberry, cleare and almoſt tranſparant, full of an excellent juice, as red as blood or Claret wine, which being bruiſed upon the backe of the hand while it is freſh will ſeeme as if you had drawne blood out thereof, which berry being dry groweth blackiſh, and containeth within it ſmall blackiſh ſeede, and will ſtill ſpring up every yeare, if it be ſuffered to ſeed: the roote is ſmall and fibrous periſhing after ſeede time.

2. *Atriplex ſylveſtris lappulæ habens.* Wilde Arrache with ſmall berries.

This Arrache like wife is ſmall even ſmaller then the other, whole branches doe not exceede an hand breadth or little more at the moſt: ſet with ſuch like ſmall cornered and pointed leaves as in the other, every one ſtanding upon a ſhort footeſtalke, at every joynt with the leafe even almoſt from the bottome commeth forth two or three ſmall berries or buttons, of the bigneſſe of a Coriander ſeede, containing therein ſmall blacke ſeede like the laſt mentioned: the roote is ſmall and woodily periſhing every yeare after ſeedetime. Of this kind there is another that hath greater browne leaves and ſtalkes, not differing in any thing elſe.

3. *Atriplex ſylveſtris ſemine compreſſo roſeo.* Wilde Arrache with flat roſelike berries.

This other wilde Arrache ſheth a whitiſh hard round ſtalke, about a foote and a halfe high, ſpreading forth many ſmall branches, and they againe ſhooting forth other ſmaller ones, which have their leaves downe a long, whereon are placed ſmall hoary or mealy leaves, no bigger then the nayle of one's finger, ſet at the joynts one over another, ſomewhat like unto the wilde Arrache called Goofefoote, every one cloſing the ſtalke and branches with their foote ſtalkes, as every of theſe leaves commeth forth a moſt dainty broad and fat coloured middle, much like unto leaves, folded up a little in the middle, having foure other eminences at the bottome edges, ſet as it were two and two, that the hollow edges are betweene them ſomewhat like unto the folding of the leaves of a Lilly, ſo as it ſeemed in every one of which foure aforeſaid eminences is contained one flat ſeede of a reddiſh blackiſh colour.

4. *Atriplex marina repens.* Creeping Sea Arrache.

This Arrache groweth upon the ground with many hoary white branches and mealy white leaves ſet on them in order, ſmall on the edges as here at the bottome, and pointed at the ends, ſomewhat like unto a ſmall Goofefoote leafe, at the toppes of the branches grow divers ſlender hoary yellowiſh ſtakes of ſeede ſet with ſmall greene like cluſters: the roote is great with many ſtrings and periſheth not: the ſtalke of a ſilvriſh colour although it grow in a Garden, ſometimes it will turne reddiſh like the Gardon red Arrache and ſometimes nothing to any bee ſeene but white greene.

5. *Atriplex marina anguſtifolia.* Narrow leafed Sea Arrache.

This groweth up with an hoary and woodily ſtalke a foote high, ſpread at the toppe into many ſmall branches ſtored with ſtarre like ſpikes, which end in long yellow ſpikes of cluſtering ſeede like the former, the leaves that grow below are ſomewhat long and narrow about two inches long, of a darke greene colour with ſome corners on the edges but ſmaller as they grow higher.

6. *Atriplex ſylveſtris vulgatior fœmina.* The greater common wild Arrache.

The greater common wilde Arrache hath ſtrong round hard ſtalkes and branches, with large leaves on them like

7. *Atriplex fylvestris angustifolia hirsuta.* Narrow leafed wilde Arrache.

8. *Atriplex vulgaris fœtida.* Stinking wild Arrache.

those of the Garden, but not so broad or pointed at the bottomes, yet much waved or cut in on the edges, and of a curry mealy greene colour: the toppes of the branches are flored with long spikes of chaffie huskes, out of which come small yellowish greene flowers, which afterwards give small blackish seede like unto Purslane: the roote is long some what woodddy and fibrous perishing yearely. There is another hereof lower and lesser in every Minor. part narrower also and a little waved on the edges, and perishing in the like sort.

7. *Atriplex fylvestris angustifolia.* Narrow leafed wild Arrache.

The stalkes of this wild Arrache are very much branched with somewhat long and narrow leaves set at the joints, pointed at the ends, and smooth, without cuts on the edges, the long tufts of yellowish greene flowers stand in the same manner with the last and the like seede.

8. *Atriplex fylvestris latifolia hirsuta.* Goosefoote.

The stalkes of Goosefoote are greene and somewhat crested, with sundry branches and great broad greene leaves set thereon, cut in somewhat deepe towards the footestoke of them, with long spiked flowers at their toppes, of a reddish colour yeelding small seede like the others.

9. *Atriplex fœtida vulgaris.* Stinking wild Arrache.

The herb small and almost round leaves, yet a little pointed and without dent or cut, of a dusky mealy colour growing on the tender stalkes and branches that spread on the ground, with small flowers in clusters set with the leaves, and small seede succeeding like the rest, perishing also yearely, and rising againe from its own sowing, that smelleth like old rotten Fish or some stinking weede.

10. *Atriplex fylvestris Halimifolia.* Sea Purslane leafed wilde Arrache.

The leaves of this wild Arrache are greater then the last, more mealy also and not stinking, of a pale Willow that grow upon stalkes or some cubits high, with flowers and seede like the others and annuall also. Some other wild Arraches there are also differing little from these before set downe, but in being higher or lower according to the soile, or having smooth or waved leaves more or lesse on the one side or both, which I thus to have declared I hold sufficient, and will not entertaine you of them.

The Place.

The first came out of [illegible] as it is thought: the second groweth upon a hill of *Narbone* in *France*: the third [illegible] the fourth by the Sea side of our owne coast almost every where, the last was found [illegible] wild places are found by walls, hedges, ditch sides and out places in many parts of the Land.

The Time.

They flower in *June* and *July*, and their seede is ripe quickly after.

The Names.

The Garden Arrache is called in Greeke Ἀτράφαξυς and Ἄτραφαξις and Ἀτράφαξυ quod Ἀτράφαξις *Theophrasto in duobus locis videtur de aliquando dicendi*: it is called also *Chrysolachanon*, ἀπὸ τῆς, *Aurum olus*, in Latine *Atriplex* and *Atriplex aurea*: in English hath it, and *Arrache*, it is called by the *Arabians Carf* and *Carf*,

by the Italians *Atriplice* and *Arrapice*, by the *Spaniards Armoles*, by the *French Arroches* and *Bonne Dames*, by the *Germans Milden* and *Melden*, by the *Dutch Melde* and *Atevescruyt*, and we in *English* Arrache, and some Orache corruptly. The firſt *Cluſius* letteth forth by the name of *Atriplex hortenſis*, and *Bauhinus Atriplex mas ſativa*. The ſecond and third *Bauhinus* letteth forth under the ſame titles they carry here; the fourth is called by *Lobel* and *Pena Atriplex repens latifolia*, and *Tragus Atriplex*, and by *Matthiolus*, *Dodonæus*, *Camerarius* and others *Atriplex marina*: the fift *Bauhinus* onely expreſſeth by the name of *Atriplex maritima anguſtifolia*: The wilde ſorts are termed *Atriplices ſylveſtres* by all authors. *Thalius* calleth the greater and leſſer of the firſt ſort, *Atriplex ſylveſtris major* & *minor*, and *Lobel Sumach*: the ſeventh is called by *Lobel Atriplex ſylveſtris Polygoni aut Helxines folio*, and *Tragus* by others: the eighth is taken to be a *Blitum* by *Tragus*, as alſo a *Solanum*, but generally by others *Atriplex canum* or *Chenopodium* by *Tabernæmontanus*, meaning the Garden ſort with purpliſh leaves of Gooſefoot like wiſe; yet *Caſalpinus* tooke it to be another ſort of *Cynocrambe*: the ninth is called *Atriplex canina* by *Tragus*, and *Tragium Germanicum* by *Dodonæus* in his *French* Herball, but in his Latine *Cynocrambe* as *Tragus* doth. *Tabernæmontanus* by ſome but by moſt *Atriplex alida* or *fœtida*, yet ſome *canina* or *hircina*: *Lobelius* onely calleth it *Cynocrambe* or *Canina ſerpens*: the laſt is called by *Lobel* in his Obſervations *Atriplex Flandrica*.

The Vertues.

Garden Arrache (for thereof alſo I ſhall relate the properties in this place, for that I have ſpoken at large of them in my former Booke, and becauſe ſome of theſe former wilde ſorts have not beene known to the world any diſcale, being but lately found out, yet I doubt not but their temperature is correſpondent to the reſt their taſte being not much different from the common wilde ſorts, which are neither to cold or moyſt as the Garden kindes are (ſaith *Galen*) and the Sea kindes ſomewhat hotter than the other, as you ſhall heare by and by: cold in the firſt degree and moyſt in the ſecond, participating of a watery quality almoſt wholy, from hence earthly parts ſmeare and little abſtriction, but as Mallowes quickly paſſe through the belly and thereby are ſoluble, it hath alſo a ſmall thickning quality therein, thus ſaith *Galen*. *Dioſcorides* ſaith it is good for the Flux, Iaundiſe, to drinke the ſeede with Meale or honyed water: *Lyeus Neapolitanus* is ſayd to give it againſt the ſtrangler that commeth to thoſe that have taken *Cantharides*. *Matthiolus* ſaith that hee knew an Apothecarie gave the ſeede Arrache to country people to drinke, which thereby purged them mightily both upwards and downwards, and that with much trouble alſo. *Hippocrates* applyed the juice thereof by a ſponge to the ſcales of the mother, it cooleth hot apoſtemes and S. *Anthonies* fire, and diſſolveth tumors applyed reſcrved freſh or boyled applyed with Vineger and Nitre it eaſeth the paines of the goute and cureth ſcaled nayles. The Sea Arrache is in proportion like unto the wilde ſorts but by reaſon of the ſaltneſſe doth more cleanſe, and doth more trouble the belly then the other, being taken in the broth of fat meate, and helpeth thoſe that have the Dropſie: it cauſeth leanneſſe in them that are too fat, and preſerveth them from putrefaction. The common wilde Arraches are neere as cold as the Garden ſorts but more drying tending chiefely outwardly for inflammations: but Gooſegraſſe is held much colder and therefore more worthy to bee applyed, being held to be ſomewhat venemous if not deadly to be taken inwardly, and found certaine to kill Swine. Smoking Arrache with dead coales is ſaid to helpe women payned and ready to bee ſtrangled with the Mother to ſmell thereunto; *Hippocrates* alſo affirming that ſtinking or ſtrong ſcented things are good for that diſeaſe: it killeth alſo the Worme in the eare of Horſes or other Beaſts.

Chap. XIII.

Beta. Beetes.

HAving I have entreated of divers ſorts of Beetes in my former Worke, even of all that have either a faire or pot herbe; there remaine ſome other ſorts to be ſpoken of in this Chapter, and becauſe more fitly in no other place than any where elſe in my grande, doth the ſorts of Spinage belong, although I know ſome do refer it either to the Arrache ſimply, becauſe it is moſt like thereto in leafe, or to nothing at all, as *Matthiolus* miſliketh; others unto *Lapathum* ſimply the Docke, as *Ruellius* who calleth that *Lapathum ſecundum ſive Spinachia*, whereunto I can finde it in no part to agree but in being raiſed upon Gardens: ſome againe finding them to agree to the Beete, eſpecially in the ſeede and with the roote, as their tuckes enumerated them *Acetoſo Lapathum*, and they would call it a Beete Docke; and others would referre them to Docke and Mallow, calling them *Bonhomalache* for the ſolubilitie and ſlipperineſſe they doe effect in the bowels, but upon good grounds, as I ſuppoſe, refuſing all the former doe ioyne them with the Beetes, and next to Arrache, not onely for the likenſſe of the ſeede unto the Beete, yet in ſome more rough or prickly, but alſo leafe alſo, although in ſome more or leſſe one of the bottome of them; if any miſlike this my opinion, he may keepe their old wayes ſtill whatſoever it be. I have thought good therefore to give you the figures of them here in the forepart before the Beetes.

1. *Beta Cretica ſpinoſa.* Prickly Beetes of Candy.

This *Candy* Beete ſpreadeth many long and weake branches upon the ground, of a reddiſh colour full of ioynts with ſomewhat long broad and round pointed leaves, covered with a ſmall hoarineſſe or mealinoſſe like unto the leaves of the blite, or ſmall red Beete: from every ioynt, even the loweſt, it ſpreadeth forth branches unto the toppes, and at every of them ſtand divers ſmall and greenith browne headded huſkes reſembling eares ſharpe and hard pricked, out of which ſtarre forth ſmall yellowiſh greene flowers and after every one ſmall round ſeede in every of thoſe huſkes covered with a red skinne; the roote is ſmall long and fibrous, dying every yeare, it giveth ſeede, or otherwiſe be hindered from bearing, for it abideth all Winter although it ſeede not.

2. *Beta ſylveſtris maritima.* Sea Beetes.

The Sea Beete hath ſuch like darke greene leaves as the ordinary Beete hath with ſome red veines in them and ſome without; ſome alſo having reddiſh ſtalkes, and others greene, but they are ſmaller, narrower, and more

Original from UNIVERSITY OF MICHIGAN

what thicker also than the Garden kinde; in other things it differeth little from it: neare the leaves hath some-what a salt taste, but nothing so much being transplanted.

3. *Beta lutea Syriaca.* The yellow Beete.

There is also from some parts of Syria, brought unto us and nurtled up in some curious gardens, a yellow kinde whose roote is of a paler yellow colour than a Carrot, the leaves also being of a yellower greene than those of the ordinary white Beete.

4. *Beta platicaulos.* Flat stalked Beetes.

Sometimes there hath beene seene a degenerated kinde of Beete, whose stalke was broad from the middle to the toppe branching forth on all sides, and foure inches broad at the highest, all the leaves being smaller than ordinary and so thicke set thereon upwards, that the stalke could scarce be seene, especially at the toppe where the seede stood.

The Place.

Their places are specified in their titles or descriptions, yet *Gesner in horto* saith, that he had it from credible persons, that the yellow kind is found about the cities *Durachium* and *Alectum* in Macedonia.

The Time.

They doe all flower in the beginning of *July*, and their seede is ripe in *August*.

The Names.

Beetes are called in Greeke σεῦτλα and σεῦτλον, *Teutla* and *Teutlon*, *ab impulsu quod facile evolvitur*, as *Lucius Beta, quoniam facilem lucem à radice femine turgescente reserre videtur*, which *Columella* in his tenth booke remembreth in these Verses.

Hemon ubi Graji, tot Betæ prodigia, &c.
Pontica vasta solo, nec sine monstro fera,
Et Barbara gregis, feroces cæspite ritu
Hispanæ vitis viridis, pedis candida Beta,

It is called by the *Arabians Dersa* and *Calo*, by the *Italians Bietola*, by the *Spaniards Selga*, by the *French Bette Rave*, and *Poree*, by the *Germans Mangolt* and *Pissem*, by the *Dutch Beets*, and we in *English* the white Beete: this called in former times *Sicula*, and in the later *Sicla*: there hath beene some doubt among many what Beete the ancients meant by the blacke Beete, some thinking the greene beete rather of a darke colour should be it, but others take the common red Beete to be it, which by the darke red colour commeth nearest thereunto, which opinion I take to be the more certaine. Beetes were onely planted in Gardens, and no wilde kinde found with the ancients, as *Gesner* saith, for although *Pliny* might thinke the *Lunarian* were kinde of the wilde Beete, yet *Dioscorides* did not so account it, but made it another quite differing kinde of herbe, and gave thereto other manner of properties: yet at this time, as you see in this Chapter there are more sorts to be growing wilde of their owne nature. Divers doe call the first *Blitum sanguineum*, because the leaves doe also resemble a Blite as the Beete. *Lobel* maketh mention of the sea kinde, *Camerarius* in parts of the yellow, and it doth *Gesner in horto Germaniæ*, who saith that in *Syria* it is called *Skandor*, and that *Prosperus Alpinus* the *Venetian* reckoneth it among the sorts of Rapes or Turneps; and that *Bellonensis* likewise mentioneth it upon his Scholies or Comments on *Aetius* in the Chapter of *Sicla nigra*. *Lugdunensis* calleth the last as it is in the title. The Spinage which I have here joyned with the Beetes, is called by most *Spinachia*, and by some *Spinachia alba*: some of the later Greekes doe call it σπανάχια *Spanachia a veritate in usu modico*; and some *Spanachia* in latine, as *Matthiolus*, and those that follow him, who I thinke first so called it, because *Turner* called it *Olus Hispanicum*, supposing as many others doe that it first came from *Spaine* to us.

The Vertues.

Simeon Sethi and divers of the ancients have set downe in their writings that Beetes have an hurtfull qualitie in them for the stomacke, and breede many diseases: they have indeede a more nitrous qualitie whereby they provoke more to the stoole than Arrache, Lettice or Mallowes doe, especially the white: for the red beete is not good to stay the bloudy flixe, womens courses, and the whites, and to helpe the yellow jaundise; the white doe more slenderly, digesting, and provoking urine also, and the red more astringent, especially the roote: the juice or the roote put into the nostrils purgeth the heade, and helpeth the noise in the eares, as also the mundificative juice of the white Beete openeth obstructions, both of the liver and spleene, and is good for the head ache, swimming therein, and the turnings of the braine, and is effectuall also against all venemous creatures: the juice of white Beetes applied upon the temples staieth the inflammation in the eyes, the same also helpeth broken being oyled without any oyle, and if a little Allome be put unto it, it is good for Saint *Anthonies* fire: the juice also is good for all wheales, pusshes, and other blisters and blanes in the skinne: the herbe being boyled and laid upon chilblanes on the hands, or kibes on the heeles helpeth them: it healeth the itch also if the place be bathed with the decoction of the herbe in water and some vineger: the same doth likewise cleanse the head of dandruffe and drie scabbe; and doth much good also for fretting and running sores, ulcers and cankers in the lips, tongue or other parts; it is much commended also against baldnesse and shedding of the haire. The wilde Beetes that are here set downe have not beene applied to any use that I know as yet; neither did I ever learne or read of any Physicall properties of the Spinage.

Chap. XIV.

Blitum. Blites.

Vnto the Beetes doe the Blites require to be next joyned, of divers whereof I have spoken more at large in the first Booke, namely of the Garden sorts white and red besides the *Amaranthus*, to which I have referred the wilde sorts, whereof I meane not further to relate here, although I may give you some of their names, as also of some other sorts not there remembred.

1. *Blitum album sylvestre minus.* The small wilde white Blite.

The small wilde white Blite groweth small and low, with smaller whitish greene leaves set in the stalkes like the

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

the greene fort of the garden: the flowers and feede are like it also, and the roote lesse, smaller in every part.

2. *Blitum rubrum folijs minus.* The small wilde red Blite.

The leaves of this fort are somewhat and in some places more red than in other, and giving a fine red juyce as it is boyled with (being ordered accordingly) as the red incke made of Brasill. This is in all other things like unto the greene garden red kinde.

3. *Blitum Polyspermon.* Wilde Blites with much seede.

The lower leaves hereof are very like unto the leaves of the former wilde sort, yet a little rounder and smaller also at the tops that are thicke set, as the tuftes whereof grow long and spike: growth heads of seede very close together resembling (to be all seede, whereof came the name *Polyspermon*) and is like unto the others, the rootes are wholly white and some what long.

5. *Blitum Virginianum majus.* The greater Virginian Blite.

The greater Blite riseth up with one great thicke round, yet almost square tall stalke five or six foote high, full of small branches on all sides from the bottome to the toppe, set with larger leaves than in any of the garden kinde, and of a fad greene colour, else to like them, that they plainely declare themselves: the seede groweth in small tufts at the toppes of the stalke and branches which being ripe is small black and shining like the rest.

6. *Blitum Virginianum minus Amaranthi facie.* The smaller Virginian Blite.

The smaller sort of Virginia is very like the last sort but much smaller and lower, having stalkes and leaves somewhat reddish with the greene, branched also but lesse, and with small long tufts of reddish late leaves as it were, and small blackish somewhat shining seede afterwards, but neither so blacke nor shining as the last: the roote is small and fibrous perishing every yeare, yet often is raised againe from the sowne sowing.

6. *Amaranthus coccineus elegans maximus.*

The greatest scarlet Flower gentle.

The greatest Flower gentle riseth up with very great thicke round tall stalkes, richer higher and greater than the most in any great Flower gentle, with as large great leaves both in colour and bignesse, but both the stalkes and they are of a high yellowish pale green colour, with very little or no mixture in them at all (and this is one proper marke to know this sort from others before it come to flower) the flowers stand at the toppes of the stalke and branches more spread at the bottome into sundry pares, the middle being longest, and chiefly when it is in the perfection hanging over the rest, the other parts like shorter spikes compassing it round which even for the proportion is very beautifull, but much more for the colour which is of a more excellent then scarlet red colour, which being gathered in the prime will hold the colour a good while before it decay, if it be kept from the Sunne and winde also: the seede included in their husks is also as white and small as the grosse sort, yet a little redder whereby it may be knowne to differ. The descriptions of the other sorts of Amaranthus we erase in my former Booke.

The Vse and Vertues.

Some of these grow in our owne land in divers wast places, as in gardens also as a weede, namely the three last sorts, the other sorts are brought from sundry parts beyond the Sea: the first from Virginia, & the last from *Brasill*, or some other part of America and Inde in the East & West.

purse,

white, Kentonense, and the Cockes foote grasse: the third is taken by *Lugd.* to be the *Polysperon* of *Cesalpinus*, and by *Lobel* and *Lugdunensis Polyspermon*: the three last sorts have not been remembred by any author before me.

The Vertues.

The generall vertue of moist as well as thick plants as in all other is that those which have red flowers, seedes or roots do stay the red coulers in women, and all other fluxes of blood in man or woman, and those that be white the whites in women or the *Hemorrhoides*, which although it may fall out right in some other yet that without hold good in all I can not certaine my selfe, nor can I assure any other, yet the qualities of all doe seeme cooling, drying and binding: for by *Hippocrates* testimony serve to restraine the fluxes of blood in many places, *Cesalpinus* hath set it downe for an experiment, and *Aegenius* confirmeth it that Tilles are much stronger when the third sort leaves pressed, and by that baite are usually taken.

Chap. XV.

Viola. Violets.

HAve given you in my former booke all the sorts of Violets and Pansyes either simple or double that are usually to furnish a garden of delight and pleasure: there are yet some other wilde ones of both sorts to be entreated of, which I have set downe together in this Chapter.

1. *Viola purpurea.* Purple Violets.

The Violet groweth about a foote high or more, with hard upright stalkes, which yet bend downe againe their tops: having two leaves somewhat round set at each joynt but longer and more deepely cut about the edges then the garden kinde, at which joynts with the leaves on both sides of the stalke commeth forth a larger flower and more spread upon the brim, being more like a Pansye, but of a pale purple colour almost as sweet as the Violet as *Matthiolus*, but without odour as *Lobel* saith: *Dodonaeus* maketh mention of this sort as I take it, but he describeth it with variety of colours like a Pansye and therefore called it *Viola affinis tricolor*, and *Gesner* set it forth to grow on Mount *Baldus*, but *Matthiolus* declareth no varietie of colours in his but onely saith the flowers are full yellow longer seede vessels then the Violets or Pansyes have, wherein is contained a small seede like that of the Pansyes or Violets, the roote consisteth of many strings which abide not after seedetime, but perish at the falling seede.

2. *Viola cornuta purpurea latifolia.*
Great purple horned Violets.

This great Violet sendeth forth divers long and narrow leaves somewhat like unto *Rosemary* leaves but far narrower and lesse than it, among which stand flowers every one standing upon a small long foote stalke very like unto a Violet and of a purple colour but without any sent at all, the seede vessels also like unto Violets with divers fibres set at them.

3. *Viola montana Lacinariifolia.* Mountaine Violets with jagged leaves.

This jagged Violet bringeth out five or six leaves from the roote cut downe to the long foote stalke, more cut in on the edges then the common sort and five or eight divisions, like unto a Crowfoote leafe or rather unto a broad leafed Anemone, between which leaves rise up several small stalkes and flowers on them of what colour as yet is not yet knowne but there were two plants found which had contained the seede like unto the former sort of Violets: the roote was somewhat great and of a meane length.

4. *Viola lutea Virginiana.* Yellow Violets of Virginia.

The Virginian yellow Violet is very like our yellow Violet remembred in my former booke, and so is the small yellow flower.

5. *Viola varie striata Eboracensis.* Yorkeshire striped red Violets.

The reverend Minister of Yorkshire assured me he found a kind of wilde Violet in many places of that Country, whose leaves were somewhat thinner and thinner then of others, and the flowers reddish with white streakes therein.

6. *Viola sylvestris.* Wilde Violets.

The wilde Violet differeth little from the garden Violet, but that the leaves are fewer in number, somewhat more deeply cut, and a little longer or not fully so round, the flowers also are larger and of a very pale purple colour, seede vessels fewer in number, not having any smell at all or very little.

7. *Viola tricolor sylvestris.* Wilde Pansyes or Heartsease.

There are two of these sorts of wilde wilde Pansyes not differing one from another, nor any of them from the garden kinds by forme of leaves, flowers or manner of growing, but in the colour and largenesse of the flowers.

All

Viola tricolor major & vulgaris.
Greater and lesse Pansyes or Three-eares ease.

β. Viola Hortensis Tricolor.
Garden Pansyes or Heart-ease.

all of them for the most part being smaller then those of the Garden, and as for the first, there is none at all in the flowers the colours are divers, yet scarce a flower among many but there will be in them for they are chiefely white and pale blew, more or lesse marked and spotted, and sometimes some yellow in the bottome.

The Place.

The first as is before sayd was found upon Mount *Baldus* as also upon the *Pyrenean* hills at *Narbone*, the second was found in *Spaine* by *Guillaume Rael* as excellent an Herbarist as any is in our time, who brought a root hereof as he saith himselfe among many other rare plants hee brought from thence: the third (as saith hee had the Doctor *More* who gathered the plant in his returne from *Italy*, and shewed it dry to *Clusius*, the fourth was from *Vienna*, and the fift from *Yorkshire* as is sayd in the description, the two last grow wilde in our own Land plentifully enough, the wild Violets in woods and Orchards and under hedges upon heaps and also in shady places, the wilde Pansie in the Corne fields and in such as lye ley, and in the borders of others fields.

The Time.

All these flower after the Garden Violets, and as the Pansyes unto the end of July.

The Names.

The Garden Violet is called in Greeke ἰὸς κηπαία *Viola purpurea* by *Theophrastus* and *Dioscorides* and *Matthiolus* ἰὸς μελανθὴς *Melanthium* by *Theophrastus* believed by the ancient Greekes (for to feed some to other writings) to be called of *Io* who was transformed into a Cow by *Iupiter*, the earth being created to bring forth that sort of cattle to feede on: or as *Hermolaus* reporteth *Nicander* to say in his *Georgicks*, that the Violet was called *Io* of certaine Nymphes of *Ionia*, who first gave of those flowers to *Iupiter* as a present, the Latines give it the same *Clusius*, and the herbe *Violarius*, *Violaeque nomen* by putting the Letter *l* in stead of the Greeke *ι* made *Iemma* to thinke that *Viola* was *Quasi Iuno* of the Ladies, unto *Iuno* in his second Eclogue *Violaria Iunonis Lactea mira Leucoia*, but *Virgil* in his tenth Eclogue shewes us that we must meane them for our Violets when he hath as different herbes in these words *Et nigræ Violæ sunt & Vaccinia nigra*, but I have shewed where the true *Vaccinium* of *Virgil* is in my former booke in folio 127. and 128. *Pinarius* also in his seventh booke of Architecture distinguisheth *Viola* from *Leucoium*, for the wing the different colours they gave unto it, whereof came *Leucoium* a Violet, A Violet or purple colour, & one others thinke that *Io* came of *Iuvo* to help, as *Plautus* saith *Ut nunc Deorum præsentia, aut præsens prospera Iuvencula Iuvenculæ Iuvenili Violæ*. The *Italians* call it *Viola mammola*, the *Italians Viola porpore* and *Pensamore* and *Viola mammola*: the *Spaniards Violeta de Marzo*: the *Germans Marien Violen*, the *Dutch Violieren*, and we our *English* Violets. Double Violets a The Heart-ease is called by us Pansyes from the *French* word *Pensées*, as also Love in idle, and three faces in a hood, and in Latine *Viola tricolor*, and *Herba Trinitatis*, some also call it *Jacea* (as *Gesner* translateth *Herbam Jaceam* some copies have) of *Theophrastus* lib. 6. c. 8. some also call it *Herba Trinitatis*, *Flos Trinitatis* and *Viola Trinitatis* of the three colours herein. Matthiolus the Italian will have *Iacea* to be called *Iacea*, but there is another *Iacea* called *nigra*, whereof I have largely entreated before, and likewise

Violets, *Violaccia* the *Italians* call it *Fiore di Gieue* and *Minuti pensieri*, the *French* as I said before *Pensees* and *petits pensees*, the *Germans Freyschenkraut*, the *Dutch Prufeen*. The first is called by *Matthiolus Viola arborescens*, by *Gesner Viola Persica*, by *Lobel Viola Martia serotina caulicula*, by *Dodonæus Viola assurgens*, by *Lonicerus Viola violarum*, and by others *Viola elatior* and *arborea*: the second is called by *Matthiolus Cara gesteriorei folia*, & *Viola montana pumila*: the third by him in his history *Viola montana lactea odora*, the fourth and all have not been remembred by any before: the two last are reckoned under the generall name of *Viola odora* with the addition of *syluestris* to shew their distinctions.

The Vertues.

The common Violets and so likewise the wilde kindes are cold and moist while they are fresh and greene, and are singularly good for any heate or distemperature of the body, either inwardly or outwardly, the inflammations in the eyes in the mother or in the fundament when they are fallen downe & are full of paine, Impostumes also and hot swellings: to drinke the decoction of the leaves or flowers made with water or wine, or to apply the pouder of it with oile to the grieved place, it likewise easeth paines in the head, which are caused through want of sleepe, or in any other place arising of heate applyed in the like manner, or with oyle of Roses: a dram weight of the dryed leaves of the flowers of Violets, (but the leaves more strongly) doth purge the body of cholericke humors, and asswageth the hearcheing taken in a draught of wine or any other drinke: the pouder of the purple leaves of the flowers onely picked and dryed, and drunke in pouder with water is said to help the Quinsie and the Falling sickenesse in children, especially in the beginning of the disease: the flowers of the white Violets ripeneth and dissolveth swellings: the seede being taken resisteth the force of the Scorpion: the herbe or flowers while they are fresh, or the flowers when they are dry are effectuall in the Pleurisie and all other diseases of the Lunge, to loose the sharpenesse of hot rheumes and the hoarsenesse of the throate, the heate also and sharpenesse of urine, and all paines of the backe or reynes and the bladder: it is good also for the Liver and the laundies, and in all hot agues the syrup is cooling, coole the heate, and quench thirst: but the Syrupe of Violets is of most use and of better effect being taken in some convenient liquor, and if a little of the juice or Syrupe of Lemons bee put to it or a few drops of the oyle of Vitrioll, it is made thereby the more powerfull to coole the heate and to quench the thirst, and besides the effect giveth to the drinke a Claret wine colour and a fine tart reddish pleasing to the taste. Violets taken or made up with honey doth more cleanse then coole, and with sugar contrariwise: the dryed flowers of Violets are accounted among the Cordiall flowers and are used in cordialls, drinkes, pouders and other medicines, especially where cooling cordialls, as Roses and Saunders are used: the greene leaves are always used with other herbes to make Cataplasmes and Poultesses for inflammations or swellings, and to ease paines wheresoever arising of heate and for the piles also being fryed with Yolkes of Egges and applyed thereto. Pansyes or Heartseare is like unto Violets in all the parts thereof, but somewhat hoter and dryer, yet very temperate, and by the vitrous or glutinous juice therein doth somewhat mollifie, yet lesse then Mallowes: it is conducing in like manner as Violets to the hot diseases of the lungs and chests for agues, for convulsions, and the falling sickenesse in children: the places also troubled with the itch or scabs being bathed with the decoction of them doth helpe much: it is said also to soder greene wounds, and to helpe old sores: drunke the juice or the distilled water: *Lugdunensis* affirmeth it downe that many sacks full of the flowers and herbes are transported from *Marseilles* in *France* into *Alexandria*, and other parts of *Egypt* where they use them boyled in water, which onely by their religion they are enjoyned to drinke, not onely thereby to make it the more wholesome to be drunke: but are perswaded also that it helpeth the diseases of the lungs and chest, and the falling sicknesses.

Chap. XVI.

Fragaria, Strawberries.

IN my former Booke I have shewed you not onely most of the edible Strawberries, but one wild sort also that was fit to furnish that Worke, the figure of one which will decipher all the rest I give you here, there are some other sorts to be entreated of fit to be eaten, which were omitted, and others that are wilde without edible fruit, and therefore called by some barren or without fruite.

1. *Fragaria minor hispido folio*, Small Strawberries with hard leaves.

This Strawberrie groweth like to other Strawberries both in leaves, flowers, and fruite, but lesse in all of them, and to distinguish it the more certainely from the other sorts, the leaves hereof are hard rough and hairie, grayish as well in the upper as under side: the berries when they are ripe are small but sufficient pleasant to eate, red on the one side, and white on the other, as if they were equally divided.

2. *Fragaria Alpina fructu compresso*. Flat Strawberries.

There is no difference in this kinde from our ordinary Strawberrie, but in the fruit which is more flat then round, and hath a little eare-like, every berrie of a taste neare a Raspis: this also usually beareth fruit againe in the Autumne.

3. *Fragaria Helvetiana nana*. Dwarfe Strawberries.

Some may judge that this Strawberries smallnesse commeth by the barrennesse of the soyle wherein it growes, but that is not so, for it is well knowne to most, that those hills of the *Switzers* have no barren ground upon them, but are beautified with small tripartted leaves next the ground, closer set together upon shorter foote stalkes then any of the rest that are set on both sides of the long branch, not above foure inches long, which lieth creeping upon the ground, grow lesse and without stalke: the flower standeth at the end of the branch many times, but not alwaies, which consisteth of five round leaves like a Strawberrie, but larger then ageeth with the proportion of the plant, and is of a yellowish colour; what fruite this beareth wee have not yet seene, or know certainely. This commeth neare unto the description of the *Fragaria affinis fericea planta* of *Bauhinus*, but differeth greatly, so calling it, which as he saith is the *Leucas Dioscoridis Adversariorum*, and giveth thereunto a small head containing small seede therein: but this was brought us from the *Alpes* by one *Fletcher* a *Switzer*, a Herbarist, or Physicke but very skilfull in simples, who perished in *Virginia* by taking some

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

poysonfull herbe, and therefore I thinke it should beare a Strawberrie like head, whereunto I am the rather

Fragaria vulgaris. Common Strawberry.

induced, because that as *Bauhinus* citeth, although wrongfully, as I thinke, for I cannot finde it in him, *Gesner in horto* that he should call one *Fragaria parva flore luteo*: the roots are blacke and stringie.

3. *Fragaria minime vesca.*

Barren or unprofitable Strawberries.

This Strawberrie is in the growing altogether like the ordinary kindes, with leaves tripartted standing on severall stalkes and flowers in the same manner but smaller, the fruite onely maketh the difference betwixt them, which being small and many set together, are fete and drie without taste and of an harsh unpleasant taste.

The Place.

The three first plants grow upon divers of the *Alpes*, and other places of *Germany*, and the last in our owne Land in moist woods and the fielde sides neare unto them, in *Cornewall*, as *Lobel* saith, but in other places also.

The Time.

They flower in *May*, when the other sorts doe for the most part or somewhat later, and the fruite is ripe quickly after.

The Names.

The whole plant is called in Latine *Fragaria*, and the berries *Fragum fraulas fragmentum vulnus & gustus*, for it hath no certaine Greeke name that I know, unlesse as *Tragus* thinketh it may be referred to the [illegible] of *Dioscorides*, or as others thinke to the [illegible] of *Aquinoctium*, but neither of them is likely: others suppose that *Dioscorides* did understand this plant under the [illegible] some have called it *Rubus Idæus non spinosus*, but there is a shrubbe like unto the Raspis that beareth no thorne, as I have shewed in my former Booke. *Pliny* maketh mention of *Fragum*, lib. 25. c. 9. *Serenus* calleth them *Mora terrestria*, and therefore some would referre it to the *Mores*: the *Italians* call the plant *Fragharia*, and the berries *Fraghe* and *Fragole*; the *French Fraisier* and *Fraises*, the *Germans* call the fruit *Erdbeer*, and the *Danish Erdtbersinn*, and we in *English* Strawberries. The first here set forth is the third *Fragaria* of *Tragus*, which he saith the people about *Spires* in *Germany* doe call *Harbeer*; and *Gesner in horto Germaniæ* calleth *Fragaria species minor*: the second is called by *Cæsalpinus Fragaria genus in Alpibus*; and *Bauhinus Fragaria bis fructum gerens*: the third is likely to be the *Fragaria flore luteo* of *Bauhinus* who citeth *Gesner in horto*, as I said in the description, to call it so; and I thinke it may as well agree unto the *Leucas* of *Lobel* which *Bauhinus* seemeth to make another plant differing therefrom, calling it *Fragaria affinis fericea incana*, for the descriptions are very correspondent: the last is that which *Lobel* calleth *Fragaria fluctifera minor vesca sive sterilis*, but is not that which *Gerard* calleth *Fragaria vesca sive sterilis*, which is another plant, as I have shewed before.

3. *Fragaria minime vesca.* Barren Strawberry.

The Vertues.

These Strawberries that are here set forth and fit to be eaten, are of the same qualitie with the other garden kinds expressed in my former Booke, the leaves of them all being cooling in the first degree, and yet some say hot and drying in the second, the roote is more drying and binding, the berries while they are greene are cold and drie, but when they are ripe they are cold and moist: the berries are excellent good to coole the lever, the blond and spleene, or an hot chollericke stomacke to refresh and comfort the fainting spirits, and quench thirst: they are good also for other inflammations, yet it behoveth one to be carefull, or rather to traine them into a fever, least by their putrefying in the stomacke, they encrease the fits and cause them to be more fierce: the leaves and roots boiled in wine and water and drunke, doe likewise coole the liver and blond, and allwage all inflammations in the raines and bladder, provoketh urine, and allaieth the heate and sharpnesse thereof: the same also being drunke staieth the bloody flixe and womens courses, and helpeth the swelling of the spleene: the water of the berries carefully distilled, is a soveraigne remedy and comfort against palpitations of the heart, that is, the panting and beating of the heart, and is good for the overflowing of the gall, the yellow jaundise; the juyce dropped into foule ulcers, or they washed therewith or with a decoction of the herbe and roote, doth wonderfully cleanse them and helpe to cure them. All kinds of gargles that are made for sore mouthes or ulcers therein, or in the privie parts, or else where, are helped with the leaves and roots hereof, which is good also to fasten loose teeth, and to heale fistulaes in the gummes: the same also helpeth to stay catarrhes or defluxions of rheume into the mouth, the eares, eyes, &c. the juyce or water is singular good for hot and red inflamed eyes, if some thereof be dropped into them, or bathed therewith, the said juyce or water is also of excellent propertie for all pushes, wheales, or eruptions of hot and sharpe humours into the face or hands, or other parts of the body to take them away, and helpeth to take away any redneſſe in the face, and spots or other deformities of the skinne, and to good [illegible]

some and cleanse forme use the juice to make a water for hot inflammations in the eyes, and to take away any films that beginneth to grow over them, or other defects in them that any outward medicine can helpe in this case: take a good quantitie of Strawberries ripe plentie, and put them into a large cestell with a little salt cast upon them, which being covered, set into a wine cellar for eight dayes, in which time the berries will be dissolved into some water, which being clerified from the fell, keepe in a glasse close stopped to use when you needes it: this water put into the eyes serveth for the purpose afore said: some in mixing both juice and braile for the face, which water both for the eyes and for the deformities in the skinne, be it morphew, leprosie, or the like in time amendeth. Into a large distillatory of body of glasse, they put so many Strawberries as they thinke meete for their use, or few, the latter glasse body will serve, which being well closed, let it be set in a bed of hot horse dung twelve or fourteene dayes, and after distilled carefully and the water kept for your use.

Chap. XVII.

Of the Chickweede.

There are so many sorts of Chickweedes, some chiefely growing in moist and watery places, others upon drie grounds, some in the Fields, others in the Woods, some worthy of ones paines to plant in a Garden, others of no such respect that I must severre them, and intreate of some in an other Chapter, where they are fittest to be spoken of: you shall therefore have those expressed in this Chapter, and the order that I shall follow that I thinke fit for this place.

1. *Alsine repens latifolia*, Great spreading Chickweede.

The great Chickweede bringeth forth many flexible branches full of joynts, rising higher than a man if it stand by a hedge, or other things where it may take hold, otherwise through weakenesse lying on the ground, it lesse growth, being long, at every of the joynts stand two leaves one against the other, somewhat like unto the ordinary Chickweede leaves, but much larger, comming somewhat neare unto those of Pellitory of the wall, and of a darke green colour: at the joynts likewise on both sides of the stalkes come forth other branches, joynted and set with leaves in the same manner, and at the ends of them large greene round huskes ending in five points, with white flowers growing out of them, consisting of five and sometimes of six white leaves apeece cut in at the ends, in which huskes after the flowers are past stand forth small round heads like berries, greene at the first, and blackish when they are ripe, containing within them many flat blackish purple seed: the roote is white and long creeping much under ground, and shooting forth in divers places every yeare new shoots, the old dying downe the yeare: this hath no taste, but lothsome as the ordinary Chickweede have, and therefore is by the judgement

1. *Alsine repens latifolia.*
Great spreading Chickweede.

2. *Alsine media.*
The ground Chickweede.

Tree of

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

of the rest Herbarists referred unto them, yet *Lugdunensis* saith it hath a stinking and most unpleasant sent.

2. *Alsine maxima.* The greatest Chickweede.

This Chickweede which is the greatest of all the ordinary sorts riseth up with sundry stalkes a foote high or more, and lye not on the ground as the smaller sorte doe, bearing two leaves usually at a joynt larger then in any other that follow, but somewhat narrower then the former. it beareth plenty of white flowers, of six leaves a peece, standing in long greene huskes, which containe likewise the head or seede vessell, after the flowers are fallen, with small yellowish seede in them; the roote is white and threddy like the rest.

Alsine minor. The smaller Chickweede.

3. *Alsine major.* Great Chickweede.

This great Chickweede is in all things like the last both in leafe and flower, but smaller, the stalkes stand not fully upright but doe a little bend downewards, and needeth no other description to cause it to bee knowne. There is another sort hereof differing in nothing else but the smalnesse of the whole plant.

Miuor.

4. *Alsine Hispanica.* Spanish Chickweede.

The *Spanish* chickweede riseth up very often with a single upright reddish stalke, not branched at all, and sometimes with many, about a foote or more high, full of joynts, at each whereof grow two smooth and darke greene leaves, narrower then the last, a little broader at the bottome next the stalke, and small pointed at the end, the middle ribbe on the backside being somewhat great; and raised up: the flowers stand at the end of the stalke many set together in heads or huskes like those of *Symphytum petræum*, of a purplish colour, the roote is small white and long.

5. *Alsine vulgo tripolium sive Lacustris.*

Upright Chickweede with jagged leaves.

This jagged Chickweede groweth upright, with a stalke for the most part branched into three or some smaller sprayes about a foote high, set at the severall joynts, with small long leaves, cut into three and sometimes foure parts, even to the middle ribbe almost, so that they seeme like severall leaves spread like so many fingers to the hand: the flowers come forth at the joynts and uppermost joynts, consisting of five small blew and round pointed leaves, with some threds in the middle and standing in small greenish huskes, wherein after the flowers are withered and gone, appeare small flat heads divided as it were into two parts, wherein lye small whitish seede: the roote is small and long, set with many fibres and perisheth every yeare after seedetime, and springeth againe of the seede that is shed.

The Place.

The first as *Clusius* saith groweth in divers places of *Spaine* and *Germany* also, and I have sometimes found it by the Sea sides in our own Land: the second and third is usually found in moyst and watery places, by wood sides, ditches, and in many other places, the fourth *Clusius* found in *Spaine*: the last groweth in sundry grounds as among rubbish sometimes.

The Time.

They flower about *June*, and their seede is ripe in *July*.

The Names.

Chickweede is called in Greeke *Κερας quod lucos, quos sæpe nominant, & umbrosa loca amat*, and *Alsine* Latine, *Trifolium* and from him *Tragi lib. 17. cap. 4.* saith *Alsine quam quidam Myosotin appellant, nascitur in umbrosis & frigidis locis.* The first is called by *Clusius Alsine vulgaris*, and so it is also by *Camerarius* and *Dodonæus*, but *Lobel* calleth it *Planta Alsines majoris facie Cerastio Solani Cucubalum Plinij*, but some would make the *Cucubalus* of *Pliny* to be *Cucubalum*, led by the false coppie of *Dioscorides*, which hath divers names to herbes which are totally reported to be none of his workes, because the confusion of names taketh away the knowledge of the one. *Lobel* in his *Icones* calleth it *Alsines majoris facie planta baccas Solani*, and maketh a doubt whether it be *Cucubalum Plinij* or no. *Lugdunensis* also calleth it *Cucubalus Plinij sive Dioscoridis vulgaris*, but *Tragus* taketh it to be *Cyclamen montanum*, but *Pena* and *Lobel* say that therein it doe shewe themselves not well experienced in plants. *Ranzovius* calleth it *Alsine frondosa baccifera*, the generall name among Herbarists to *Alsine* although the second which is the greatest Chickweede next unto it beareth heads of seede somewhat like, yet they are nothing so great nor the seede within them. and is the *Alsine maxima* of *Lugdunensis*, which also calleth *Magnus Solanus*, the third is the *Alsine major* of *Lobel*, the second *Alsine sativa* of *Tragus*, the *Alsine major* of *Camerarius*, *Dodonæus*, *Lugdunensis* and others, and is called by *Cordus* and *Camerarius* and *Dodonæus* *Alsine minima*: the fourth is the *Alsine alba* and *tertia* of *Clusius*, which *Lobel* calleth *Alsine Lysimachiæ folio*, the last is called by *Lobel* and *Camerarius* *Alsine parva vulgo*, I cannot but wonder hereto how ought referre it, diversity a name according to the forme of the fingers of ones hand as he would have it, & calleth it in his owne language *Hierba con cinco dedos*, (for this other is that kind with white flowers the *Parvula* and *Leo* John *Lobel*) and thereupon giveth it the name of *Dactylobatanon caruleo flore*, *Lugdunensis* calleth it to be an *Elatine* and calleth it *Elatine tripyllon*, and *Columna* as I take it meaneth this plant when he calleth *Alsine tenuifolia altera sive tertia altera tricephyllon*, but not *Lagopus spergula* as *Bauhinus* saith, &c.

agrees, the leaves hereof are divided but into three parts, and the *Sagina Spergula* into five as *Columna* in the same place doth acknowledge, besides, those are set but as single leaves divided at the ends, and the *Sagina* of many leaves like the Rowell of a Spurre. *Bauhinus* calleth it *Alsine trifolia foliis ternatis*.

The Vertues.

The second and third great Chickweedes are of most use, for the other of these sorts are not applyed to any use that I can learne. *Lobel* saith that some did affirme that the *Cucubalus* is no lesse deadly to be eaten then the Sleepie Nightshade; yet if the first be the *Cucubalus* or *Cucubalus* of *Pliny* he is faith otherwise, for hee saith that the roote hereof bruised with some Vinegar and applyed to the plate strung with Serpents or Scorpions helpeth them, and that the juice thereof taken with twice so much sweete or honyed wine, easeth the paines of the backe and loynes, and the paines of the head or headach if it be applyed with Rosewater to the forehead and temples, and tied fast being bound to Wens or Kernells or else they bathed therewith dissolveth them. The other great Chickweedes are of as good use as any of the smaller sorts, and are good to coole any inflamation and is astringent withall as *Dioscorides* saith, but *Galen* and *Oribasius* say they have no altringent quality in them. *Paulus Aegineta* and *Actius* agree in the cooling, but say nothing of the binding properties, it serveth therefore for all manner of heate whether inward or outward, to coole and temper the blood inflamed in Agues, or the heate of the stomacke and liver breaking out into the lippes, and to procure an appetite being lost or become weake, and is good in fleshie Ulcers, and to asswage the heate of the backe and urine. *Galen* and other say that it hath the same vertues that Pellitory of the Wall hath, but wee have commonly found it to bee as effectuall as Pellitory of the wall the properties whereunto it serveth except for meat onely: the herbe bruised or the juice applyed with diverse tyringes dipped therein to the region of the Liver, and as they drye to have fresh applyed doth wonderfully temper the heate of the Liver, the same likewise is effectuall for all hot Impostumes and swellings whatsoever, Sore, *Erisipelas* fire and the like, and for all rednesse in the face, Wheales, Pushes, Itches or Scabs, either the juice boyled or boyled with *Axungia* and applyed: the same is said to helpe Crampes, Convulsions and Palsies, applyed in the same manner: the juice or the distilled water is of much good use for all heate and rednesse in the eyes to drop some thereof into them, as also into the eares to take paine in them, and is of good effect to ease the paines heate and sharpenesse of the blood in the piles, and generally for all paines in the body arising of heate, it is used also in hot and virulent Ulcers and sores in the private parts of man or woman, or legs or else where, the leaves boyled with Marsh Mallowes and made into a Poultis with Fenigreek and Linseede, applyed to swellings or Impostumes ripeneth and breaketh them, or swageth the swellings, and easeth the paines: the same also helpeth the Sinewes when they are shrunke by Crampes or otherwise, and to extend them and make them pliable againe: it is said by some that while the herbe is in boyling with Oyle or *Axungia* to make a salve for to heale sore Legs, that if one doe stirre it with their bare finger they shall take no harme thereby, if any will make it *probatum* they may make it a meritorious worke: when a Sinew is strayned here is a sure medicine for it: Boyle a handfull of Chickweede, and an handfull of red Rose leaves dryed but not distilled, in a quart of Muscadine untill a fourth part be consumed, then put to them a pint of the Oyle of Trotters or Neats feete, let them boyle a good while still stirring them well, which being strayned annoint the greeved place therewith warme against a fire rubbing it well in with ones hand, and binde also some of the herbe if ye will to the place, doe so againe the next morning and evening, by which time you shall finde helpe if God will.

Chap. XVIII.

Alsine Montana. Mountaine Chickweede.

Another sort of Chickweede groweth upon hills most usually, whereof some are greater, and others smaller, of whom in this Chapter and first of the greater.

1. *Alsine montana hederacea maxima Columnæ.* *Columna* his great Ivie leafed Chickweede.

This great Chickweede groweth up with upright stalkes, yet somewhat bowing downe againe with the lower branches set at each joynt with two somewhat large leaves, waved about the edges, and as it were crumpled and hairy, somewhat like unto the curld Mallow, being two inches broad and three inches and more long Ivie leaves or great Bindeweede rather, standing upon long foote stalkes: the flowers set at the ends of the branches, consisting of five white leaves, so deepely cut in at the middle that they seeme to be ten, rising out of the greene huskes, wherein after the flowers are fall groweth a long round seede vessell crowned or crested with a small spire top, ending in a small pricke, wherein lye store of small seede: the roote consisteth of some long stringe with fibres set at them.

2. *Alsine Hederæ folio major Lobelij.* *Lobel* his greater ground Ivie leafed Chickweede.

The greater ground Ivie leafed Chickweede hath sundry almost round leaves next the ground, dented or cut in the edges, making them seeme somewhat like Ale-hoofe or ground Ivie leaves of a sullen greene colour, and somewhat hairy as the stalkes are, which have at every joynt such a round dented leafe as growe below, but comming up with slender and roosse stalkes, whereat especially from the middle upwards come forth small hooded purple flowers, somewhat like unto those of Germander, the seede is small and the roote stringy perishing yearely.

3. *Alsine hederæ folio minor.* The smaller ground Ivie leafed Chickweede.

The other Ivie leafed Chickweede groweth lower and more leaning to the ground with the branches, which are somewhat hairy also and more tender, set with two leaves at a joynt, but nothing so large: the flowers grow at the tops consisting of five small blew round pointed leaves, the seede is small contained in round heads: the leaves are small and thicke.

4. *Alsine folijs subrotundis Veronicæ.* Speedewell Chickweede.

The fourth hath many small branches upon the ground full of small and almost round leaves, set by couples very much like those of *Veronica* or *Beccabunga Fœmina*, called Speedewell, but not unto *Elatine* or *Linaria* of any sort: the flowers grow at the joynts with the leaves from the middle of the branches upwards, being very small, made of

Original from UNIVERSITY OF MICHIGAN

the large leaves, after which come small flat seede in reflexed fil'd pouches, wherein is conteined small round yellowish seede: the roote is small and thready, and perisheth not in Winter.

γ. *Alsine montana cornuti, folio*. Small narrow leafed Chickweede.

This small Chickweed hath divers small branches rising a little above the ground, with small somewhat long and downy greene whitish leaves, set by couples at the joynts, from betweene which rise smaller branches, with the like on them, and at their ends two or three small white flowers made of foure leaves a peece, the middle of which is small and brownish conteined in round heads: the roote is small and thready.

δ. *Alsine serpens angustifolia flore luteo-rubente*, Small narrow leafed Chickweede.

This Chickweede creepeth with the branches upon the ground, bearing such like small long and whitish leaves set by couples as in the last but both branches and leaves are bigger and larger: the flowers grow at the ends of the branches of a yellowish colour, which give long and pointed seede vessels, wherein is contained small seede like the common Chickweede.

ε. *Alsine petræa*. Rockie Chickweede.

This small Chickweede but groweth so full of small weake slender thicke set, and entrelaced one within another, that it creepeth like unto a small bush; the leaves are small and pointed, and the flowers small and white like other small Chickweedes, bearing round heads like unto Lins or flax, wherein the small seede is contained: the roote is small and thready.

ζ. *Alsine Alpina glabra*. Smooth leafed mountaine Chickweede.

This Mountaine Chickweede is like unto the other small Chickweedes, rising up with the branches scarce halfe a foote high set with small long and smooth leaves like unto Lyne or Flex, of a pale greene colour, but shorter and sharpe pointed, the flowers are white, scarce fashioned and standing upon small long footestalkes: the heads are made as like the rest and so is the small fibrous roote.

η. *Alsine Alpina maxima glabra*. The smallest mountaine Chickweede.

This mountaine Chickweede is smaller then the last, but more beautifull in regard of the flowers which are made of foure leaves a peece, either white or whitish, spotted with small pricks or spots of a deeper red colour standing three or foure together each severally upon a small footestalke and they all upon small branches scarce foure inches long set with the like pale greene narrow leaves, yet have tower'd the toppes neare unto the flowers.

ιο. *Alsine Alpina Tunicæ folio*. Rush leafed mountaine Chickweede.

This Rush leafed Chickweede groweth little above an handbreadth high, spreading from the stalke a couple of branches which are divided againe into smaller, whereof some onely and not all doe beare a flower or two at the toppe somewhat large for the proportion of the plant, made of five white leaves standing in small greene cups: the leaves on the branches are very narrow, small, and very greene, stand also by standing, and set without order.

ια. *Alsine rodia Gallica*. *French* Chickweede with knotted heads of seede.

This small Chickweede groweth sometimes a foote high, having many long and narrow leaves lying neare the ground, from whence rise divers upright stalkes set with smaller leaves without order, from the middle upwards one above another, at the toppes standeth one small white flower a peece, compoted of five white leaves, with some small heads of seede standing one above another, as if they had beene strung upon a string, and somewhat wrelled or furrowed: the roote is small and full of fibres of a yellowish colour on the outside.

The Place.

These sorts of Chickweedes grow upon hills and mountaines in divers places, some in *Italy*, *Spaine* and *France*, and many of them in our owne Land.

The Time.

They all flower in *June* and *July* except the first which floweth not untill *Autumne*.

The Names.

The first is called *Alsine stamma* as it is in the title, who *Smith* it was not mentioned by any before him: the second is the *Alsine minor* of *Lobel*, the third is called by *Lugdunensis* and *Trallian* *Alsine prior*, by *Dodonæus* *Alsine minor*, by *Lobel* *Alsine hirsuta*, by *Lobel* *Morion gallinæ folio hederulæ*, thought to be *Cerastium* of *Dioscorides*, and called *Cerastium hirsutior* by *Cesalpinus*; but generally *Alsine hederacea*, and the rest have added to distinguish it from the greater: the rest have their denominations by *Lobel* as they are set downe in their titles.

The Vertues.

All these sorts of Chickweede but lately found out and to be referred to the family of Chickweede, are not of such extraordinary use, as the rest of ancienter knowledge: but it is most probable that being in taste some what agreeing with the common sort, their qualities are not much differing, and therefore untill wee have learned some certaine vertues thereunto they are effectuall, let this be sufficient at this time to have given you the knowledge of them.

Chap.

Chap. XIX.

Alsines spuriæ aliæ parvæ. Small Ballard Chickweedes.

There are some other Chickweedes to be entreated of that pertaine to this Classis, and grow in di-verall soyles which shall be shewed in this Chapter.

1. *Alsine Viscosa.* Clammy Chickweede.

This clammy Chickweede standeth more upright then the last, with rough, hairy and clammy leaves somewhat like the other, but of a more blewish greene colour: the flowers hereof are white and small, scarce opening themselves but in the hot time of the day, standing at the toppes of the stalkes, which from the middle upwards are so clammy, that they will sticke to the fingers of any that touch them, wherein they are apt to hold flyes, and such other small things as light upon them.

2. *Alsine Muscosa.* Mosse like Chickweede.

This creeping and spreading Chickweede scarce sheweth it selfe above the Mosse and other herbs among which it groweth, with very slender small stalkes and small fine but thicke leaves thereon, and small white flowers of foure leaves a peece at the ends turning into long and round heads like unto the other small Chickweedes, the roores are nothing but threads.

3. *Alsine nodosa Germanica.* Knotted Chickweede of Germany.

This knotted or great joynted Chickweede, thereof tooke the name because the stalkes which are part leaning and part upright an handbreadth long, have the joynts more knotted or bunched out then then in others, the greene leaves that grow at them are very small and long like threads, many set together, from whence likewise spread small branches bearing small white flowers of five leaves, set in great huskes that end in five cornets every one on a long footestalke.

4. *Alsine folio Tragi.* Germander leafed Chickweede.

This small Chickweede spreadeth sundry small weake branches upon the ground, three or some inches long, set with small some what round leaves dented about the edges, and pointed at the ends, by couples one against another, at the joynts whereof towards the toppes come forth small blew flowers, and sometimes white, consisting of five round pointed leaves, after which succeede small round seede vessells, two always joyned together, having small round seede within them: the roote is compoſed of many threds, and abideth the Winter.

5. *Alsine cornuculata Clusii.* *Clusius* his horned Chickweede.

This Chickweede riseth up a spanne high, with one tender hairy stalke full of joynts, and two small long somewhat hairy leaves set at them, towards the toppe divided into some branches, where and at the joynts there come forth small white flowers in greene huskes, and after them small and long thinne crumpled hornes, not unlike to Cockes spurres, and clammy withall, wherein lye small blacke seede: the roote is small and annuall.

The Place.

These Chickweedes grow in Fields as well tilled as untilled, and by the wayes sides, &c.

The Time.

They flower in Summer, some a little earlier or later than others, and their seede is ripe quickly after.

The Names.

The first *Authour* calleth *Alsine hirsuta altera vulgaris*, and *Camerarius Alsine vulgaris*. *Dodonæus Alsine spuria* [illegible] and *Matthiolus in collationē priorum Alsine species plurimas*, yet this is not the *Cerastion* or horne any sort thereof, although for the properenesse it might be called *Alsine cornuta*: the second *Lugdunensis* calleth *Alsine minor* of the third called by *Bauhinus Alsine nodosa Germanica*, and differeth from the *vulgaris Gallica*, whose heads or seedes are like unto a thread or string, as is shewed in the Chapter before: the fourth is the third *Matthioli Italica* of *Lugdunensis Alsine spuria altera* of *Dodonæus*, called by *Lobel* and others *Alsine folio Trifagonis*, taken to be *Antirrhinum* [illegible] by *Lobel* and *Camerarius*, and by *Bauhinus Alsine Chamædrifolia flosculis pedunculis oblongis insidentibus*: but rarely if ever below any whose flowers had long stalkes, I did never: the last is so called, first by *Clusius*, and after him by all others, which in the title, yet some supposed it might be a kind of *Nigella sylvestris* or Cockle.

The Vertues.

There is little use in Physicke of these Chickweedes, yet the two first are of the taste of Borrage, and the rest of Chickweede.

Chap. XX.

Borrago & Buglossum. Borrage and Bugloss.

Although I have given you in my former Booke the knowledge of the Garden Borrage and Bugloss, and some other sorts of them, yet there doe remaine some others both of the Garden and wilde kindes, whereof I meane now to speake.

1. *Buglossum minus sativum.* Small Garden Bugloss.

This Garden Bugloss is very like the ordinary garden kinde for the manner of growth, but that it is smaller in all the parts thereof, the leaves are narrower and shorter, the flowers are smaller, some of a blew colour, and some purple: (and *Lobel* mentioneth one with a red flower, which he calleth *Echij facie Buglossum minus flore rubente*) the seede is likewise blacke but smaller: the roote perisheth not, and is like the other. *Buglossum Echij facie.*

2. *Buglossum sylvestre maius flore nigro.* Great wilde Bugloss.

This kinde of Bugloss differeth not from the last in any thing but in the greatnesse, being greater in every part, and in the colour of the flowers which are of so deepe a purple colour, that it is called blacke, and that it is found growing naturally in some places of *Italy*, and the other not but in Gardens.

3. *Buglossum sylvestre minus.* Small wilde Bugloss.

Buglossum minus Echij facie flore variegato. Small Bugloss with the flowers.

This other wilde Bugloss hath somewhat broad short and rough leaves, smaller than either the garden or the last wilde kinde, and somewhat more unevenly cut in on the edges: the flowers grow at the toppes of a blewish purple colour but smaller, and the seede groweth three or foure together like it, and blackish: also the roote is small and long.

4. *Buglossum sylvestre minus alterum.*

The rougher wilde Bugloss.

The rougher kind differeth from the last in these particulars: the leaves are much rougher than it, and sharper or smaller at the edges: the flowers on the toppes of the branches are more like the flowers of *Sedanpper* Stinking dead Nettle than of any of the former sorts of Bugloss, some plants being of a blewish purple colour and some white, and not of both these colours in one plant.

5. *Buglossum siliquosum ex Insula Lancastræ.*

Lancashire Bugloss.

This other Bugloss shooteth forth many slender stalkes of a foote or halfe a foote more, some lesse: the lower leaves whereof are the greatest are much lesser than those of Borrage, and of a whitish green colour, somewhat rough, but those that grow on the stalkes smaller, having the flowers set at the joynts with them, which are red before they are blowen are of a reddish colour, but when they are blowen are of a blewish purple, somewhat like the flowers of Bugloss, or betweene them and Borrage flowers: the seede is very sweete like honey, the roote groweth great and long with many strings, divided downewards into some few heads.

6. *Borrago minor flore cæruleo.* Small wilde Borage.

This small Borage is very like the garden kinde, but that it is much smaller and tenderer, the leaves also are much smaller, narrower, sharper, rougher and more prickly, and of a paler green colour, sommer set like wise upon the stalkes, for it hath many branches: the flowers grow at the joynts with the leaves from the middle of the stalke upwards, three or foure set together, and are like the other, but more pale and roun-

der

1. Buglossum minus sativum.
Small garden Bugloss.

2. Buglossum sylvestre minus flore purpureo.
Lesser wilde Bugloss.

3. Buglossum sylvestre Lanceolatum.
Lanceolate Bugloss.

4. Borrago minor hirsutissima.
Small rustling Borage.

and so small that they scarce shew themselves out of the huskes wherein they stand or rather hang, for they turne downe their heads and quickly fall away; in the said huskes are found foure small flat seedes somewhat like unto *Echium*, or the wilde Bugloss: the roote is small and long, and perisheth as soone as it hath borne seede which is very early.

7. *Borrago minor barbariensis.* Small creeping Borage.

This small Borage shooteth forth many leaves from the roote very like unto the leaves of *Pulmonaria maculosa*, lying all low upon the ground, every one upon a long foote stalke (but not sported) of a darke greene colour, and lesse than they: the stalkes are small and slender not above halfe a foote high, with very few leaves thereon, and at the toppes come forth the flowers made of five blew round pointed leaves, more like Bugloss than Borage, with many threads in the middle, every one upon a long foote stalke, the roote is composed of many long blackish strings more like unto *Auens* than Borage: in the leaves is a certaine acrimony or sharpenesse, joyned with some mucilaginousnesse when they are tasted.

The Place.

The first is only nurled up in gardens, even in *Italy* from whence the seede was brought unto us and unto other countries also: the second, third, and fourth grow wilde in divers countries, and are sometimes found in our owne: the fift groweth in one of the Iles about *Lankashire*, there found by *Mr. Thomas Heskit*: the sixt in *Germany* *Lobel* saith, and in *Naples* as *Columna* saith, and in our owne Land if I be not much deceived, for I thinke I have seene such a one in divers fields in *Kent* as I have passed through them: the last *Lobel* saith he saw in the garden of the *Low countries* with those that were lovers of rare plants, and prospereth well in our owne gardens.

The Time.

They doe all flower in the moneth of *June* and *July*, yet *Lobel* saith that the last flowreth both in the Spring and in *August*, and their seede doth ripen quickly after, both ripe seede and flowers, may at one time be gathered from many of them.

The Names.

Our Garden Borage is called by the Greekes, as *Pliny* saith, Euphrosinum ab efficiendo voluptate, and by the judgement of the best of our moderne Writers is the true Euphrosinum of the ancients, most truely answering in the Greeke tongue, which is *Lingua bubula* or *Bouina*, & so it seemed it was called by *Cato*, *lib. de re rustica*, cap. 96. when he adviseth to take a leafe or a branch of *lingua bubula* to cover a flocke when it is grafted, to keepe away the rayne from abiding in the cleft, for which purpose these leaves of Borrage being broader than those of Bugloss is more fit. *Apuleius* saith, that *Euglossum* (meaning our Borrage) was called by them of *Luca*, *Corrago quod cordia affectibus medetur*, which by the alteration of one letter is *Borrago*, & from thence I think came the name of *Borrago*, which is not found in any of the ancient Writers. Our Bugloss is called by some *Bugloss* and *Buglossum* by most, yet some doe call it *Buglossum Hispanicum* and *Italicum*. It were an advise not to be connived, that our Borrage should be used for *Buglossum*, where it is appointed in any medicine, especially in *Syrupus Byzantius*, for if the juyce of our Bugloss be taken to make it, the juyce is so slimie that it will never make a good syrupe as it ought to be, unlesse that after the bruising of the herbe it be set in a cellar or cold place before the juyce be tried. The fift here expressed is called by *Fuchsius* and *Lonicerus*, and from them in *Englandesse Cirsium germanicum*, for they did account all the sorts of Bugloss to be *Cirsia ex Theophrasto*. *Tragus* doth also, and calleth the *Boxe*, *Fuchsius* likewise calleth it *Echium Longifolium primum*. *Gesner* in horto calleth it *Buglossum hirsutum*, and *Englandesse Buglossum minus sativum*. *Lobel*, as I said in the description, calleth that sort with red flowers, which is a species hereof *Echij facie Buglossum montanum*, and thereupon *Bauhinus* calleth it *Buglossum angustifolium minus*: the second *Matthiolus* calleth *Buglossum sylvestre* and *viperinum flore nigro*, *Thalius Buglossum sylvestre primum*, and *Bauhinus* thereupon *Buglossum sylvestre majus nigrum*: the third is called by *Dodonæus Buglossum latifolium* and *fruticosum*, and *Lycopsis sylvestris*: by *Lobel Buglossum serratifolium elegans Echioides*, by *Fuchsius Echium Germanicum spinosum*, it is the *Borrago sylvestris* of *Tragus*, and called by *Bauhinus Buglossum sylvestre minus*: the fourth called by *Tragus Buglossa sylvestris*, by *Lonicerus Lycopsis*, by *Cordus in historia Anchusa minor*, by *Englandesse Buglossum sylvestre minus*, and by *Bauhinus Buglossum sylvestre minus alterum*, and is likely to be the *Cynoglossum* of *Tragus* and *Fuchsius*, for that it was formerly used among the *Germanes* for *Cynoglossum*, and is called *Anchusa altera* of *Cordus* upon *Dioscorides*, the fift hath not beene related by any before: the sixt is called by *Lobel Echium Germanicum Echioides*, by *Thalius Buglossa sylvestris species*, and taken by *Tabernamontanus* and others to be the *Anchusa major* of *Pliny*: but *Cæsalpinus* calleth it *Cruciata quædam*, and *Dodonæus* in his *Dutch* Booke *Alysso folio*, *calamus Borrago minor sylvestris*, and *Bauhinus Buglossum sylvestre caulibus procumbentibus*: the last is called by *Lobel Symphytum pumilum repens Borraginis facie*, *seu Borrago minima herbariorum*, which *Bauhinus* putteth under the *Symphyta*, and calleth it *Symphytum minus Borraginis facie*. The *Arabians* call the Borrage and Bugloss *Lisan thaur*, the *Italians Borragine* and *Buglossa*, the *French Borrache* and *Buglosse*, the *Germanes Ehrenpreis*, *Ochsenzungen*, the *Dutch Borrage* and *Ossentonghen*.

The Vertues.

Because I was so briefe in my former booke in setting downe the properties of the Garden Borrage and Bugloss, I thinke it convenient to expatiate their vertues under these wilde sorts. The Garden kindes are temperately commended rather hot and moyst in the first degree then cold, and yet for their cordiall properties are often used among other cold herbes as conducing to the like effect. *Dioscorides* appropriateth them with oyle against the bitings of mad *Dogges*, and to cure greene wounds. The leaves or roots are to very good purpose made a part of all *Epithemata*, or *Cataplasmes* to defend the heart, and to helpe to resist and expell the poison or the vertues of other creatures: the seede is of the like effect and also helpeth Nurses to have more store of milke, for which purpose the leaves are much conducing: the leaves, flowers and seede, all of them or any of them are very cordiall, and helpe to expell pensivenesse and melancholie, that ariseth without manifest cause, whereof came the saying, *Ego Borrago gaudia semper ago*, and as I said before called *Corrago*: it helpeth also to clarifie the blood and cheare the heate in feavers: the juice made into a Syrupe prevaileth much to all the purposes aforesaid, and is made with other cooling opening and clensing herbes to open obstructions and to helpe the yellow laundies, to purge and clense the blood and temper the heate and sharpenesse thereof, especially with *Fumiter* and thereby helpeth the Itch, Ring wormes or Tetters or other spreading scabbes or sores that arise from adust and sharpe humors

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

humors and for that purpose is put into the *Syrupus Ryzantinus*, which worketh to the same effect: the Conserve made of the flowers, or the flowers candied are helping also in all those cases, but are chiefely used as a Cordiall and good for those that have beene long sicke and feeble or in a Colliquation, to comfort the heart and spirits and thereby good for those that are troubled with often swounings or passions of the heart. The distilled water is no lesse effectuall to all the purposes aforesayd; and the eyes washed therewith helpeth the redenesse and inflammations of them: the dryed herbe is never used but the greene, yet the ashes thereof boyled in wine or brooke water is available against inflammations and Vlcers in the mouth or throate, to wash and gargle it therewith: the roots of Bugloss are much more clammy and glewish then of Borrage and therefore by some good Physitions not held so convenient to be used in opening decoctions: for it is thought by the numerous mucilagines in them, they rather helpe to binde them open obstructions, but may be effectuall in a Lohoc or licking medicinary for the cough, and to helpe to condensate thin flegme and rheumaticke destillations upon the Lungs. The other sorts of wilde Borrage or Bugloss are somewhat hotter and dryer, and are very neare unto the properties of *Echium* Vipers Bugloss whose Vertues I shall not neede here to reiterate, I shall rather referre you to that Chapter to be informed in the particulars thereof.

CHAP. XXI.

Cucurbita, Gourdes.

THere is so great a likenesse of Gourdes, Melons or Pompions, Muskemelons, Cowcumbers, and Citrulles one unto another, both in their manner of growing, and qualitie of vertues, that the ancient Greekes, and others have much confounded them together, yet they doe each wayes differ one from another, both in the forme of their fruite and seede, besides their size and colour. I have in my former Booke set forth the sorts, both of Muskemelons, and garden Cowcumbers, wherefore I shall not needs to speake againe here, although I may give you some of their figures: of the wild Cowcumber, or also of the wilde or bitter Gourde called *Colocynthis*, I have spoken in the second Classis of this Worke: divers sorts of Gourdes remaine to be entreated of, whereof the Pompion is a peculiar kinde, and having spoken of the garden kinde thereof also in my former Bookes, I extend not to repeate it againe, but of some other wilde kindes I must here comprehend under the Gourds, although their seedes doe differ *Citrulli* Citrulles, which are accounted by divers to be kindes of Cowcumbers, but I doe rather referre them also to the Gourds, for their seedes have hard shells, such as neither Melons nor Cowcumbers have, which two are of so neare affinity, that their seede is very hardly distinguished. Of Citrulles I shall entreate in the next Chapter and of the Gourds this and with them some such strange fruites as have come to our sight or knowledge from forraine parts, whose of we tooke the figures, and that after I have given you some of their descriptions to have many reasons

1. *Cucurbita lagenaria major.* The greatest bottle Gourde.

The great Gourd groweth as all other of these kinds of herbes do, spreading many great, rough and hairy stemmes and branches, with severall great and broad leaves, soft and almost round, yet pointed at the ends, and sometimes dented about the edges set upon long footestalkes and long clasping tendrills like a vine, fast at other joynts whereby it climeth, taking hold and winding it selfe about whatsoever poles, arbours, trees or other things that stand next unto it, or else not having whereon to clime and raise it selfe, it lyeth on the ground spreading a great compasse as the Pompion doth, at the severall joynts likewise with the leaves come forth severall flowers in the same manner as Pompions, Cowcumbers or Melons doe, but are very large hollow bells ending in five points or corners with a round greene head under each of them that will beare fruit, for many flowers wither and beare no fruit, not having that round greene head under the flowers which should grow to be the fruit, and will be full and ready to come forwards with the short little stalke under it, the colour of the flowers are either white, or pale white, or pale yellow, the fruit when it is ripe hath an hard outer rind or shell yellowish, large and round bellied, flat at the bottome like unto a bottle and smaller up to the necke, above which is a small round formed head whereunto the stalke is fastned, and sometimes without any small head, being pendulous or hanging downe not standing forth or upright, within which fruit lye dispersedly many seedes, having smooth hard woodie shells, flat and broad at the upper end or head, and somewhat pointed below, wherein lyeth a sweete white kernell: the roote consisteth of many long strings spreading much within the ground but perisheth finally with the first frosts.

2. *Cucurbita lagenaria minor.* The lesser bottle Gourd.

This differeth from the former in nothing but that it is smaller in every part as well leaves stalkes flowers & fruit, which is of the same forme but smaller.

3. *Cucurbita longa.* The long Gourd.

This Gourd also differeth little but in the fruit and seede from the former, for the fruite groweth long and sometimes crooked or bending like a horne, almost of an equall size all the length which in some places groweth extreame great and of an incredible length, especially when the fruit hangeth downe from some high place, otherwise lying on the ground, it never attaineth to halfe that length. whose outer Rinde is yellowish in the ripenesse as the other sort is, but with us whitish, and seedes therein, somewhat whitish with us, and not so broad at the top nor so hard.

4. *Cucurbita clypeiformis sive laciniata.* The Buckler or Sionell Gourd.

There is a manifest difference not onely in the fruite of this Gourd from the rest but in the manner of growing also, for it groweth upright with great hollow rough hairy erected stalkes, to the height of three cubits and runneth not along on the ground as the rest, having greater leaves rough and hairy like unto, or of a darker colour, and more cut in or divided on the edges: the flowers are belt fashion like the others, of a faire yellow colour standing upon the head of the fruite which growing to ripenesse is somewhat like and round also with a stalke but flat forewards, with a crumpled verge or brim, somewhat cut in or endented, and thinner there then any other place, the forme doth much resemble those sodden baked cakes that are made in Lent upon which we

4. Cucurbita longa. The long Gourd.

Cucurbita Indica, Oualo, Pyriformis & rotunda.
Indian Gourds: Oval, Pearie fashion, and
almost round.

have to encircled, or else
do, in how much you please: the pulpe
is sower & curdish like an Apple, without
the middle bur where the seede lyeth, which is some what like unto the Kernell of an apple,
and flatter at the head.

5. *Cucurbita rugosa.* Rugged Gourds.

The seed herein consisteth onely in the round fruit, whose shell or barke is not smooth as in others, but
all set with knobbes and warts.

5. *Cucurbita hyemalis.* Winter Gourde or Millions.

These Gourds differ little in forme of growing from the other sorts before mentioned but in the manner and durabilitie of their fruite; for there are of them that are greater then others, and of different colours, some yellow others greene or of other colours: but all of them doe ripen later, and doe better endure the cold and wet of Winter then the others, for they are not full ripe and fit to be eaten before they are hung up in a Chimney as they be gathered.

6. *Cucurbita indica rotunda & diversi formi.*

Round *Indian* Gourds, or Millions, or Pompions, and of other formes.

There is very great varietie of these Gourds (or Millions as some call them, or Pompions, as I may call some of them) that come out of *Affrica* or the West *Indies*, from sundry places, both farther South among the dispersed Colonies, and nearer hand in our owne of *Virginia*, *New-England*, &c. Some whereof in their forme are as round as a ball; some longer like a Peare, some more long then round, and some flat as the bottome: some also as great as our Pompions, some as small as an Apple, and some of divers other sizes, meaner or greater as being fed with much moysture or water that is very sweete and pleasant in them, and some having little or no sense of moysture: some againe discoloured on the outside, greene, with whitish or yellowish stripes in them, or else so finely that they give great delight to behold them, some also reddish spotted or striped, and some of a deep yellow colour. the seedes in these like wise are variable in divers, some more like unto the ordinary Gourd but blacker or browner, or red, in others white, either like the long Gourd, or like to our Pompions, but not so large as our Pompion. and others as small almost as the Cowcumber seede. So that to give you an orderly declaration of every one of them were a worke of curiositie, and of more travell then profit, and therefore I will leave it for them that can intend it, and will gather them all together and publish such a peece, I must convey my pen to other parts which I hope shall proove more beneficiall to the Commonwealth.

Divers other sorts of Gourds or Millions, or Pompions, or whatsoever else you please to call them, are growing and have beene brought us from sundry places, both *Syria* and the East *Indies* differing from them here expressed, some being as red as blood both within and without, and much pleasanter in eating then many of these Counterfeits, whereof to write more largely were almost superfluous, the diversitie being so great as we presently almost see some sorte no before seene of us, and therefore who so will may quote those they like to the same or end hereof.

The Place.

All these Gourds are strangers and brought from severall places, some out of the *Levant*, as *Egypt*, *Syria*, &c. others as I said before out of *America*, both further off and nearer to us, as in *Virginia*, &c.

The Time.

They are all to be planted at the seede in the Spring, and in very good ground that shall not want plenty of moysture, or else the heate of our owne Country will not serve to ripen them.

The Names.

The Gourde is called in Greeke [illegible] *Cucurbita vulgaris*, to shew the difference from the others [illegible] the wilde or bitter Gourde called *Colocynthis* or *Cucumis agrestis* before spoken of: in Latine *Cucurbita* & *cucurbita* (as it is thought) *quasi semper gravis & ponderosa, nec extendatur incrementum* (the Ancients as I said in the beginning have beene very variable in their denomination of Gourdes, Cowcumbers, &c. for they have by the word *pepo* which is *Latinum*, called them all one of these fruits: *Columella* setteth it downe in his second booke that *Euthydamus* called the Gourde *Cucumis Indicus*, because as he there saith, the seede was first brought out of *India*, and that *Mithridates* made the Cucumber to be of two sorts, the one of *India* called *melopepo*, the other called *melothrum* [illegible] Booke and fift Chapter maketh the Pepo or Pompion, a kinde of Cowcumber, saying *Cucumeres ea magnitudine excedere Pepones vocant*, but *Galen* saith *lib.* 3. *alimentorum* that *pepo* (which agreeth to many fruite and may be appropriate to all fruites) is yet given to one peculiar, but then it is called *pepo Cucumeralis*, but hereof I shall speake a little more in the next Chapter. *Pliny* hath two sorts of Gourds, the one he calleth *Cucurbita Cucumeris*, because it was planted or placed neare unto Chambers and windowes to be a fine and coole refreshing from the heate, which by climing up and leading it which way they pleased it did perfume for as he saith it is *sublimitatis avidæ*: the other he called *Cucurbita plebeia*, which lay upon the ground and climed not, which I doubt whether it be any of those sorts here spoken of. For all of them except the *Cyprian* will clime if they have any high thing stand neare them whereon they may rise. The *dodonæi* call them *Cherba* and *Herebarba*, the *Italians Zucca*: the *Spaniards Calabaça*, the *French Courges* and *Concombres*, the *Germane Kurbs*, the *Dutch Cauwederen*, and wee in *English* Gourds. The two first are called by *Lobel* and *Tabernæmontanus*, *Cucurbita lagenaria major & minor* and *Cucumis major & minor*: the third is called *Cucurbita* almost all Authors except *Dodonæus*, *Lobel* and *Gerard*, who call it *Cucurbita aquatica*: the fourth is called *Cucurbita siphilata & scyphis* by *Cæsalpinus* and *Gesner* as before: by *Tabernæmontanus Cucurbita cydonia*, by *Gerard Cucurbita sylvestris fungiformis*, *Pepo Indicus fungiformis*, and *Pepo maximus clypeatus*: for all these last three sorts precise but the one sort of Gourd, and by *Dodonæus Pepo latus*: the fift is called *Cucurbita Indica rotunda* of *Cæsalpinus* and *Lugdunensis*, and *Indica major* or *minor* of *Tabernæmontanus*. *Zuccha major rotunda* of *Gesner* and *Citrullus minor* and *Pepo minor sylvestris* of *Gerard*. which although he expresse these as he doth to be diverse for sundry places yet they are not so: of this kinde *Matthiolus* and others have made mention of another varietie which they saw in their time, and wee I thinke in ours many more as I have declared before: the sixt is mentioned by *Lugdunensis* onely by the name of *Cucurbita vermicosa*: the last some call *Cucumis crocodilinus*. I had rather call it *Cucurbita hyemalis* partly for the reasons before set downe, but chiefly for the fashion which is more like a Gourd then a Cowcumber. What I said before concerning the variable varietie of the Authors in their names, I may as well say of our moderne writers in condemning *Pepo*, *Melopepo* and *Cucurbita* so promiscuously, that it is not possible to finde out the distinct certaintie of them all. For some make *Pepo* that others call *Melopepo* and others *Cucurbita*. And *Bauhinus* who taketh upon him to explaine all mens writings and distinguish of them, in making *Pepo*, *Melopepo*, and *Cucurbita* several kinds of fruit, doth so huddle and confound them together, as any that will reade him advisedly and compare him may soone see: he giveth several names to one and the same plant in divers places, which errour and the profitable [illegible]

...endeavoured as much as I can to avoyd. But to give you one note worth the observation to know the several varieties of these and the other sorts of Millions, Citrulls, Cowcumbers, &c. is diligently to marke the forme of the seedes. for the seede of the ordinary bottle Gourds are formed quite differing from all the other [illegible] whatsoever strange seede shall come to your hands formed somewhat like unto them, you may conclude them kinds of Gourds. So likewise of the Pompions or Millions which are flat, white, and greater then either Muske Melon or Cowcumber: in like manner the Citrull hath a thicke hard shelled seede rounder and rounder then the Gourd, and therefore what seede is nearest thereto in like sorte you may include them under that family, the Muske Melons and Cowcumbers are very like one unto another, and therefore I would gladly have them both under one *genus*, yet if you will well observe them you shall soone know their differences by the rougher and harder shell of the Melon, & greater also when as those of the Cowcumber are whiter, smaller and tenderer shelled: I know none other of these kinds of fruites but may be most truly referred by these tender rules, one more either by forme, colour or taste, to one of these foure forethewed sorts. Some other things more I leave this occasion I thinke good to shew you, namely, the grosse errors both of *Plinie* and divers other ancient and moderne, who thinke that all or most of these varieties of Gourdes have come from the seede of one kinde, viz. that the seede that lyeth in the necke of the Gourde will give long Gourdes, those in the middle round like Gourdes, and those in the bottome or lowest parte, flat or bottle like Gourds. and that the variation of formes in them is also caused by the Art of Gardiners, who by moulders and such like, doe bring them into what forme they please, which forme, say they, they will commonly keepe afterwards each from their own seede, which is found utterly untrue, for howsoever they may by moulders, &c. bring them into [illegible] owing to the forme of the mould, yet the seede thereof assuredly will give no other forme than the full naturall, unlesse it be altered againe. Another errour or opinion possesseth many that by the standing of water in a pot three or foure dayes of from the place where it groweth, it will choake and destroy wondrous fast, and that if oyle be set neare it, it will drinke in as fast: and againe, that if women when they have their courses shall touch any part of them, it will hinder their growing: and lastly, that to make them come without seede, is to steepe the seede in oyle of Scorpions before you set it, all which are as erroneous as the former.

The Vertues.

All these sorts of Gourdes how ever different in forme, yet are of one qualitie, that is, cold and moist in the second degree: they are eaten in the hot countries with much delight, kept and preserved with great care, are, and paines to be had almost all the yeare after, and have there, as I said before, a farre more sweete and pleasant relish than in their colder climates, where being more waterish, they are the more unwholsome, at the least more inapte: they are eaten boyled or stewed, but much better being fried whereby they give the better nourishment to the body: for by their moisture being boiled or stewed, they are the more loathsome, and make the body the more soluble, and so they doe also being pickled up as many use to doe: Wine also kept in a fresh Gourde all night, after it hath beene cleansed from the loose inward pulpe and seede and drunke in the morning will cause the belly to be soluble. They are conveniently given to hot & cholericke bodies to coole the heat and inflammation of the liver and stomacke: but the distilled water of them before they are throughripe drunke with some Sugar, doth wonderfully helpe to allwage thirst, and the hot fits of agues. For want of a Still to make water, you may make some effectuall in this manner. Put a whole Gourd when you have cut off the upper head and cleansed it from the seede, into an Oven with a batch of bread, in the middle whereof there will be gathered a fine cleare water, which being powred out, may be kept to use as neede requireth: the leaves and young branches are commonly applied to all the hot humors, compostures and inflammations, and to allwage paines of the headach, the [illegible] and heat in the eyes, the paines in the reines, and the paines of the gout, if either the juice of them, or the water applied in clothes, and spunges wet therein the same applied to womens breasts pained with the abundance of milke, easeth them by cooling and restraining the hot qualitie and quantitie thereof: the water or juice being [illegible] or outwardly applied to the privie parts of man and woman, represseth the immoderate lust of the body: the ashes of burnt Gourds are used of many to clense and heale old ulcers and sores, as well in the genitories, as other parts of the body, and to helpe scaldings or burnings by fire or water: they are a commended good [illegible] leane and weake bodies to feede on, as they are hurtfull to such as have the winde cholicke, to whom they are not to be given at any hand. The seedes of Gourds are one of the foure greater sorts of cold seedes used very much in Physicke, and are very availeable in decoctions, [illegible], Emulsions or Almond milke to coole the heate of the liver, the reines or backe and urine, and to give much ease to them that are troubled with the stone or gravell in the kidneyes, and the ulcers or sores of the inward parts and bladder. The Simnel Cake being of a thicker substance dressed any good way, is both more acceptable meate, and is no lesse effectuall in medicine. The *Indian* sorts are some more waterish, others more solide, and accordingly are more or lesse fit for use of medicine.

Chap. XXII.

Anguria sive Citrullus. The Citrull or *Turkie* Million.

The Citrull or *Turkie* Million hath also some varieties being a fruit different from the other, as well in the [illegible] thereof as of the seed, which much leadeth me to distinguish of them, or joyne them together, [illegible] because some doe account them kindes of Cowcumbers. I will give you the figures both of some [illegible] of Cowcumbers and Muske Melons also.

Anguria sive Citrullus vulgatior. The ordinary Citrull or *Turkie* Million.

The stalke of Million groweth like as other Melons and Cowcumbers doe with rough trailing branches, the [illegible] whereof are hairy, longer and narrower than in any other, and more divided into severall parts, and hath [illegible] pale and yellow flowers, but the fruit is greater than a Melon, somewhat neare the fashion of a Pompion, with a smooth greenish barke which will change yellow by time, having some ribbes thereon, the meate

Original from UNIVERSITY OF MICHIGAN

the inner substance is watterish, in some sweete, in others a little tarte or soure, the seede whereof is smaller, rounder, blacker and harder shelled than those of the Gourd, the roote spreadeth and dieth like the rest.

2. *Anguria Americana versicolore pelle.* The discoloured *Indian* Million.

This other sort of Million varieth little from the former in growing, leaves or flowers, in the fruit is the chiefest difference, which is as great as a middle sized Pompion with a discoloured barke very variably sponed and lopped with white spots and markes upon the greene, the inner substance whereof is watterish, yet somewhat better than of the former, and will keepe sound for a good while after it is ripe and gathered, as the others also will: the seede within this is like the other, but longer, greater, redder, and more smooth and shining.

3. *Anguria Ægyptiaca.* *Egyptian* Citrulls or Millions.

Some of these *Egyptian* fruites are greater than others, even so great as *Bellonius* saith that foure or five will loade a camell, and one a man; the outer rinde being yellow, the inner sweete or substance very little and almost emptie, filled in the middle with much water that is very sweete, much gelded and drunke by them of the more reach with Rosewater, Muske and Amber, and is the present they offer to strangers whom they will chiefely entertaine; it hath a few smaller seedes within it than in the former, in other things there is little difference. I have given you the figure of this fruit in the former tripartite table in the foregoing Chapter.

4. *Anguria carne lignosa.* Hard or Wooddy Millions.

Cæsalpinus maketh mention of this sort as of a kinde of Cowcumber (for so the *Italians* doe call these sorts of fruits that growing wilde or manured in other countries are noted up in *Italy* but delight and rarities) whose fruite is so hard and wooddy, that it will not breake being let fall upon the ground, but will rebound againe like a ball that is let fall: Hereof I have no further knowledge than his relation, that is, *teste Cæsalpino.*

The Place.

The first groweth generally throughout *Turkie*, and so likewise in all *Italy* and many other hot countries, where they make account it for their best of Cowcumbers: the second was given me among others out of the *Indies*: the third is naturall to *Egypt*, as *Prosper Alpinus* saith in his Booke of *Egyptian* plants; and *Bellonius* in his second Booke of Observations, and 75. Chapter: the last is not knowne or not mentioned where it is naturall.

The Time.

They flower and beare their fruit about the same season that the others doe.

The Names.

It is thought by divers that this kinde of fruit was not knowne to the ancient Greeke or Latine Writers, and that *Ruellius* did first make it knowne by the name of *Anguria*, from whom *Matthiolus* and others doe call it so: others doe suppose that it is the *Pepo* of *Dioscorides*, *Galen*, and *Pliny*; but I thinke it not amisse here to relate the words of *Galen* 8. *simpl. medicament.* *Universe Peponum natura frigidior, cum laxe humiditatis sit: sedimen quoque quandam ab se gendit: atque Melopeponis minus humidi, quam Peponis sunt*; by which words one may more than halfe ghesse which of these sorts of fruites come neerest unto *Pepo*, and *Melopepo* of *Galen*, and those of our time, unlesse our climate alter their substance or properties. It is generally called *Citrulus* or *Citrullus* *quibusdam aliis formis*, and *Cucumis Citrullus* by divers, to distinguish it from the other Cowcumber. In the Chapter before you have *Pliny* alledged to account the Cowcumbers that grow over great, to be called *Pepones*, and here you have that these *Citrulli* be accounted *Cucumeres* as *Cæsalpinus* and all *Italy* over doe account them commonly; so that you see how various mens opinions are in these sorts of fruites, none knowing directly which of them is most truely the *Pepo* or *Melopepo* of the ancients, nor which is their *Citrulli*, whether this that beareth the name of the *Italians* take it, or our ordinary *Cucumis* commonly so called: withall *Alpinus* in his Booke of *Egyptian* plants, saith, that the *Egyptians* have divers of these sorts of *Citrulli* differing one from another which they distinguish by the severall names of *Chate*, *Abdolavi*, *Chaja* &c. Of the *Arabians* it is called *Bate*, and *Batecha*, and as it is thought is the *Dulhatha* of *Serapio*; but *Bellonius*, in the place before alledged, saith, that the *Egyptians* call it *Capona*, and that *Anguria* signifieth a Cowcumber, and is not this plant: of the *Italians* *Cocomaro* and *Angria*; of the *Spaniards* *Cogombro*, of the *French* *Citrouiller*, of the high and low *Dutch* following the Latine name *Citrullus*, and so wee in *English*; as also *Turkie* Million or Cowcumber, because that others doe call it *Cucumis Turcicus*.

The Vertues.

The Citrull is of the same temperature with the Gourde, that is, cold and moist: the seede is much of use in the Apothecaries shoppes, and reckoned one of the foure greater cold seedes, being used as Gourdes, Millions, and Cowcumbers to coole the heate of the firs of agues, and the distemperature of the liver and blood, to quench thirst, and to take away the drinesse and roughnesse of the tongue caused thereby, and is as available for the stone, the heate of the raines, and the sharpenesse and stopping of urine as any of the rest. It is thought more convenient for more tender bodies, and that are growne feeble and weake by long sicknesse, in regard of the greater facilitie more than in the Gourde, as aforesaid; and generally both leaves, branches, juyce and distilled water thereof, is as effectually applied for all those diseases that the Gourdes before mentioned are, and therefore needs not be repeated. I shall referre you to the Chapter going before for the rest.

Chap. XXIII.

Intubacea plantæ. Endive or Succory like herbes or plants.

Under this generall name of *Plantæ Intubaceæ* Succory like herbes, is comprehended so great a varietie, that to dispose them in some methodicall manner, I must distribute them into severall Chapters under their principall heads or titles, whereunto they are to be referred, which are, *Endivia*, *Cichoreum*, *Sonchus Lævis*, *Chondrilla*, *Sonchus*, *Lampsana*, *Hieracium*, *Lactuca*, *Senecio*, and *Jacobæa*; of some of which I have spoken both in my former Booke, namely of all the sorts of Garden Lettice, and in this Worke of *Jacobæa* and *Senecio*. I will then to begynne with Endive, the kindes whereof also I have shewed

Endivia sativa.
Garden Endive.

Intybus sive Endivia minor angustifolia.
Small Garden Endive.

you in my former Booke, and therefore I will make no further description of them but give you the figures of the vsuall garden kinde, and expresse a wilde sort here, but withall set out the Vertues of them all as briefly as I have done.

Intybus sive Endivia minor angustifolia, Small garden Endive.

This small Endive hath many very long leaves lying on the ground, narrower than the first garden Endive, and somewhat more bitter: the stalke is slender, more full of branches, and lower than the other, bearing at the top small blew flowers like the common Endive, after which follow the like seede also, and the roote perishing in like manner.

The Place.

This is onely planted in Gardens, as well beyond the seas as in our country as the other sorts are.

The Time.

It flowreth and perisheth with the other sorts if it be sowen in the Spring, but if at Midsummer it will stande the beginning of Winter, and will well serve to be used as the others be.

The Names.

The Greek word Ἔντυβος as the Latine *Intibus*, *Intubus* or *Intubum*, doth denominate as well Endive as Succory, and therefore both they and the kinds thereof are called after the Greeke or Latine, or *Intibace* after the Latine. Dioscorides maketh two kindes of *Seris*, the one tame, the other wilde, and of the former sorte he saith the one hath a broad leafe like unto Lettice, which is our ordinary garden kinde, and called by *Matthiolus Intubus maior*, and others *Intubum latifolium*; the other hath a narrow leafe, and is somewhat bitter in taste, which is the Endive here set forth by the judgement of the best moderne writers, and is called by *Matthiolus Intubus* and *Endivia minor*, *Lactuca Intubus hortensis* alter, by *Gesner* & others *Intubus angustifolium Seriola aliquibus*; by *Lugdunenses plantarum Cichoreum sativum*; by *Lobel Seriola aut Endiviola*, who saith that the name of *Seriola* or Garden Endive, was but the corruption of the other, which should have been called *Seriola quasi per Seris*, and therefore wherever *Seriola* is appointed in any medicine, this sort of Endive is intended thereby and commanded. Endive is called by the *Arabians Dumbebe* & *Endube* or *Endeba*, by the *Italians Endivia*, and this kinde *Endivia minore* (and in the Apothecaries shoppes beyond the seas *Seriola domestica*) by the *Spaniards* by the *French Endivie*, by the *Germanes Endivien*, by the *Dutch Endivie*, and by us in *English* Endive, and small Endive.

The Vertues.

All the garden Endives are cold in the second degree at the least, but are more moist and less drying than or the kinds thereof which is more bitter, and serveth well to coole the excessive heate in the liver and and in the hot fits of agues, and all other inflammations in any part of the body, to ease the ardentnesse of or the juyce or distilled water: the same also helpeth to coole the heate and sharpenesse in the urine, and corlations in the urine or in parts: the seede is of the same properties, or rather more powerfull, and bridles able for the faintings and swoonings and passions of the heart: outwardly applied they serve to temper the

sharpe humours of fretting ulcers, hot tumors and swellings, and pestilentiall sores; and wonderfully helpeth, not onely the redness and inflammations in the eyes, but the dimmenesse of the sight also: they are also used to allay the pangues of the goute. They are all used in sallats familiarly both Summer and Winter, when as being whited, they are the more tender and delicate very pleasing to the stomacke, and refreshing the weake and fainting spirits.

Chap. XXIIII.

Cichorium. Succory.

Of the Succories there are many sorts, some accounted tame or of the Garden, others wilde or of the fields, &c. of the most usuall Garden kinde I have spoken in my former booke, and of the other sorts I am to entreate here, but because I should pester one place too much to set them forth all in one Chapter, I must handle them severally, and speake of those kinds of Succory here in this Chapter that beare blew flowers or come nearest the Garden kinde and of others that beare yellow flowers in the Chapter following.

1. *Cichorium flore rubello.* Red flowred Succory.

The red flowred Succory is in the long leaves a little more divided on the edges in the tall and high round stalke, in the forme of the flowers and seede and in the long white roote, abiding yearely like unto the Garden Succory, the onely difference hereof consisteth in the colour of the flowers, which in this are of a pale red delayed colour, which will degenerate as I have often observed in my Garden, turning to bee blew, I meane those plants that rise from the seede of the red and not the same plants that have borne red flowers.

Of this kinde likewise there is one that beareth white flowers, not differing else, but that the seede hereof as well as the other will give blew flowred plants. *Flore albo.*

2. *Cichorium sylvestre.* Wilde Succory.

Wilde Succory hath divers long leaves lying on the ground very much cut in or torne on the edges, on both sides even to the middle ribbe ending in a point, sometimes it is found to have a red ribbe or veyne downe the middle of the leaves, from among which riseth up a hard round woodily stalke spreading into many branches, set with smaller and lesser divided leaves on them up to the toppes, where stand the flowers, both for forme and colour like unto the Garden kinde that is of a blew colour, after which come the seede like thereunto also; the roote is white but more hard and woodily then the other; the whole plant is exceeding bitter.

3. *Cichorium spinosum Creticum.* Thorny Succory of Candy.

This Thorny Succory hath the lower leaves next the ground somewhat long and narrow, cut in somewhat roundly on the edges like the ordinary Succory into many short not deepe cuts; the crested greene stalke that ri-

1. *Cichorium sylvestre.* Wilde Succory.

3. *Cichorium foliosum crecticum.* Thorny Succory of Candy.

ſcith from among them is hard and wooddy, ſpreading many ſuch like branches from the very bottome all about, making it ſeeme a round buſh ſet with many narrower leaves, and without any cut or diviſion on the edges which quickly fall away leaving the ſtalkes bare or naked, and each branch ending in one, two, or three ſometimes long forked thornes at the joynts with the leaves, which towards the toppes abide a little longer, come forth ſmall ſcaly huskes, and out of them the flowers which are made of five leaves a peece broade at the ende, and cut into two or three deales of a blewiſh colour like unto Succory with ſome yellow threds in the middle: the ſeede that followeth is like the ordinary ſorts, and ſo is the roote, but ſomewhat thicker and thornier, and ſo ſower as the Succory doth.

The Place.

The firſt ſort is found wilde in ſome places of *Italy* from whence I had the ſeede, and the winter after in *Germany*: the ſecond is found in many places of our Land in waſte, untilled, and barren fields: the third by the Sea coaſts and other ſandy grounde in *Candy*.

The Time.

The two firſt ſorts flower in the time that the other common ſort doth, but the laſt not until *Auguſt*, and hardly then, ſo that in our Country it doth give no ſeede, neither will well indure our Winters.

The Names.

Σέρις in Greeke as I ſaid before in the laſt Chapter, and *Intubum* in Latine doe ſignifie Succory as well as Endive, and the wilde ſort of Succory is called *Intubum ſylveſtre vel agreſte ſeris picris* becauſe it is more bitter then the reſt. Some call it *Cichoreum* and ſome *Lactuca ſylveſtris* to bee *Seris* or *Intubum ſylveſtre*, but *Matthiolus* gaineſayeth againſt them. In Latine alſo *Cichoreum ſylveſtre*, *Plinie lib. 22. cap. 8.* ſaith that this *Intubum ſylveſtre* or *Seris* or *Cichoreum agreſtis* was called by ſome in his time *Ambugia*, but *Celſus* and ſome truer copies have *Ambubeia*, *Turpinius* calleth it *Ambubeia* and *Cichoreum*. *Horace* hath *Cichoreum* or *Cichorea*, where he ſaith,

Alle paſcunt Olivæ,
Alle Cichoreæ, levesque Malvæ. *Tragus* alſo hath *Cichoreum*.

Of the firſt with red flowers I finde *Tragus* (to note one that hath *garitæ candidum purpureum flores* and ſuch like him *Ruellius* to make mention, and *Thalius in Hercynia ſylva* of that with white flowers: the ſecond is called of *Lobel Seris pereg. Cichorea & Seris ſylveſtris*, by *Geſner Intubum ſylveſtre* and *Cichorium ſylveſtre*, and *Seris agreſtis* by *Lobel Seris pereg. Cichorea & Dalechamps*, whereof *Theophraſtus* maketh mention in his ſeventh Booke and firſt Chap. among the *Cichoreums*, which *Gaza* inwardly tranſlateth *Porcellio*, *Brunfelſius* calleth it *Sonchus Germanicus* porcelle: the figure whereof under the title of *Hieracium latifolium*, and *Ranbolfus* noteth it: the ſame mentioned by *Howorius Bedue* in his fourth Epiſtle to *Cluſius* by the name of *Cichoreum ſylveſtre*, and *Sonchus ſylveſtris* of *Lobel*, *Hydria ſpina* by the *Creeans*: *Cluſius* in his hiſtory of Plants calleth it *Chondrilla elegans* [illegible] and afterwards both by *Pona* in his *Italian* deſcription of Mount *Baldus*, and by *Ranbolfus* in his *Cichoreum Cichoreum ſylveſtre vel ſativum Creticum*: the *Italians* call Succory *Cinoſole*, *Radicchio*, *Scarola* and *Scarioli*.

some under *Cichorea salvatica*: the *Spaniards* *Almaneca* and *Cicoria salvaja*, the *French Cichorée sauvage*, by the *Germanes* *Wegwart*, by the *Dutch Cichorye*; and by us in *English* Succory, and wilde Succory.

The Vertues.

Wilde Succory as it is bitter is more dry and lesse cold then Endive, and therefore more opening also. An handfull of the leaves or roots thereof boyled in wine or water, and a draught thereof drunke falling driveth forth choller & flegmatick humors: the same also openeth the obstructions of the Liver, Gall and Spleene, and helpeth the Yellow Iaundice, the heate of the Reines and of the Vrine, the Dropsie also, and those that have an evill disposition in their bodies by long sicknesse, evill diet, &c. which disease the Greeke call *Cachexia*. A decoction thereof made with wine and drunk is very effectuall against long lingering agues, and a dramme of the seede in powder drunke in wine before the fit of an Ague doth helpe to drive it away. the distilled water of the herbe and flowers performeth the same properties aforesaid: and is especiall good for hot stomacks, and in Agues either pestilent all or of long continuance, and for swoundings and passions of the heart, for the heate and headach in children, and to temper the distemperature of the blood and Liver: the said water, or the iuice or the bruised leaves applyed outwardly allayeth rumors, inflammations, S. *Anthonies fire*, pushes, wheales and pimples, especially used with a little Vinegar, as also to wash pestilerous sores: the said water is very effectuall for sore eyes, that are inflamed or have any rednesse in them, and for Nurses sore breasts that are pained by the abundance of milke. The wild Succory as it is more bitter, so it is more effectuall to the stomack and Liver.

Chap. XXV.

Hieracium sylvestre sive Cichoreia sylvestris floribus luteis. Rasbord or wilde Succory with yellow flowers.

There are diverse other herbes which are accounted kindes of wilde Succory for their neare relemblance in forme but not in qualitie thereunto, some whereof shall be set forth in this Chapter, especially such as beare the title of *Cichorium* Succory: For the *Dens Leonis*, *Dandelion* and the *Hawkeweeds*, Gum Succory that be kinds of Succory also so like unto it, that many have mistaken the one for the other, shall follow in their order.

1. *Cichorium pratense luteum asperum.* Rough yellow field Succory.

This rough yellow Succory hath longer and rougher leaves then those of the former wilde Succory, in one sort with few or no nuts at all, in others like unto it with deepe cuts and divisions: the stalkes grow to be three or foure foote high, tough and reeded, divided into sundry branches with smaller leaves on them, and lesse jagged bearing small yellow flowers like unto an Hawkeweede, at the ends of every one, which when they are ripe turne downe, with a small long yellowish seede fashioned thereat, and are both carried away with the windes: the roote is hard, tough and unprofitable.

2. *Cichorium pratense laeve. Herba pratensis dilleni.* Smooth yellow Succory.

4. *Cichorium vehrarium pratense.* Gilded yellow Succory.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Cichorium pratense, folium leve.* Smooth yellow Succory.

This other yellow Succory hath long and large leaves as smooth as Succory, but of a whiter greene colour, & in on the edges, but not so much nor so deepe as the former: the stalkes rise not up so high nor are so much ched, the leaves thereon are lesse cut in, and up higher little or nothing at all: the greene heads that stand at toppes of the branches are greater, and the flowers that spring out of them are larger and more double, neither like those of Dandelion of a yellow colour, which turne into downe, and the seede therewith carried away with the winde: the roote is full of a bitter milke.

3. *Cichorium flore exiguo Hispanicum pumilum.* Dwarfe Spanish yellow Succory.

Of this last kinde *Guillaume Boel* found a dwarfe plant neere the Sea in the Isle of *Calez* in *Spaine*, which by his owne sight and *Clusius* judgement, as he recordeth it in his *Curæ Posteriores* differeth not in any thing from the last but in growing lesse in every part. Why *Bauhinus* should make this a *Dens Leonis* rather then the rest, (which for their seedes take may be so accounted) as he setteth it downe in his *Pinax*, I cannot see any reason for: sure I am he never saw the plant, *cum hæc scribsit, &c.*

4. *Cichorium vesiculosum pratense.* Blistered yellow Succory.

This kinde of Succory is in forme of leaves, bignesse, and colour so like unto the ordinary Garden Succory, that it is often taken for the same, especially in the Winter and the beginning of the Spring time, before it putteth to shoote up stalkes, for during that time it spreadeth his many leaves round upon the ground, sometimes broad and whole, almost without or with very few devisions or jagges, and sometimes also somewhat hairy & rough, in others smooth and more divided, of a shining greene colour: from the middle of them groweth a long bladder, out of which in the Spring riseth up a round hairy stalke parted into many branches, somewhat high and crested, set with lesser divided but shorter and broader leaves then those below, at the toppe whereof out of the skinny bladder doe the flowers breake forth many standing together, each upon a long stalke, rising out of a long greene husk like unto those of Hawkeweede and consist of many yellow with leaves, somewhat purplish underneath with sundry threds as a thrummie in the middle, which turne into downe, and with the seede is carryed away at the will of the winde: the roote is somewhat long and slender, blackish on the outside, and white within, yeelding a bitter milke as the rest of the plant doth.

5. *Cichorium dulce Neapolitanum.* Sweete yellow Succory of *Naples*.

The sweete Succory is in the forme and divisions of the leaves very like unto the wilde Succory, yet not so deepely gashed, but thicker in feeling, covered with a fine soft haire not rough at all, and of a darke greene colour: the stalke riseth to be two foote high or more, round, firme and whitish because of the hoarinesse thereof, sometimes breaking out into branches toward the toppe, set with shorter long white broader and more divided leaves then below, closing the stalkes at the bottomes, having at their toppes greene hairy heads or husks and gold yellow flowers in long hairy husks like unto the Hawkeweedes, which growing greater when they are ripe within them is contained very small long browne seede, with a fine white downe on them, and so carried away with the winde, the roote is long and blackish on the outside and white within, so full of silver

1. *Cichorium dulce Neapolitanum.*
Sweete yellow Succory of *Naples*.

2. *Scorzonera foliis Cichoriæ variegatis.*
Variegated Succory.

milke.

Original from UNIVERSITY OF MICHIGAN

milke without any bitternesse at all and so is the rest of the plant, that it will grow hard like a gum if it bee not pitched away but suffered to abide.

6. *Cichorium montanum asperum.* Rough Mountaine Succory.

This mountaine Succory hath divers long narrow leaves next the ground very sharpely dented about the edges, but not divided or cut in at all, rough also all over: from among which riseth up a stalke branched forth with such like leaves set thereon and divers large double yellow flowers like unto those of Dandelion at the toppes, whichcome into downe as the rest and blowne away: the roote consisteth of many long strings.

7. *Cichorium tenuifolium fœtidum.* Strong or ill tenced hoary Succory.

This kind of ill scented hoary Succory from a thicke roote sendeth forth sundry weake, round, hairy or hoary stalkes about two foote or more high, having divers large long hairy or hoary leaves next the ground, deeply gashed on both sides, somewhat like to Succory leaves, parted into many branches with lesse leaves thereon the lower below, and lesser aboue, at the toppes of whom stand many pale yellow flowers in greene huskes, like unto Groundsell which quickly fade in like manner turning into downe, which with the seede is carried away by the winde: this herbe hath somewhat an ill or strong sent with it, yet more as the hoarie time of the same then else, which procured it the denomination of *fœtidum* Stinking.

8. *Zacynthe sive Cichorium Verrucarium.* Warted Succory.

The warted Succory spreadeth sundry long and somewhat hairy greene leaves next the ground, cut or divided on the edges into deepe dents, but not deepe gashes, somewhat resembling Succory leaves: the stalkes divide themselves into some lesser branches with a small long leafe at every joynt broad below and compassing it about at the bottome: the flowers grow severally at the toppes and upper joynts of the branches upon short scales like being small and yellow, compased of divers small yellow leaves, broad pointed and notched in, which turne not into downe as the other sorts before doe, but into small round and flat hard heads, parted at the crowne into sundry bunches or knobbes like unto warres with a little tuft or crowne in the middle, in each bunch whereof is contained a kernell or seede: the roote is small and stringy dying every yeere after seedetime, and never abiding a Winter unlesse it spring up from the seede in *Autumne*.

The Place.

The first two sorts and the sixt are many times found in our medowes and other moist grounds taken for kinds of Hawkeweeds and so the lesse regarded: the fourth and fift *Cichoreums* found on the hilly in *Naples*, the seventh often found in sandy grounds and by woods and hedges sides: and the last is thought to grow in the Island *Zacynthus* from whence it was brought into *Italy*, and thence into other parts. but *Pona* saith it groweth in divers places in *Italy*.

The Time.

They doe all flower and seede about the same time of the other Succories, except the second, which flowreth an hot time the rest.

The Names.

All these herbes are accounted severall sorts of Succory by many writers, and some of them (that is those of *Italy* as *Columna* saith) are used in the stead of the true Succory with good successe, but as I said before they are but bastard sorts which their seedes declare, being rather Hawkeweedes as I doe thinke: The first is called by *Fuchsius* (in *Calathiana Virgilii Hieracium præcox asperum*, by *Tabernæmontanus* and *Gerard Cichoreum latifolium*, by *Dodon latifolia sylvestris sive Cichorium sylvestre flore luteo*, *Tragus* maketh it his *Cichorea 3*, *Dioscorides*, and *Cæsalpine* calleth it *Lactucula altera*: the second is the *Cichoreum luteum præcox* of *Lobel* in *Adversaria* and *Thalius* and *Cæsalpinus Theophrasti* in his Observations, as *Dalechampius* before him had done, and as *Lugdunensis* writeth is downe for *Aphace Dalechampij*. *Cæsalpinus* calleth it *Endivia sylvestris*, and *Gerard Dens leonis Columnæ*, *Dodonæus* and *Tabernæmontanus* make it their third kind of *Dens leonis*, and *Bauhinus* calleth it *Cichoreum, sylvestre, latifolium lactucæ*: the third is sufficiently expressed in the description: the fourth and fift *Columna* maketh mention of, the one under the name of *Cichorium sylvestre asperum primum*, and the other of *Cichoreum Hieracioides asperum minus*, *sive Cichorium dubium*, which *Bauhinus* numbereth among the sow Thistles and calleth it *Sonchus folijs lenitèr hirsutus*: The sixt is *Tabernæmontanus* ninth sort of *Hieracium*, which he calleth *Hieracioides hirsutum asperum*, and *Gerard Hieracioides asperum*: the last was full called by *Matthiolus Zacynthe sive Cichorium verrucarium* and so doth *Clusius* also: but *Lobel* in his Observations, Pag. 116. (in ralling it *Chondrille prima Dioscoridis Clusij Zacynthe Matthioli*) doth foulely confound the two plants of *Matthiolus* and *Clusius* together, for he there giveth the thicke woolly leaves of *Clusius* his *Chondrille* to this *Zacynthe* of *Matthiolus* which hath greene leaves, and maketh it first to have erected heads of seede as the true *Zacynthe* hath, and afterwards saith the flower is yellow &c. flying away in downe utterly contrarying himselfe, which *Clusius* knowledge of and found fault with him for it, and thereupon set forth the true figure and description of it in his history of plants: *Gesner in horto* calleth it *Verrucaria Scriptorij species* and *Cæsalpinus Dandelion species tertium*, whereupon *Bauhinus* putteth it among his *Chondrillas*, and calleth it *Chondrilla verrucaria folijs hirsutis*: the *Italians* call it *Mazzo di Cavalliero* and *Mazza ferrata*.

The Vertues.

These kinds of Succories except the Neapolitane and the last are not used in Physicke that I know but they, that in the Neapolitane kinds as *Columna* saith are there used in stead of the true Succory being so like it that as I said in the beginning they soone deceive one, willaking one for another yet used with good successe whereby we may judge of the others not to be much differing, and therefore untill some further and more certaine experience bee made of them, let this advise serve for the present. *Matthiolus* hath given us full knowledge of the vertues of *Zacynthe* or warted Succory, from *Cæsalpinus* of *Verona*, who by practise had found it to be excellent to drive away warts from the hands by once eating the leaves as a Sallet, and *Matthiolus* saith that by his own experience a dram of the seede in powder taken for certaine dayes together in white wine to bedwards did drive away the warts from mens hands that was wonderfully pestered with them: but *Pona* denying that the once eating the leaves will doe any good, but yet saith that if the juice of the leaves bee used to bathe the warts, it will corrupte them most certainely as he and divers other found by their experience, the same also taken in wine is good for the biting of a mad Dog.

CHAP. XXVI.

Dens leonis. Dandelions.

THe Dandelion is assuredly a differing kinde of wilde yellow Succory, and therefore I thinke it fit to expresse it before the *Chondrilla* Gumme Succory which is also an other kinde: betweene these are more differences and varieties found out of late than have formerly beene knowne, which shall be set forth here together.

1. *Dens leonis vulgaris.* Common Dandelion.

Our common Dandelion is well knowne to have many long and deepely gashed leaves lying on the ground round about the head of the roote, the ends of each gath or jagge on both sides looking downeward as the way againe, the middle ribbe being white which being broken yeeld abundance of bitter milke, but the lesse and more from among the leaves which alwayes abide greene, arise many slender weake naked fistie stalkes rather than stalkes, every one of them bearing at the topp one large yellow flower, consisting of many rowes of yellow leaves broad at the points and nicked in, with a deepe spot of yellow in the middle, which growing into greene huske wherein the flower stood, turneth it selfe downe to the stalke, and the head of downe is couered as round as a ball with long reddish seede underneath bearing apart of the downe on the head of every seede together is blowne away with the wind, or with the blast of ones mouth may be blowne away at once: the roote groweth downewards exceeding deepe, which being broken off within the ground will not perish, but shoote forth a new againe, and will hardly be destroyed where it hath once taken deepe rooting in the ground.

2. *Dens leonis angustifolius folijs.* Dandelion with narrow leaves.

This Dandelion is in all things like the other, but that the leaves are narrower, yet hath not fewer gashes or divisions on the edges, so that by this one note it may be distinguished.

3. *Dens leonis tenuissimè folia.* Fine jagged Dandelion.

This Dandelion hath a thicke reddish roote full of fibres, sending forth sundry most finely cut and jagged leaves, each of a hand breadth long and two inches broad, deepely jagged, and divided againe into many more other small rents or divisions, ending in a fine small point: the flowers are much smaller than the rest, growing on naked stalkes and yellow, turning into downe as the other.

4. *Dens Leonis minor radiatis foliis sive Trinciatella Italorum Camerarij.* Sweete Dandelion.

This sweete Dandelion (called by *Camerarius Trinciatella Italorum*, hath many leaves spread on the ground, three inches long and halfe an inch broade, cut in on the sides into sundry deepe gashes, whole ends have each them three very deepe dents, and each having divers points standing like a starre or sparre, the foremost whereof are a little hairy, among which rise up many smooth slender naked stalkes, one whereof hath grown right scarse an hand breadth high, the rest are lower and bend downewards, each of them bearing a small yellow

1. *Dens leonis vulgaris.*
Common Dandelion.

4. *Dens leonis Monspelliensium sive Afforum.*
Called in English Dandelion.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

flower like unto other Dandelions turning into downe and flying away with the wind carrying the seede with it, which is somewhat long and broad with hard haires like beardes at the tops: the roote is small and blackish without and white within, very sweete in taste as the leaves are also, and so tender to keepe that it perisheth with the first cold it feeleth: and must therefore be housed, which then will endure many yeares giving seede yearely.

3. *Dens leonis minor aspero folio.* Small rough Dandelion.

The small rough Dandelion sendeth forth sundry small leaves lying round about the roote of two or three inches long and one inch broade, divided or torne in on the sides, each of them set with small smooth sharpe prickles or haires like as the prickly Sowthistle hath: the stalkes are about two inches high, and beare each of them a large, fair yellow flower like the rest and turned into downe: the roote is small and wyrtish.

4. *Dens leonis Monspelliensium sive Asphodeli bulbosi.* Bulbed or clogged Dandelion.

The Asphodill rooted Dandelion spreadeth many large and blewish greene hairy leaves upon the ground unevenly waved or cut in on the edges but not deepely gashed, as the common Dandelion is of a bitter and sharpe taste like unto it, from which rise sundry bare or naked stalkes with severall flowers at the toppes of them larger and more double than it, and of a paler yellow colour which passe into downe like the rest: the rootes are fumy, long, tuberous and slender clogges like unto those of the Asphodill but smaller, shorter, and more pointed at the ends.

7. *Dens leonis Gadensis.* Dandelion of *Cadiz* in *Spaine*.

This plant so like in face unto a little Dandelion hath made me contrarie unto others opinions place it in the same ranke with them. It hath a number of long leaves a spanne long or more, rising from a long white tender roote, the middle ribbe of the leafe is bare from the roote to the halfe length of the leafe, and then it hath many sections or cuts on each side, very much resembling the leafe of the ordinary Dandelion but smaller and narrower: the flowers likewise stand upon long foote stalkes as the Dandelion doth being small and yellow, and doe turne into downe that is carried away in the winde, with the seede which is small long, and reddish like unto some of the kinde vnerdes. It groweth in the Iland of *Gades*, which wee call *Cales* or *Cadiz* as *Guillaume Boel* saith, who brought it in out of *Spaine*, and called it *Cichorium Gadense*: *Clusius* it seemeth not well marking the plant being dried, and never having seene it greene or growing, tooke it from *Boel*, and calleth it in his *Curæ posteriores Cichorium silvestre pumilum sive Hedipathi*, and saith it is altogether like unto it though lesse: but how like it is, upon this description truely set downe as before, I leave it to any judicious to determine. It flowreth in *July*, *August* and *September*, and the seede is soone ripe after the flower is past; the roote liveth all the Winter if it be milde, or else it perisheth with the hard frostes.

The Place.

The first is too frequent in all medowes and pasture grounds, but the second is more rare, yet often to be met with: the third groweth in *Austria*: the fourth in *Italy* as it is suspected, because it came from thence: the fift and six about *Montpelier*, as also about *Florence*, and in other parts of *Italy* especially the six, and the last in *Spaine*.

The Time.

They flower in the Summer moneths, yet as is well knowne the first is found in some place or other in flower every moneth in the yeare.

The Names.

The Dandelion is not certainely intimated by any Greeke denomination, for it is certaine it is not *Thrincia Theophrasti* but hath divers Latine names, as *Dens leonis, Urinaria, Corona* and *Caput monachi, Rostrum porcinum*, and as *Dioscorides* hath it *Chondrilla Galeni*: the first is usually called of most of the later writers *Dens leonis*, but *Tragus* would have it to be *Hieracium majus*, and *Cordus in historia*. to be *Hieracium parvum*: *Gesner in horto Hieracium minus Italum* and *Dodonæus Chondrilla altera*, and *Cæsalpinus* (as divers others also doe) to be the *Aphaca* of *Theophrastus lib. 7. cap. 7.* and 10. among the Wortes: divers also take it to be *Hedypnois Plinij lib. 22. c. 8.* but the most learned rather take the former *Cichorium luteum* to be it: *Fuchsius* calleth it *Hedypnois major*, and *Lugdunensis Dalechampij*: *Lonicerus* calleth it *Taraxacon minor*, and is generally held to be the true *Taraxacon officinarum Arabum*, and so used with us in all compositions whereunto *Taraxacon* is appointed: the second *Lobel* calleth *Aphaca angustiore folio*: the third is called by *Columna Hieracium pedibus*: and *Camerarius* calleth it fourth *Tripleurella*: the fift as also of *Bauhinus* mentioned by the name in the title: the last is called by *Clusius Cichorium Constantinopolitanum*, because, as hee saith, hee received it from *Augerius de Busbeque* the Emperours agent at *Constantinople*: but *Lobel* and *Pena* say that hee needed not to extoll the plant as a stranger, because it groweth plentifully in his owne country of *Siena* and *Tuscane*, *Liguria* and other places of *Italy* whereof he was diligent, as also about *Montpelier*, whereupon they called it *Dens leonis Monspeliensium Asphodeli bulbus*, but I shall suppose it to be the *Chondrilla altera Dioscoridis*, or *Perdicium* (rather *Perdicium*) of *Theophrastus*; the chiefe leaves stalkes then leaves. *Tabernæmontanus* calleth it *Dens leonis altera*, the last is mentioned sufficiently in many formes: the *Italians* call *Dandelion Dente de leone*; the *Spaniards Diente de leon*; the *French Dens de lion*; the *Germanes* of the Low Countries *Paffenbet*, *Kerkrout* and *Paffenpratlin*; the *Dutch Paepesnuyt Hoenderpoten* and *Leeuwentanden*, and we in *English* Piss a bed and Dandelion.

The Vertues.

Dandelion is neare in propertie unto the wilde Succory, and by the bitternesse doth more open and clense, and therefore is excellent for the obstructions of the liver, gall and spleene, and the diseases that arise from them, as the jaundise and the hypochondriacall passion, it wonderfully openeth the uritorie parts, causing abundance of urine, so as children whose nature and veines are not sufficiently strong to containe the quantitie of urine they receive, but that then without restraint or keeping it backe they water their beds, but in those of riper yeares the stopping or yeelding small quantitie of urine, it also powerfully clenseth apostumes and inward ulcers in the passages, and by the drying and temperate qualities doth afterwards heale them, and for the same the roote being buried a while in sand and whited (which taketh away much of the bitternesse, and then the more tender) being eaten as a sallet are more effectuall than the leaves used in the same manner: such as are accustomed to such raw sallets may take the decoction of the roote or leaves in white broth, and then eaten as pot herbes with a few Allisanders boiled in their broth. And who so is inclined towards a consumption, or hath an evill disposition of the whole body, ready to fall into a *Cachexie* by

the vse hereof for some time together shall finde a wonderfull helpe, not onely in clensing the leaning corrupt but strengthening the good, and preserving the body sound in all his functions: it helpeth also to procure sound sleepe to bodies distempered by the heate of ague fits or otherwise: the destilled water also is effectuall [illegible] in pestentiall fevers and to wash the [illegible]

CHAP. XXVII.

Chondrilla. Gumme Succory.

IN *Dioscorides* time there were but two sorts of *Chondrilla* knowne, both which are much conuerted in our time, divers herbes being assimilated unto them, and scarse any agreeing in all things with them, but this age hath found out sundry plants, which for the resemblance we haue ranged to *Chondrilla*, and called by that name, whereof some beare blew flowers, and diuers yellow. Of those with yellow flowers I shall entreate in this Chapter, and of the other in the next.

1. *Chondrilla prior Dioscoridis legitima Clusij.*

The former true Gumme Succory of *Dioscorides* according to *Clusius* his minde.

This Gumme Succory hath many long and somewhat broad hoary leaues lying vpon the ground compassed a thicke downe, cut in on the edges somewhat like those of Succory, from among which rise vp one [illegible] a foote high or more parted into a few branches with smaller and narrower leaues set without order. Whose are somewhat round yellowish graines like unto small peeces of Gumme, which grow quickly to be ripe: at the toppes of the branches stand singly yellow flowers like those of Camomill, which when they are ripe vaile downe, and with the seede is carried away with the winde: the roote is of a fingers thicknesse blackish vnto the outside with some fibres thereat, and parted at the toppe into some heads, which bring forth leaues, &c. full of iuyce which is yellowish when it is drie.

2. *Chondrilla cum ramulis virgeis.* Gumme Succory with twigge-like branches.

This twiggy Gumme Succory shooteth forth sundry slender tough and flexible branches of twigge-like stalkes very clammy in handling, set with many narrow and short leaves, but those that grow at the foote of the stalkes next the ground are larger and longer, cut in on the sides into divers long gashes, when those stalkes grow toward flowring, the greater leaves begin to wither and die, so that being in flower they are quite gone and withered, the toppes whereof are furnished with small yellow flowers, which in time turne into downe and vaile away with the winde: the roote is long and slender, full of milke as all the rest of the plant is if any part be broken.

3. *Chondrilla cimina vifcosa Monspeliaca.* French twiggye Gumme Succory.

This *French* kind of Gumme Succory hath a white round iointed clammie stalke two cubits high, spreading into

1. *Chondrilla prior legitima Dioscoridis.*
The former true Gumme Succory according to *Dioscorides* his minde.

2. *Chondrilla cum ramulis virgeis.*
Gumme Succory with twigge-like branches.

flowers clammy branches pliant and eatie to bend, whole leaves at the bottome are smooth like Willow leaves of five inches long, and halfe an inch broad, sometimes having a tooth or two on them, but those that grow up higher are somewhat like unto the lower leaves of the tall Gumme Suctory divided into many and very fine parts: the flowers are small and yellow like the last which passe into downe and are blowen away, the roote is long and yellowish on the outside.

4. *Chondrilla viscosa humilis.*

Clammy dwarfe Gumme Suctory.

This Gumme Suctory sendeth forth from a small long white roote sundry slender rough clammy, and bending stalkes about a foote high with a few long and narrow leaves set at any distance thereon, especially from the middle upward, where at the joynts with the leaves stand leavie tufts of small and yellow flowers turning into downe like the tall, and the lower leaves, and those on the lower part of the stalke are long and narrow, some whole without any deut, and others with one or two on the sides.

5. *Chondrilla Jacobæa villosa tenuis.*

Slender Gumme Suctory.

This Gumme Suctory (which as *Columna* saith was first discovered) hath a long roote to fall set on the rocke where it groweth, that without breaking the rocke it cannot be got out, and being broken yeeldeth store of thicke white milke or juice like unto the milke of every part ville of the plant doth, which is much to be wondred at where it thicketh to the hands, &c. The leaves are many that grow below, and are very much torne on the sides with deepe and crooked gashes like unto Dandelion: it seldome hath more than one stalke, and seldome any branches thereon, which is slender white and round, about a cubite high, set from the middle upward with long narrow leaves not cut in or dented at all but parted at the bottome where it compasseth the stalke, and sometimes one side of the leafe cleaving thereto, that almost none of the stalke is seene: at the top of the stalke stand many flowers which caused *Columna* to give it the name of *Jacobæa*: at the joynts with the leaves come forth

Original from UNIVERSITY OF MICHIGAN

forth two or three or more flowers in long huskes, with short footestalkes, yellow on the inside and whitish without, flowring by degrees, so that some will be ripe and blowne away when others are new blowne or in the bud: the taste hereof is bitter: the upper part hereof in the forme of the flowers and posture of them is very like unto the wilde Lettice, whereunto *Galen* resembleth *Chondrilla lib. 2. alimentorum*, and so may be understood his *Chondrilla* or that of *Dioscorides* for it hath some resemblance with each.

6. *Chondrilla bulbosa.* Bulbed Gum Succory.

The bulbed Gum Succory hath divers small leaves lesser then Succory, with small divisions on the sides of them on slender stalkes, among which spring up many slender weake stalkes on them, and at the toppes of each, a small yellow flower like unto Dandelion which turneth into downe as the rest: the roote are divers small round and bulbous, cleare, and of a purplish white colour, every one fastned to the head with a long string: the whole plant both roote and leafe is of a bitter taste.

7. *Chondrilla bulbosa Syriaca angustifolia.* Bulbed Gum Succory of *Syria*.

This *Syrian* plant hath many long grassielike leaves lying upon the ground, among which arise divers small stalkes set with small leaves, from the joynts whereof breake forth small branches bearing one flower at the top, which is large double and yellow like unto the great Mouseare: the roote is as big as ones little finger at the head, and about a span long growing smaller downewards smooth and of a browne yellow colour, having divers round balls hanging at the end thereof of the bignesse of a Chesnut, full of milke being never broken or broken.

8. *Chondrilla bulbosa Syriaca altera latiore folio.* Another *Syrian* bulbed Gum Succory.

This other Succory is both in roote and flower altogether like the last but differing onely in the leaves which are broader, more hairy and of a grayer colour.

The Place.

The first *Lusitan* saith he found in divers places of *Spaine* in moist places: the second he saith he not onely found in the Corne fields about *Salamanca* in *Spaine*, but in divers places of *Germany* and *Hungary*: the third in sandy by the way sides, and about *Montpelier* in Mount *Lupo*: the fourth about *Basile* in *Switzerland*: the fifth upon the Rockes in the Kingdome of *Naples*: the first not onely under the hedges about *Naples*, and in the way from thence to *Tarentum*: but towards the Sea side about the Fishermens cottages in *Narbona*, and the last under the *Mons Garus* and there abouts: the two last *Rauwolfius* in his Peregrination found about *Aleppo* in *Syria* the one in the plowed fields and the other in stony places.

The Time.

All these sorts of Succory doe flower later then the rest, many of them not until *August* in their native places, and are so tender that they quickly perish with the cold of these colder climates.

The Names.

Gum Succory is called in Greeke χονδρίλλη *Chondrilla*, so called as it is thought from χόνδρος which signifieth a drop or Gumme like Matticke that groweth upon the herbe and stalke hereof, originally taken from the likenesse with that kind of graine prepared for pulrage which was used in auncient times, called *Chondros* or *Alica*, as I shall shew you more fully in the proper place, when I come to speake of *Corne*: and the severall kindes of Pultage and Pulanes the ancient times made of them: some saith *Dioscorides* called it *Cichorium* and some *Ieris*, and in that the leaves were like unto Succory, they accounted it a kinde of wilde Succory. The first is taken by *Lobel* and others here for the true *Chondrilla prima Dioscoridis* and calleth it *Chondrilla prior Dioscoridis Lobelius* and divers others doe account *Matthiolus* his *Chondrilla prior* to bee but *Jgnorantiæ monstrum*, but I verily beleeve that it is *Cichoreum luteum*, for *Matthiolus* expresseth not the colour of the flower, and saith the Figures are transposed or misset, for the first Figure answereth the second description, and the second figure to the first description, which *Lacuna* it seemeth well observed in making that his first figure of *Matthiolus* is the second: *Lobel* and *Dalechampius* from him doe call it *Chondrilla verrucaria*: but as I have shewed in the description of *Cichoreum verrucarium*, he mingled this and that together, *Tabernæmontanus* calleth it *Scorzonera Graca*: *Bauhinus Chondrilla folio Cichorei tomentosi*: the second *Clusius* calleth *Chondrilla minor altera* or *prima*, and *Lobel Chondrilla minima mitissima cinerascens*, *Cordus* upon *Dioscorides Chondrilla altera*, *Dodonæus Cichorium luteum*, *Eschalonius Chondrilla species in collibus et vicinis*, *Tragus Cichorea pereger nel quinta*: *Columna* taketh to be *Chondrilla prior Dioscoridis* as *Bauhinus* doth also, and without doubt it is the *Apogon* of *Theophrastus*, *Hermolaus* and *Gerard* call it *Chondrilla lutea*: the third is called by *Bauhinus Chondrilla minima folio longo lutea*: the fourth also from *Bauhinus* taketh the name of *Chondrilla minima folio humile*: the 6th *Columna* in addition it is in the Tuscan: the first is called by *Lobel Chondrilla pusilla marina lutea bulbosa*, and may very well be (saith *Theophrastus* thus gathered *Perdicium*, *lib. 1. cap. 11.* for *Perdicium* is not read in him) of *Clusius Chondrilla viridis* and so doth *Columna*, by *Cesalpinus Herba verrucaria similis*, by *Castor Durantes Hemerobasilis*, *Lacuna* setteth it forth by the name of *Liberticum bulbosum Dalechampij*, and of *Tabernæmontanus Bauhinus* thinketh, but I rather take *Prenanthem* to be that sort of *Chondrilla* which *Rauwolfius* found in Syria the larger leaves and is the last here expressed which *Bauhinus* calleth *Chondrilla bulbosa Cretica*: or the *Chondrilla marina* of *Lobel* thereunto, wherein he is much mistaken in my judgement for that it hath no such bulbous roote, which carrieth a great difference, besides the difference in the heads of flowers: the *Imperatus* of *Naples* saith that they about *Naples* call it *Herba Stellata*, and *Serrame* in Italy *Pondolorium* calleth it *Nodulata*. The *Arabians* call *Chondrilla Condarel Cenereu*, and *Alcendu*, the *Turkes Andrilla*, and *Terracrepola*, the *Spaniards Lenguas* and *Peschagas de vaca las plantas*, and *Lechuga* (as they do of *S. Geiseria*, and that by the same name they call *Phyllum*, and that they call the second *Condrilla* and *Ajonjera*, the *French Escorcera*, the high and low *Dutch Condrille*, and we in *English* Gum Succory because of the Gum is found upon it.

The Vertues.

Gum Succory is of the same properties with wilde Succory but more bitter and more dry, and more effectuall in opening obstructions, and by the drying qualitie stayeth the looseness of the belly if the broth of the roote be taken in wine: the Gum used with Myrrhe in the forme of a pessarie draweth downe the courses that are stayed, the juice of the roote or the herbe and roote together made into powder and

Original from UNIVERSITY OF MICHIGAN

...helpeth the biting of the Viper and all other venemous Serpents and deliteriate milk also: Pliny writeth as much. Dorotheus in his verses sheweth that it is beneficiall to the stomacke, and helpeth digestion, and further such that some did account it hurtfull to the eyes and to hinder generation both in men and women, and yet numbreth Chondrilla among other sallet herbes that were used to bee eaten: the juice of the leaves but more usefully of the roote dropped from the point of a needle or other such small thing, taketh away by the roots the superfluous haires of the eyebrowes, the same also used with a little nitre cleanseth the skinne from all freckles, morphew, spots or any discolouring thereof. The gumme Gum Succory is much commended against the swellings and kernells of the throat, called the Kings Evill, and so is the distilled water thereof: the roots preserved are found to be wonderfull effectuall, if the use be continued for some time together.

Chap. XXVIII.

Chondrilla purpurea. Purple Gum Succory.

There are other sorts of Gum Succory to be entreated of, differing from the former in many notable points as well as in the flowers which are quite of another hew, as shall be shewed in this Chapter.

1. *Chondrilla cærulea sive purpurea.* Purple flowred Gum Succory.

This Gum Succory shooteth forth in the beginning of the Spring sundry long winged or rather jagged leaves, consisting of many long and narrow jagges, cut in on both sides to the middle ribbe, and equally set or ranged against another of a blewish greene colour very tender and full of milke being broken, among which rise up weake and tender stalkes three or foure foote high, scarce able to stand upright, very brittle also and apt to be broken, so full of milke as the leaves, which divideth it selfe towards the toppes into a few other slender branches, with smaller and lesse jagged leaves upon them, and small blewish purple flowers at the ends and sometimes white, consisting of ten or twelve small narrow leaves standing round about the middle, which when they are fallen away of themselves: the rootes grow deepe downe and spread into many corpulent branches like Dandelion, blackish on the outside and yeelding much milke in every part that is broken, which are apt to grow that every little peece in the ground will spring againe and beare leaves &c.

2. *Chondrilla cærulea latifolia.* Purple Gum Succory with broader leaves.

This other Gum Succory is very like unto the former in all things, but that the leaves are somewhat shorter and broader, and the gashes also larger wherein chiefly consisteth the difference.

3. *Chondrilla purpurascens fœtida.* Stinking Gum Succory.

The stinking Gum Succory hath divers long and somewhat narrow leaves growing next to the ground some being waved or some what deepely on the edges, the footestalkes being somewhat reddish, in the middle whereof riseth up sundry browne stalkes a little hairy, and about 2. cubits high, having but very few branches and

they bare naked of leaves from the joynts to the toppes, where every one of them sustaine a flower consisting of fifteene small leaves or more, dented at the edge, of a purplish red colour compassing the middle, wherein afterwards are conteined long brownish seede lying in downe, which together are blowne away with the winde, the roote hereof perisheth every yeare after seedetime, but recovereth it selfe by the fallen seede, the leaves as well as the flowers have a strong unpleasant sent.

4. *Chondrilla 2 a purpurea Crupina Belgarum dicta.*
The bearded Creeper.

I have two other plants to shew you which have passed by the names of *Chondrilla*, either of which hath small affinitie with them as I thinke, onely excepted by *Columna*, yet give me leave to inferr them in this place, although I shew you my mind of them. This first hath the first leaves that spring up, nothing so much cut in or divided as the others that follow, but are thes somewhat resembling the leaves of Groundsell, and are roughly dented about the edges, the next are very much cut and divided into many small parts somewhat rough or hard in handling, and somewhat sharpe at the points of the cuts, from among which spring many slender whitish and hairy stalkes about a foote and a halfe high, with two or three branches and smaller but not lesse divided leaves upon them to the toppes, where stand three or foure flowers in scaly heads, the points whereof are purplish, consisting of five leaves, of a purplish blew colour as the border, and many purplish threeds in the middle, some whitish threads also in the midst: the seede that followeth inclosed in the heads is like the seede of a Lacea or Knapweede or Matfellon but somewhat greater blacke and shining, with divers small staring haires like a beard at the head

4. *Chondrilla 2 a purpurea Crupina Belgarum dicta.*
The bearded Creeper.

5. *Chondrilla purpurea tertij loco.*
Spitting grass Sowthistle.

5. *Chondrilla tertia dicta.*
Spitting grass Sowthistle.

of every one, which will not abide or be still either in ones hand or in paper, &c. if it be never so little shaked, but will wax creepe or thrust it selfe forwards by the stiffe haires (whereupon I have given it the *English* name as it is to the title) the roote is long and white and perisheth every time it beareth seede, yet abideth the first Winter after it springeth in the Autumne, for it hardly abideth a Winter if it rise in the Spring although it doth not flower nor seede.

3. *Chondrilla Sefamoides altera.* Strange Gumme Succory.

The other plant referred, as I said, to the *Chondrilloes*, hath many long and narrow rough leaves, pointed at the ends, and jagged in two or three places on the edges, sometimes more or lesse lying on the ground, resembling very much the leaves of *Cerinthe* or Bucks horne Plantane, but with fewer greater and longer cuts or jagges, the naked stalkes are set from the middle of them, with such like leaves, but narrower, some without any jagge, and some but with one or two, bearing at the toppes every one upon slender bare long stalkes, a small scaly head like a Thistle head, out of which breaketh forth faire double flowers consisting of many purplish blew leaves scarred or cut in at the broad ends, with some yellow threads in the middle of them. *Matthiolus* hath very lively set this forth with the heads of *Thalictri Cretici*, gralle after which commeth small seed like unto *Sesamum*, and is compared, and from thence tooke the name of *Sefamoides*, but as I thinke more like unto a *Crupina* Cornflower or blew-bottle but browner: the roote is small and long, yeelding a milke: both these plants may in my mind be better referred to the *Jaceas* than unto any other herbe, they doe in leaves not much varie, not yet in heads nor flowers, but in seede especially come nearest thereunto: and not unto the *Chondrilloes*, whose seede is much unlike having downe on the heads of them, and flie away together with the winde.

The Place.

The first (as well as the second, for I account them both as one) groweth, as *Matthiolus* saith, in many places of Italy, as well as *Tuscane* in wast grounds, by ditch sides, and the way sides in fields and pastures; and as *Cordus* saith in the Vineyards about *Genua*: the third *Bauhinus* saith he onely saw in *Zuingerus* garden and his owne: the fourth in *Some Narbonin France*, and *Naples* also: the last is not certainely known from whence it is the originall but is nourished up in gardens.

The Time.

They doe all flower in the Summer moneths, and yeeld their seede soone after.

The Names.

They are all accounted *Chondrilla species* by divers, whereunto for the former three I may well agree being in face not much differing from wilde Succory: the first being called by *Lobel Chondrilla cærulea Belgarum*, by *Dodonæus Chondrilla altera*, by *Cordus* upon *Dioscorides Chondrilla prima Sabaræ similis*, and in his History *Chondrilla tenuifolia*, by *Camerarius Chondrilla cærulea flore*, who saith the *Italians* call it *Cuscuta lepori*, *Lugdunenses* maketh it to be *Cyani flore campi*, and saith the *Italians* call this *Terra cæpola*, by *Tabermontanus Chondrilla cærulea* and *alba*, as *Cordus* before him did: *Gerard* giveth two figures hereof, which *Bauhinus* noteth, and calleth this first *Chondrilla cærulea altera Lobelij flore simplici*: the second is that which *Matthiolus* setteth forth as an *hyssopo prostrato*, as I said before, calling it *Chondrilla altera*, and *Lacuna Chondrilla prima*, observing, as it is likely the errour, and by *Bauhinus Chondrilla Cretica latifolia Lacinata*: the third *Bauhinus* mentioneth in his *Phytopinax*, *Prodr.* and *Pro-drom.* by the name of *Chondrilla purpurascens folijs*, and *Hesler in horto Eystetensi Chondrilla rubra foliis serratis*: the fourth is called by *Lobel Crupina Italorum cæruleo purpurante flore semine nitido decoloro*, and *Crupina Belgarum*, and findeth fault with his owne mistaking in calling it formerly *Superbæ vicentinorum*, wishing it to be blotted out: *Lugdunensis* calleth it *Chondrilla purpurea Lobelij*, and *Tabermontanus Chondrilla Hispanica Narbonensis*: *Columna* finding it in *Naples*, could not well tell to what genus he might referre it, and therefore called it *Senecio Cordati Apulus*, and *Bauhinus* having his title from all others, calleth it *Chondrilla foliis laciniatis serratis, purpurascente flore*: the last is but one sort, although *Bauhinus* maketh it to be two, because *Camerarius* first set forth the plant with the flower spread open that it might be the better knowne, yet is the same that *Matthiolus* calleth *Sefamoides parvum*, not rightly expressed, and from him *Castor Durantes*, *Camerarius*, *Tabermontanus* and *Columna* doe so entitle it, yet *Columna* doubteth it may be *Cyanus Plinij*. *Lobel* calleth it *Sefamoides parva Dioscoridis*, but *Gesner in scholijs stirpium Coniza cærulea flore ceruino*, *Dodonæus* maketh it his *Chondrilla cærulea species*, & *Lugdunensis Catananche quorundam*, as I said, to make two sorts hereof entituleth his first *Chondrilla cærulea Cyani capitulo*, and the other (whereby I said *Camerarius* in his *Academicis* setteth forth, with the title of *Sefamoides parvum flore magis composito*, *Cæsalpinus Chondrilla Sefamoides altera cærulea flore completo*) *Chondrilla cærulea Cyani capitali altera*, *Cordus* saith that the *Germans* call this first *Chondrilla Klein Sommer wurtzel*, and as is said before, the *Italians Cuscuta lepori*, some *Terra cæpola*.

The Vertues.

Dioscorides reciteth not the people in *Italy* where the first sorts doe grow doe eate them in their sallets as Succory is, being counted of the same propertie, but I have no other Author that giveth any speciall instance of the vertues of these, and therefore you may as I referre them to the kindred of the Succories, and be perswaded of the like vertues to be in them, neither have I any more certainty to speake of the rest.

Chap. XXIX.

Hieracium. Hawkeweede.

To set forth the whole family of the Hawkeweedes in due forme and order, is such a world of worke, that I am much in doubt of mine owne sufficie, it having lyen heavie on the shoulders that hath already waded thorough them, and will be as heavie to me, although he be a guide for me to follow: if I therefore (as he before me no doubt hath done) happe to goe awry, let it be pardoned in me, as it must be in him, or let them that too critically find faute amend it by assured knowledge if they can themselves, and I will give them thankes. For such a multitude of varieties in forme pertaining to one herbe is not to be found againe, *in rerum natura*, as I thinke. That I may therefore so set them forth, that ye may see them rightly, as I shall endeavour to expresse them aptly and methodically, I must distribute them into

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

into sundry formes and orders after such a manner, as I thinke meete to dispose them: and in severall Chapters according as you shall finde by the titles at the heads of every of them.

Ordo primus. The first Ranke or Order.

Hieracia Dentis leonis folijs acuta. Sharpe pointed Dandelion-like Hawkeweedes.

1. *Hieracium majus Sonchites.* Great Hawkeweede with Sow-thistle leaves.

THis great Hawkeweede hath many large hairy leaves lying on the ground much rent or torne on the sides unto divers gashes and jagges, somewhat like unto Dandelion, but with greater parts, more like unto those of the smooth Sow-thistle, from among which riseth a hollow rough stalke, two or sometime three foote high branched from the middle upwards, whereon are set at every joynt, where it brancheth longer leaves, little or nothing rent or cut in, bearing at their tops sundry pale yellow flowers, consisting of many small narrow leaves broad pointed, and nicked in at the ends, set in a double row or more, the outermost being larger than the inner, which forme most of the Hawkeweedes doe hold in all the sorts, which turne into downe and with the seed brownish seede is blowne away with the winde: the roote is long and somewhat great with many fibres thereat: the whole is full of a bitter milke.

2. *Hieracium majus Creticum.* Great *Candy* Hawkeweede.

This *Candy* Hawkeweede hath the first leaves little or nothing dented, but somewhat like Endive, yet those that follow are cut in on the sides, not so much as the Sow-thistle, else not much unlike, which are somewhat yet larger than the former as the stalkes are likewise, bearing on the branches greater husks wherein the yellow flowers grow, which passe into downe with rough crooked seede lying therein, and are both dispersed by the winde: the whole plant is bitter, and perisheth at the first approach of Winter being but annual, and to be sowen every yeare.

3. *Hieracium majus Hispanicum.* Great *Spanish* Hawkeweede.

This *Spanish* Hawkeweede hath a round hollow crested stalke somewhat hairy, about a cubite high or more, whose bottome leaves are long and large like Dandelion, very much cut in and hairy on the edges, containing about a foote in length, and an inch and a halfe in breadth; those on the stalkes are divided at the bottome into two parts like eares, compassing them about, as they grow higher they are lesse jagged, and the highest a little waved onely at the edges: at the toppe of the stalke groweth a double flower like the Dandelion, and of the same yellownesse, but of a paler yellow colour which passeth into downe as the rest doe.

1. *Hieracium majus Sonchites.*
Great Hawkeweede with Sow-thistle leaves.

4. *Hieracium foliis & facie Dentis leonis latis.*
Bulbed Dandelion-like Hawkeweede.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

4. Hieracium asperum folijs ut floribus Dentis leonis bulbati.
Bulbed Dandelion-like Hawkeweede.

The rough leaves of this Hawkeweede that lie upon the ground are much cut in on the edges, like unto those of the bulbed Dandelion each rent or gath looking downeward to the footestalke of the leafe, amongst which riseth up an hairy bare greene stalke, bearing a large Dandelion-like yellow flower which turneth into downe, and is carried away with the winde: the roote is somewhat great and long with many fibres thereat.

5. Hieracium Dentis leonis folio asperum.
Rough Dandelion-like Hawkeweede.

The fift Hawkeweede hath divers long and narrow hairy leaves reddish at the bottome next the roote, deepely snipped or gasht on the edges, being about two inches long, from which rise one or two or more bare or naked stalkes rough or hairy, bearing each of them a double yellow flower like unto the Hawkeweedes falling into downe: the roote is small somewhat like a finger, with a few fibres hanging thereat.

6. Hieracium minus glabrum.
Small Hakeweede with smooth shining leaves.

This little Hawkeweede riseth little above a spanne high with smooth fresh greene stalkes, branched forth into divers parts with few, but smooth shining greene leaves lying all round, being little torne on the edges, compassing the stalkes at the bottome, and eared as the third: the flowers that grow at the toppes are of a faire gold yellow colour, lesse than any other Hawkeweede, each standing on a long stalke, about an inch long, which as the rest, doe passe away with the winde: the roote is small, long, and whitish.

7. Hieracium hirsutum ferè umbellatum.
Small Hawkeweede with umbel-like flowers.

This small Hawkeweede hath five or six small leaves lying upon the ground, waved or cut on the edges like unto the common Hawkeweede, having a soft downe like haires on the upper side of the leaves, and smooth without haires underneath, full of a bitter milke, from among which riseth up slender hairy stalke about a foote high or more, bearing at the toppe divers small flowers set together as it were in a ruft or umbell, of a gold yellow colour like in forme unto others, as also in the downie heades: the roote liveth long, being compoled of many small white stringes, which shooteth forth and spreadeth it selfe also into many heads above ground, which shoote forth branches, rooting also in the ground as they lie.

The Place.

The first groweth in divers places about fields sides, and the path wayes in dry grounds: the second is of *Candy*: the third of *Austria*: the fourth of *Italy*: the fift in our owne Land, as well as about *Montpelier*, *Naples*, and *Spaine*: the sixt about *Basil*: the last about *Vienna* in *Austria*.

The Time.

They bee all flower and die away in the Sommer moneths.

The Names.

The Greeke name of it, *Hieracion* or *Hieracion*, *Accipiter* an Hawke, *Sic dictum quasi accipitres hoc habent suos oculos acutos & acres* (as divers other herbes tooke their names, some from beasts as *Elephantopodium*, *Cervicornia* from birds, as *Chelidonium ab Hirundine*, *Perdicium a Perdice*,) in Latine also *Hieracium*, and of some *Accipitrina*, because they doe partake of Sow-thistles as well as of succory, I have placed them betweene them both: the Italians call it *Hieracio*, the *French* *Herbe d'espervier*, the *Germanes* *Hauks kraut*, the *Dutch* *Haucksmoer* and so in *English* Hawkeweede, and of some yellow Succory: the first here set forth is the *Hieracium* of *Dodonæus*, *Lobel*, *Bauhinus*, *Dodonæus*, *Lobel* and others, the *Taraxacon magnum* of *Lonicerus*, *Latibus secundus* of *Matthiolus* and *Hieracium Sanchitis* or *Sanchi folio* of divers, but of *Lugdunensis Hieracium minus*, because it comes neere the *Chondrilla prior Dioscoridis* for *Hieracium magnum*, as I shewed you in the last Chapter out of the same Author and *Camerarius* onely make mention of, the one *in horto Germanico*, the other *in Italia*, by the name of *Hieracium Creticum pro Endivia latè missum*, and there sheweth why hee called it so, as hee could be found the like seede among *Epithymum* that came from *Candy*: the third *Lobelius* in his *Icones* by the name of *Cicer leonis latifolium arborescens*, saying it came to him out of *Spaine* *Contrariorum* of *Matthiolus*, by the name of *Hieracium Hispanicum*; and therefore I have so called it, and placed it here, and *Dodonæus* in his *Pinax*: the fourth *Lobel* in his *Dutch* Herball, and *Tragus* calleth *Hieracium dentis leonis bulbati*, because being very like it, yet differeth in the long roote: the fift *Matthiolus* and others, calling them *Hieracium dentis leonis folio hirsutie asperum magis laciniatum*, and *Columna* thinks they are both one, and therfore doe not distinguish them: *Columna* calleth it *Hieracium minus*: the first *Bauhinus* calleth *Hieracium minus glabrum*; and the last *Gesner* deciphereth for *Hieracium*, but the figure he setteth for it, is much differing from the description thereof, but answereth with the description of the eleaventh, and it may be, was but the Printers fault in transposing the letter I, being set before

betwen the X. that stande here before it, thereby making it XL. when it is set IX.

The Vertues.

Hakeweede, saith *Dioscorides*, is cooling, somewhat drying and binding, and therefore is good for the heate of the stomacke, and for inflammations, and the hot fits of agues and grownings of the stomacke: the quantitie of a cruple of the dried juice, saith *Pliny*, taken in *Posca Potter*, that is vinegar and water mixed purgeth the belly: per be saith in another place, drie a small quantitie bindeth the belly: the said juyce taken in wine helpeth against the stinging of venemous beastes: it stirreth up urine, stirreth and prouoketh the monethly courses of women, it helpeth also the difficulte in making water: the same likewise taken in wine helpeth the bitings of venemous Serpents, and of the *Phalangium*, and the stinging of *Scorpions*, if the herbe also be outwardly applied to the place, and helpeth also the other poysons that *Cerastes*, or those that bite the bladders or that kill by stranging: a scruple of the dried juice given in wine and drunke, is profitable for those that have the dropsie: the decoction of the herbe taken with honey, purgeth tough flegme in the chest or lungs, and with Hyssope, doth helpe the cough: the decoction thereof, and of wilde Succorie made in wine and taken, helpeth the wind collike, and those that are troubled with shortnesse of breath: it prouoketh rest and sleepe, it hindereth venery and venereous dreames, restraineth fluxes of the stomacke, encreaseth blond and helpeth the diseases of the reines and bladder. The water thereof is singular good for all the diseases and diseases of the eye, vsed with some womens milke: it is also very good to be vsed in the ulcers or gnawing vlcers, especially in the beginning: the greene herbe bruised, and vsed after the same manner as any plaister vnto sore biles before bladders doe arise, doth helpe them, as also inflammations, burnings of fire, and all pustles and eruptions of heate and sale flegme: the same applied with vinegar and salt, is very good for the goute, and helpeth to ease the paine: it is also very good for those that are troubled with convulsions, and the crampe, or such as are out of ioynt: for it doth give helpe and ease. The distilled water is of good vse in many of the diseases aforesaid, and the last maketh the teeth white, helpeth the fastnesse, and taketh away freckles or spots, the morphew and other deformities in the face: and helpeth to take away many sores in the face also. The first is by the relation of Mr. *Iohn Gerard* Gentleman of *Nottingham* beyond *Trent*, sent vnto me by great experience from others, singular good to be vsed against the Leprosie, onely by taking the iuyce thereof in drinke.

Chap. XXX.

Hieracium Dioscoridis laciniatis foliis. Dandelion like Hawkeweede with blunt pointed leaves.

Ordo secundus. The second ranke.

1. *Hieracium longum radice.* Long rooted Hawkeweede.

1. *Hieracium longum radice.* Long rooted Hawkeweede.

The leaves of this Hawkeweede that lie vpon the ground are long and narrow much vnlike and iagged on the edges somewhat like vnto Dandelion, but cut into many short round pointed peeces, and of a darke greene colour, the stalkes that rise from among the leaves are smooth and bloskie reede a foote high, bare or without leaves on them vnto the toppe, but at the very toppe, from whence spring sundry flowers each standing on a long hairy stalke, which are yellow like vnto other Hawkeweedes and none of the downe as they doe: the roote is white small and long, running downe as deepe into the ground, saith *Lobel*, as the stalke is high, that which I and many others have taken for it, have more and fairer roots.

2. *Hieracium minus laciniatis alis multo latioribus.*

Small Dandelion like Hawkeweede with round pointed leaves.

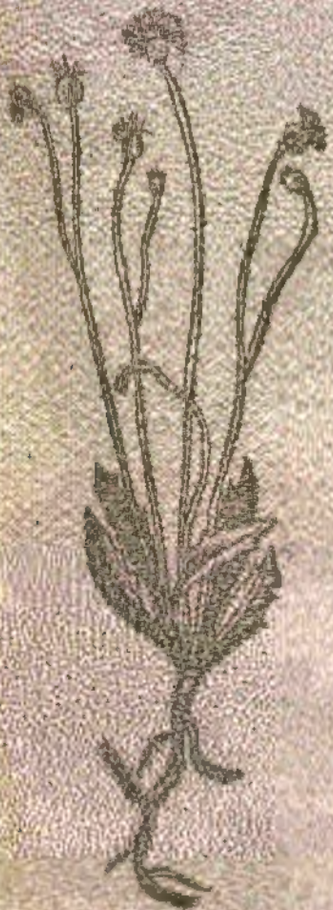
This small Hawkeweede hath five or seven rankes of leaves lying on the ground, about two inches long, and halfe an inch broad, round pointed and iagged about the edges, after the fashion of the former, but not so much cut in deepe iagges, among which riseth a bare hollow stalke hairy, whereupon is set a large pale yellow flower, which turneth into white downe: the roote is small and slirous.

3. *Hieracium villosum Hispanicum.*

Spanish woolly Hawkeweede.

This Hawkeweede hath very many hairy soft woolly leaves lying on the ground cut in on the sides like Dandelion, every one standing upon a small long footestalke, the leaves of these are foure inches long, and halfe an inch broad, thicke, hairy all over, and branched about a spanne high, with smaller leaves thereon, with smaller diuisions, at the top stand very yellow flowers on very short hoary stalkes, the bottome of very fine hairy lockes mounted at the brimmes with many pointes: the roote is white on the outside.

4. *Hieracium dens leonis folio sinuato primum.*



Dandelion Hawkeweede with small flowers.

The roote hereof is small, white, woodie and fibrous, the stalke is round, a foote high, and somewhat hairy, at the bottome whereof grow a few rough leaves dented in, as it were about the edges, about three inches long and halfe an inch broad, having but few leaves thereon and those about the middle, which are but only dented and compasse it at the bottome, bearing many very small yellow flowers together, whose cups are short scales at the toppe thereof.

5. *Hieracium*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

5. *Hieracium dentis leonis folio subhirsutum.* Asphodill rooted Hawkeweede.

This Hawkeweede hath for the roote a few long clogges, like the *Asphodill* roote, the ſtalke that riſeth from thence is about a cubite high, bare of leaves from the bottome to the middle, ſmooth and reſted, about the middle ſeparated into one or two branches, of a foote long apeece each whereof ſuſtaineth a ſmall yellow flower like the others in this kinde, which paſſe away in like manner; the leaves that lie upon the ground are ſomewhat rough on the upperſide, and ſmooth with a certaine woolineſſe underneath, cut or torne on the edges very like unto Dandelion, being about three inches long and one broad.

6. *Hieracium media nigrum Boeticum majus.* The greater blacke ſpotted Hawkeweede of *Spaine*.

This hath foure or five ſmall, long, and narrow ſmooth whitiſh greene leaves lying on the ground, ſomewhat in on the ſides, but not very deepe, the midde ribbe being whitiſh all the length thereof, from thence ſpringeth uſually but one ſmall ſtiffe whitiſh greene ſtraked ſtalke branched into ſundry parts, about a foote and a halfe high, with a few ſmaller leaves thereon at the joynts, and few or no deuts upon them; the flowers grow at the toppes and from the joynts of the branches thicke and very double, but one on a head or joynt like ſmall Hawkeweede, of a very pale yellow colour, with a blackiſh purple ſpot in the middle, which turne very ſhort downe, that with the ſmall browne ſeede flieth away: the roote is ſhort and woddy periſhing every yeare that it ſeedeth.

7. *Hieracium media nigrum Boeticum minus.* The ſmaller blacke ſpotted Hawkeweede of *Spaine*.

This is altogether like the laſt, both in ſtalkes, leaves, and flowers, ſwith the like purple ſpot in the middle, but they are in every part three times ſmaller.

8. *Hieracium aſperum Hypochœris ſive Porcellis dictum.* Swines Hakeweede with rough leaves.

This ſmall Hawkeweede (rather than Succory, as *Gerard* calleth it, and his Corrector to leaue a paſſ) hath divers ſomewhat long and rough leaves lying on the ground, ſmaller at the bottome, and broader towards the end, unevenly waven at the edges: the ſtalkes are ſomewhat rough, ſlender, and bare of leaves ſpringing into ſundry long ſtalkes, about halfe a foote high, bearing every one a large yellow flower like unto Hawkeweede: the roote is ſmall and long. There is another of this ſort, whoſe leaves are ſmooth and narrower, differing little in any thing elſe.

Hieracium glabrum ſive Porcellis angustifolia.

9. *Hieracium Cluſij. Hyoſeris Tabernamontani & Gerardi.* *Cluſius* his leaſt Hawkeweede.

This ſmall Hawkeweede of *Cluſius* hath divers ſmall leaves upon the ground, ſomewhat like unto Daiſie leaves but longer, and unevenly dented or waved about the edges, from whom ſtand up ſtalkes of two or three times more, halfe a foote high, naked, hollow, and reddiſh at the bottome, and ſometimes branched towards the toppe, reddiſh alſo at the joints, which grow bigger above than they are below, contrary herein to all, moſt other plants, bearing on each of them a ſmall yellow flower like others, and turning into downe that blowes away as the reſt. *Cluſius* maketh mention of another ſort hereof, was brought him by *Gallimeede Mer*, a Phyſition, whoſe flowers paſſed not into downe, but the ſeede being long and ſomewhat bladiſh, ſtuck ſtill on the heads.

Minimum diuturnum.

10. *Hieracium parvum Creticum.* Small hawkeweede of *Candy*.

This *Candy* Hawkeweede being an other ſort of the laſt deſcribed, hath divers leaves ſpread upon the ground, ſmaller at the bottome, and growing broader to the ends, cut in with a deepe cut or two whereof proceed, as all the reſt of the edges unevenly waved, the middle ribbe being reddiſh, from among which ariſe two or three ſlender bare ſtalkes, about a foote high, branching forth into two parts, with a ſmaller leafe at the joynt, more divided than any below, bearing on each of them a larger flower than anſwereth well the proportion of the plant in forme like other Hawkeweedes, but pure white on the upper ſide, and of a bluſh colour underneath: the roote is long and ſmall with ſome fibres thereat.

The Place.

Divers of theſe Hawkeweedes grow abroad in the fields, waſt grounds, and lanes in divers places of our owne country, as well as in other: but the ſixth and ſeventh came to me from *Spaine*.

The Time.

They all flower and fall in the Summer time, and ſome abide untill the Autumne colde cauſe them to periſh, and will riſe againe of their owne fallen ſeede.

The Names.

The firſt is called by *Lobel Hieracium longe radicatum*, and *microphyllon* by *Tabernemontane*; *Dodonæus* in his *French* Booke calleth it *Hieracium minus primum*, and *Lugdunenſis Aparyne Dalechampij*, whereof *Theophraſtus* ſpeaketh, *Lib. 7. cap. 9. inter eos qui ſecundo ad terram folioſa plantas*; and *Bauhinus Hieracium dentis leonis folio hirſutum*: the ſecond *Bauhinus* calleth, as it is in the title, *Hieracium dentis leonis folio rhœadis minus flore majore*: the third calleth *Hieracium tomentoſum Hiſpanicum* in his *Prodromus*, which hee omitted in his *Pinax*: the fourth likewiſe call *Hieracium dentis leonis folio floribus parvis*: the fift he calleth *Hieracium dentis leonis folio* [illegible]: the ſixt and ſeventh are as I ſaid *Hieracia* raiſed from the *Spaniſh* ſeede I received, and are the ſame that *Lobel* mentioneth in his *Cure poſteriores* without deſcription: the eight is the *Hypocheris ſive Porcellis* [illegible] *cui, & Gerard* which he putteth among the *Chondrillæ*, & calleth it in *Engliſh* Swines Succory, he doth likewiſe hereunto Male Swines Succory, they being both certainely kindes of *Hieracium*. *Bauhinus* calleth it *Hieracium minus dentis leonis folio ſubaſpero*, and maketh ſome doubt or queſtion whether it ſhould not be the *Alterum minus* of *Columna*) and the other of this kinde *Hieracium minus dentis leonis folio* [illegible] *alterum vel anguſtifolia* of *Tabernemontanus*: the ninth is the *Hieracium minimum* of *Cluſius*, the figure whereof is falſely quoted I X. for X I, and is the *Hyoſeris lat. folia vel minuſcula* of *Tabernemontane* and others, which *Bauhinus* calleth *Hieracium minus folio ſubvirente*: the laſt *Cluſius* ſetteth forth in his firſt *Appendix* [illegible] Hiſtory of plants, and is the laſt there by the name *Hieracium parvum Creticum*, which *Bauhinus* calleth *Hieracium minus flore albicante*. *Pona* in his *Italian* Booke of *Monti Baldi*, calleth it *Hieracium tomentoſum*.

The Vertues.

All theſe ſmall Hawkeweedes, or the moſt of them, being of the like bitter qualitie to the former, doe no doubt performe the ſame effects, although peradventure in a weaker manner: but becauſe I have not any [illegible] purpoſe

…commodious use of any of these, I referre you to the former Chapter to be informed of their qualities, and to …what they may be conducible.

Chap. XXXI.

Hieracia Chondrillæ folijs. Gumme Succory-like Hawkeweedes.

Tertius Ordo. The third Ranke.

1. *Hieracium maximum asperum Chondrillæ folio.*
The greatest Gumme Succory-like Hawkeweede.

1. *Hieracium maximum asperum Chondrillæ folio.*
The greatest Gumme Succory-like Hawkeweede.

This great Hawkeweede hath a great round rough straked stalke, bigger in one place than another, almost three foote high, branched towards the toppe into short branches, with great long leaves set there on one above another, much corne in on both sides, to the middle ribbe almost, about three inches long, very hairy and rough in handling: the flowers are great and yellow like unto other Hawkeweedes.

2. *Hieracium folijs & facie Chondrillæ Lobelij.*
Lobel his Gumme Succory-like Hawkeweede.

This kinde groweth not so high as the former, and hath the leaves thicker jagged, but not so large, each jagge somewhat pointed also and somewhat hairy: the flowers are yellow, but not so thicke or double, but more growing in a tuft together, which being ripe and turned into downe, are blowne away with the winde as others are.

3. *Hieracium Chondrillæ folio glabrum.*
Deepe jagged Hawkeweede.

This Hawkeweede differeth not much from the last, but that the leaves hereof are smooth, very much, and very deeply cutted even to the middle ribbe, each jagge being small, narrow, and pointed; the stalkes and flowers, &c. are like thereunto.

4. *Hieracium minus prænorsa radice.*
Small Hawkeweede with bitten rootes.

The leaves of this Hawkeweede are many that lie next the ground somewhat long and narrow cut in on the edges, not broad and short pointed gashes: the stalkes are small and grow to be scarce a foote high, parted into a few branches with some leaves here and there upon them that have indention on the side: at the toppes whereof stand the flowers much separate in sunder each upon a long stalke, and doe consist of fewer leaves or lesse double, of a goldy yellow colour which turne into downe, &c. the roote is made of many stringes like a Plantane roote, but the middlemost that is greatest, is short, as if it had beene bitten off like the Devills bit: the whole plant, and every part thereof, is very bitter rather more than any other.

The Place.

All these but the first grow plentifully enough in our Land in many places, and that about *Mompelier*.

The Time.

They flowre with the rest, that is in *June* and *July*.

The Names.

The first is called by *Bauhinus*, who onely doth make mention of it, *Hieracium maximum asperum Chondrillæ folio*, the second is called by *Lobel Hieracium folijs & facie Chondrillæ*: the third *Bauhinus* calleth as it is in the title, and rather *Tabernamontanus* his first *Hieracium* which he called *Aphaca*: the last is the *Hieracium minus* of *Matthiolus, Dodon, Tragus, Fuchsius, Gesner, Tabernamontanus* and others; *Lobel* calleth it *Hieracium minus prænorsa radice*, and *Lobelius leporina*; *Lugdunensis* calleth it *Picris Dalechampij*, because of the bitternesse, and *Bauhinus Hieracium Chondrillæ folio incisis radice*, whereof he maketh a *major* and a *minor*, yet differing little, that they may well be accounted but as one, differing onely in the greatnesse and smoothnesse of the leaves, and therefore I include them both in one.

The Vertues.

These Hawkeweedes are no doubt as effectuall as the greater sorts in every degree, and therefore whatsoever hath been said of them, may fitely be applied to these, and therefore to avoid a tautologie, I referre you to them.

2. Hieracium folio ex parte dentato Lonic.
Jagged Garden Succory like Hawkeweed.

1. Hieracium sonchi folio.
Smooth Dandelion like Succory like Hawkeweed.

Chap. XXXII.

Hieracia Cichoreæ folijs.
Garden Succory-like Hawkeweedes.

Quarta Ordo. The fourth Ranke.

4. *Hieracium cichoreum flore luteo.*
Yellow garden Succory-like Hawkeweede.

This kinde of Succory Hawkeweede riseth up with a slender smooth stalke about a foote high, yet somewhat leaning downewards, and spread into many branches, at the foote whereof grow smooth long darke greene leaves, about foure inches in length, and one and a halfe in breadth, some of them without dividons, and others especially, those that grow upwards very much; each of the stalkes and branches, being about an hand breadth bare into the toppes, where each of them carrieth a yellow flower of a middle size which turne into downe, and is carried away at the will of the winde.

3. *Hieracium cichoreum flore magno albido medio luteo.*
White garden Succory-like Hawke-weede.

This other Hawkeweede is very like unto the former, but that the leaves are somewhat larger and broader, and more deeply jagged on the sides: the flowers also are whitish and more yellow in the middle, and somewhat reddish underneath.

5. *Hieracium subcæruleum flore cæruleo.*
Bluish garden Succory-like Hawkeweede.

The bluish Hawkeweede hath divers long and somewhat narrow rough leaves lying neer the ground, very much jorne in on the edges, from among which rise five or six, or more slender short browne and hairy stalkes, about a foote high or more, spreading a branch or two, with lesser,

1. Hieracium sonchi folio non ita crispo.
Great garden Succory-like Hawkeweede.

and these divided leaves thereon up to the toppes, where there are severall large flowers, consisting of two or three rowes of leaves, of a deepe bluish colour, of somewhat a strong Opium-like scent, broade pointed and notched in the ends, the outermost row being larger than the inner, standing in rough scaly huskes, wherein afterwards the blacke long browne seede is contained, which lying among much downe, are carried away together with the winde: the roote is composed of a downeright string, with other fibres thereat, which perisheth at the first frosts.

The Place.

All these Hawkeweedes have come to us from *Italy*, where it is likely they are naturall.

The Time.

They flower from the middle of Summer to the end of *August*, and the seede ripeneth in the meane time.

The Names.

The first is called by *Bauhinus Hieracium Intubaceum flore luteo*, which he quoteth in his *Pinax* to be the eight in his *Prodromus*, mistaken for the tenth; and the second *Hieracium Intubaceum flore magno albido*, this is there also mistaken for the eleventh: they have both come from *Italy*, and *Bel* likewise from *Lysbone*, by the name of *Hieracium Apuleide*, and *Sonchus Hierachioides*: the last is called by all Writers of it *Hieracium Intubaceum*, and *Intubus agrestis*, and *viperinum* by *Pona* in his *Italian Mount Baldus*, for he accounteth the *Hieracium parvum Creticum* to be the same, to be *Hieracium Intubaceum non ramosum*, as I shewed you in the Chapter next save one before this: it is also likely the *Hieracium Apuleium flore suaverubente* of *Columna*.

The Vertues.

These kinds of Hawkeweeds are of the like temperature with the former, and may performe as much in their operation as they, and therefore I will referre you unto them to be informed of their qualities which may safely be transferred to these.

Chap. XXXIII.

Hieracia Cichoriacea. Wilde Succory-like Hawkeweedes.

Quintus Ordo. The fift Ranke.

1. *Hieracio folio Hedypnoidis.* Yellow Succory-like Hawkeweede.

This Hawkeweede hath a few leaves neare the ground, somewhat long and narrow, waved or unevenly dented about the edges, in some more, in other lesse, and sometimes hairie withall, yet planted in Gardens hath little or none at all: it sendeth forth a great many slender stalkes, with a few leaves set dispersedly upon them, smaller than those below, and branching at the toppes whereat stand severall great scaly huskes with yellow flowers in them, hanging downe their heads before they are blowen, whereby narrow crooked seede lying in the downe, and are scattered where it pleaseth the winde: the roote is long and white, with some small fibres fastened thereto.

2. *Hieracium falcatum sive stellatum.* Scarre-like Hawkeweede.

The lower leaves of this Hawkeweede are somewhat long and narrow, with but three or foure dents on the sides reaching to a point: the stalkes are branched from the middle upwards, and at every joint a leafe under it bearing at the joynts and toppes severall pale yellow small flowers, which turne into heads of divers crooked seede like small round and hard hornes or hookes, set all most round and starre fashion, some of the seedes being longer and bigger than others, the roote is milkie small and stringy perishing every yeare after seede time.

3. *Hieracium falcatum herbaceum.* Herbe Impious like Hawkeweede.

This wilde Hawkeweede (not that it hath any hurtfull qualitie therin, but because the side branches rise higher than the middle most, like the herbe *Impia* or *Impious* Cottenweede) hath the lower leaves of two or three inches long, and one and a halfe broad, of a darke greene colour, and with but few dents on the edges: the stalkes are foure or more high, bearing but few leaves on them, and at the tops one small flower, of a pale yellow colour, somewhat browner in the middle, compassed about with divers rough hornes which grow hairy or bearded and

1. *Hieracium folio Hedypnoidis.* Yellow Succory-like Hawkeweede.

sharpe pointed when they are ripe, from the bottome of this head riseth one and sometimes two small branches, about foure inches long with very narrow greene leaves set on them, and a flower at the toppe made after the same manner, and having sometimes a small branch or two rising from the head thereof in like manner as the other.

4. *Hieracium minimum sive minus folijs latioribus.*
The little sea Hawkeweede.

This little Hawkeweede riseth not above halfe a foote high, and from a small long reddish roote, sendeth forth verie small thread like stalkes spreading into branches, bearing very small pale yellow flowers, which are compassed about with such like crooked hornes, sharpe pointed as are in the last: the leaves at the bottome are as small and narrow as they, but a little more dented about the edges.

The Place.

The first and second grow naturally both at *Mompelier* in *France* and in *Italy*: also the third at *Nerle*, and in the wood *Vincennes* neere Paris both by *Mompelier*: the last by the sea shore not farre from *Tongeller*.

The Time.

They keepe the same time that the rest doe.

The Names.

The first is called by *Cesalpinus Hieracoides*, and by *Clusius Hieracium folio Hieracij*: the second is called by *Lobel* and *Lugdunensis Hieracium Mordicinale foliatis siliqua*, by *Cesalpinus Hieracoides alterum*, by *Tabernamontanus Hieracium Chondrilloides*, and *Narbonense*, of some *Italians Sonchus sylvaticus*, by others *Chondrilla stellata Hieracium Gallicum* and *Hieracium Gallicum simplex*: the third is called by *Columna Hieracium calyce barbato*, & by *Bauhinus Hieracium pulchrum folijs latioribus*, who thinketh it may be the *Hieracium minimum alterum* of *Clusius*: the fourth is remembred only by *Bauhinus* by the name of *Hieracium minimum folijs latioribus*.

The Vertues.

The Vertues of these Hawkweedes are alike unto the former sorts, and therefore there needeth not the same things to be spoken againe here which are there set down.

3. *Hieracium folijs latioribus sive Sonchi sylvatici.*

Chap. XXXIV.

Hieracia Montana glabra.
Smooth Mountaine Hawkeweedes.

Sectio Quinta. The fift Ranke.

1. *Hieracium Montanum latifolium glabrum magnum.*
Great smooth Mountaine Hawkeweede.

His mountaine Hawkeweede hath divers fairs great leaves, somewhat narrow at the lower ends, and broader to the middle where it is cut, and ending in a point unevenly dented or waved about the edges, and compassing the stalkes as they rise up: which branching themselves beare stocks or foure flowers, as it were in an umbell together, which seldome appeare open, but when they doe they are yellow like unto others falling into downe, and close into the winde as others doe.

2. *Hieracium Montanum latifolium glabrum minus.*
Small smooth Mountaine Hawkeweede.

This other Mountaine Hawkeweede hath his leaves and flowers in all things like the last but smaller, and the whole plant lower and fuller, in other things it doth not differre.

3. *Hieracium Asphaltum gummiferum Chondrillæ folio.*
Small Mountaine Hawkeweede with Gumme Succory leaves.

This small Hawkeweede hath a few leaves next the ground about foure inches long of a pale greene colour, and scarcely dented or divided on the edges at all, every

4. *Hieracium folijs quam minimis glabrum.*
Smooth least Hawkeweede.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

rise upon a long footestalke: but those that grow up higher are of an inch long a peece upon the stalke which is not above an handbreadth high, and divided at the toppes into two or three small branches, bearing every one a reasonable large yellow flower like the others, and are more divided on the edges like unto the leaves of Garden Succory: the roote is small, blackish without, white within, and abiding after seede time.

4. *Hieracium Alpinum angustifolium.* The narrowest mountaine Hawkeweede.

From the roote of this Hawkeweede which is reddish and somewhat woodily spring forth divers very long and narrow gosse like leaves being about an handbreadth long, soft, and of a darke greene colour, among which riseth up a smooth round straked stalke about a foote high or more bearing a few small and shorter leaves thereon, and divided from the middle upward into sundry branches having on each of them a small yellow flowre which passe into downe and then into the winde.

5. *Hieracium Tragopogonis folio.* Goates-beard Hawkeweede.

The mountaine Hawkeweede hath for his roote divers white strings rising from a small blackish roote, and from it sendeth forth divers long and narrow leaves like unto those of Goates-beard, each of them of a fingers length, furred or halfe hollow all the length, of a grayish greene colour giving a bitter milke as others do, from among which riseth a small slender stalke not a foote high, with some few leaves sparedly set thereon smaller then the others, divided into some branches bearing small yellow flowers like the others, out of scaly greene huskes falling into downe, that when it is ripe is with the small seede carried away with the winde.

The Place.

All these sorts of Hawkeweedes grow upon the Alpes, mount *Baldus* and others in *Germany* from whence they have been brought to furnish the gardens of the curious.

The Time.

They keepe the same time of flowring and seeding that the rest doe.

The Names.

The first is the *Hieracium montanum majus latifolium* of *Tabermontanus*, whose true figure *Gesner* hath set forth under the name of *Chondrilla Hispanica*, but the description pertaining thereunto is not answerable: the second both *Tabermontanus* and *Gerard* from him set forth by the name of *Hieracium montanum latifolium minus*: the third *Lobelius* hath set forth in his *Icones* and *Prodromus* (but hath mistaken the numbers to his *Icones* in setting downe the seventh for the ninth in his *Prodromus* and so almost in all the rest of the numbers following) by the name of *Hieracium Alpinum pumilum, Chondrillæ folio*: the fourth is not numbred by *Lobelius* in his *Icones* but in his *Prodromus* by the name of *Hieracium Alpinum angustissimo oblongoque folio*, which I therefore here quote that the reader be not mistaken therein: the fift or last *Clusius* in his *Pannonicke* observations formerly set forth under the title of *Scorzonera quarta*, but better considering that the roote answered not to a *Scorzonera* altered the title in his history and maketh it his seventh *Hieracium humile*.

The Vertues.

You may likewise referre the vertues of the former to these sorts of Hawkeweeds for they are thought to bee to like effect all then they in all the qualities and properties pertaining to them, for of any other particular qualities in any of them I have not yet heard or read.

Chap. XXXV.

Hieracia montana hirsuta. Hairy mountaine Hawkeweede.

Septimus ordo. The seventh ranke.

1. *Hieracium montanum Rapifolium.* Turneps leafed Hawkeweede.

His Hawkeweede sendeth forth a few leaves standing upon long and rough reddish footstalkes next the ground somewhat like unto Turneps leaves being rough and torne in very much on the sides into round pointed jagges, among whom riseth up a rough reddish straked stalke more then a cubit high, with one or two small short leaves thereon, divided toward the toppe into many small branches, on every one whereof standeth one flowre for the most part, or sometimes two, of a fine orenge like and yellow which turne into downe as the rest: the roote is somewhat long and stringy of a reddish yellow colour.

2. *Hieracium montanum foliis dentatis flore magno.* Dented Hawkeweede.

The leaves of this Hawkeweede lye for the most part all on the ground, being foure or five inches long, and one broad, verie woolly, and finely dented about the edges, of a fair greene colour: the stalke that riseth up to be almost high is in a manner bare of leaves, rough and hollow, bearing one reasonable large, deepe yellow flower standing in a fine scaly huske which turneth into downe as the rest.

3. *Hieracium ramosum magno flore.* Great flowred Hawkeweede.

The large Hawkeweede hath a round rough stalke two cubits high parted into many branches, on every one whereof standeth a large gold yellow flower like unto Dandelion: the leaves are an handbreadth long and three inches broad with a great ribbe in the middle, and many veines running through it, of a pale greene colour, and somewhat rough, waved about the edges, and set thereabout with small haires, and many veines running from it.

4. *Hieracium Alpinum non laciniatum flore fusco.*
Mountaine Hawkeweede with darke red flowers.

This hairy Hawkeweede riseth up with an hairy stalke two foote high bare of leaves from the middle upwards, and with a few hairy darke greene leaves at the bottome an handbreadth long, and three inches broad, pointed at the ends, and with a little scarfe about the edges: the flowers are of a red colour set many together and being ripe are turned into downe, and with the seede are blowne away: this is very like the *Pilosella major* set forth in my former booke, but is not the same.

3. Hieracium paradoxum dilutum pratense vulgare. 5.
Dwarfe mountain Hawkeweede.

1. Hieracium asperum angustifolium
Small hairy Hawkeweede.

4. Hieracium dilutum latifolium flosculis magnis flore.
Broad leaved mountain Dwarfe Hawkeweede with a large flower.

5. Hieracium asperum latifolium
Mountaine hairy Dandelion leaved Hawkeweede.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

5. *Hieracium pumilum Alpinum prænorfa radice.* Dwarfe mountaine Hawkeweede.

The dwarfe mountaine Hawkeweede hath a short blackish roote, bitten as it were halfe off with some other beast, whereat likewise, sending forth sundry hairy long leaves about three or foure inches long and halfe an inch broad, with long footestalkes under them, cut in on the edges in three or foure places on each side, among which rise up divers hairy slender stalkes, not above a handbreadth high without any leafe thereon except at the top of them the most bearing one flower a peece, of a pale yellow colour.

There is one variety differeth in this sort, one bearing shorter and rounder leaves without any footestalkes underneath; another that hath the stalke branched forth diverslie. *Alterum eius.*

6. *Hieracium montanum lanuginosum laciniatum parvo flore.* Mountaine woolly Hawkeweede.

This mountaine woolly Hawkeweede hath from a long darke red roote many thicke woolly long leaves of a darke greene colour, as if it were spotted, and deepely torne in on the edges about three inches long, and one and a halfe broad, yet some narrower, each of them upon a footestalke, among which riseth up a small soft stalke of a handbreadth high, bearing a few small yellow flowers at the toppes.

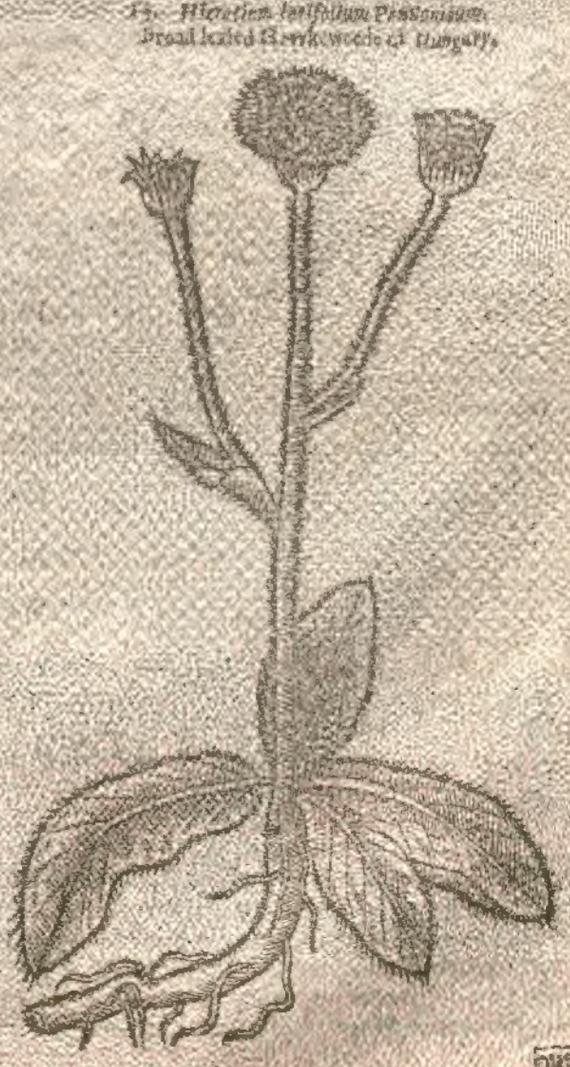
7. *Hieracium Alpinum parvum lanuginosum.* Small mountaine woolly Hawkeweede.

This is smaller then the last and hath more hairy or woolly leaves of a fingers length and halfe the breadth: the stalke is about foure inches long, bearing a yellow flower like unto the rest, the roote is thicke and hath blackish strings.

8. *Hieracium montanum hirsutum minus.* Small hairy Hawkeweede.

This small Hawkeweede hath a few small leaves about an inch long and somewhat hairy, cut in or waved on the edges, the stalke is without branch or leafe, or seldome any appearing (and somee me by the abundance of nourishment it receiveth growing bigger in the middle) bearing a small pale yellow flower like unto a Sowthistle and with such a greene huske under it.

9. *Hieracium Alpinum latifolium villosum magno flore.*
Broad leafed mountaine Hawkeweede with a large flower.



This broad leafed Hawkeweede hath the lower leaves long and somewhat narrow covered with a long hairy downe almost hoary, nine inches that grow up higher upon the hairy stalke which is about a foote high are somewhat shorter but three times broader then they, pointed at the ends and lesse hairy: the stalke is branched into two or three parts, every one bearing one flower usually, yet sometimes two or three out of woolly huskes of the forme and colour of other Hawkeweedes.

10. *Hieracium montanum Dentis leonis folio incano.* Mountaine hoary Dandelion like Hawkeweede.

The roote of this Hawkeweede lyeth longwise under ground with divers fibres shooting downewards, and sending divers heads of leaves upwards, which are not all of an equall length, but some longer and shorter then others, of one two or more inches long, and halfe an inch broad, with a great or thicke middle ribbe, covered over with a soft hairy downe or sotten, the lower part of them being narrower & much torne in on the sides, and the upper part broader and but onely dented: from among which rise two or three stalkes of a foote long, with-

9. *Hieracium montanum angustifolium.*
Narrow leafed mountaine Hawkeweede.

9. *Hieracium latifolium Pannonicum.*
Broad leafed Hawkeweede of Hungary.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

out any leaves, and bearing one large flower at the toppe, of a deeper yellow colour then to many others.

11. *Hieracium Britannicum Clusii Conyzæfolio.* Fleabane like Hawkeweede.

This Hawkeweede riseth up with round straked reddish greene stalkes halfe a yard high, fet with fomewhat large rough leaves like unto thole of Fleabane without order, but not fo fat or thicke and dented about the edges, compalling them at the bottome, and pointed at the ends: the flowers are yellow like other Hawkeweede, fet in hairy huskes upon long footeftalkes which turne into downe, and with the whitifh long feede is blowne away with the winde: the roote is compofed of many blackifh ftrings which perifh not but abide many yeares.

12. *Hieracium montanum angustifolium sive sextum Clusii.*

Clusius his narrow leafed mountaine Hawkeweede.

The narrow leafed mountaine Hawkeweede of *Clusius* breedeth from the long and thicke blackifh roote, vers hearbs of long and narrow fharpe pointed leaves fomewhat hoary upon the greene, from among the leaves of every head ftart up naked hard ftalkes about halfe a foote long, bearing one large yellow flower at the toppe like unto others, and flying away in downe in the fame manner.

Alterum. This kind is found to vary fometimes, having the leaves a little waved about the edges, and fometimes foft hoary, and of a darke greene colour.

13. *Hieracium latifolium Pannonicum sive primum Clusii.*

Broad leafed Hawkeweede of *Hungary*.

This Hawkeweede of *Hungary* hath divers large hoary leaves lying next the ground fometimes a little waved other whiles torne on the edges, fometimes with blacke fpots on them and fometimes without any, among which riseth up an hairy ftalke with very few leaves thereon, parted at the toppe into two or three other braunches, with every of them a large yellow flower like the great Hawkeweedes.

Vnto this ranke or order is alfo to be referred the *Buglossum luteum vulgare* of *Camerarius* and *Gerard*, which is our *Lingua bubula* called by *Lobel Buglossum Echioides luteum Hieracii cognatum*, and by *Tabermontanus Hieracium Echioides purpureum*, and by *Bauhinus Hieracium Echioides capitulis Cardui Benedicti*, but that I have expreffed it in my former booke.

The Place.

All thefe forts of Hawkeweedes are growing upon hills and mountaines in feverall places of *Italy* and *Germany*, &c. and are alfo found many of them in divers places of our owne Land.

The Time.

They doe all flower in the Summer when the other forts doe.

The Names.

The firft three forts and the fixt *Bauhinus* onely hath made mention of by the feverall names are in their tables the fourth *Columnæ* calleth *Hieracium Germanicum primum Gesneri*, and the fifte *Hieracium pumilum quintum folio (fic. fexto) Bauhini* maketh them the 7. and 10. in his *Pinace* by the titles here expreffed; the fixt is the twentieth; the feaventh is likewife called by *Columnæ Hieracium pumilum serratum*, and the eighth *Hieracium montanum asperum*; the ninth is called by *Clusius Hieracium quintum minimum*, and by *Tabermontanus Hieracium latifolium montanum*; the tenth is the eighth *Hieracium folio Hedypnoidis* of *Clusius*, which *Tabermontanus* called *Hieracium montanum angustifolium folio Cichoracis*: the eleventh is called by *Clusius Hieracium Britannicum*, and is his fourth kind; the twelfth is alfo found in the title; the fixt fort of *Clusius* called by *Tabermontanus Hieracium latifolium angustifolium serratum*: the laft is the firft *Hieracium latifolium* of *Clusius* called by *Camerarius Hieracium latifolium Pannonicum*, and as he faith by fome *Italians Coffa*, or *Herba Coffa*, and by others, *Ingrata & pro*, and by *Tabermontanus Hieracium Blomidis*.

The Vertues.

There is no doubt but that thefe fort of Hawkeweedes are as effectuall as any of the former, both their form and former eafie expelling their qualities, yet the laft hath beene found by many in our Land to have a particular properties, but fet downe by no other Author then *Camerarius*, who faith concerning it, that it is fingular good for the Tifficke or conſumption of the Lungs, to be taken either made into a Syrupe or Conderve, or the powder of the dryed herbe taken with hony, or as he faith they doe in *Assyria*, put it into their Sallets, broth and meates for the fame purpofe, and is availeable for the pluriſie alſo without any helpe of blood letting as is affirmed by many credible perſons.

CHAP. XXXVI.

Hieracia pratensia. Medow Hawkeweedes.

Ordo secundus. The eight ranke.

1. *Hieracium profunde laciniatum pubescens.* Medow Hawkeweede with deepe cut leaves.

This Hawkeweede hath divers long and narrow leaves next the ground deeply cut in or torne at the edges, and pointed at the ends with long footeftalkes under them, and covered with a foft downy hairinelle as all the plant elfe is: the ftalke is hollow, round and three foote high, having very few fuch like ileepe cut leaves thereon and branched divers, whereon ftand gold yellow flowers at the toppes of all the ſmall long footeftalkes, which clofe into downe like the reſt: the roote is blackiſh and woody.

2. *Hieracium pratense non laciniatum majus.* The greater uncut medow Hawkeweede.

The many and divers rough leaves that ſpring about the roote of this Hawkeweede upon the ground are of fix inches long a peece, and one and a halfe broad, without any gafh or dent on the edges being very greene and ending in a round point, from among which riſeth up one ſingle ſtraight and erected ſtalke about a cubit high wholly naked or deſtitute of leaves, bearing at the toppe a number of ſmall yellow flowers, ſet cloſe together and were in a tuft every one upon a ſhort footeſtalke, which doe as the reſt turne into downe and then into the wind: the roote is ſmall and blacke with divers long ſtrings faſtned thereto.

3. Hiera-

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Hieracium praemorsa folio minus.* The lesser moth Mullein Hawkeweede.

This other and lesser Hawkeweede hath many fuller leaves & uncut next the ground, of an inch and a halfe long, and one broade, being alwaies round and rough: the stalke that riseth from the middle of them standeth upright, and is leafed, bearing at the toppe a few such like flowers as the former turning into downe: the roote is long and of a meane size.

The Place.

They doe grow in the fields and meadowes, and by woodes sides that lie open to the Sunne.

The Time.

They flower and seede when the former doe.

The Names.

Lobel giveth the name of the first, as it is in the title: the second and third *Dodon.* maketh his minor and *Lobelius*, calling them *Intubus Leontodontis, major* and *minor*, and *Bauhinus Hieracium praemorsa folio pilosum* major and minor.

The Vertues.

The being Hawkeweedes as their face and outward forme sheweth them to be, the vertues of the Hawkeweede may be in some sort appropriated unto them.

Chap. XXXVII.

Hieracia fruticosa. Bushie Hawkeweedes.

Nonus Ordo. The ninth Ranke.

1. *Hieracium fruticosum latifolium glabrum.* Bushie Hawkeweede with smooth broad leaves.

This tall bushie Hawkeweede leaneth forth from a blackish fibrous roote some round straight hairie stalkes three foote high, set here and there without any order, with soft hairie or woolly leaves indented, or as it were bearded about the edges, foure or five inches long, and one and a halfe broad, of a darke greene colour and pointed at the ends: the toppes of the stalkes runne into slender sprayes bearing every one a small pale yellow flower.

1. *Hieracium fruticosum angustifolium glabrum minus.* The greater bushie Hawkeweede with narrow leaves.

Hieracium murorum Bauhini quod est Pilosum villosi Lobelii. *Bauhinus* his more hairy Hawkeweede of the walls, which is *Lobels* French Pilosella.

2. *Hieracium*

2. *Hieracium fruticosum folio subrotundo*, Round leafed bushie Hawkeweede.

The stalke hereof is about a cubit long, straked, round, and somewhat rough, divided at the toppe into foure branches, three or foure inches long a peece, every one vphoulding a pale yellow flower, the leaves that grow at the stalke at the lower end are somewhat round, about an inch and a halfe broad, yet ending in a little point, notched about the edges, and of a light greene colour somewhat hoarie.

3. *Hieracium fruticosum latifolium hirsutum*, Bushie Hawkeweede with rough broade leaves.

This broad leafed Hawkeweede hath divers broad and somewhat long hard rough darke greene leaves lying on the ground without any incisures or dents on the edges: the stalke that riseth up among them is two or three foote high, thicke set with such leaves but lesse unto the toppe, where stand a few yellow flowers consisting of fewer leaves than in others, being but of one row of leaves bordering a middle thrumme which ouerreacheth

Varietas. downe: the roote is wholly composed of strings and small fibres, which yeeldeth milke as much of the Hawkweedes doe: sometimes this is found to varie with lesse rough, or rather with soft leaves, and sometimes with broader and shorter.

4. *Hieracium fruticosum angustifolium majus.*

The greater Bushie Hawkeweede with narrow leaves.

This other bushie Hawkeweede groweth very like the last, but hath longer and narrower leaves, somewhat rough and dented or waved about the edges: the stalke is more branched at the toppe where the flowers are more and thicker, of faire yellow leaves, the roote is whitish very long and deepely threading into the ground possessing a great deale of ground quickly, for every little peece will grow being broken, and not easie to be rid out againe.

5. *Hieracium fruticosum minus.*

The lesser bushie Hawkeweede.

This lesser bushie Hawkeweede riseth up with a single smale stalke halfe a yeard high, set about with diuers shorte and smooth leaues in some places, and with almost round rough leaues in others, dented about the edges, bearing diuers yellow flowers upon shorte footestalkes, at the toppe like unto the last: the roote is short, and as it were bitten off without any fibres at it.

6. *Hieracium Murorum angustifolium.*

Narrow leafed Hawkeweede of the walles.

From a thicke reddish roote riseth up a round rough stalke almost two foote high, set with a few shorte and narrow leaves dispersed thereon, at the toppe whereof stand many small yellow flowers as it were in a tuft or umbell close set together, every one on a small long foote stalke: the leaves that grow at the foote hereof, and next to the ground, are many long and narrow of fiue inches long, and scarce halfe an inch broad, covered with a soft downe or fleece, which grow shorter as they rise higher on the stalke: this is found much smaller about *Padua* as *Bauhinus* saith.

6. *Hieracium murorum angustifolium.*
Narrow leafed Hawkeweed of the walls.

The Place.

Although these are set downe by *Bauhinus* and others to grow in seuerall places in *Germany* &c. yet some of them haue beene found in our owne Land, as I haue oftentimes gathered in the way to *Hampstead Heath*, and backe againe, especially the third and the fourth.

The Time.

These keepe the same time of bowring and seeding or rather later.

The Names.

The first is called by *Bauhine* as it is in the title, & is the second *Hieracium tenuifolium* of *Clusius*: the second is called also by *Bauhine*, as I haue here downe: the third is taken to be the *Erinus Matthioli*, yet no way answereth to his figure as *Lobel* hath, being much bigger than it, and as it is thought by diuers that the figure is but a figment, for it is not certainly knowne what herbe among all we haue should be the right *Erinus* of *Dioscorides* or that which doth answer it in all points: *Lobel* in his *Aduersaria*, would referre both the *Esula dulcis Trago* nominata, and *Esula sylvestris* also, because they give milke, and their leaues doe neerest resemble *Basil* whereunto *Dioscorides* compareth the leaues of *Erinus*, and therefore as it should seeme *Castor Durante* calleth *Erinus Matthioli Serpilli folium aquaticum*: *Goulandine* calleth this *Hieracium Militaris Galeni*, and *Lattuca Plini*, whose opinion of what herbe *Matthiolus* his *Erinus* should be, shewed this *Hieracium*. *Hortus Eystettensis*, calleth it *Hieracium tenuifolium polycephalon*, & called also by some *Hieracium Sabaudum tenuifolium*, as the fourth is called by *Lobel* *Hieracium Sabaudum angustifolium*, and *Hieracium alterum grandius*, for he maketh them to be both one, although the description of their leaues be much differing, it is the third *Hieracium* of *Clusius*, for as he saith himself it is very great affinitie unto *Lobels*, if it be not the same: *Dodonæus* maketh it his first *Hieracium*, *Gerard* maketh it the *Hieracium latifolium*, and *Bauhinus* calleth it *Hieracium fruticosum angustifolium majus*, as he doth the first *Hieracium latifolium*, and *Bauhinus* calleth it *Hieracium fruticosum angustifolium minus*, as he doth the *Hieracium tenuifolium minus*: the last is added to this ranke not having any other of that sorte to ranke with it: I haue found but two other sortes of *Hieracium murorum*, the one is our *Pilosella major*, called *Auricula muris major*, *Tragi*, some *Chondrilla muris* and *Palmucia Gallorum*, or *Gallica* which *Lugdunensis* very plainly calleth *Cariophyllata*, but is not *Caryophyllata Cæsalpini*, as *Bauhinus* seemeth to suppose, for *Cæsalpinus* referreth it to the *Hieracium latifolium Pannonicum* of *Clusius*, as I said before in the last Chapter saue one, and his other is the *Pilosella tertia* of *Tabernæmontanus* if they be seuerall (being noted to be *Laciniatum*) and not one and is called in Latine *Hieracium murorum angustifolium non finuatum*, I haue given you the figure here of *Lobel* which hath narrower leaues to be compared with this of *Bauhinus*.

The Vertues.

There is none of these Hawkeweedes inferiour to any of the former in their qualities as farre as may be judged, for that alwaies we have no further experience set downe by any, and therefore if yee will so take them yee may use repetition of the same things against that have beene delivered, but I will referre you to the first rancke of Hawkeweedes, to peruse the vertues there appropriated to them and transferre them if you please hereunto. And thus much shall serve to have spoken of the whole family of the Hawkeweedes.

Chap. XXXVIII.

Sonchus. Sow-thistle.

Dioscorides and the other ancient writers have set downe but two sorts of Sow-thistles, dividing them into rough or prickly and smooth, *Pliny* into blacke and white, *Theophrastus* mencioneth onely the rough kind: but since their time there have beene sundry other herbes found out, which doe so nearely resemble them, that they are therefore referred unto them as shall bee presently shewed: but because there are so many that beare that title I thinke good to avoid confusion to distribute them into sundry Chapters as you shall finde them mentioned.

Sonchi asperi. Prickly Sow-thistles.

Ordo primus. The first ranke.

1. *Sonchus asper major non laciniatus.* The greater prickly Sow-thistle with whole leaves.

This prickly Sow-thistle hath somewhat long and broad leaves of a whitish greene colour, unevenly dented, but not parted or cutte on the edges, and every dent set with a sharpe and short pricke somewhat hard, and sometimes prickly also along the middle ribbe on the under side, yeelding a more fatter milke in every part where it is broken then the smoother kind: the stalke is somewhat tender and as it were winged with a skinne running upon it, rough and sharpe, set with such like leaves as grow below, diversly branched with small pale yellow flowers at the toppes which turne into downe and are blowne away: the roote is long yellowish and somewhat hard when it is growen up with a stalke with a number of small fibres set thereat.

2. *Sonchus asper minor non laciniatus.* The lesser prickly Sow-thistle with whole leaves.

The lesse Sow-thistle is in all things like the other but lesser in every part, having a rounder stalke seldome above a foote high, somewhat firmer and not so tender, with smaller leaves but as sharpe and prickly as the former, some because this doth more usually grow in the fertile grounds, doe account it to be the cause that the leaves are whole and not rent, which is but an opinion with small reason therefore.

1. *Sonchus asper major non laciniatus.*
The greater prickly Sow-thistle with whole leaves.

2. *Sonchus asper laciniatus vulgaris.*
Prickly Sow-thistle ordinary.

3. *Sonchus*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Sonchus asper laciniatus.* Common prickly Sow-thistle.

This common Sow-thistle hath the leaves very much cut or torne on the edges into three or fowre peeces reaching almost one from another, and smaller peeces of leaves set betweene them of a whitish green colour like the former, and having prickles on the dented edges likewise: the stalke groweth very high sometimes as high as a tree, and prickly, with such leaves thereon as are below, branched at the toppe, where grow such like yellow flowers turning into downe: the roote is like the other.

4. *Sonchus asper laciniatus Creticus.* Prickly Sow-thistle of *Candy*.

This *Candy* Sow-thistle hath the first leaves little or nothing divided on the edges of an handbreadth long or more, but those that rise up with the stalke are very much torne on the edges into great and deepe gashes, with some prickles likewise; the stalke is rough, straked and hollow, halfe a yard high, branched from the middle upwards, with such like leaves but smaller set at the joynts, at the toppes whereof stand large yellow flowers in rough greene huskes upon long foote-stalkes which turne into downe as the other.

5. *Sonchus asper folio rotundo folio major.*

The greater round leafed prickly Sow-thistle.

The greater of these two round leafed prickly Sow-thistles riseth up with a round hollow stalke not a foote high, set with many short prickles at the bottome, whereabout grow a few leaves that are somewhat round and an inch and a halfe long, some whereof are waved about the edges, and all of them a little prickly as well on the edges as on the backes, the stalke is branched at the toppe into two or three parts, every one with a small pale yellow flower like unto an Hawkeweede, which afterwards is turned into downe and into the winde: the roote is small and long with fibres set thereon.

6. *Sonchus asper folio rotundo folio minor.*

The lesser round leafed prickly Sow-thistle.

This is a smaller sort by many degrees having small threadlike roores and two small stalkes about foure or six inches long, bearing onely one small yellow flower at the toppe, the leaves that lie on the ground being six or seven in number are small and round pointed, and dented about the edges.

7. *Sonchus frutescens spinosus Africanus spinosus.*

Thorny shrub Sow-thistle of *Africa*.

7. Sonchus frutescens spinosus Africanus spinosus.
Thorny shrub Sow-thistle of Africa.

This kinde of Sow-thistle groweth somewhat high, with woodily stalkes and branches much spread at the toppe and every twigge ending in very sharpe prickes or thornes, the lower leaves are much jagged and prickly, the upper smaller and little or nothing jagged, the flowers are small, fragle, and pale yellow, whose seede succeeding is with the downe as the rest carried away with the winde.

The Place.

These Sow-thistles grow in unmanured as well as in manured soyles forsooth Orchards and Gardens where the leaves are usually lesser and lesser divided then in the rough and unmanured grounds: the last as the title declareth among the rockes and stony grounds about *Tyre* and *Sapha*, found by *Bel* and brought to us.

The Time.

They doe all flower and shed their seede from Midsummer or thereabout all the Summer long, and sometime untill *August* be past, but the last hardly endureth a Winter with us.

The Names.

It is called in Greeke Σόγχος ἀκανθώδης ὁμοίως τῷ ἡμέρῳ, quod fabulosum fundat figmentum: the Latines also call it *Sonchus* and the kind is called *Asper*, *asperior* or *spinosior* to put a difference betweene it and the next which is *lenis* or *levis*. The first is called by *Tragus Sonchus spinosus sylvestris seu creticus dentis folio*, and by *Cordus* in *Historia Sonchus asperrimus*, of *Lobel Sonchus tenerior ecalcis asperior aut hirsutior folio*, by *Dodonæus* and *Lugdunensis Sonchus asperior*, by *Valerius Cordus Sonchus altera in viderobin*, and by *Bauhinus Sonchus asper non laciniatus*: the second is called by *Cæsalpinus Sonchus asper minor*: the third is the *Sonchus asper* of *Matthiolus*, *Dalechampius*, *Gesner* and others, by *Lobel* in *Icones Cicerbita asperior*, by *Lugdunenses Sonchus spinosus* and by *Lugdunenses ordinarii Sonchus minor*: the fourth is onely mentioned by the name of *Sonchus asper laciniatus Creticus* as it is in the title: the fift and the last so are wont to call them, *Sonchus asper folio rotundo folio major & minor*: the last hath his name in his title as it is used here.

The Vertues.

The properties of these rougher or more prickly Sow-thistles are like with the next, which are the lawfullest and therefore because they are more generally used I shall give you the vertues of them under those to comprehend them both in one to bee the more succinct, and to avoid a tautologie, or needelesse repetition of one thing twise.

Chap.

Chap. XXXIX

Sonchi leves. Smooth Sow-thistles.

Ordo secundus vulgaris. The second ranke.

1. *Sonchus levis.* Common Sow-thistle.

The common Sow-thistle is well knowne to rise up with a round hollow stalke three or foure foote high or more sometimes, if it grow in good grounds and in gardens as usually it doth, set with many long and much torne leaves of a whitish greene colour, not having that roughnesse or those sharpe prickles on them as are in the former kind: branching forth towards the toppe into divers branches bearing pale yellow flowers which passe away into downe & with the seed into the wind, the roote groweth downe right, and hath many fibres thereat perishing likewise every yeare, and dying it selfe whensoever sowing, and is not plentifull in giving milke as the former, which is somewhat pleasanter and not so bitter.

2. *Sonchus Levis alter parvis floribus.* The lesser smooth Sow-thistle.

The lesser Sow-thistle groweth not so high nor hath so many leaves set on the stalke, but are long and more pinn'd on the edges, else not unlike to the former, the many branches of the stalke have fewer and smaller leaves on them, and the flowers are much smaller, yet of the same pale yellow colour in bud, which passe away into downe as the rest, &c.

3. *Sonchus levis Latifolius flore albo.* Broad leafed Sow-thistle with white flowers.

The leaves of this are like the last but somewhat larger and broader and with fewer divisions on the edges: the flowers hereof are white, which with the forme of the leaves make the difference.

4. *Sonchus levis angustifolius.* Narrow leafed Sow-thistle.

This Sow-thistle hath but few and those very long and narrow leaves, whose lower parts are narrowest and have no eares at all, but from the middle almost forwards they are broader and have divers gashes on both sides, some greater and deeper and others smaller especially towards the ends where they are broadest: the stalkes grow somewhat low and divided but into one or two branches, set sparingly with leaves, the uppermost whereof are long but not divided or very little compassing the stalke, at the foote bearing one large yellowish flower upon a long braked toppe branch, which being ripe flyeth away: the roote giveth milke as the whole plant else beside, and is long and slender with a few strings.

5. *Sonchus levis vulgo laciniatus.* Sow-thistle with fine cut leaves.

The leaves of this Sow-thistle that grow lowest are long and divided into many slender jagges, but those that

1. *Sonchus levis vulgaris.*
Common Sow-thistle.

2. *Sonchus levis alter parvis floribus.*
The lesser Smooth Sow-thistle.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

3. Sonchus laevis tuberosus flore albo.
Broad leafed Sow-thistle with white flowers.

4. Sonchus angustifolius maritimus.
Narrow leafed Sow-thistle.

are set at the joynts of the slender smooth greene and high stalke where it branceth, are somewhat greene not so finely cut in on the edges, at the toppes are yellowish flowers like the others, of a middle size which grow into downe.

6. *Sonchus angustifolius maritimus.* Sea narrow leafed Sow-thistle.

This Sea Sow-thistle shoots a slender long roote wanting fibre, rise many long darke greene leaves, some foure and some of six inches long and scarse one inch broad, a little rough, with small prickles about the edges which give milke as the others doe, and among them one slender stalke about a foote or little high, with two or three leaves thereon which compasse it at the bottome, and beare one or sometimes two yellow flowers at the top of a reasonable bignesse, which passe away into downe, &c.

The Place.

The first, and second sometimes also, grow in Gardens and manured grounds, and sometimes by old walls the pathsides of fields, high wayes, but the third and the fourth in *Germany*; the fift about *Montpelier* and *Florence* also, where they eate it familiarly as the common: the last is found in the Island of *Ios* in the Venetian territory, and by *Montpelier* also.

The Time.

They doe flower quickly after they are sprung, for it is late before they rise out of the ground, and abideth till *autumne*.

The Names.

It is called *Sonchus levis* in Latine to distinguish the one from the other as is layd before; some call [illegible] as the Italians doe to this day, *Apuleius* calleth it *Lactuca leporina*, and the Germans thereafter, *Hasen Lattige*, some also *Hasen Kol*, that is, *Brassica leporina*: it may well be accounted as a kind of wilde Lettuce, to like it, others therefore call it *Lactucella* and *Lactucrones* from the French *Laictrons*. *Tragus* calleth it *Intybus sylvestris sive erratica cretica*, *Lonicerus Endivia sylvestris*, *Lugdunensis Ambrosia minor*, *Dodonæus* [illegible] *Sonchus levis sive lævis*, all other authors *Sonchus levis*, or *mas asper*, or *vulgaris*, or *ruderalis*, the second *Matthiolus* calleth *Sonchus levis alter*, and *Lobel Sonchus asper profundis incisuris*, *Fuchsius* [illegible] *Sonchus levis altissimus secundus*, *Tabernæmontanus Sonchus sylvaticus quartus*; *Dodonæus* calleth it *Sonchus asper Lactucæ facies Galeni*, *Gesner in horto Germania Lactuca sylvestris flore luteo*, which although it [illegible] in the outward face resemble somewhat, yet it is much more bitter, and never eaten as the other [illegible] sallet herbes; and *Calsalpinus Lactuca marorum*, *Bauhinus* calleth it *Sonchus levis tuberosus maculis purpurascentibus*, the third *Tabernæmontanus* and *Gerard* have set forth by the same name as in the title, and *Bauhinus* [illegible] *minor paucioribus laciniis*; the fourth *Lobel* setteth forth in his Dutch Herball by the name of *Sonchus* [illegible] *chich*, *Gesner in Horto* calleth it *Sonchi genus terra crispa*, and *Calsalpinus* saith they call it *Terra crispa* or *Flemmes*, *Lugdunensis* setteth it forth for *Crepis Dalechampii*, and *Bauhinus* calleth it *Sonchus levis* [illegible] the fift and sixt are set forth onely by *Bauhinus* by the names of *Sonchus levis in plurimas* [illegible]

Original from UNIVERSITY OF MICHIGAN

Sonchus asper flatibus maximus; the *Italians* doe call it *Sonchi lisci*, and *Cicerbita gentile*; the *Spaniards* and *Sequois*; the *French Lactrones*, and *Palais au lieure* from the *Latine Palatium leporis*, and as some have it *Lepus arrectabile*; the *Germans Gens distel*, *Sow-distel* and *Dudistel*; the *Dutch Ganse disteb* and *Melcery*; and are in *English* generally Sow-thistle, and of some Hares-lettice.

The Vertues.

These as well as the former Sow-thistles are cooling and somewhat binding, and are very fit to coole an hot flowing humour, the gnawing paines thereof, they are usually eaten as salet herbes in the Winter and Spring, whiles they are young and tender by those beyond the seas familiarly, but the roots are much more esteemed by them, being very tender and sweete: the herbe boyled in wine is very helpfull to stay the dissolutions of the humours, and the milke that is taken from the stalkes when they are broken given in drinke, is beneficial to those that are wounded and have a wheesing with all: *Erasistratus*, saith *Pliny*, did there with cause the gravell and stone to be voided by urine, and saith, that the eating thereof helpeth a stinking breath: the juyce thereof to the quantity of three spoonfulls taken in white wine warmed, and some oyle put thereto, easeth women in travell and giveth them easie and speedy delivery, that they may be able to walke presently after: the said juyce taken in like manner helpeth the strangurie or pissing by droppes, and paines in making water: the decoction of the leaves and stalkes given to Mouses causeth abundance of milke, and their children to be well coloured, and is good for them whose milke doe curdle in their breasts: the juyce boyled or throughly heated with a little oyle of sweet Almonds, in the pill of a Pomegranate and dropped into the eares, is a sure remedy for deafenesse and singing and all other diseases in the eares. It is said that the herbe bruised and bound upon warres will quickly take them away: the herbe bruised or the juyce is profitably applied to all hot inflammations in the eyes, or wheresoever else, and for pushes, wheales, blisters, or other the like eruptions of heate in the skinne, as also for the heate and inflamation of the *hæmorrhoides* or piles and the heate and sharpenesse of humours happning in the secret parts of man or woman: the distilled water of the herbe is not onely effectuall for all the diseases aforesaid, to be taken inwardly with a little sugar, which medicine the daintiest stomacke that is will not refuse it, or outwardly by applying clothes or sponges wetted therein: but is wonderfully good for women to wash their faces, to cleare the skinne and to give a faire complexion.

Chap. XL.

Sonchi Montani. Mountaine Sow-thistles.

Tertius Ordo. The third Ranke.

1. *Sonchus Alpinus cæruleus.* Blew flowred mountaine Sow-thistle.

This mountaine Sow-thistle hath divers broad and long leaves much cut in to the midle ribbe, and dented also on the edges, the end peeces being the broadest, of a greene colour on the upper side, and grayish underneath, compassing the stalke at the bottome, which is round, rough, and set with hard reddish haires about a foote high branched at the toppe, with lesser and lesse divided leaves on them: the flowers stand many together in small little greene tufts upon purplish hairie foote stalkes, every one consisting of twentie and more small narrow leaves, wide at the ends and nicked in of a purplish blew colour like unto Succory, which turne into downe as other sorts doe, & are blowen away: the same roote is great, thicke, white and hard, very sparingly fastned with long strings fastned strongly in the earth, which perisheth not but abideth many yeares by the shew of the dry stalkes: this giveth milke in as plentifull manner as the others doe and is very bitter. There is another of this sort, whose leaves are more divided into smaller parts, yet the end peece is lowest like the other, and so are the flowers but more sparingly set at the toppes somewhat lesser also, and of a paler yellow colour.

2. *Sonchus arborescens.* The greatest Sow-thistle.

This Sow-thistle groweth to the height of any man, with a strong stalke of the bignesse of a mans thumme, smooth striked and without any pricke whereabout are set many leaves, parted sometimes and sometimes into five divisions placed on each side one against another, and compassing it about at the lower end, where they have small peeces sticking forth beyond the rest, the upper leaves have no divisions nor prickles on the edges but the very edges upon the dents, and are greene on the upper side, and grayish underneath and full of milke: the stalke growes at the toppe into sundry branches, bearing at the tops many flowers like the other, as it were in an umbell, all of a like height, small in comparison of the tallnesse of the plant, else not much unlike those of

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

...Sow-thistle, compoſed of many yellow leaves cut in at the ends, compaſſing a middle thrumme ... yellow, which when they are ripe paſſe into downe with grayiſh ſtriped ſeede therein, both which ... away with the winde: the roote is great and whitiſh ſet with many great fibres, and periſheth not but ... winter.

2. *Sonchus Dioscoridis Dalechampi.* Tall Sow-thiſtle without branches.

The great tall Sow-thiſtle which *Dalechampius* found, and *Lugdunenſis* hath ſet forth, hath a great blackiſh root, ... ſtrong ſtalke, faſtened thereto, from whence riſe divers ſtrong, tall, round ſtalkes, two cubits high or more ... no branches at all, but thicke ſet with broad leaves from the bottome to the toppes on both ſides, waved ... the edges, ſmaller at the bottomes and broader toward the ends which are pointed: from the toppes ... and likewiſe from the joynts with the leaves come forth ſhort foote ſtalkes, with three or foure ... Sow-thiſtle-like flowers on them, which turne into downe, and ſo into the winde as others doe.

3. *Sonchus Montanus laciniatus minor.* The leſſer Mountaine Sow-thiſtle.

The leſſer Mountaine Sow-thiſtle hath the ſtalke next the ground for a ſmall ſpace ſmooth and round, ſomewhat ... and woaddy, which then breaketh out into branches, and riſeth to the height of two foote or there ... ſet at out with divers leaves farre in ſunder one from another of an inch and a halfe long, and cut in on ... into ſeverall peeces, and pointed at the ends, the flowers ſtand at the toppes of the ſtalkes and branches, ... by the above another, as it were in a ſpike, being ſmall and yellowiſh, which being ripe is turned into ... and carried away with the winde as all the reſt are: the roote is ſomewhat blacke.

The Place.

All this kinde (ſave the ſecond which groweth among Willowes and Reedes, and yet I have here inſerted for the ... ſake) grow upon the hills in *Aſturia* and other places, and for their rarities are nurſed up in Gardens.

The Time.

They in their naturall places flower ſomewhat late, but tranſplanted are in flower about *July*, and their ſeede ripeneth the ſooner.

The Names.

The firſt is called by *Lonicerus* upon *Matthiolus Sonchus cæruleus* and *Sonchus hortenſis*, by *Thalius Sonchus ... Hercynia*, the other of theſe ſorts is *Cluſius* his *Sonchus levior Auſtriacus cæruleo flore*: the ſecond is the ... *Sonchus* of *Clusius*, which he calleth *Sonchus levior Auſtriacus altiſſimus*: the third is, as I ſaid, called by *Lugdunenſis Sonchus Dioscoridis Dalechampij*: the fourth *Bauhinus* ſetteth forth by the name of *Sonchus montanus levis ... laciniatus minor*.

The Virtues.

Theſe Sow-thiſtles are of the like qualitie and operation with the former, and therefore whatſoever hath beene ſaid of the other before may be tranſferred to theſe to ſave a repetition of the ſame things.

Chap. XLI.

South-ſowe-thiſtle.

Hairy or woolly Sow-thiſtles.

Order quarton. The fourth ranke.

1. *Sonchus villoſus latifolius major.*
The greater woolly Sow-thiſtle.

The greater woolly Sow-thiſtle hath divers ... ly woolly long rough and ſomewhat narrow ... leaves lying on the ground pointed at the ... ſmall ends, and unevenly waved at large di... ſtances on the edges, with a white middle ... rib in them, from among which riſeth up a ... woolly hairie ſtalke a cubit high ſet with ſuch like ... leaves thereon but leſſer and leſſer up to the toppe ... where it is ſlenderly branched into ſome few branches, with ſoft ... woolly heads on them, out of which come gold yellow ... flowers ſtanding in ſcales formed into the ordinary Sow-thiſtle, and ... after turne into downe, away being ripe: the whole plant ... is full of bitter milke as the Succories doe, and is almoſt as bitter. ... The roote is long, white and ſlender, with divers ſmall ... threds at it.

2. *Sonchus villoſus latifolius minor.*
The leſſer woolly Sow-thiſtle.

This kinde hath from a ſmall reddiſh long roote ſi... milar to the former, two or three round woolly ſtalkes ... a cubit high, ſlightly parted at the toppe into two or three ... branches which grow very narrow leaves about ... an inch long, ſmall, or nothing divided on the edges, but ... thoſe that grow lower and at the ground are narrow and a... cubit long, with ſome rents or diviſions upon ... the ſides under one from another, the flowers are of ... a pale yellow colour ſtanding in ſmall huskes, cove... red with a ſoft and woolly downe which paſſe into ... downe, and are blowne away with the winde.

The Place.

This plant is found in the woods about *Montpelier* in *France*, and in ſome other places of *Spaine* and

1. *Sonchus villoſus latifolius major.*
The greater woolly Sow-thiſtle.

The Time.

They flower in the moneth of *June* and *July*, and the seede ripeneth quickly after, even with the other flowers.

The Names.

The first is called by *Lugdunenses Senebua fœtens* because of the whitenesse, like unto woolle, and some also saith did call it also *Hollaw* from the like woollinesse thereof, but yet is not the *Acolluga Plini*. *Dodonæus* calleth it *Senebua villosa latens major* or as he doth the other *Senebua villosa latens minor*, and is called also by him *Hieracium compositum*, and therefore might be referred to that family, but that I follow my author herein.

The Vertues.

These also are somewhat bitter more like Hawkeweede then Sow-thistles, and therefore may be applyed accordingly, for there is no author hath written any thing more particularly hereof.

Chap. XLII.

Lampsana, Nipplewort.

Was almost indifferent whether I should set this plant next after the Hawkeweedes and next the Sow-thistles or after, in regard it commeth so neare unto both of them; but let it take place here, as partaking more with those than these in my opinion, yet whereas all former writers have made it one from them all, *Rembertus* hath added thereunto another that commeth very neare it, as you shall see by and by; and I am bold to adde a third, which in my opinion may well be accounted as one of them.

1. *Lampsana vulgaris.* The ordinary Nipplewort.

This herbe *Lampsana* (which I have entituled Nipplewort for the reasons hereafter declared) maketh sundry hard upright stalkes, whereon grow divers greene leaves from the bottome to the toppe, but lower and higher, in some places whole without any dents on the edges, and in others with a few uneven cuts therein somewhat like a kinde of Hawkeweede; the toppes of the stalkes have some small long branches, which carry many small starre like yellowish flowers on them which turne into small seede; the roote is small and threddy, that yeeldeth a bitter milke as the others doe.

2. *Lampsana Austriaca.* Nipplewort of *Austria*.

This other herbe (which I hold may be accounted as one of this kinde) hath slender smooth and solid stalkes not easie to breake, a cubit high or more, whereon are set without order somewhat long and narrow leaves cleft in the middle and sharpe at the ends, waved a little about the edges and compassing them at the bottome, yeelding a little milke; from the upper joynts with the leaves grow forth small firme branches, yet a little bending ou-

1. *Lampsana vulgaris.*
The ordinary Nipplewort.

2. *Lampsana Austriaca.*
Nipplewort of Austria.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd

Original from UNIVERSITY OF MICHIGAN

of them foure or five long greene huskes and in them small purplish flowers of five leaves a peece cut in at the broad ends, with some small threds in the middle, which turne into downe and so into the seede: the roote is small and fibrous lasting many yeares.

3. *Sonchus affinis Lampsanæ sylvestris.* Wilde or wood baftard Nipplewort.

The wilde or wood kinde is like into the first sort, but with somewhat broader leaves, and more store of branches, flowers and other parts not so much differing.

The Place.

The first groweth upon the bankes of ditches and the borders of fields almost every where: the other *Clusius* found in *Hungarie* and in *Sauoye* *Harrymasplon* and other places: the last is found neare woods sides and hedge rowes.

The Time.

They flower in the Sommer, and their seede ripeneth soone after.

The Names.

This is taken by many to be the *Lampsana* of *Dioscorides*, *quia folionum mollitie, & lenitate ad humanum tactum videtur*, and thereupon some call it *Lapsana*: but I see no reason of this name: the Latines keepe the same name of *Lampsana* or as some have it *Lapsana*, but I make some doubt thereof although *Dioscorides* giveth no description thereof as being well enough knowne in his time yet believe it to be a wilde or pothearbe whereon the poorer sort of people did feede, as being the meanest and cheapest herbes (which can of *Pliny* lib. 19. c. 8. may also be gathered, when as *Iulius Cæsar* souldiers at *Durrhachium* complained of their scarcitie of their allowance in diet for their service by feeding on *Lampsana*, and that they were driven to eate the same) *Pliny* also saith it was of the old *Romans* called *Napum graff Napus sylvestris*. Some of late time the rude of *Matthiolus*, *Cæsalpinus*, *Gesner*, *Lobel* and *Lugdunenses*, their opinion that tooke for *Lampsana* to *Lactuca* with pods, as all their figures expresse it, and as shall be shewed more amply in the proper place where I shall entreate of their kinde) but this herbe hath no prohibitive force the roote being heard of nothing but that we can heare of to be as foode to feede upon: *Gerard* hath boldly fathered in a double name still retaining former a false figure so that *Lampsana*, which he grossly mistooke to all that agree in company with him also in sampling, which even this that is here set forth and generally with all Herbarists in these times called *Lampsana*, which differeth much from a Charlock that hath long pods, and seeke to give it the name of *Dock Cresses*, as though it were some wilde kind of *Cresses*, which as more fully as *Lobel* in *Adversaria* hath it may be referred to an *Hieracium* or as I say to a *Sonchus*. The first is called *Lampsana* by *Lobel* and *Dodonæus* in his last Edition (for in his former he tooke it to bee *Lapsanum*) and *Lugdunenses* who all give one and the same figure of this herbe as also by *Thalius* and *Camerarius* who saith that in *Brasile* they call it *Papilaria*, because it is good to heale the Vlcers of the Nipples of womens breasts, and thereupon I have entitled it Nipplewort in *English*: by *Gesner* in *Horto* it is called *Sonchus carnosum* and *in Belle de collection Sonchus purpura Cichoreum folio*. *Gerard* his Figure of *Sonchus sylvaticus* doth more truly represent this *Lampsana* then his Figure of *Lactuca* is. The second is called by *Clusius Sonchus lævior Lampsanæ quarum purpurea flore*, but I have entituled *Lampsana Asiatica*, supposing it may more fully agree thereunto, then unto a wilde Lettice as *Rauhinus* and who called it *Lactuca montana purpurea flore*. *Columna* as I said before saith that this of *Clusius* was like to his *Montana purpurea*, but differed in some things and so doe I also, as first in the roote, *Columna* his not being so thicke as this of *Clusius*, and the flowers hereof having five leaves and his but foure, and therefore I take them to be divers plants. If I have erred herein I referre me to his censure that can confute mee by proofe: and to *Lobel* in his *Sonchus sylvestris 3. secundus*, which *Rauhinus* calleth *Sonchus affinis Lampsana sylvestris*.

The Vertues.

We have no pretended to shew you of this *Lampsana* more then what *Camerarius* as I said before hath given out for friends, which is that they in *Brasile* from the vertues to heale womens breasts, and their nipples when sore or excoriated call it *Papilaria*, which may induce us to thinke that it hath an especiall healing quality in it, and that it is temperate in heate and drines, with some rentastic of parts able to digest the crudeness of those humors that breake out into those parts.

Chap. XLIII.

Lactuca Sativa. Manured or Garden Lettice.

There are two kinds of Lettice, the one of the Garden, the other wilde. Of the Garden kinds I have in my former booke given you the knowledge of so many sorts, that it might seeme that there had beene no more to have beene set forth, for I there shewed you eleven severall sorts besides that small Sallet herbe called Lambes Lettice or Corne Sallet, which although it be no kind of Lettice as all know well enough, yet performeth the office of it in a Sallet, whose Figure I there give you, and the ordinary Garden kinds also, but upon further search I have two other sorts to bring to your consideration which shall bee declared in this Chapter, and the wilde kinds in the next to close up this Classis.

1. *Lactuca sativa acuminata.* Sharpe pointed Garden Lettice.

This differeth not in stalkes, or flowers, or manner of growing from other sorts of open Lettice that have their leaves cutly, which are about foure inches long and two inches broad, dented on the edges and ending in a small point, the middle rybbe being great that runneth through the leafe.

2. *Lactuca Italica laciniata foliis.* Italian jagged Lettice.

This differeth not from the ordinary sort but in the leaves which are cut into many small parts of a pale greene colour, very tender and pleasant to eate.

The Place.

These sorts come from *Italy* and are there noursed up in the Gardens of the curious, but scarce knowne to us.

The

Original from UNIVERSITY OF MICHIGAN

Lactuca sativa.
Garden Lettuce.

Lactuca capitata.
Cabbage Lettuce.

The Time.

Their time of flowring, seeding, and spending is the same with the common sort.

The Names.

Lettuce is called ϑρίδαξ *Thridax* in Greeke, and in Latine *Lactuca sativa*. The first is taken by *Bauhinus* to bee the *Lactuca sativa* of *Cæsar Dalechamp*, and calleth it himselfe *Lactuca folio oblongo asino*, the other also is called by him *Lactuca Italica laciniata*, and we in *English* thereafter *Italian* jagged Lettice, the *Arabians* call Lettuce *Chau* and *Cherbas*, the *Italians Lattuga*, the *Spaniards Lechuga* and *Alfalfa*, the *French Laitue*, the *German Lattich*, the *Dutch Latouwe*, and we in *English* Lettuce.

The Vertues.

Although these sorts of Lettice doe differ in forme from the other & each of them also one from another in the *forme* of their leaves, yet in vertue they are alike, and acceptable to an hot stomache troubled with choller, yeelding good nourishment to the body, as both *Avenzoar* and *Isaac* testifie of the experience thereof in themselves: and *Pliny* also sheweth that the leaves of Phylirion *Aristo* did by Lettuce ease *Augustus* of the violence of his disease. *Galen* sheweth that the eating of boyled Lettice at night when hee went to bed procured him rest and sleepe, who should have had none if hee had beene without it, having used himselfe to watching from his youngest dayes: the same is found effectuall also with divers, for the juice thereof mixed or boyled with oyle of Roses and applied to the forehead and temples, both to procure rest and sleepe and to ease the headach of any hot cause: being eaten raw or boyled it helpeth to loosen the belly, and the boyled more then the raw, which eaten last performeth it the better and was generally so used in ancient dayes which made the Poet *Martiall* move this question seeing the contrary course held in this time.

Lactuca agrina.
Lamber Lettice or Corne Sallet.

Cichorium

Cholerae gedenae Lactuca fatebat amorem,
Dic mihi cur mutas vultus, cur albet aper, Which may be thus,
Lettice that earst our Grandames cocales did close,
Why is begun pray tell me whence it growes.

[illegible] quencheth thirst, helpeth to encrease milke in Nourses, and easeth all griping paines of the [illegible] bowels that come of Choller: it abateth bodily lust, and therefore leather and Rue are commended [illegible] Nunnes and the like sort of people to eate, and nie to keepe them the chaster: it repelleth to [illegible] and applyed outwardly to the Cods with a little Camfire, abateth the pride and heate of lust [illegible] the Coltes evill, applyed also in the same manner to the region of the Heart, Liver, or Reynes, [illegible] laying the said place with the juice or distilled water wherein some white Saunders and red Roses are put [illegible] superstitious medicine to stay and represse the heate and inflammations therein, but doth also [illegible] thereby those parts: the same also tempereth the heate of Wine, *Galen* adviseth old men to ale [illegible] to cherish the radicall moysture, and that where spices are wanting to adde Mintes, Rocket, and [illegible] for sallet herbes, or else Citron, Lemon, or Orrenge seedes, of the young flowres of them, to abate the [illegible] one and the heate of the other. The seede and the distilled water of the Lettice worke the like effects [illegible] the use of the Lettice is chiefly forbidden those that are short winded or have any imperfection [illegible] lung, or are unfit to spit blood: *Galen* saith it did hurt his teeth and some ivy it hurt their sight.

Chap. XLIIII.

Lactuca sylvestris. Wilde Lettice.

Of the wilde Lettice there are two or three sorts to bee declared in this Chapter, wherewith I shall [illegible] and finish this Classe of soaking herbes.

1. *Lactuca sylvestris Latifolia folijs odore virosis.* Broad leafed wilde Lettice.

The wilde Lettice reacheth up with foure or five somewhat long and large leaves, smaller at the bottome and broader at the ends being round pointed, unevenly dented about the edges but not cut in [illegible] of a pale or whitish greene colour, and very like unto the Garden Lettice or Garden Endive leaves [illegible] will soone deceive one that never saw it before, which doe soe abide the first winter after the sowing, [illegible] in the Spring or Autumne of the third yeare but in *May* following it beginneth to rise up to a stalke, and [illegible] those leaves will have the middle ribbe on the backside set full of small sharpe prickes: the stalke [illegible] in my Garden to be eight foote high at the least, and as bigge as the thumbe of any mans hand at the [illegible] somewhat browne and spreading into divers very long branches, whereon are set large leaves like [illegible] but more crumpled, the lowest and so to the middle of the stalke set with prickes in the manner of the [illegible] leaves, but lesser, and higher, some what more jagged or divided on the edges, all and every part yeelding [illegible] milke being broken, which smelleth strong, very like unto Opium or bitter lettice: the flowers are [illegible] small and staple some what like unto Lettice, but smaller and paler yellow, scarce opening themselves, and [illegible] standing but halfe a day open, but turne into downe with small blacke seede therewith very like unto [illegible] seede, and is carryed away with the winde: the roote is white long and woodily when it beareth [illegible] perisheth presently after.

2. *Lactuca sylvestris Indica.* Wilde Lettice with jagged leaves.

The other wilde Lettice groweth like the last but not so high or great, the first leaves are of a grayer greene [illegible] smaller and narrower then the other, which so [illegible] afterwards some thornes or prickes on their backs [illegible] the other both those that follow are much more [illegible] then the others, and set with sharpe prickes also, [illegible] milke as plenti full being broken and as bitter as the former, but doth not [illegible] so strongly of Poppie or Opium as the other: the flowers and seede are like it flying away with [illegible] and the roote perisheth after seede when as the other doth not.

2. *Lactuca sylvestris Latifolia flore purpureo.* Wilde Lettice with purple flowers.

The great Plate Cockrowes in moyst grounds riseth up to [illegible] five cubits high but usually two or three with [illegible] leaves first set on the stalke with leaves smallest at the [illegible] but larger as they rise up higher, being largest [illegible] the stalkes and then grow smaller a- [illegible] the toppes, all of them unevenly waved about [illegible] somewhat in the bottome, of a darke [illegible] above on the upper side and grayish under- [illegible] milke when it is broken, the flowers stand [illegible] long stalkes rising from the joynts with the [illegible] upwards, with many flowers on [illegible] of the darke purple coloured leaves with [illegible] five pointed tips with a yellow dust & three [illegible] in the middle, which standeth in long purplish [illegible] hanging downe their heads and turne into

Downe

2. *Lactuca sylvestris laciniata.*
Wilde Lettuce with jagged leaves.

1. *Lactuca sylvestris purpurea flore.*
Wild Lettuce with purple flowers.

Downe with smooth grayish seede among it flying away with the winde: the root is thicke and set with nodes in divers places not growing downewards, but spreading forwards, and having long fibres shooting from it which perish not.

The Place.

The two first grow in divers places of our owne Land as well as beyond Sea, the first in the borders of fields and by the hedges and lanes sides of *Buckinghamshire*, the other on a high banke by the footeway going downe *Grayes Inne-lane* unto *Bradford* bridge and in many other places, the last is found upon hills and mountaines in divers parts of *Germany* mentioned both by *Gesner*, *Thalius* and others, and in *Naples* also in *Colonna's* faith.

The Time.

They doe all flower about *July*, and their seede ripeneth and is blowne away while it is in flower and hath young buds on it.

The Names.

It is called in Greeke [illegible] *Thridacine*, and [illegible] by *Dioscorides* derived as it is thought [illegible] *quia nitet folio seu folia nitent aspectu suo*, some saith *Pliny*, *lib. 19. cap. 8.* called it *Endivion*, in Latine *Lactuca agrestis* and *sylvestris* a *lactis copia*, because it giveth more store of milke then any of the Endivies Succory doe, or because it causeth milke in women. There is a controversie among our moderne writers what plant should be the true *Lactuca silvestris* of *Dioscorides*, *Theophrastus* and *Galen*, some allowing of one that I disprove, for that which *Mattiolus* setteth forth, *Lobel* findeth fault withall, calling it *Sera sonchus*, the first is called by *Tragus Endivia major*, as hee calleth the other *Endivia vulgaris*, yet hee calleth the same another place of his book *Lactuca sylvestris prior* and *altera*, his latter sort being the first here, and his former other. *Dodonæus* in my minde hath erred in misletting *Tragus* his *Endivia major* both making two Endives calling it *Lactuca Endiviæ folio*, and a *Lactuca sylvestris* alike, but now can it be both a Garden and a wilde herbe, the one not having any bitternesse therein nor prickles on the leaves and the other having both. *Lobel* calleth it *Lactuca sylvestris* a *Scariola hortensi folio lactucæ flore Cyaneo odore*, *Lugdunensis* letteth it downe in the Catalogue of herbes for *Lactuca sylvestris vera Dalechampi*, and in the 14. Chapter of the first Booke calleth it *Thapsos Dalechampi*, whereof *Pliny* out of *Theophrastus* maketh mention, *Camerarius* calleth it *Lactuca sylvestris Anglica dulcis tota*. The second is called *Lactuca sylvestris* by *Matthiolus*, *Dodonæus*, *Lobel*, *Thalius* and others, *Brunfelsius* and *Tragus* as I sayd call it *Endivia vulgaris*, because generally in [illegible] Apothecaries shops it is so accounted and used, taken from the *Italians*, whose Physitions use it for the other perverted the errour. *Lobel* calleth it *Sonchus domestica altera lactucæ Dioscoridis*, and *Sonchus Lactuca sylvestris* and *Serriola* according to the received opinion thereof in their time to be Endive. The last is called by [illegible] *Tertia Lactuca sylvestris flore purpureo*, and *Sonchus arborescens plumbeo flore*, *Thalius Lactuca* [illegible]

and Cattonia, *Sonchus montanus purpureus magnus*, *Tabermontanus* maketh it his third *Sonchus*, and taketh it to be the *Lactuca sterilis* of *Theophrastus* which *Gerard* setteth forth under the title of *Erysimum sylvestre*, and likewise calleth it *Lactuca montana purpurea asperior minor*, because he maketh that to be the *minor* hereof which I call *Lactuca sylvestris*. The *Italians* call this wild kind *Lattuga salvatica*, the *Spaniards Lechuga salvaje* and *Alfalfa* in some parts, the *French Laitue sauvage*, the *Germans Wilder Lattich*, the *Dutch* wilde *Lattouwe*, and wee in *English* wilde Lettice.

The Vertues.

The wilde Lettice is neare the same propertie of cooling that the Garden kinde is, although the bitternesse therein be more, it the more openeth, but not heating even as it is in Succory, Poppie, Opium & the like, whole bitternesse doth rather open a way for the qualities to worke the better, no cold qualitie being powerfull of it selfe, and therefore as Succory, Poppie, or Opium it is more availeable to procure sleepe then the Garden kinde, and so is often times that are given to much watching, which by the seede, the juice or the distilled water drunke or outwardly applyed performeth well, the milke of the wilde Lettice gathered and dryed in the Sunne and given in Vinegar distilled is sayd to purge the water of the Droplie, to provoke womens courses, and to helpe the sting or poyson of the Scorpion and Spider *Phalangium*; the distilled water of the whole herbe is singular good to wash the cloth in any burning or pestilentiall fever, the said juice dissolved in white wine and a little hony mixed therewith being dropped into the eyes doth wonderfully strengthen the sight, and cleareth them from mistes, dimnesse, blood or skins growing over them. And as some are of opinion that it may be used in stead of the Garden kinde for any the physicall purposes before mentioned,

PLANTÆ CALLIDÆ ET ACRES.

HOT AND SHARPE BITING PLANTS.

CLASSIS SEPTIMA,

THE SEVENTH TRIBE.

CHAP. I.

Eruca. Rocket.

FRom the cooling herbes I am now come to those that are hot, sharpe, and fretting the tongue, especially such as are not umbelliferous or more properly belong to another Classis.

There are divers sorts of Rocket, some growing in gardens (where I have set downe one in my former booke, which is the most common with us, and called by Lobel *in horto Eruca tertia Anglica*, as I take it;) some wilde growing in divers places, others that grow neare the sea side: I will speake of them severally as I finde Classes is the best way, and not to cloy one Chapter with too many sorts.

1. *Eruca sativa alba.* White or *Romane* garden Rocket with white seede.

The *Romane* Rocket is a smaller plant than our garden kinde, having darkeer broad leaves cut in on the edges, but not so much nor so deepe, each part being rounder, and round at the end: nothing so hot also or sharpe in taste: the stalke hath some leaves thereon, lesser, and lesse cut, and bears white flowers at the toppes, made of foure somewhat long and round pointed leaves, after which come the pods somewhat long and round with a small nocke at the end, wherein is contained whitish round seede: the roote is small & perisheth presently after the seede is ripe. We have an other very like unto this, but whose stalke riseth three or foure foote high, branched into many parts with the like leaves on them, and whitish flowers at the toppes of foure leaves apeece, also round pointed, with a blackish line in the middle: each leafe having slender long pods with small blackish browne seede therein: the roote perishing in like manner.

Altera sponte nascitur.

2. *Eruca latifolia.* Great Garden Rocket.

This large Rocket hath broader and larger divisions at the leaves, and smaller at the ends than our ordinary garden Rocket, and each part more unevenly dented about the edges, the flowers hereof are more yellow, inclining to a gold colour, and the seede smaller and darker in smaller and longer pods.

3. *Eruca maxima Americana.* Great Rocket of *America*.

This fruitfull herbe riseth up to a mans height, with a number of rough hairy stalkes branching forth on all sides, and set with divers long and pointed leaves unevenly dented about the edges, somewhat like unto *Lysimachia* Loose strife, but having a small downy hairinesse upon them tasting sweete at the first, but sharpe afterwards, the flowers are many that stand at the ends of the stalkes and branches, consisting of foure yellow leaves apeece, which turne into slender long pods, containing small seede that are sweete also: therefore I have rather placed it here for the mildnesse than with the wilde sorts.

The Place.

Both these former kindes of Rockets are nursed up in gardens in all places and countries, their originall being not well knowne, yet it is thought that the first is originally from the sea side in some countries, and that from thence came to us from *Boetia* by the name of *Eruca Aragonica*: the last from that part of *America* the *French* possesse called *Canada*.

The Time.

They doe flower about *June* and *July*, and their seede is ripe in *August*.

The Names.

It is called in Greeke [illegible] and *Eruca* in *Latine*, [illegible] the *Arabians* call it *Jargir* and *Ergir*: the *Italians Ruchetta* and *Ruchetta*: the [illegible]

1. Eruca sativa vulg. Garden Rocket with white seede.

2. Eruca agrestis. Wilde Rocket.

or dogs: the *French Roquette*: the *Germane Rauken* and *Rockes*: the *Dutch Raketse*: and we in *English* Garden Rocket, Brasse Rocket, Rocket gentle, and white Mustard seede. The first is called by *Dodon.* *Eruca sive Erucastrum vulgare*, by *Cordus* & others *Eruca sativa*, yet he giveth thereunto long blacke seedes which cannot agree with this and quoteth *Tragus* to agree with his, which hath yellowish seede: of *Lugdunensis Sinapi hortense* [illegible], and *Lobel Sinapi sativum cornu alce anglo quam Thalictri valeriani magno*: there is no other that I know hath expressed this sort, for *Matthiolus* and others have set forth a garden kinde that beareth yellow flowers, and also white seede in slender long pods, which *Camerarius* calleth *Eruca lutea*: we doe usually call this *Eruca* or *Eruca flore albo*, to put a difference betweene it and the other: the second is called by *Matthiolus Eruca lutea* not mentioned by no others: the last is set forth by *Lobel* among his *Cretica* plants.

The Vertues.

The Rocket gentle so called from the *Italians* who love that side of Cresse, mustard and anything that maketh sharpe and ready to gall, to play, or in Venery as this seede doth: for that it is more pleasant and gentle in taste, than the wilde kinde, it is seldome sowen alone but among Cresses, Purslaine, or some other cold herbes to temper them withall and hearten or as it is said by *Galen* it procureth bead-ach if he eaten alone: it is in a manner of the same vertues with Cresses, stirring the appetite and to please the palate, or to incrate humours being as a sauce or condiment to meate, to purifie and cleanse the stomacke, and to expell wormes and ventrous effects, for which purposes *Aduersall* hee setteth the effects in these Verses.

Et Veneri reuocat vis Eruca torpentem.
Semper Eruca falax fœcundæ prouocat herbæ,
Nec minus Eruca jubet vitare salaces.

But as for any Physicall qualitie I know not any it is employed upon, for that the wilde Rocket, or rob shall [illegible] to, are vsed for all such purposes, except in the want of the one the other may be taken: but as it is more effectuall and gentle in taste, so it is also in operation.

Chap. II.

Eruca sylvestris. Wilde Rocket.

Of the wilde Rockets that are more seldome vsed for sallets or sowse except unto churlish stomackes, but are much vsed in physicall vses, there are divers sorts, as shall be here declared in this Chapter, and the other three that follow.

1. *Eruca sylvestris vulgatior.* The more common wilde Rocket.

This common wilde Rocket hath longer and narrower leaves much more divided, and into slender [illegible] and fingers on both sides of the middle ribbe, of a sad over-worne greene colour, from among which ri-

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

seth up divers stiffe stalkes two or three foote high, sometimes set with the like leaves but smaller, and smaller upwards, branched from the middle into divers stiffe stalkes, bearing sundry yellow flowers on them made of foure leaves a peece as the others are, which afterward yeeld small reddish seede in small long pods, of a more bitter and hot biting taste than the other, as the leaves are also.

3. *Eruca sylvestris minor parvo flore.*
Small ill smelling wilde Rocket.

This small wilde Rocket doth not much differ from the last but in the smallnesse of the leaves, branches, flowers, and pods, for in all it is lesser, and the leaves, although as much divided, yet into smaller parts, and smelleth nothing well.

4. *Eruca sylvestris minor hirta pallido flore.*
Small wilde Rocket of *Monspelier.*

This is a very small Rocket, the stalke not growing much above an hand breadth high, and somewhat rough withall parted into small and short branches with a few leaves upon them at the joynts, which are little or nothing divided: but those that grow at the foote of the stalke next the ground, are somewhat long and more cut in on the edges into divers parts, much like the leaves of Shepherdes purse, and rough likewise; the flowers are somewhat large and yellow standing upon long shore stalkes, after which come small seede in small and short pods.

4. *Eruca sylvestris minor hirsuta.*
Small hoary wilde Rocket.

The hoarie wilde Rocket riseth up with divers hoarie or whitish greene stalkes halfe a foote high, and sometimes lower, branching forth at the toppes into short sprigges of an inch long, bearing many small yellow flowers which turne into very slender and short pods with seede: the leaves at the bottome are many very small cut and jagged, and hoarie over the whitish greene, as those upon the stalkes growing on each side one above another are also.

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Eruca agrestis.* Wilde-flowred Rocket.

This kinde of Rocket hath the lowest leaves cut in on both sides somewhat like a Rocket, but more like Cressies in my mind, from among which rise up divers hairy straked stalkes scarce a foote high, bearing rough hairy leaves on them, lesse jagged, and some not at all shorter also and narrower at the toppes: and the flowers stand in clusters of an excellent purplish blew colour made of foure leaves, after which come small long smooth pods with small reddish sharpe seedes therein: the roote is long slender and reddish with some fibres thereat.

4. *Eruca sylvestris angustifolia.* Narrow leafed wilde Rocket.

This plant is doubtfull whereunto it might be referred, in that it participateth of divers plants, namely of the leaves of Tarragon long and narrow of the colour of Rocket; the yellow flowers of wilde Rocket upon stalkes a cubit high with ends of Mustard or Cresses and not sharpe seede, and the whole face of *Erysimum* Bunckes-yelles, yet the taste of Rocket.

The Place.

Many of these are found wilde in divers places of our Land, although they are recorded by divers Authors to grow in others, yet some of them are strangers to us, and therefore imported to furnish the gardens of the curious.

The Time.

They keepe the same time to flower and seede that the others doe.

The Names.

The first is called *Eruca sylvestris* by *Matthiolus*, *Lobel*, *Dodonæus* and others: the second is called by *Gesner* in his Epistles *Eruca sylvestris latifolia*, by *Tabernæmontanus Eruca palustris minor* by *Lugdunensis Eruca sylvestris*, and *Lepidium* by *Gerard Sinapi palustre* the third and fourth *Bauhinus* hath set forth by the same names as the first: the first *Bauhinus* hath set forth in his *Matthiolus* and *Phytopinax* by the name of *Eruca palustris tenuifolia*, and in his *Pinax* by the name of *Eruca exulans in arenosis crescens*: the last is the *Eruca sylvestris angustifolia* of *Lobel* which *Bauhinus* calleth *Eruca angustifolia Austriaca*.

The Vertues.

The wilde Rockets are hotter and dryer than those of the garden, more strong and effectuall also to encrease lycour and Venereous qualities whereunto the seede is no lesse effectuall than the herbe: it serveth also to help digestion, and to provoke urine exceedingly: the seede is used to cure the bitings of Serpents, the Scorpion, and the Shrew-mouse and other poysons, and expelleth wormes and other noysome creatures that engender in the body: *Pliny* writeth that it is too superstitious to relate, that if one gather three leaves of Rocket with their left hand and thrice fasting, and drinke them in mede or honied water, it shall cure the jaundise, and that he that should after whipping or beating, by drinking hereof in wine, shall not have any sence thereof or feele any paine, but I will not say he had beene a true relator hereof by his owne experience heere, that others might have released stripes into the herbe boyled or stewed, and some Sugar put thereto helpeth the cough in children being taken: the seede also taken in drinke taketh away the evill smell of the arme-holes or pits, and of the rift of the cony and encreaseth milke in Nurses breasts, and walleth the spleene: the seede of wilde Rocket mixed with honey and used on the face cleanseth the skinne from spots, morphew, and other discolourings therein, and also with Vinegar taketh away freckles and other redneese happning in the face or other parts, and used with the gall of an Oxe it amendeth foule scarres, blacke and blew spots, and the markes of the small poxe restoring the skinne to his owne colour againe. As both these Rockets, and the former are forbidden to be used alone, in regard the seede doth fume into the head there causing each and paine, so they are no lesse hurtfull to hot and choleriques persons, and to be forbidden them for feare of inflamming their blood, and therefore for such we may say that doth but a little harme.

Chap. III.

Barbarea. Winter Cresses, or rather Winter Rocket.

Now the Rocket (and not unto the Cresses as the name hereof commonly given doth import) by the judgement of the best Herbarists in these dayes pertaineth this *Barbarea*, whereof there are two sorts more, although untill very lately one onely was knowne.

1. *Barbarea simplici flore.* Common Winter Rocket or Cresses.

The Winter Cresses or Rocket whether he will, hath divers somewhat large and grosse leaves lying upon the ground jagging or cut into divers parts somewhat like unto Rocket or Turnep leaves a reasonable size, but smaller towards next the bottome, and broade at the ends which so abide all the Winter: (if it spring any thereof it is used to be eaten either greene or stewed) from among which ariseth up a tender smal stalke full of branches, bearing many small yellow flowers of foure leaves apeece, after which come small long pods containing the seede in them: the roote is somewhat stringie, and perisheth ever after the seede is ripe.

2. *Barbarea flore pleno.* Double flowred Winter Cresses.

This double flowred Winter Cresses differeth not from the former but in the greatnesse of the stalkes which are greater and fuller, yet shorter in the leaves being an inch long cut in on the sides in the same manner, and the flowers which are double and some what larger but yellow as the single, and in the roote which perisheth not but endureth many yeares.

3. *Barbarea minor.* Small Winter Cresses.

This smaller sort hath blackish greene leaves somewhat jagged or torne on the sides resembling Moth-Mullein, but smaller, yellow and lesse than the former, and so are the rods like wise: the roote hereof perisheth like the rest.

The Place.

This growth oftentimes of its owne accord in gardens and in the fields also by the pathes and wayes side

in divers places, and by nature in the next Pasture to the Conduit head behind *Gregs Inne* that bringeth water to Mr. *Lambes* Conduit in *Holborne*: that with double flowers was found in the province of *Berne* among the *Switzers*, and the last in Gardens onely both with us and in *Germany*.

The Time.

They doe all flower in *May* and the single ones doe seede in *June* and then perish, but the double abideth greene both Summer and Winter.

The Names.

It hath no Greeke name that I know except it should be the *Leucoium Pseudobunium* of *Dioscorides* which *Lobel* thinketh should rather be *Pseudolonium*, for having shewed the difference betweene *Bunion* and *Bunias*, the one that is *Bunium* to bee *Bulbocastanum*, Earth Nuts, or Earth Chelnuts, and *Bunias* the Navew with herbe in the forme of the leaves flowers and seede is like unto the Turnip or the Navew, which is called *Bunias Bunias* or the wilde kinde not eyther: the Latines call it *Barbarea*, *Herba Barbara herba*, *Nasturtium Barbarorum*, and of some *Nasturtium hybernum* from whence came our *English* name of Winter Cresses, but as I said being neuer both in forme and qualitie unto a Rocket then unto Cresses, the most iudicious have hereunto referred it. *Tragus in herb.* calleth it *Nasturtio-thlaspi affine*, and *Lugdunensis Eruca palustris*, *Cameracius Bunias adulterinum*, *Dodonæus Pseudobunias*, *Anguillara Stopa regia*, and *Fuchsius Sideritis latifolia*, *Tragus* nameth it his *Sinapis 5. genus*, and *Bauhinus* calleth it *Eruca lutea latifolia sive Barbara*: the second *Bauhinus* onely hath written of and calleth it *Eruca lutea sive Barbarea flore pleno*: the last *Lobel* calleth *Barbaræ minor Herba Sancti Alberti Bonoriensium*, and so doth *Eua saluatica* also. *Bauhinus* putteth it among his sorts of *Erysimum* and calleth it *Erysimifolia lævis lacuniata floribus luteis*. The *Italians* and *Spaniards* are scarce acquainted herewith being more peculiar to these colder climates. The *French*, high and low *Dutch* and we doe follow the Latine names, some of Saint Barbary and some of Winter Cresses, as is said before more properly to be called Winter Rocket.

The Vertues.

This is somewhat sharpe in taste and withall somewhat binding, whereby it may easily be knowne to be hote and dry, and is profitable to provoke urine, and helpeth the strangury and to expell gravell and the stone, it is also of good effect in the Scorbute or Scurvey, and may be used for it to very good purpose: it is also found by good experience to be a singular good wound herbe both to cleanse inward wounds, the juice or decoction of the herbe to be drunke, or outwardly applied to wash foule ulcers and sores, cleansing them by the sharpenesse and drying the dead flesh growing therein, or hindering it from growing therein, and healing them by the drying quantitie. It is used as Rocket or Cresses eaten in Winter when varietie of Sallets are not to be had with as great ease as some other for that time.

CHAP. IIII.

Eruca marina. Sea Rocket.

Of the Sea Rocket there are three or foure sorts, with notable differences as you may perceive in the succeeding Chapter.

1. *Eruca marina Anglica*, *English* Sea Rocket.

The *English* Sea Rocket (for so I call it for distinctions sake, and that this sort and none other groweth on our coasts, although it grow in other countries also) hath divers stalkes some lying upon the ground others standing roore upright (but brought into Gardens it somewhat resembleth in stalkes and leaves) scarcely set with small long leaves thereon waved as it were on the edges like unto Sellery or Rocket (but longer and fatter in the Garden) at the toppes of the stalkes grow the flowers, of a faint purplish colour of the fashion of the flowers of Radish compoted of foure leaves, after which come fruite like unto a wheate Corne (such also is bearen in the Garden) but greater, which are somewhat spongie within and solid, not two joyned together as it is set downe to have by the Sea side, but every seede single by it selfe.

2. *Eruca marina Cretica*, *Candy* Sea Rocket.

The Sea Rocket of *Candy* hath divers short and narrow rough greene leaves next the roote, cut and divided on the edges into small parts: the stalkes are straked and crooked about halfe a foote long bearing flowers at the toppes (which *Bauhinus* who giveth us the knowledge thereof hath not set downe) but if it be the same that *Dioscorides* setteth forth by the name of *Eruca marina*, which as he saith *Mycenis* sent out of *Spaine*, I am verily perswaded it is, it hath purplish flowers, and three square pods with seede, and after the manner of Rocket and joynted pods three or foure inches long, containing small reddish seede: the plant is hoary all over with stalkes and leaves.

Original from UNIVERSITY OF MICHIGAN

1. *Eruca marina Anglica.*
English Sea Rocket.

2. *Eruca Monspeliana siliqua quadrangula.*
Square codded Rocket.

3. *Eruca Monspeliana siliqua quadrangula.*
Square codded Rocket.

This square codded Rocket hath the lower leaves small, long and narrow, hairy, rough and waved or cut in on the edges like Groundsel or Rocket, from whence rise two or three stalkes five or six round, rough and reddish at the bottome set with some few leaves, lesse divided then those below, and when it is full of flowers almost not at all: the stalkes are branched at the toppes bearing many small yellow flowers of foure leaves a peece after which succede small square smooth pods, hard when they are ripe, with a rough sharpe point at the end, and open narrowwise, each one containeth seede lying in each part or side, and is round like a stalke pointed at the ends, and sharpe in taste upon the tongue: the roote is somewhat thicke and white, with some fibres about the same.

4. *Eruca marina Italica.* Italian Sea Rocket.

The Italian Sea Rocket hath some long and narrow leaves growing next to the roote, very much and finely cut into divers parts even unto the midrib, the stalke branched diversly, and set with the like leaves but lesse and lesse divided still up to the toppes, where the flowers being purplish consisting of foure leaves, standing above another in small tuftes, with two points a piece wherein when the flowers are faded and gone stand small pointed heads fashioned like a Speares point wherein is contained a white kernell: the roote creepeth under ground with long strings, and perisheth after it hath borne seede.

The Place.

This is growed in our owne Sea coasts in many places both of England and Scotland especially, yet it is not proper only to our Iles, but found in the like places in divers Countries: the seede was sent by *Prospero Alpino* from *Candy* unto *Bauhinus* from whence the dryed plant with seede thereto but no flowers, which notwithstanding would not suffer me to determine them but as I sayd in the description it is very probable to be the same that *Lugdunensis* saith he had from *Lobelius* in *Spaine* where it grew, to *Lyons*:

the third groweth about *Montpelier*: and the last about the Sea coasts of *Italy*, both Genoa and other places.

The Time.

They doe all flower and seede in the Sommer moneths, for they are all but annuall plants and are to be sowen in Gardens in the spring of the yeare.

The Names.

The first is called by *Lobel Eruca marina Kakile Serapionis*, and so it is also by *Anguillara, Camerarius, Tabernæmontanus* and *Lugdunensis*: the second is called by *Bauhinus Eruca maritima crispa flore purpureo*, and is likely to be said the same of *Mycone*, which *Lugdunensis* calleth *Eruca maritima* having three square rods, which is a manifest difference from the former: the third is called also by *Bauhinus Eruca Monspeliana quadrangula echinata* which *Lugdunensis* calleth *Sinapi echinatum*: the fourth is called by *Bauhinus Eruca maritima Italica hastæ cuspidis facie*, and withall maketh the *Kakile Serapionis*, the *Eruca maritima* of *Lugdunensis* and his *Nasturtium maritimum* to be all one with it; for which I can see no reason, in that having given the figure thereof in his *Frodromus*, every one may plainely see it to differ very much in the forme of the leaves from the other, it may well be his *Nasturtium maritimum* for thereunto it answereth very well as also unto the *Eruca cinerea* in some part that is in the leaves.

The Vertues.

The Sea Rocket is in the same degree of heate and dryeasse with the wilde kinds but fatuish and are effectual for the same diseases: moreover *Anguilara* saith that *Kakile* (which I call the *English* Sea Rocket) purgeth exceedingly, and *Mycone* affirmeth that his *Eruca Maritima* doth wonderfully helpe those that are troubled with the Collick, and those that are grieved with the stone or gravell in the Kidnies or Bladder, if they drinke the quantitie of foure ounces of the distilled water warme at a time.

CHAP. V.

Reseda. Base wild Rocket.

BEsides the two sorts of this kind of Rocket the greater and the lesser set forth by sundry Authors we have some others which for their neere affinitie and likeneesse are fit to be joyned and ranged together.

1. *Reseda major.* The greater base wilde Rocket.

This greater kind riseth up with divers crested bending stalkes about two foot high, set with many and much divided leaves thereon somewhat like unto the lowest leaves of Rocket, of a piercing sharpe taste and taste like unto Cresses and many such like leaves also bushing together at the foote of them: at the toppes of the stalkes grow yellow flowers in long spikes thicke bushing together, which opening by degrees at the bottome, spread themselves farther in order, and afterwards upon the said short roundstalkes come small skinnie cornered swollen cods turning downewards, wherein are contained very small seedes: the roote is long and wooddy with divers fibres thereat, and abideth many yeares.

1. *Reseda major.*
The greater base wilde Rocket.

2. *Reseda minor seu vulgaris.*
Common base wilde Rocket.

This other *Reseda* groweth more upright and not so high, with whiter greene leaves, deeply cut in or torne on the edges, but each division is broader then the former, the flowers are small and yellow growing on such spikes but shorter.

3. *Reseda Linariæ folio.* Narrow leafed base wild Rocket.

The stalke of this *Reseda* is straight and round, about a cubit high parted into sundry branches, compassed about with long and narrow greene leaves like those of *Linaria* or Tode Flax: the flowers grow at the toppes of the branches spike fashion, of a yellow colour, after which come cornered seede vessels double forked at the toppes, full stored with pale coloured seedes.

4. *Reseda alba minor.* Small white base wilde Rocket.

This small *Reseda* shooteth forth divers whitish greene stalkes not fully a foote high, bearing divers long and narrow hoary leaves lesser then those grow neare the ground, or at the foote of the stalke, which are somewhat broader but not lesse hoary: the flowers are white growing on the like spikes many clustering together, with small greene beads in the middle of every one, wherein afterwards there is small blackish seede contained: the roote is small long and white with fibres adjoyning unto it.

5. *Reseda alba Plinianæ Monspelliensium dicta.*
Lowes plant of *Montpelier*.

The lowest leaves of this small plant are small long and somewhat narrow, of a whitish greene colour, and very like to those of Lambes Lettuce, the others that grow afterwards and upon the stalks which are weake and tender, about halfe a

1. *Reseda alba sive vulgaris.*
Common wilde Rocket.

2. *Reseda alba Pharetrata Monspelliensium.*
Lovely plant of *Monpelier*.

…are high and doe almost lie on the ground are cut in, some on the sides single, and others more divided at the ends resembling small *Valerian* leafe: the flowers grow towards the tops of the stalkes one above another, but not in any spike with a small leafe at the bottome of every one, and are composed of divers white narrow leaves like threeds, with many small threds also in the middle set in greene full huskes, the heads of seede are wide and broad above and smaller below, wherein is contained white seede with a shew of a hole or dent in every one of them: the roote is white and somewhat long, divided into sundry small stringes which die every yeare, shaking it selfe againe from the shed seede.

The Place.

The two first are commonly growing in our owne Land in divers waste ground, both neare *London* and further off: the others grow on the *Pyrenean* hills and about *Montpelier*.

The Time.

They doe all flower about *June*, and some of them all the Summer long.

The Names.

Reseda is Latine *a sedando dolentibus collectiones & inflammationes discutere vocem tradit*: from hence hath no Greeke name that I know: yet is thought by most to be that *Reseda* of *Pliny* which he saith grew about *Arimenum*, for as much as I know: yet is thought by most to be that *Reseda* of *Pliny* which he saith grew about *Arimenum*, for as much as I know, both the two former sorts grow there now frequently: the first is called by *Lobel Reseda Cameraria* in horto latifolia, both the two former sorts grow there now frequently: the first is called by *Lobel Reseda Cameraria* in horto latifolia, by *Thalius* and *Tabermontanus*, *Reseda latifolia* by *Lugdunensis*, by *Camerarius Reseda vetula*, *Reseda* and *Reseda major* by *Thalius* and *Tabermontanus*, *Reseda latifolia* by *Lugdunensis*, by *Camerarius Reseda vetula*, in Gardens in horte, *Reseda quæ Sesamoides major Clusio*, *Sesamoides magnum*, by *Lacuna*, and *Sesamoides alterum* by *Cordus*, and *Pyrenaicum* by *Anguillara*: the second is called by *Lobel Reseda Flore Nasturtiorum Erucæ pereginæ*, and *Cucullaria*, by *Camerarius Reseda sylvina*, by *Tabermontanus Reseda latifolia*, by *Cæsalpinus Sesamoides minus*, and by *Columna Eruca sylvestris*: the third is described by *Bauhine* by the name of *Reseda flore luteo*, and by him thought to agree with the *Reseda candida* of *Lugdunensis*, and with the *Sesamoides Pyrenaicum* of *Clusius*: the fourth is called by *Bauhinus Reseda alba minor*, and by him said to be *Clusius* his other *Sesamoides Pyrenaicum*, and so doe *Lobel*, *Tabermontanus* and *Lugdunensis*; but as I noted before in the first Chapter of the Chaffes of Vulnerary herbes which is of the *Lychnides sylvestris*: *Bauhinus* hath much forgotten himselfe in setting downe these small *Sesamoides* of *Clusius* making them there to be *Lychnides*, and here to be *Resedæ*, call them how: I referred them to these, to whom in my judgement they better agree: the last is called by *Lobel Reseda Monspelliensium*, and *Narbonensium* by *Lugdunensis*, *Sesamoides parvum* by *Lacuna*, and *Sesamoides Pyrenaicum*, by *Cæsalpinus*, and as *Bauhinus* saith *Eruca sylvestris Apula Columnæ*, but the description thereof in *Columna* is not fully agreeing thereto in my opinion. *Gerard* calleth the two first sorts (for he knew none of the rest) *Base*, *Bastard*, Rocket and Crambling Rocket, but I thinke it better to call them base wilde Rockets, in that they serve to the Rockets they are base and wilde herbes but clammer not.

The Vertues.

Although our ancients have mentioned any knowne properties, these plants are endued withall more than [illegible] as may be gathered from the definition of the name which is to ease paines, and to discusse swellings and inflammations: [illegible] old wives spell or charme we obtaine it not worthy the reciting, but the taste thereof [illegible] Rocket may induce some such like propertie.

Chap. VI.

Nasturtium. Cresses.

OF Cresses there are divers kindes, and divers sorts of every kinde, some are of the Garden, some of the Fields or Medowes, some of the Water, some of the Hills or Mountaines. I shall rehearse & speake in this place of those that grow in the Water, having a Classis of water herbes among whom they shall be expected: I will beginne with those of the Garden, and make them the subject of this Chapter, yet I have in my former Booke given you the knowledge of that which is the common and best knowne, whose figure notwithstanding I thinke not amisse to exhibite here againe to have his fellowes company, and that thereunder the properties of the rest may be comprehended.

1. *Nasturtium hortense latifolium Hispanicum.* *Nasturtium hortense.* Garden Cresses.

Great *Spanish* Cresses.

The great *Spanish* Cresse hath the first leaves small like Basill, among which riseth up a stalke about a foote and a halfe high set with larger leaves thereon without division, but finally dented about the edges and pointed at the ends, every one standing upon a long foote stalke, branched from the middle to the toppe with lesser and narrower leaves, like to the toppe leaves of Garden Cresses, from whence breake forth many white flowers set in spikes one above another, after which come browne seede in pouches like the other Cresses, but much more bitter, and not so fiery sharpe: the roote is small and long perishing every yeare, and therefore must be sowen in the Spring, for although it will spring up quickly from the shed seed, yet it will not abide the cold of our Winters.

2. *Nasturtium hortense crispum latifolium & angustifolium.*

Curl'd Cresses with larger and lesser leaves.

Curl'd Cresses groweth like the ordinary Garden Cresses, and differeth there from onely in the leaves which are of two sorts, the one with broad leaves cut and roundly dented and curl'd about the edges, every one by it selfe on a long stalke: the other consisting of many smaller leaves set one against another upon a middle ribbe each part whereof is in the same manner cut in and curl'd as the other: the flowers are white like the common garden kinde, and so is the reddish seede likewise, and perisheth yearely after seede time as the others.

The Place.

The first is the rude the weth came first out of *Spaine*, but the others are not known from whence their originals are.

The Time.

They doe not ere follow the time that the other garden kinde doth, that is in *June* and *July*, and sometimes later.

The Names.

The Greekes call it [illegible] *Cardamon quod cardiacis sit bonum, & quod sit fervidum*, and *in scorpii cardiaca plurimum valet*; others thinke it to be called [illegible] *quasi nasi tortor quod* [illegible] *ignes & acrimonias reprimat tortor*, and thereupon the Greekes had this proverbe [illegible] *Nasturtium quod in scorpii cardiacis, & hebetem dicebant, propterea quod Nasturtio simile cruciatum mitigaret*, that is, Rate Cresses to refine up the spirits of those that are dull and heavy: the Latinists *Nasturtium a torquendo nasum*, as Pliny saith, some after the Italians call it *Crespie hortensi*: the Spaniards *Mostaza* and *Mostaza de Huerta*: the Italians *Crescione*, *Nasturtio*, and *Agretto*: the Spaniards *Mostaza* and *Mastuerco*: the French *Cresson de jardin*, *Cresson menu* and *Nasitort*: the *Germane Kerss* and *Kressicke*: the *Dutch Kerssen*: in *English* Cresses. The first is set forth by *Tabermontanus* and *Gerard*, who doe resemble it unto wormwood, but by *Dodonæus* more truly and plainely giving a truer figure thereof likewise, it is usually called with us *Nasturtium latifolium hispanicum*: the other *Dodonæus* hath set forth and the figures of both sorts which are common in any other nation.

The Vertues.

The common Garden Cresses (in declaring the vertues whereof those other here specified are included, for of the same properties or very neare thereunto) is hot and dry in the fourth degree, especially the seede as greene herbe by reason of the humidity therein is more qualified, and therefore the people in many countries doe eate it either alone with butter or with Lettice and Purslane in sallets or otherwise, but the dried herbe and seede retaine in the force of the seede, as *Galen* saith, who maketh it of the like facultie and operation with Mustard both for the head and lungs to cut grosse flegme and to expectorate it, as also in all other the properties of Rocket and Mustard, both to provoake urine and to cleanse the raines and the bladder, to procure women their courses, to kill the birth and to further up Venery; yet *Pliny* saith it hindereth, but he was therein either much mistaken or his bookes are much falsified that so relate it. It is an enemy to the stomacke and troubleth the belly: but it loosneth the belly and purgeth it from viscous humours; it helpeth the obstructions of the liver and spleene and healeth all inward wounds, it driveth forth venome and poison; being eaten with oyle it easeth the cough and shortnesse of winde and the paines of the breast or chest: being chewed in the mouth it helpeth the [illegible]

1. *Nasturtium hortense latifolium Hispanicum.* Great Spanish Cresses.

2. *Nasturtium hortense crispum latifolium & angustifolium.* Curl'd Cresses with broade and narrow leaves.

tooth-ach the leaves bruised and applied take away all spots and markes of the body, helpeth the itch, and easeth the paines of the Sciatica, and of the loynes, draweth forth bones, splinters and thornes, stayeth the corroding and creeping ulcers: the seede chewed in the mouth helpeth the palsie in the tongue provoketh sneezing, raiseth lethargicke persons and such as are drowsie and heavie by quickening their blood and spirits: being boyled with vinegar and applied to the kernells of the throate healeth the Kings evill, and healeth also the scabbes and sores of the head if they be anointed with it and Goose grease mixed together: it ripeneth also plague sores, and breaketh them, and taketh away the deformities of the nayles.

Chap. VII.

Nasturtia pratensia sive Cardamines. Ladies Smockes or Cuckow flowers.

Into the kindes of Cresses must of necessitie these herbes appertaine called Ladies Smockes, or Cuckow flowers, both for the neerenesse in name in forme and qualitie whereof there are some few varieties as shall be shewed here, yet that sort which beareth double flowers, I have set forth in my former booke, which shall not be further entreated of here more than the figure, nor those of the water, which are reserved for another place.

1. *Nasturtium pratense majus sive Cardamine latifolia.* Great Ladies Smockes.

The great Cardamine or Lady Smocks shooteth forth divers long stalks of winged leaves, that is many together, somewhat broad and round, render darke greene leaves set one against another upon a middle ribbe, the greatest standing at the ends, among which rise up divers tender weake round greene stalkes somewhat straked, with much smaller and longer leaves thereon, very like the smallest divided leaves of Garden Cresses, at the toppes whereof stand many flowers made of foure leaves apeece, somewhat large, and almost like a Stocke gilloflower, but pale and wan of colour, whitish or somewhat dashed over with blush, and many times but at the edges only, which when they fall, bring in a greene husk, after which come small powches containing reddish seede somewhat like Cresses but lesser, which also is sharpe in taste as the herbe it selfe is also, resembling neare to Cresses: the roote is composed of many small threds or fibres.

2. *Cardamine altera minor.* Small Ladies Smockes.

In all things like the former but smaller in every part not bulbing with so many leaves or stalkes, the stalke being somewhat longer, than in the former.

3. *Cardamine altera parvo flore.* Small flowred Ladies Smockes.

The leaves of this *Cardamine* are most usually smaller and longer, and yet round sometimes also, growing in the

1. Double flowred Ladies Smocks. 2. Double white flowred Ladies Smocks.

the same manner that the other doe: the flowers also are like them but smaller, and the pods of somewhat longer.

4. *Cardamine odorata pomposa.* Tuberous rooted sweete Ladies smockes.

The greatest difference in this from the second sort here expressed consisteth first in the roote, which among the small fibres have many small kernelly roots growing, and soe the flowers, which although they be white or blush like them in colour and forme, yet smell far sweeter then they all together or any of the rest.

5. *Cardamine minor laciniata folio.* Small jagged Ladies Smockes.

The chiefest difference in this from the third sort resteth in the leaves which are more jagged then any of the former, growing somewhat neare unto the forme of the lower leaves of the Garden Cresses: the flowers are white and small like that sort.

The Place.

The three first are found in diverse places of our Land in moist Medowes, and neare unto brookes sides or the small Rilles of water that passe through the low grounds, the others are of *Germany*.

The Time.

They flower somewhat early in the Spring about *April* or *May* at the farthest, and abide with the lowest all the Winter.

The Names.

They are called by divers writers *Cardamine* as deduced from *Cardamon* [illegible] from [illegible] because they are like thereunto. Some also call it *Nasturtium* and *Nasturtium aquaticum*, but these properly herbes more properly [illegible] called, and therefore others call them *Nasturtium pratense*, as *Tragus* and *Gesner*, [illegible] *Dodonæus* called it *Nasturtium agreste*, and *Lobelius sylvestre*, *Cordus* [illegible] *Pratense Lepidium* [illegible] and *Penax* [illegible] the *Germans Ganch blumen*, whereby they [illegible] *Matthiolus Lepidium aquaticum alterum*, and to doth *Tabernæmontanus*, *Lacuna* and *Lyndanensis* call them [illegible] *Fachlin Hoppe*, and *Fachlin Herp*, and *Agrio cardamum sive Cardamine minor Kaiserl. sylvis sapor Cardamomi* and to doth *Lobel*, *Besler* in *Horto Eystettensi* calleth it *Nasturtium aquaticum simplici flore*, and *Rochelius* [illegible] *flore simplici & magno flore*; Or the third and of the last *Banhinus* only doth not [illegible] and of the [illegible] *Lyndanensis*. The *French* call them *Passerage sauvage*, the *Germans* as I said *Ganch blumen*, [illegible] we have another *Thlaspeoli*, *Cuckowflower* differing from this, accounted among the Campions [illegible] declared in my former Booke) the *Dutch Winter Kresse* and *Cockowes*, *Harmes*, and we in *English Cuckowflowers* and Ladies smockes.

The Vertues.

These herbes are seldome used either as sawce or sallet, or in Physick, but more for pleasure and to decke up Garlands of the country people, yet divers have reported them to be as effectuall to the Scorbute as the Water Cresses, and may serve in stead of them where they are wanting and not to be had.

Chap.

Chap. VIII.

Nasturtia Montana seu Cardamine Alpina. Mountaine Ladies Smockes.

There is another kinde of Cresses to be entreated of which grow upon mountaines, hills, and dryer grounds which shall follow here, yet one of them I have declared in my former booke, called *Cardamine Alpina trifolia*, which shall not be described here againe although I will give you the Figure thereof.

1. *Cardamine tenuifolia montana.* Thin leafed mountaine Ladies Smocke.

This mountaine *Cardamine* or Ladies Smocks hath divers long winged stalkes of smaller and narrower leaves then in the former, a little dented about the edges, from whence spring up sundry stalkes with smaller leaves on them to the toppes, where stand many small yellow flowers in clusters, and afterwards small long pods full of small yellowish seede in them, which opening themselves fall out: the roote is small and fibrous running upon the ground.

2. *Cardamine Alpina minor Resedæ folijs.* Small mountaine Ladies Smockes.

The small *Cardamine* sendeth forth from a small long white roote divers weake and leaning stalkes, some a little reddish and others not at all, set in many places with long stalkes of leaves divided into three foure or five parts, round leaves, somewhat like unto those of *Reseda*, the base wild Rocket, the flowers that stand at the toppes are small and white, and afterwards give long and slender round pods an inch and a halfe long.

3. *Cardamine Alpina media Clusij.* *Clusius* middle sized Ladies Smockes.

The leaves of this mountaine kind lye in a round compasse upon the ground, very formally being two inches long, set with small leaves like unto the other Ladies Smockes, but of a middle size and more rough, and halfe the bignesse, of a grasse green colour on the upper side and greene underneath, the stalke riseth to bee halfe a foot or more high, bearing many white flowers like the others at the toppes, where afterwards stand long pods with seede in them: the roote is white and fibrous.

4. *Cardamine Alpina minima.* The smallest mountaine Ladies Smockes.

This is a very small and tender plant whose stalkes are not much above an inch long, bearing on them five ranks of small white flowers on them of foure leaves a peece, the greene leaves are very small, five or seven, set upon a small foote stalke on both sides of a middle ribbe as in the rest, very sharpe in taste.

5. *Cardamine Alpina insipida.* Vnsavory Ladies Smockes.

This hath small long leaves rough and hairy and jagged like the field Mustard, but without any sharpenesse or hotnesse at all in them: the stalke is small and hairy bearing small white flowers, and afterwards small cornered and pointed pods with very small seede therein: the roote is small and long with few fibres thereat.

6. *Planula Cardamines alterius aspecta Clusij.* The Ladies Smocke like plant.

This small plant hath six or seven small leaves lying upon the ground, not much unlike the leaves of the small white ones, but much more tender, having a little sharpenesse in them: from the middle whereof riseth up a very tender stalke an hand breadth high or little more, with very few and they smaller leaves and small

white

Nasturtium cardaminis storum in montibus Cleffi. The Ladies Smocks-like plants.

Nasturtium petræum. Rocke Cresses.

white flowers at the toppes, after which commeth pods which are somewhat larger and greater then in the nettle of the plant might seeme to give, with small reddish seede therein somewhat sharpe in taste: the root creepeth under ground shooting forth in sundry places.

7. *Nasturtium petræum hirsutie nasturtij folio.* Rocke Cresses.

In the leaves of this Cresse consisteth the greatest difference from the others which is small and jagged also in on the edges like the leaves of shepherds purse, for the flowers are small and white, and the seede yellowish and flat like to *Thlaspi* or Treakle mustard.

8. *Nasturtium pumilum vernum.* Small Cresses of the Spring.

The first leaves of this small plant are somewhat round, two or three being set one against another almost like unto those as the others are, but those that follow are somewhat longer and more in number, the stalke is scarce a handbreadth long, bearing such small white flowers that they are scarse discerned, after which come very small short and round pods with very small yellowish seede, the roote is small and fibrous: the whole plant is sharp in taste.

9. *Nasturtium Alpinum capsula Nasturtij hirsuta.* Mountaine Cresse.

This mountaine Cresses hath small and narrow thicke leaves smaller then the nayle of ones hand and lying not above two inches high, with such small white flowers on them, and soone what large, as inches like to common Garden Cresses: the roote is somewhat woodily and fibrous.

10. *Nasturtium Alpinum Bellidis folio majus.* Daisie leafed mountaine Cresse.

The stalke hereof is smooth and round about a cubit high, branched from the very bottome, the leaves are very thin but of foure inches long, somewhat like to Daisie leaves, those on the stalkes are scant what waved on the edges and without footstalkes compassing the branches at the bottomes, the flowers are white and stand in a long spike one above another of six inches long, after whom succeede long and slender pods three inches long containing within them flat round reddish seede.

11. *Nasturtium folijs Barbaræ.* Winter Rocket-like Cresse.

The stalkes of this Cresse are very small, tender and bowing downewards somewhat hairy and divided into some branches of an handbreadth long, some twice that length, and some a cubit high having many very small slender greene leaves lying at the bottome of them, divided after the manner of the Winter Cresse, or Rocket as I called it before, but with fewer divisions, those on the stalkes are fewer, smaller and lesse divided: the flowers are very small and white, and the pods very slender and long: the roote is small white and tough.

The Place.

Most of these plants grow upon the Alpes and other hills and mountaines of *Germany*, yet those that are not, as *Columna* hath made mention.

The Time.

Some of them flower earlier in the Spring then others, and some later.

The Names.

Columna of *Naples* calleth the first *Sium alterum aquaticum luteum sive Cardamine* [illegible] *Bauhinus Nasturtium montanum luteum*: the second is called by *Bauhinus Nasturtium Alpinum folio*: the third *Clusius* calleth *Cardamine Alpina media*, and *Bauhinus Nasturtium Alpinum* [illegible] *sparsa*: the fourth is called by *Clusius Cardamine Alpina minima*, by *Gesner* in *Epistolis* as *Lepidium* [illegible] *sertiolum* and *Lugdunensis Thlaspi montanum minimum*, by *Columna Cardamine pusilla* [illegible] and by *Bauhinus Nasturtium Alpinum tenuissime divisum*: the fift is called by *Columna Cardamine*

[illegible] *Nasturtium Alpinum insipidum*: the sixt is called by *Clusius Plantula Cardamines alterius simula* [illegible] *Nasturtium Alpinum*, and by *Bauhinus Nasturtium Bellidis folio minus*; the seventh is called by *Tabernæmontanus* [illegible] *Nasturtium petræum*, and by *Bauhinus Nasturtium petræum foliis Lunæ posteris*; the eight is called by *Bauhinus Nasturtium pumilum vernum*: the ninth is called by *Bauhinus Nasturtium Alpinum capsula* [illegible] *ovata*; the tenth and last he also calleth as they are in their titles.

The Vertues.

There hath not beene any especiall triall made of any of these herbes that I know, but most of them being somewhat hote in taste, they are adjudged to be neare of the same qualitie with the former, or rather stronger in that they are more cumous plants, but I have nothing to affirme for certaine, and therefore let this suffice untill wee shall more of them.

Chap. IX.

Nasturtia sylvestria. Wilde Cresses.

THere is a wilde kinde of Cresses yet to be handled whereof there are not many sorts, one of them is to be found almost in every field, which although it be accounted a very foule weede in a garden, yet it is not amisse as I thinke to place it with the rest.

1. *Nasturtium sylvestre Osyridis folio.* Narrow leafed wilde Cresses.

The wilde Cresse bringeth forth many small round and hard stalkes, with divers small round and narrow leaves set without order thereon, branched from the middle upward into many parts, at the toppes come forth a number of small white flowers (yet some have beene found with yellow flowers) one standing above another spike fashion, after which appeare heades containing small seede: the roote is woodily and perisheth after seede time.

Nasturtium sylvestre Osyridis folio.
Narrow leafed wilde Cresses.

2. *Nasturtium sylvestre Valentinum.*
Spanish wilde Cresses.

Spanish wilde Cresses groweth up with a round greene, rough and hairy stalke about a foote high spreading into branches from the very ground at every joynt whereof stand long winged leaves very much divided like unto the ordinary garden cresses but yet more finally parted and sharpe in taste like Cresses: the flowers are many, and of a pale whitish yellow colour standing in long spikes at the toppes, and afterwards small flat pouches divided into two parts which stand not upright looking downewards wherein is contained small reddish seede like unto Cresses: the roote is long and slender, and perisheth every yeare.

3. *Lepidium Clusij, sive Pseudonasturtium sylvestre.*
Elixe weede.

There is no doubt but that this herbe pertaineth to the family of wilde Cresses, although a baſtard sort of them rising up with a round right hard stalke foure or five foote high spread into many branches, wherein grow many grayish greene leaves very finely cut and lobed into a number of short and almost small parts, the flowers are very small and yellow growing spike fashion, after which come very small long pods, with very small yellowish seede in them: the roote is long and woody, perishing every yeare.

The Place.

The 1. and the last grow wilde in the fields by hedge sides [illegible] and among rubbish and many other places: the 2. [illegible] in the kingdome of *Valentia* in *Spaine*.

The Time.

They flower and seede quickly after, namely in *June* and *July*.

The Names.

[illegible] grow, and *Nasturtium* 5. *Tragi, Thlaspi angustifol.* of *Fuchsius* and *Lugd. Thlaspi minus hoc* [illegible] *sive Cardamindi Lyke* of *Dodonæus*, and may in any reason be accounted a *Thlaspi* much better yet [illegible] second is called by *Clusius Nasturtium sylvestre Valentinum*, and so doth *Lugdunensis* in [illegible] *Eruca Nasturtio coronopi ramulis*, and is reprehended by *Lugdunensis* also *Eruca sinuata*, as *Bauhinus* thinketh, who maketh it also to be the 1. [illegible] and called this *Nasturtium sylvestre Eruce folio*: the last is called by some *Pseudo-* [illegible] by *Tragus* and *Gesner* in horto *Nasturtium sylvestre*, by *Tragus Sisymbrium Germanicum*, and [illegible] very erroniously not having any affinitie with Wormewood) by *Dodonæus* [illegible] by *Gesner* in horto, by *Cordus*, *Lugdunensis*, *Thalius* and *Tabernæmontanus Thalictrum* or [illegible] by *Dodonæus* in his Latine Booke, by *Lobel* and *Gerard Sophia Chirurgorum*, by

2. *Nasturtium sylvestre Valentinum.*
Spanish wilde Cresses.

3. *Sophia Cluſij prouin.*
Flixe weede.

which name it is now generally called and knowne, by *Caſalpinus Aretinus*, who maketh two ſorts thereof. *Tabernæmontanus* doth of his *Thalictrum*, viz. *latifolium* and *angustifolium*, *Ieuenum* calleth it *Pedis vaccæ tenuifolium deciſum*. *Lobel* putteth a doubt whether it be not the *Eruca Gallica* of the *Italians*: the Grecians call it *Irio*, *Lunaria* as they doe Wormeſeed, and *Sophiakraut* after the *Latine*; the *Dutch Engliſh* and *Welſh* Flaxeweede from the effect.

The Vertues.

The two ſorts of wilde Creſſes are neare the qualities of the other Creſſes; but both the ſeede and the leafe of Flixeweede is of excellent uſe to ſtay the fluxe or laske of the belly being drunke in water, or in ſtrong whitewine, ſome gads of ſteele being heated have beene oftenquenched, and is found alſo no leſſe effectuall than Plantaine of Countrye for the ſaid purpoſe, and to reſtraine any other fluxe of bloud in man or woman, as alſo conſolidate all broken bones, or out of joynt; the juyce thereof drunke in wine, or the decoction of the leafe drunke doeth kill the wormes in the ſtomacke or belly, as alſo the wormes that grow in putride and filthy ulcers, and waſhing the ſalve doth quickly heale all old ſores how foule or malignant ſoever they be: the diſtilled water of the ſame worketh the ſame effect although ſomewhat weaker yet is a fitte medicine, and more acceptable to be taken

CHAP. X.

Sinapi. Mullard.

There be divers that make ſome of the Rockets to be kind of Muſtard as you have heard before, and ſo be many alſo that make ſome kindes of Muſtard to be Rocket. I will endeavour as neare as I can to ſhew each their due title and place, yet of theſe kindes I have in my former Booke ſet forth thoſe that are moſt frequently uſed to make ſawſe in this Land, wherefore I ſhall not needs to ſpeake againe.

1. *Sinapi ſativum Rapi folio.* Broad leafed Muſtard.

This Muſtard hath large and broad rough leaves very much jagged with uneven and unequall edges ſomewhat like a *Turneppe* leafe but leſſer and rougher; the ſtalke riſeth to be more than a foote high and ſometimes two, being round, rough, and branched at the toppe, bearing forth like leaves thereon as are below, but leſſer and leſſe divided, and divers yellow flowers one above another at the toppes, after which come ſmall rough pods with ſmall lancite flat ends, wherein is contained round yellow with ſome greene ſeede, ſharpe, hot, and biting upon the tongue: the roote is ſmall, long and woody, periſheth every yeare.

2. *Sinapi ſylveſtre minus.* Small wilde Muſtarde.

This Muſtard is ſomewhat leſſer than the former not riſing above a foote high with ſmall [illegible]

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

irregularly placed somewhat like those of the Shepherds purse, but more finely gashed, the flowers are yellow and the seede brownish like the former but not so sharpe.

3. *Sinapi parvum Monspelliense*, Small Mustard of *Monspelier*.

This small Mustard is the least of them all growing not above a spanne high, with small bending branched stalkes and small pale yellowish flowers at the toppes, which afterwards give small long and slender rough pods winged at the side or edges, with very small seede therein: the lower leaves are somewhat broad, cut into many peces as those on the stalkes have very small cuts lesser than the smallest leaves of Rocket somewhat hot and sharpe in taste.

4. *Sinapi agreste Neapolitanum*.
Wilde Mustard of *Naples*.

This *Neapolitane* Mustard from a small whitish fibrous roote shooteth forth many rough greene leaves cut into divers parts, somewhat like unto the leaves of the greater Celandine, but lesser and more pared at the ends: the square stalke is divided into sundry branches bearing at the toppes divers small purplish flowers consisting of foure leaves apeece set together as it were in an umbell or tuft, after which rise foorth pods of two inches long a peece, with small roundish seede within them, which quickly breake their cellells and fall not onely by ones touch, but by the shaking of the winde, when it is used to gather the ripe seede.

5. *Sinapi marinum Ægyptium*.
Sea Mustard of *Egypt*.

This Sea Mustard (saith mine Author) because it hath larger leaves than Rocket, and might incline to be the *Eruca marina Matthioli*, which hee saith hee hath not any hitherto seene as his saith he hath seene Rocket so is commonly called *Eruca marina* which is a somewhat hot taste in it when as this hath a very sharpe taste: the roote is small & long, white, slender and woodie, having one or two stalkes, round, brittle, not standing upright but a little bending, spreading forth into divers, with a few winged leaves thereon, that resemble those fine long leaves on a side, a little jagged about the edges, of a bitter taste and smell, resembling nearest in Rocket, the tops of the stalkes come forth blewish flowers in fashion of those of Rocket, which turne into small long pointed pods,

containing small smooth round seede of a very sharpe taste and smelling like Rue. This is very like the two *Sorts* set forth before.

The Place.

The first is not found wilde with us but in Gardens onely, but the second, as well as that which is by some other bookes, are found often in the borders of fields, as also in the low furres and furrowes of them: the other three are strangers to us, the one being of *Montpelier*, the other of *Naples*, and the last of *Egypt*.

The Time.

All these Mustardes are but annuall plants flowring in *July*, and their seede ripe in *August*.

The Names.

It is called in Greeke σίναπι *Sinapi*, and so doe the *Latines* call it also, and *Sinapi*: but *Athenæus* saith that the *Athenians* called it ῥάφυ, and *Aristophanes* in *Equitibus* saith of *Cleomenes* when he was angry,

Ἐξεβόησεν, ἐχόλωσεν ἀλόμενον,
Συνέσεικε Σίναπι & frontem contraxit.

The *Arabians* call it *Cardi*, the *Italians Senape*, the *Spaniards Mostaza*, the *French Senevé* or *Moustarde*, the *Germans Senff* and *Senff*, the *Dutch Mostaerte*, and we in *English* Mustard. The first is called of *Dioscorides* Σίναπι ἥμερον *Sinapi sativum Rom.* and *Raphanus*, of *Cordus* upon *Dioscorides* and of *Lugdunensis* *Sinapi hortense*, of *Matthiolus* *Sinapi sativum primi*, of *Camerarius* *Sinapi album* differing from *Erucæ semine albo*, of *Bauhinus* *Sinapi vulgare*, *Sinapi Dioscoridis* of *Theophrastus*, *Sinapi altissimum Plinij*: the secundis called by *Label Sinapi sylvestre primum*, *Sinapi sylvestre secundum* by *Dodonæus* and *Lugdunensis* *Sinapi sylvestre*, and is the third *Sinapi* of *Matthiolus*, *Camerarius*, and *Lobelius*, *Tragus* calleth it *Eruca sive Rucola marina minor*, and *Sinapi nostrum*; *Fuchsius* *Eruca sativa*, *Myagrum*, *Eruca hortensis*, and *Cordus* *Sinapi* & *Eruca sylvestris*: the third is called by *Bauhinus* *Sinapi altissimum folijs glaucis*, and the fourth *Columna* calleth *Sinapi alterum agreste nostras*: and *Bauhinus* *Sinapi umbella purpurea* is also so called by *Alpinus* in his title.

The Vertues.

Mustard seede especially the common sort is hot and drie in the fourth degree: but the white seede and the other small sorts are not so hot, and hath the vertue of heating, discussing, melting and drawing forth any sliver of bones or other things out of the flesh. The condiment or sawce is of great use, for in a manner the whole increase of the ground is spent thereabout to season or sharpen the meate, both of fish and flesh that are used by the rich or poore: the said Mustard is of good effect to bring downe womens courses, and for other bellicall diseases, and for those that are bitle pricke or Lethargicke, that is troubled with the falling sickenesse, lethargie, drousie, forgetfull, evill, to rub both inwardly and outwardly to rubbe the nostrills, the forehead and temples, to warme & quicken those dull spirits that are as it were asleepe or almost dead, for by the force thereof it pierceth to the braine and purgeth it by sneesing and drawing downe flegme & other vitious humors which by their residence doe much offend, or by their distillation upon the lungs and shell prosume coughing, and therefore with some honny added thereto doth much good therein. Our ancient forefathers even the Latines were more simple, and as I may say the more healthfull age of the world were not sparing in the use hereof, for without doubt they found it much conducing to their health by warming the stomacke and helping digestion, by clensing the braine, lungs and breast of the rheume and flegme: but now adayes it is seldome used by reason (being accounted the clownes sawce, and therefore not fit for their tables) but is transferred either to the meaner sort, who therefore reape the benefit thereof. The decoction of the herbe, but the seede is the more usuall and effectuall made in wine and drunke provoketh urine, resisteth the force of poison, the malignitie of Mushromes, and the venome of the Scorpion or other venemous creatures, for it letteth not the violence thereof to pierce to the heart, and vitall parts, thereby to overthrow life, but mattereth it in the way if it be taken in time: the same also taken before the fit of ague doth by warming the blood and spirits, keepe it so and soften the cold fits, thereby altering the course and curing the disease: the seede also taken either by it selfe or with other things, either in an Electuary or drunke doth mightily prevaile to shere up bodily lust, being taken also in the same manner it helpeth the tisicke and paines in the sides and gnawings in the bowels, and used as a gargle, it helpeth the *Fowlon* palsie of the mouth when it is fallen downe and falleneth it, and also dissolveth the tumours & evils about the throate in the Kings evill, especially if it be also applied outwardly thereunto being dawbed in the manner it otherwise helpeth the toothach: the outward application hereof upon the pained place of the *Sciatica* doth much helpe to dissolve the humours, and to ease or fallen the paines, & also for the gowte and other joynt-aches, and is much used to ease paines in the sides or loynes, the shoulders or other parts of the body, by applying thereof to the place affected, and by drawing the paines to the place from the inward or more remote parts the disease or diseasednesse to those outward places where locall medicines may helpe: it is admitted to keepe falling of the haire: the seede boyled mixed with honey and applied, or made up with wax, taketh away wrinkles and blacke and blew spots and bruises of bestings or the like, the roughnesse of scabbednesse of any place, as also the leprosie, and lowse evill: it helpeth also the cricke in the necke, or that disease when one cannot turne their heads, for they must turne their whole body with it. The distilled water of the seede while it is in flower, is much used both inwardly to drinke to helpe in any the diseases aforesaid, or in washing the mouth for *Fowle*, or for kernells and tumours of the throate: but outwardly also for the foresaid seede is used to cleanse the face and skinne from freckles, spots, morphew, or other deformities thereof. The same also doth keepe a fine condiment or sawce made of Mustard seede in use upon all occasions, indeede more now adayes which it is likely they learned from *Dioscorides* who taught his to forge. Rocket seede good for a consumption beating it and making it up with vinegar and milke into balles to be eaten: for they much alter the constitution appoint two ounces of Mustard seede to be taken, and halfe an ounce of good Cinamon well beaten to powder and made into balles or cakes with honey and vinegar, which being dried in the Sunne are ever keep available to use: the decoction thereof, which then seasoned with a little vinegar is made into sawce pretily, very delicate and pleasant to the palate and stomacke.

CHAP.

Chap. XI.

True sive Erysimum. Hedge Mustard.

There are divers sorts of this Hedge Mustard more knowne at this time then formerly hath bin, being found out by divers diligent and experienced searchers of herbes, as you may perceive in the insueding discourse.

1. *Erysimum vulgare.* The common wilde Hedge Mustard.

The common *Erysimum* groweth up usually but with one blackish greene stalke, rough or limber, crested and not to breake, branched into divers parts, and sometimes with divers stalkes, set full of branches with narrow long rough or hard rugged leaves very much cut in or torne on the edges into many parts, some bigger and some lesser, of a dirtie greene colour: the flowers are small and yellow that grow at the tops of the branches in long spikes growing by degrees so that continuing long in flower, the stalke will have small pods at the bottome, growing upright and close to the stalke, while the toppe flowers yet shew themselves, in which are contained small yellow seede, sharpe and strong as the herbe it selfe is also: the roote groweth downe slender and woodily, yet abiding and springing therefrom every yeare.

2. *Erysimum alterum siliquis Erucæ.* Broad leafed hedge Mustard.

This hedge Mustard riseth up with two or three darke greene stalkes, somewhat like the former but not so much branched, set on all sides with large darke greene leaves, cut into three or some parts, with almost equall ribbes on each side, but the end is the largest, somewhat unevenly waved or dented about the edges thereof: the flowers are small and yellow, yet greater then the former, whose spikes are not so long, neither doe the long and round pods of yellow seede stand so close to the stalkes, nor are so small but shorter like to those of Rockes: the roote is not so long or woodily but more fibrous continuing but a yeare.

3. *Erysimum verum sive montanum.* The true hedge Mustard.

The leaves of this *Erysimum* are of a fresher greene colour then either of the former, smaller also, and cut in on both sides into more but smaller parts, resembling the divisions on the leaves of Dandelion but very small, each part or corner looking downewards, from among which rise up sometimes two or three stalkes, but more usually but one, round, and about halfe a yard high, thicke set with such leaves but smaller and full of branches to the toppes, all along which come forth very small yellow flowers with smaller leaves with them, after which follow whitish yellow small cods growing close to the stalkes, containing within them small yellow seede, nothing differing or sharpe as the first, yet somewhat spicie upon the tongues: the roote is small and perisheth after seede, this onely sowing it selfe never misseth to be in the ground where it hath once seeded.

4. *Erysimum latifolium Neapolitanum.* Broad leafed hedge Mustard of *Naples*.

The *Neapolitane* hedge Mustard hath many small long and smooth greene leaves lying in a compasse upon the ground, divided or cut after the manner of the wilde Rocket (which we call our ordinary Garden Rocket) but with smaller and lesser divisions, the middle ribbe being white, the stalke that riseth from among them, for it

1. *Erysimum vulgare.*
The common wilde hedge Mustard.

3. *Erysimum verum sive montanum.*
The true hedge Mustard.

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

seldome beareth more then one is about two foote high, set with the like leaves but lesser and lesse divided up to the toppe, and with longer ends more pointed, of a strong scent and bitter tharpe taste, the flowers are many together, small and yellow, with longer spikes more like to Mustard then Rocket, after which come longer and thicker cods about two inches long, small and round not closing the flatbe like the last, but spreading somewhat further off, wherein is small yellow seede, nothing so sharpe as the leaves: the roote is long and white, stronger and hotter then either leaves or seede and most neare unto Mustard.

3. *Erysimum angustifolium Neapolitanum.* Narrow leafed hedge Mustard of *Naples*.

The lower leaves of this hedge Mustard are long and narrow, somewhat hairy but soft, of a pale greene colour, cut in or some on the edges, and pointed very like unto the common hedge Mustard here set lower: but those that grow up higher upon the stalke, which is seldome more then one about a yard high and rough, smaller and with fewer divisions, branched from the middle upwards, and somewhat from the very bottom, bearing the smaller yellow flowers at the toppes of all the rest, after which come small long pods set on either of the branches standing upright, thicke and blunt at the toppes with small yellowish seede in them of very sharpe.

4. *Erysimo simile hirsutum planta.* An hairy hedge Mustard with narrow leaves.

This hairy hedge Mustard-like plant hath many leaves lying on the ground cluttering together, each leafe rough, hairy, and whitish, an inch and a halfe long, unevenly dented about the edges, and lesse divided deepely cut in, from whence rise up sometimes many stalkes, and sometimes but one, rough, hairy and reddish at the bottome, with some few lesser leaves set thereon compassing them at the beginnings like those that are fashion at the toppes of the stalkes, which are sometimes branched made of foure small white leaves, and after them rise straight long cods with small seede in them.

The Place.

The first is very frequent in our Land by the wayes and hedge sides and sometimes in the eyes of the corne fields where they are sowne with, yet is sometimes found but full in the better ground: which the second is very rare, the third is found wild in *Italy* as *Matthiolus* saith in the like places with the first: the fourth and fifth are sowne as *Columna* saith: the last groweth upon stones and rubbish and upon old mudde walles at *Dover*, and many other places.

The Time.

They doe flowere sometimes late and sometimes earlier, but most usually in *July* or thereabouts.

The Names.

The Greeke name is diuersly written *Erysimum* and *Irio*: *Erysimum* is also a *folio serum multiplici sectione* sic dictum quibusdam *Myagrum* alijs *Sesamoides quasi pretiosum*, neither of which seemeth to likely as *Irio quasi à virium facultate præditum est*: in Latine also *Erysimum* and *Irio quod acrimonia sua irritet cutem*. This is the *Erysimum* of *Dioscorides* and not of *Theophrastus*, for hee placeth his *Erysimum sine fructu* among the sorts of Corne & Grasse

Plinie as shall be declared both when we come to speak of them, & somewhat also in the Chapter of *Myagrum* following; *Galen* doth acknowledge both sorts, for of this kind he speaketh in *de simplicium medicamentorum, and of the other in primo de alimentorum facultatibus*: *Pliny* also speaketh of them *lib. 18. cap. 7.* and *lib. 22. cap. 25.* but he confoundeth them both together: for in the former place he saith *Eyssimum sponte nascens Asiaticum, Italicum, Cnecum*, and after *hunc feliciter Sesamo similem esse diximus, Asia Orientaque Egyptum, laudatque usu pauciores fe, quae in agris nascitur Sesamo similem esse diximus, and a Greek Sesamum nocere, esse autem ei simile Eyssimum, quod in agris nascitur, Sesamo Nostrati.* this being the description of *Dioscorides* his *Sisymbrium* and the other of *Sesamum*. The first is called *Hierabotane femina* of *Brunfelsius*, *Verbena femina* and *Eyssimum* of *Fuchsius*, *Eyssimum Sinapi sylvestris species* of *Cesalpinus*, *Irio sive Eyssimum* of *Matthiolus*, *Dioscoridis, Lugdunensis* and *Camerarius*, *Eyssimum vulgare* of *Raubinus*: the second is *Eyssimum montanum* his second *Eyssimum* whose figure is placed for *Eruca sylvestris*, *Raubinus* calleth it *Eyssimum alterum Eruca folio*, *Cordus* the first *Matthiolus, Lugdunensis* and *Camerarius*, *Eyssimum verum* of *Dodonæus*, *Dentaria alba Brunfelsius* of *Horta*, *Irion verum spurium* of *Cesalpinus*, and *Saxifraga Romanorum* of *Lugdunensis*, according to his figure, but the figure is transposed to a contrary place under the other title of *Saxifraga nasica*, *Raubinus* calleth *Eyssimum perfoliatum vel cornicularum*, but is generally called by most *herbarists* with us *Eyssimum petræum*: the fourth is called by *Columna Irio lævis Apulus Eruca folio*, and by *Raubinus Eyssimum* [illegible] now *Novi Montis*, and was sent him as he saith by the name of *Eyssimum Hispanicum sive Sisymbrium*. I have translated *Columna Irio latifolium Neapolitanum*: the fifth is called by *Columna Barbarea minoris Eruca folio*, but by *Raubinus Eyssimum angustifolium majus*: but in this as in many other *Raubinus* doth much forget himself, as I have noted two or three leaves before in his *Pinax*, for he setteth this for a *Barbarea* among the other sorts of *Barbareas*, and cannot be an *Eyssimum* and a *Raphitrum* both, for so to do were to make a confusion unpardonable in any man as he was, or any other that would be accounted of any worth in his judgement. The sixth is called by *Raubinus Eyssimo similis Iberis folio non laciniato alba*, and was called so by him at the first sight of it in the garden of the President *John Raubinus*. The *Italians* call it *Erisimo* and *Irione*, the *Spaniards Boraches*, the *French Tore* and *Tortelle*, the *Germans Hedericke* and *Winder Senff*, the *Dutch* and *Brabanders*, and in *English* by *Gerard* and *Cooke Crosbie* but because I finde the most judicious to make it a kind of wild Mustard, I have thereupon entitled it wild Hedge Mustard.

The Vertues.

The three first sorts of *Eyssimum* are the most in use and effectuall doe temperately heate, consisting of a thinne substance, cutting and rarefying with some moyst parts joyned therewith, whereby it doth not dry the thicke and viscous humor but rather it is easie to be spit forth, for it is singular good in all the diseases of the Chest and Lungs, hoarsenesse of the voyce, and by the use of the decoction thereof for a little space those have beene recovered perfectly well, who had utterly lost their voyce and therewith their spirits also almost: the juice thereof made into a Syrupe or Lohoc with honey or sugar, is no lesse effectuall for the said purposes, and for all other coughs wheezings and thicknesse of breath: the same also is profitably taken of those that have the Jaundice, the Plurisie, paine in the backe and loynes, and for torments and wringings in the belly or in the Colon, which is called a Collicke being used also in Glisters: the seede is held to bee a speciall remedy against poyson and venome. It is singular good for the paines in the hippes or huckle bones, called the hippe Gowte or Sciatica, the same also and all sorts of aches, as also for Fistulaes, hollow Vlcers, and eating or running Cankers, and for Aphthæ Vlcers and Cankers in the mouth or throate or behind the eares, and no lesse also for the hardnesse and swelling of the kernels breede of in the testicles or stones.

Chap. XII.

Thlaspi. Treakle-Mustard.

Vnto the Cresses, Rockets, and Mustardes pertaine these herbes called *Thlaspi*, Treakle-Mustard as resembling neerest unto them both in forme and qualitie, whereof there are found at this day to many sorts more then the former ages ever knew, that I shall set them here down with as many other as I have yet seene, which be these yeeld a plentifull varietie, distribute them into sundry ranks or orders, that so they may be both better described and apprehended.

Thlaspi arvense. Treakle Mustard of the Fields.

1. *Thlaspi Erucæ folio.* Treakle Mustard with broad flat Powders.

The stemme of this riseth up with a hard round stalke about a foote high, parted into sundry branches, having long and narrow leaves set thereon, somewhat but not altogether like unto the leaves of Rocket, but somewhat rounder and pointed: the flowers are white that grow at the toppes of the branches after which come large round powders, parted in the middle with a furrow, wherein is contained in either side some what thicker and larger then in any other of the *Thlaspies* whose smell is ranke and smelling of Garlick, especially in the heate where it is naturall, but not so strong to smell unto as others have expressed it, for any thing I could ever perceive, in this place: the roots are small and thredly perishing every yeare.

2. *Thlaspi Erucæ dentatis foliis sive valentissimum Tarraconense.* Straighter-Mustard.

This groweth higher then the former, spreading more and longer branches, whose leaves are smaller and narrower withall unevenly dented about the edges; the flowers are small and white growing on long stalkes with more smaller and rounder seede vessells after them, and parted in the middle in the same manner

with

3. Thlaspi Creticum folio.
Treckle-Mustard with round flat pouches.

2. Thlaspi Pastoris folio.
Shepherds-Mustard.

1. Thlaspi majus.
Great Treckle-Mustard.

4. Thlaspi Alliaceum siliqua.
Hairy Treckle-Mustard.

Original from UNIVERSITY OF MICHIGAN

with darker browne seeded thereon then in the former, and much sharper in taste: the roote perisheth after seed[ing] that dyeth the first winter after the springing.

3. *Thlaspi majus.* Great Treakle-Mustard.

The great Treakle-Mustard hath larger, smoother and broader leaves then the last, somewhat pointed at the ends, the flowers are small and white like the other, standing at the toppes of the stalkes which are two or three foot high, with divers branches on them: the seede vessells are round, and set with browne seene therein: the whole plant is of a strong unpleasant sent and taste.

4. *Thlaspi Nasturtij folio Monspeliacum, French* Treakle-Mustard.

The leaves hereof are somewhat like the leaves of the second kind, being smooth and of a darke greene colour, the flowers are small and white also that grow on the stalkes which are about halfe a yard high: the seede vessells are somewhat broad at the head like unto those of Shepherds-purse but greater.

5. *Thlaspi saxatile incano folio minus.* Small hoary *French* Treakle-Mustard.

The creeping or bending branches of this *Thlaspi* are all hoary over, scarce rising a handbreadth high, whose leaves are hoary also somewhat long and narrow without any footestalke unto them but set thereon without order much like, having small white flowers on a short spike and small seede vessells following.

6. *Thlaspi villosum capsulis hirsutis.* Hairy Treakle-Mustard.

The stalke of this *Thlaspi* is about a foote long round and hairy, at the bottome whereof grow divers hairy leaves somewhat long and broad set upon long footestalkes, but those that are upon the stalke have no footestalke but cleaue to the stalke at the bottome, being pointed at the ends and somewhat dented about the edges, the flowers stand in the toppe fullie fashioned of five white leaves a peece, after which succeede flat hairy powches parted as they are with reddish sharpe seede within them.

7. *Thlaspi graecum pyrefolium majus.* The greater Treakle-Mustard with Thoroughwax leaves.

The lower leaves hereof that lie upon the ground are small and somewhat round like those of *Basill*, but yet a little longer, dented on the edges at the bottomes, where they are smallest and a little dented about the other part, of a grayish greene colour, every one upon a small footestalke, among which ariseth up a round stalke purplish at the bottome, about a foote high sometimes spotted, whereon grow single leaves one above another at the joints by certaine distances, which compasse it at the bottome in the manner of Thoroughwax leaves, and whereat likewise come forth other smaller leaves upon short branches, whereon and at the toppes of the stalke stand divers small white flowers that breake forth out of reddish husks, after which appeare small flat powches like unto those of Shepherds purse parted in the middle, as is usuall with most of the *Thlaspies*, on each side whereof lye small flat yellowish seede: the roote is long white and woodily, the whole plant is more solide or lesse sharpe then the[re]to.

8. *Thlaspi pyrifolium minus.* The smaller Treakle-Mustard with Thoroughwax leaves.

The other *Thlaspi* hath a few leaves lying on the ground, which are of a grayish greene colour, like both for

7. *Thlaspi graecum pyrefolium majus.*
The greater Treakle-Mustard with Thoroughwax leaves.

8. *Thlaspi pyrifolium minus.*
The smaller Treakle-Mustard with Thoroughwax leaves.

forme

9. Thlaspi arvense minus luteum.
Yellow field Treakle mustard.

10. Thlaspi arvense maius luteum, Treacle mustard with yellow flowers, Treacle mustard with broad leaves, Treakle Gedard.

forme and colour unto the leaves of *Braſſica campeſtris* Codded Thoroughwax, but much leſſer, thoſe that grow up higher upon the ſtalke, which is ſcarce a foote high, and but a few ſet thereon are ſmaller, pointed at the ende, and broad at the bottomes compaſſing it like the laſt, the flowers are ſmall and white, and the ſeede veſſells are like the *Caſſe* kind, ſomewhat ſharpe pointed.

9. *Thlaſpi arvenſe minus luteum.* Yellow field Treakle-Muſtard.

This hath ſometimes but one ſtalke and at other times many ſet thicke with ſmall long hoary and hard leaves, with a great long tuft of yellow flowers at the toppe, made of five leaves apeece, after which follow the roote yellow with pouches, ſwelling in the middle, containing within them browne ſeede: the roote is ſmall and long and dyeth every yeare.

10. *Thlaſpi ſemine latiore Americanum.* The ſpare bearing *Thlaſpi*.

This *Thlaſpi* branched from the roote divers waies ſomewhat thicke, ſet with long fat greene leaves ſomewhat like thoſe of Mechlin: the toppes of the branches are without leaves, but ſtored plentifully with ſmall yellowiſh flowers of foure leaves which endure but only one day, falling away for the moſt part without bearing any ſeede or very ſparingly, for that on the whole plant there will be ſcarce foure or five huskes of ſeed, gathered in a yeare which are flat and a little long like to thoſe of the manured Woade, with a ſharpe pointed beake within, the roote is ſtaid with many fibres therein, and taſteth ſharpe like Creſſes.

11. *Thlaſpi ſinapium maximum Hiſpanicum, Eruca peregrina Cluſio.* Spaniſh hoary Treakle-Muſtard.

This ſmall Spaniſh (or Italian) plant ſendeth forth ſundry ſlender round hoary ſtalkes about two foote high with many long and narrow leaves at the bottome, a little unevenly waved about the edges, narrower at the bottome and broader to the ende, of a grayiſh greene colour or rather hoary, with a great rib in the middle of a ſharpe taſte, the upper leaves on the ſtalkes being ſmaller then the lower, with ſome pale yellow ſmall flowers at the toppes, made of foure leaves a peece dented in the middle, after which ſucceede long and full ſeede veſſells parted in the middle as many other ſorts of *Thlaſpi* are, with a ſmall point at the end containing therein many browne reddiſh flat ſhining ſharpe ſeede: the roote is white and long like unto that of the toppe with many fibres downewardly.

The Place.

Divers of theſe ſorts of Muſtard have beene found in ſundry places of our owne Land, eſpecially the laſt ſecond, as hath a mile from *Harfield* by the river ſide under an hedge as you travell to *Harfield*, and in the fields at *Feckham* on Surrey ſide, &c. the other ſorts grow ſome in *Germany*, ſome at *Montpelier*.

The Time.

They flower and ſeede ſome earlier and later then others even from *May* unto *Auguſt*.

The Names.

The Grecians call it Θλάσπι and Θλάσπη *Thlaſpi* and *Thlaſpe, quod ſemel ſe quaſſa ſpargat*, and alſo Θλάσπι *Thlaſpi*

Sinapi agreste [illegible] *Fuchsium elegantium* and *Sinapi agreste quod Sinapi accinnum refert*: the *Latines* keepe the Greeke name for the moſt part and call it *Thlaſpi*, yet ſome do call it *Capſella* and *Scandalacum*, *Naſturtium ſylveſtre* and *Sinapiaſtrum*: the *Italians* call it *Thlaſpi*: the *French Senevre Sauvage*: the *Germans* wilde *Kerſe*: the *Dutch Boſtart*: and we in *English* Treakle-Muſtard, or Mithridate-Muſtard, becauſe the ſecond ſort eſpecially above any other is that the beſt do allow for the trueſt *Thlaſpi* to be uſed in Treakle and Mithridate. The firſt is called by *Lobel Thlaſpi Dioſcoridis Drabe* and *Chamelinæ folio*, & *Secundo-Thlaſpi* by *Dodonæus* and *Lugdunenſes*, and a ſecond *Thlaſpi* of *Matthiolus*, called *Plurycarpon* by *Camerarius*, and by *Bauhinus Thlaſpi arvenſe ſiliquis lunatis*: the ſecond *Lobel* calleth *Thlaſpi vulgatiſſimum Cæſariæ folio*, whoſe figure is the ſame with the firſt of *Matthiolus*, differeth much from that which *Bauhinus* ſetteth forth in his *Prodromus* by the name of *Thlaſpi vulgatum Cæſariæ folio*: *Lobel* calleth it *Thlaſpi verum caput feminæ nitens in Theriaca*: by *Cordus* in *Iuſtaria Thlaſpi Cardamoides*, by *Tragus Thlaſpi*, and *vulgare Thlaſpidium*, and by *Bauhinus Thlaſpi arvenſe incanum ſolio magno*: the third is the *Thlaſpi* of *Tabernæmontanus* and *Gerard*, which *Bauhinus* firſt ſetteth forth by the name of *Thlaſpi arvenſe Draconis folio*, but afterwards in his *Errata* appointed it to be amended & made *Acetoſæfolio*: in ſtead whereof *Gerard* is called by *Bauhinus Thlaſpi Cæſariæ folio burſæ paſtoris ſiliqua*: the fifth is alſo called by him *Thlaſpi Draconis folio maximo*: the ſixt is alſo called by him *Thlaſpi villoſum capſulis hirſutis*: the ſeventh is called by *Lugdunenſes Thlaſpi graminis Dalechampii*, by *Tabermontanus Thlaſpi olerace*, becauſe it is almoſt without taſte, by *Bauhinus Thlaſpi arvenſe perfoliatum majus*, who quoteth it to be *Columnæ* his *Thlaſpi alterum minus rotundifolium burſæ paſtoris*, and yet *Columna* in his deſcription thereof maketh no mention of perfoliating in the leaves, *Gerard* alſo miſtaken this to calling it *Thlaſpi incanum* which belongeth to *Incanum Mechlinienſes*: the eight is called by *Cæſ.* *Thlaſpi perfoliatum*, and *Thlaſpi montanum minus*, but by *Bauhinus Thlaſpi perfoliatum montis*: the ninth is called *Alyſſum* by *Matthiolus*, and *Anguillara*, & *Alyſſum Matthioli* by *Lugdunenſes* and *Camerarius*, by *Lobel Thlaſpi Cretense* by *Lugdunenſes Alyſſum minus Dalechampii*, by *Tabermontanus Thlaſpi minus Cretense*, by *Peſſon Scordium Sylueſtre*: *Polium Alpinum flore luteo*, *Bauhinus* maketh two ſorts thereof calling them *Thlaſpi Scandracum compoſitum majus & minus*, and yet ſaith they are ſo like that they may be both accounted one ſort: unleſſe I have referred it rather to the *Thlaſpi* than any other as neareſt reſembling it, and to this ranke of the *Thlaſpi* which is the proper place of the growing: the tenth is ſo called by *Cæſalpinus* in his hiſtory of *Candia* plants: the laſt is called by *Cluſius Eruca peregrina*, and ſo doth *Lugdunenſes*: but *Lobel* inverteth the name calling it *Leucoium marinum Pamphylium*, but *Cluſius* miſliking it, holdeth ſtill his owne, and *Bauhinus* more enclining to *Lobelius* him (for his loves ſake to *Padua* as it ſeemes) calleth it *Leucoium incanum utriculis cornutis*: but ſo cauſe both herbe and ſeede is hot and ſharpe, and ſo are not the *Leucoia* generally, I have thought it more fit to joyne it to the *Thlaſpies*.

The Vertues.

The moſt of theſe ſorts of Muſtards are hot and drie in the fourth degree, or very neare like unto Creſſes, for they are ſharpe and quicke in taſte, and are bearing, rarefying, attracting and purging: it is ſet downe by ſome authors to purge the body both upward and downewards, and that if any exceede a due proportion it will ſcourge unto blood, but how truly I know not in that I never heard of any to make triall thereof in that manner: it is ſaid to procure womens courſes ſo forcibly that it ſuffocateth the birth being taken inwardly: it breaketh inward apoſtumes uſed in cliſters helpeth the *Sciatica*, the ſeede applied outwardly doth the ſame. It is an eſpeciall ingredient into *Aſtriadatum* and Treakle, for it is held to be of it ſelfe an antidote reſiſting poyſon, venome and putrefaction beſides the acrimony it addeth to the compoſition. It is alſo availeable in many of thoſe cauſes that Muſtard is uſed but ſomewhat weaker.

Chap. XIII.

Thlaſpi Umbellatum. Umbelliferous Treakle-Muſtard.

Another kind of Treakle-Muſtard bearing their flowers in tufts and round umbells, and not in ſpikes, of ſome whereof I have ſpoken in my former booke, that is, the *Thlaſpi Candia*, *Candy* tufts, both with white and purplith flowers, as alſo a *Spaniſh* kinde not ſet forth by any before.

1. *Thlaſpi Creticum album umbellatum majus*, Great white *Candy* Muſtard.

This *Candian* plant hath divers hard and ſmall ſtalkes, bearing a few long and narrow pointed ſmooth leaves, ſet on them one above another up to the toppes, where the white flowers grow in round tufts, ſomewhat larger than in that ſort is expreſſed in my former booke: the ſeede veſſels that follow are greater alſo with a pointell in the middle of them: the roote is ſmall and thready, and endureth divers years not dying as the other doth.

2. *Thlaſpi umbellatum purpureum Iberidis folio*, Variable flowred Muſtard.

The leaves hereof are ſomewhat long and narrow, cut in or deepely dented about the edges, more than thoſe of the former: the flowers grow in tufts or umbelle like thereunto but of mixed colours, that is white and purple in one tuft, ſometimes wholly white, and in others yellowiſh but much more rare: the ſeede is like the *Candian*.

3. *Thlaſpi umbellatum Cretense flore albo odorato*, Sweete Treakle Muſtard with a white flower.

This *Candy* Muſtard is ſmaller, and groweth lower than the firſt, having ſtalkes with ſmaller and narrower leaves ſtanding thicke at the ends: the flowers are white but ſmaller than they, and ſmelling very ſweete: the ſeede is ſmall and flat like powder with yellowiſh ſeede in them: the roote periſheth yearely.

4. *Thlaſpi umbellatum Naſturtij folio Monſpelienſium*, *Montpelliers* umbelliferous Muſtard.

The leaves of this Muſtard are many and greater than in the other before, bearing many more jagged leaves on each ſide like unto thoſe of the common garden Creſſes: the flowers are white in ſpikie roundles or umbells at the top which grow thicker ſeede than the others but as ſharpe as any of them.

The Place.

The firſt groweth about *Montpelier*, and the greater number in *Candy*, and but in gardens with us.

The

1. Thlaspi Creticum album umbellatum majus.
Great white Candy Mustard.

2. Thlaspi Creticum purpureum [illegible]
Variable flowered Mustard.

3. Thlaspi umbellatum Creticum flore albo odorato,
Sweet Candy-Mustard with a white flower.

4. Thlaspi umbellatum Hastulæ folio [illegible]
[illegible] umbellatum Monense.

The Time.

flowers and seede about the same time that the Candy kindes doe, expressed in my former booke, which
usually are until *July*.

The Names.

the Author calleth *Thlaspi Creticum flore albo majus*, and I thinke it to be the *Thlaspi Narbonense Cæsalpini* of *Lobel*, which as he saith he *Italicum* and *Matthiolus* accounted an *Alyssum*: the second is taken to
be the *Nasturtium Alliarium* of *Clusius*; and the *Thlaspidium, aliud genus vel teretium Tragi*, the *Thlaspi amarum* of *Tabernæmontanus* and the *Nasturtium sylvestre* of *Lugdunensis*, which *Bauhinus* enumbreth *Thlaspi umbellatum arvense*
Lobelio: the third is the fourth *Thlaspi* of *Clusius* called *parvum odoratum flore*, which *Bauhinus* calleth
Thlaspi Creticum flore albo odoratum majus: the last is called by *Lobel Thlaspi alterum amplius umbellatum*
Italicum siue Narbonense, which *Lugdunensis* and *Tabernæmontanus* doe both remember, the one by the
name of *Thlaspi umbellatum Pena*, and the other by the name of *Thlaspi Narbonense umbellatum*.

The Vertues.

Because these herbes are to be referred to the former, for being almost as sharpe they cannot but worke
the effects yet in a weaker manner, and therefore thus much shall be sufficient for them.

Chap. XIIII.

Thlaspi Montanum. Mountaine Treakle-Mustard.

The best kinde of Treakle-Mustards that are to be spoken of, are those that grow upon high hilles and
mountaines and in rockie stonie places.

1. *Thlaspi montanum Clusii folio majus*; *Clusius* his *Hungarian* Treakle-Mustard.

This *Thlaspi* riseth up with divers small but strong stalkes a foote or more high, set at distances with
long and somewhat broad leaves, compassing it at the bottome as the *Bursa pastoris* doth, and
of the same colour, greene above and grayish underneath smelling somewhat like unto Garlike, as those
also doe that grow upon the ground: the flowers are many and
white plentifully growing at the toppes without any sent,
which turne into flat and broad pouches, not parted as o-
thers are but whole and round sticking forth in the middle like a
bodkin, in the middle whereof lieth but one seede, the roote is
tuffie and full of strings and fibres that continue many yeares.

2. *Thlaspi montanum Clusii folio minus*,
The small Treakle-Mustard of *Baden*.

This hath a great many small leaves lying on the ground round
about the roote, very like unto the blew Daysie, full of juyce,
and of a like blewish greene colour, among which rise up di-
vers stalkes about a foote high, bearing thereon many leaves
longer and more pointed than the lower, and at the toppes sun-
dry white flowers one above another, which afterwards bring
forth pouches like those of Shepheards purse: the roote is long
white and hearie.

3. *Thlaspi montanum semper virens.*
Evergreene Mountaine Mustard.

The leaves of this *Thlaspi* is somewhat great and wooddy, co-
vering the foote upwards to the branches, with a brownish
rough barke set with divers long white leaves at spaces, some-
what like to those of Stocke-Gillow flowers but smaller and ve-
ry quick and sharpe in taste: at the toppes of the branches
which are many and much dispersed stand tufts of white
flowers, which come forth like husks as are in the common
Thlaspi, full of like seede in them very hot and sharpe: the
roote perisheth not, but abideth with the stemme all above ground uncorrupted ma-
ny yeares.

4. *Thlaspi scutis rotundifolium.*
Mountaine Treakle-Mustard with round leaves.

This mountaine *Thlaspi* hath from among many small short leaves, that grow next the ground being
round at the ends, little dented about the edges, and every one on a short foote stalke, divers tender stalkes
of a foote or more in height, branched at the toppes, and bearing a few narrow long leaves on them, and small
white flowers thereon, after which hollow small round seede vessells divided by a small skinne into two
cells growing upon very slender foote stalkes with small yellowish sharpe seeds within them: the roote grow-
eth somewhat great at the topp, and smaller downwards.

Original from UNIVERSITY OF MICHIGAN

13. *Thlaspi Veronicæ folio.*
Treakle Mustard with Speedwell leaves.

14. *Thlaspi montanum Sinapeos aut Cardamines folio: & alterum ramosius, tenuifolio fubo.*
Treakle Mustard with very small and parted leaves, and another with small blacke leaves.

6. *Thlaspi Alpinum majus capitulo rotundo.* The greater mountaine Mustard with round heades.

The greater kinde hath divers heads or tufts of somewhat longer leaves next the ground, from the middle of which ariseth up a bigger stalke, set with narrow leaves up to the toppes, where they branch forth and beare small white flowers and round heades with seede, as the lesser kinde doth but larger: the roote likewise is somewhat great.

7. *Thlaspi Alpinum repens.* Creeping mountaine Treakle Mustard.

The small *Thlaspi* hath many small branches creeping by the ground of foure or five inches long with some few leaves set somewhat round it without order on them, and at the toppes many white flowers somewhat greater, in whose places afterwards come small flat pow'ches, containing seede in valle like unto Rocket: the roote is small and long.

8. *Thlaspi parvum exoticum flore rubente.* Small reddish flowred Treakle-Mustard.

The stalke of this *Thlaspi* is white and long, from whence come three or foure round upright yet weake stalkes, with small and round leaves at the bottome, not much broader than the fruit or seede vessells themselves are of colour, and those that grow up higher smaller and narrower up to the toppes, where the [illegible] leaves sparcely stand in tufts many set together of a pale reddish or bluish colour, striped [illegible] and riseth out of reddish greene huskes being the outer flowers, which is a crowne compassing the middle rife other flowers afterwards upon long foote stalkes, and flat seede vessells [illegible] seede in them, but the roores and leaves are bitter.

9. *Thlaspi montanum Polygalæ folio.* Mountaine *Thlaspi* with Lentill-like leaves.

This *Thlaspi* is like to be about a foote high having small leaves on them in forme like unto *Polygala* [illegible] much smaller or rather like unto those of the pulse we call Lentills: and in some countries [illegible] than round: the flowers are many small and white perking on the toppes of the [illegible] small round seede vessells, parted in the middle with very small seede therein.

10. *Thlaspi montanum luteum majus.* The greater yellow *Thlaspi.*

This growing forth lowdey weake branches scarce able to stand upright, set with divers small [illegible] leaves a little hoary without order, somewhat like unto *Serpillum* Mother of Time [illegible] small yellow flowers set together in a tuft or umbell something large, where afterward [illegible] vessells with very small seede in them.

11. *Thlaspi montanum luteum minus.* The lesser yellow *Thlaspi.*

The leaves of this *Thlaspi* are small somewhat long and narrow, pointed at the ends like unto the last, but [illegible] rough and hoary withall, the stalkes are browne leaning downe to the ground rough and [illegible] bearing many flowers at the toppes of them somewhat larger than the last, and

of a deeper yellow colour almost like the Wall-flower, every leafe being round pointed, and cut in the middle, making them seeme like hartes which doe not stand in round tufts or umbells but in short spikes, after which come rough and hoary round seede vessels, with a pointell sticking forth in the middle of every one of them, and containing one flat round yellowish seede in them: the roote is small and long and springeth new leaves and stalkes every yeare: this hath but little sharpenesse in it.

12. *Thlaspi Veronicæ folio.* Treakle-Mustard with Speede-well leaves.

This *Thlaspi* hath divers leaves lying next the ground rough or hairy and almost round, of the bignesse of a nayle of ones thumbe, and of a deepe greene colour every one upon a short footestalke, so as these leaves are like leaves of Speedewell; the stalke is hairy halfe a foote high branching usually from the bottome and sometimes without branches, set with very few leaves that compasse them at the bottomes and bearing at the toppes small white flowers and after them small round and long pods upon small footestalkes one above another spike fashion, containing in each a small brownish yellow seede somewhat sharpe in taste, the roote is white and long.

13. *Thlaspi sonchi arvensis accommodatum ad folia.* Treakle-Mustard with very small and pointed leaves.

From a great white hard roote rise sundry thicke and short rivelled stalkes above a span long, couered with very small leaves without order, being narrow and almost round, & pointed at the ende, somewhat hairy about the edges and of a sad greene colour, but smaller upwards unto the flowers at the toppes which grow many standing together in a large umbell, consisting of foure white or somewhat reddish leaves, the under couple being greater then the upper with some yellow threds in the middle: the seede followeth in broad round flat powches, hollowed in the middle like a Spoone on that side next the stalke and bunching or bellying forth on the other side flat also at the head, with a seame in the middle as is seene in many sorts of these *Thlaspies* which is flat and yellow in both the sides.

14. *Thlaspi montanum carnosa rotunda folia.* Treakle-Mustard with small thicke leaves.

The roote of this small *Thlaspi* is long, smooth, white and hard, from whence spring divers reddish stalkes set thicke with small leaves that are fleshie, and not much broader then the powches with seede, of a blewish greene colour, yet smaller and narrower up to the toppes, where the flowers stand in a small round tuft of a pale colour striped with reddish lines or strikes: after which come smaller flat pouches a little dented at the toppes and purplish with small seede in them like the other but lesse.

The Place.

All these Mustards grow on hills and in rocky stony places in severall Countries, yet some of them are found in our owne Land in the like stony places.

The Time.

They all for the most part flower and give their seede in the Sommer moneths, yet some sooner or later in the Spring.

The Names.

The first of these is called by *Lobel, Camerarius,* and *Tabernemontanus Thlaspi Pannonicum Clusii,* by *Clusius* himselfe *Thlaspi primum vel montanum peltatum,* and by *Bauhinus Thlaspi montanum Glastifolio minus* the second is the second *Thlaspi montanum* of *Clusius,* called also by him *Thlaspi Badense,* by *Lobel* and *Tabernemontanus Thlaspi album supinum, Columna* mentioneth it under the title of *Thlaspi montanum primum hirsutum peltatum fructu,* which *Bauhinus* calleth *Thlaspi Alpinum Glastifolio minus* according to his correction in his Appendix: the third is *Lugdunensis* his *Thlaspi montanum candidum,* and called by *Bauhinus Thlaspi montanum longo fructu:* the fourth *Bauhinus* onely maketh mention of by the name of *Thlaspi saxatile rotundifolium:* the fifth called by *Lobel* in his Epitome upon *Matthiolus* and *in horto, Thlaspi iberinum saxatile,* and by *Bauhinus* in his *Matthiolus Thlaspi saxatile minore folio,* but in his *Pinax* and *Prodromus, Thlaspi Alpinum minus cappadocicum,* and by *Pona* in his description of Mount *Baldus, Thlaspi petræum Bryngroides:* the sixt is the third *Thlaspi* of *Matthiolus* which *Lugdunenses* and *Thalius* doe also mention, but *Thalius* his description thereof is much differing from ours and *Camerarius* upon *Matthiolus* saith hee never found that sort among rockes and stony places, but in the fields and under hedges, and therefore in his *Matthiolus* he setteth forth that figure of that which he grew with them, and omitted the other of *Matthiolus, Bauhinus* afterwards saith that such an one as *Matthiolus* his sort was brought him out of *Italy* and therefore he giveth the figures of them both in his *Matthiolus,* and *Prodromus* by the name *Thlaspi Alpinum minus & minus capitulo rotundo:* the seaventh is called by *Bauhinus* onely *Thlaspi Alpinum:* the eighth is the *Lithothlaspi quartum cæsalpini folio* of *Columna* and called by *Bauhinus Thlaspi petræum serpens rubens:* the ninth is called by *Bauhinus Thlaspi saxatile Polygali folio* according to the correction in his Appendix folio 519. at the latter end of his *Pinax,* but is among his *Thlaspies* folio 107. *Perfoliatum folio:* the tenth is his *Thlaspi supinum luteum* which *Bauhinus* entituleth *Thlaspi montanum incanum luteum Serpilli folio minus* which doth the eleventh *Thlaspi saxatile incanum luteum Serpilli folio minus,* and is the *Lithothlaspi tertium montanum luteolum* of *Columna:* the twelfth is called by the learned of *Montpelier, Thlaspi Veneris folio,* but *Bauhinus* saith is the *Draba minima muralis Dioscoridis* of *Columna,* and yet like much to be a *Draba* also, calling it *minor loculo oblongo,* but *Columna* saith it hath a sharpe taste like a *Draba* but in both the *differs:* the thirteenth and the last are mentioned by *Columna* under the same titles here expressed.

The Vertues.

These sorts of *Thlaspi* also as they are all or the most of them of the like sharpenesse in taste unto the rest, so they may be of the same qualities in operation but no speciall properties being set downe by any writer that have made mention of them nor other private experience, I cannot speake further concerning any of them.

Chap. XV.

Thlaspi clypeatum. Buckler-like *Thlaspi* or Treakle-Mustard.

A Fourth kind of *Thlaspi* is to be spoken of, whose difference from others consisteth chiefly in the seede vessels which are formed somewhat like a buckler, and thereof taketh the name, of which we have not many to entreat, but as they are they shall here follow.

1. *Thlaspi clypeatum Hieracifolium majus.* The great Buckler-Mustard.

This *Thlaspi* hath divers long leaves lying next to the ground, some-what like unto those of common Hawkeweede, but lesser and unevenly dented or rather waved about the edges, and a little hairy also, among which rise up two or three weake trayling stalkes, with a few leaves thereon much smaller then those below, without any dent or incision in them at all, at the toppes they divide themselves into a few branches, whereon are set many pale yellow flowers made of foure leaves a peece, which afterwards give place to round pouches divided as it were into two round parts like bucklers, the foote-stalke standing between them, and ending in a small pointell, in each side whereof is conteined one seede of little or no sharpe taste: the roote is small and tender perishing every yeare.

2. *Thlaspi clypeatum alterum minus.* The lesser Buckler-Mustard.

This lesser Buckler-Mustard hath lesser leaves but more rough and hairy then the former, deeply dented or waved about the edges, and from them riseth a small weake stalke, divided at the toppe into two or three branches with narrow leaves and small yellowish flowers, made of five leaves a peece at the toppes one above another as before, where afterwards stand small Buckler-like heads, and pointed in the same manner as are in the former but smaller as the seede is also: the roote is small and perisheth.

3. *Thlaspi clypeatum vel flore vel cale ari donato,* Spurre flowred Buckler *Thlaspi.*

The leaves of this *Thlaspi* that lye on the ground next the roote are about two inches long & halfe an inch broad, somewhat like unto the former but deeper gashes being hairy and of a light hoary greene colour: the stalke is likewise hoary and hairy of a foot high, set with such like borne leaves but lesser and compassing it about at the bottome branched at the toppe and bearing large pale yellow flowers consisting of foure leaves a peece, with a small heele or spurre behind like unto those of Todeflaxe, with a small pointell and some threads about it in the middle standing, which when the flowers are past appeare such like buckler like seede vessels as are in the former, parted into two cels, with a pricke in the middle betweene them standing forth: the roote is thicke and long of the bignesse of one little finger of a taste betweene sweet and sharpe, but the leaves and seede much more sharpe and biting upon the tongue.

4. *Thlaspi clypeatum minus Serpilli folio.* Small Buckler-Mustard with wild Time leaves.

This is a very small herbe not above foure or five inches high whose lower leaves are as small as those of Mother of Time, of a whitish yellow greene colour, those on the stalkes are like the other but smaller, and thickly

1. *Thlaspi clypeatum Hieracifolium majus.* The greater Buckler-mustard.

5. *Thlaspi clypeatum alterum Creticum.* The great Buckler-mustard of Candy.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

set thereon, the flowers are small and yellow like the last, and so are the seede vessells but cleare and transparent like cleare parchment somewhat yellowish: the taste whereof is small like the first.

5. *Thlaspi clypeatum arborescens Creticum.* The great Buckler-*Thlaspi* of *Candy*.

This hath the lower part of the stalke thicke short and woodily, the branches rising from them are of a cubits length and woodily also, with two hoary thicke leaves set all along the branches, many of them turning one way, bearing at the toppes sundry small white flowers, and after them round flat huskes, resembling little flatted Bucklers among the *Cruciferæ*, with small round flat seede within them, and somewhat sharpe in taste. The roote is thicke, short and woodily, with divers strings and fibres thereto.

The place.

Some of these sorts are naturally growing about *Montpelier* and the parts not farre off, some also about *Nice* as *Columna* reciteth, and the last in *Candy* as *Alpinus* saith.

The Time.

They flower and give their seede about the same time that the others before set downe do, or somewhat later.

The Names.

The first is called by *Lobel Thlaspi parvum Hieracifolium sive Lunaria lutea Monspeliensium*, by *Clusius Thlaspi clypeatum*, by *Camerarius Thlaspi bifurcatum vel Lunaria bifurcata*, by *Lugdunenses Lunaria lutea Dalechampij*, by *Thalius Leucoium montanum primum*, by *Columna Leucoium Alyssoides umbellatum montanum*, by *Lobel Thlaspi Cypreæ minimum*, but in *Herball* the figure is mistaken, the greatest in stead of the lesser as the description doth clare, and by *Bauhinus Thlaspi bifurcatum asperum Hieracifolium majus*: the second *Columna* calleth *Leucoium Alyssoides Apuli spicata* and by *Bauhinus Thlaspi bifurcatum asperum minus*: the third *Columna* calleth *Leucoium montanum flore pedunculo*, referring it rather to *Leucoium* then to a *Thlaspi*, although the seede vessells are same differing, but *Bauhinus* contrariwise maketh it a *Thlaspi* as it doth most fitly thereunto agree, and calleth it *Thlaspi bifurcatum violaceum flore cæruleo donato*: the fourth is called by *Lobel Thlaspi alterum minus Clypeatum Gallobelgicum Lugdunense Thlaspi minus clypeatum Pena*, by *Columna Thlaspi minimum pusillum luteum*, by *Dioscorides Leucoium Græcum quartum*, and by *Bauhinus Thlaspi clypeatum Serpillifolium*: the last is so named by *Alpinus* in his booke of exoticke plants as it is in the title.

The Vertues.

There is none of these herbes of halfe that fiercenesse or sharpenesse that many of the others before are, neither is any of them used in Physicke that I know for any purpose, but serve onely as varieties in some to please the curious.

Chap. XVI.

Thlaspi fruticosum. Shrubby, bushie, or wooddy Treakle-Mustard.

THis kind of *Thlaspi* is of those that grow greater then the rest and more wooddy like a shall bush, whereof there are some varieties here to be expressed.

1. *Thlaspi fruticosum Leucoij folio latifolium.*
The broader leafed wooddy Treakle-Mustard.

This broad leafed wooddy *Thlaspi* riseth up with a wooddy round stalke halfe a yard high bearing thereon long pale greene leaves like unto those of the Stock-Gilliflowers but shorter and narrower: the flowers that stand at the toppe are somewhat large and of a pale white yellow colour, after which follow seede vessells made like shields parted into two parts, as many other of the former sorts are.

2. *Thlaspi fruticosum Leucoij folio angustifolium.* Narrow leafed wooddy Treakle-Mustard.

This other wooddy *Thlaspi* spreadeth with many branches thicke set with narrow long leaves, even like to the lesser Sea *Leucoium*: the flowers at the top are white standing many together in short spikes, which are followed with small flat seede vessells like unto the first: the roote is white long and wooddy spreading much and growing

3. *Thlaspi fruticosum Hispanicum.* Spanish wooddy Treakle-Mustard.

This *Thlaspi* shooteth forth many weake hard and woodily stalkes, scarce able to stand upright, thicke set on sides with rough hairy leaves like unto Savory up to the toppe where grow many small white flowers in short spikes and after them small flat pouches with seede in them: the roote is hard and wooddy perishing every yeare.

4. *Thlaspi fruticosum spinosum.* Thorny Treakle-Mustard.

This thorny *Thlaspi* riseth up with diverse hard wooddy stalkes branching forth diversly, set in divers places with short and sharpe thornes, the leaves are dispersed on the branches without any order, in some places three together and at others more, which are small and long, pointed at the ends, and hoary as it were all over, but more on the underside: the flowers are white standing thicke together at the first, but afterwards grow into long spikes where come small seede vessells like unto the smaller sorts of *Thlaspi*: the roote spreadeth divers ways in the ground, and perisheth not but perisheth as the rest doe.

5. *Thlaspi incanum Mechlinense.* Hoary Thlaspi of *Mechlin*.

This Thlaspi of *Mechlin* groweth first with many long and whitish hoary leaves lying on the ground, afterwards bushing thicke upon the slender weake stalkes, beare a number of small white flowers at the tops in tufts, and afterwards spread more in length, where follow small round seede vessells a little pointed, containing small seede therein, and lesse sharpe then any others: the roote is long and white perishing every time every yeare, but rayling it selfe againe of the shed seede. Sometimes I have seene this kind of Thlaspi flowers but no seede neither did it endure long after in my Garden.

Vide chaplet.

2. Thlaspi procumbens folio Leucoij angustifolium.
Narrow leafed procumbent Treakle-mustard.

3. Thlaspi fruticosum hispanicum.
Spanish woody Treakle-mustard.

4. Thlaspi spinosum frutescens.
Thorny Treakle-mustard.

5. Thlaspi incanum Orientale.
Hoary Thlaspi of the East.

The Place.

Theſe ſorts grow in ſeverall countries, ſome in *France* about *Marſilles* and *Montpelier*, ſome in *Spaine* and *Italy*, and ſome in the *Low Countries*, the ſame alſo that were thought proper to ſome countries have been found alſo in others.

The Time.

They all flower in Summer, and give their ripe ſeede ſhortly after, but few of them abiding after the ſeede is ripe.

The Names.

The firſt is called by *Bauhinus Thlaſpi fruticoſum Lonicij folio latifolium*, as it is in the title; the ſecond is called by *Lobel* in his Obſervations *Thlaſpi fruticoſum folio Lonicij marini minoris*, whom *Lugdunenſis* and *Caſtreſis* alſo doe follow, but *Bauhinus* calleth it *Thlaſpi Lonicij folio anguſtifolium*; and *Camerarius Thlaſpi Lonicij biſarum*; the third is called by *Lobel Thlaſpi fruticoſum alterum*, and ſo doe *Lugdunenſis* and *Caſtreſis* alſo as *Cluſius* thinketh it is his *Thlaſpi ſecundum Hiſpanicum alba flore*, by *Bauhinus Thlaſpi fruticoſum folio Sorbi hortuſis*; the fourth is called by *Lobel* and other ſince him *Thlaſpi fruticoſum ſempervirens Narbonenſe* or *Thlaſpi ſempervirens* the laſt is called by *Lobel* and *Cluſius Thlaſpi incanum Alpeſtre*, by *Bauhinus Thlaſpi fruticoſum incanum*, who taketh it to be *Thlaſpi incanum frumentoſum Franconia* of *Camerarius* in parte, as alſo the *Iberis* of *Tabernæmontanus* which *Gerard* hath expreſſed under the title of *Thlaſpi fruticoſum*.

The Vertues.

Some of theſe ſorts as are ſharpe as any of the former which therefore may be judged as conducible to the greeſes the firſt ſorts were appropriate as they: the others that are little or nothing ſharpe are held to be unprofitable.

Chap. XVII.

Thlaſpi exoticum, Strange faſhioned *Thlaſpi*.

The laſt kinde of theſe Treakle-Muſtards are ſuch as are in forme of leaves, or growing farre differing from all the other kindes and not from the ſtrange countries where they grow.

1. *Thlaſpi hederaceum*. Ivie leafed Treakle-Muſtard.

This *Thlaſpi* ſhooteth up with many weake tender ſtalkes leaning downewards, and rather creeping upon the ground, than raiſing it ſelfe to be much above a ſpanne high, ſuperficially ſet with ſmall broad leaves, thicke and ſhort, broad at the bottome, cornered about the middle, and pointed at the end, fomewhat reſembling Ivye leaves: the flowers are ſmall and white growing ſpike fathion at the toppes of the branches, which afterwards yeeld ſmall round ſeede veſſells parted at the ends containing ſmall reane ſeede ſhaped like *Thlaſpies*: the roote is ſmall, long and fibrous periſhing every yeare.

1. *Thlaſpi Hederaceum.*
Ivie leafe Treakle Muſtard.

2. *Thlaſpi aliud Lunatis folijs ſive Creticum Anglicum Anglo-Lobij.*
Strange Moone-wort-like Treakle Muſtard.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Thlaspi sive Lunaria folijs sive Lunaria Magorum Arabum Lobelio. Sarasens Moonewort like Treakle Mustard.

Although it be not determined by *Lobel* to what genus this plant is to be referred, yet I have presumed to place it next unto the Ivie leaved kind untill it can be otherwise disposed, his discription thereof being briefe thus. It shooteth forth in *March* from an ash coloured tending woodily, three or foure leaves somewhat like unto a *Lunaria*, or like unto the new sprung leaves of the *French* round leafed Sorrell, and almost like also to those of the lesser kind of wilde Mustard, bee neither saw flowers nor fruit: he found this herbe such onely in *Italy*, in the mountaines between that high hill called *Mons Seny*, and Saint *Ioan de Maurienne*.

3. *Thlaspi Alexandrinum. Levant Thlaspi* or of *Alexandria*.

This small plant bee very beautifull, for it is halfe a foote high, from whose roote which is long and slender, do rise diverse slender stalkes, at each joint whereof where a broode doth groweth a large round leafe somewhat like unto those of Thorough wase, from the toppes of the branches come forth many flowers, and after them small round seede vessells ending in a point, parted in the middle by a skinne, wherein lie the small seede.

The Time.

Master *Lobel* saith hee foundin *Portland* which is an Iland belonging to *Cornewall* not farre from *Plimmouth* here in the West of *England*, and in divers of the sea coasts thereabouts: the second he likewise found he saith in *Italy* as I have before showne in the description: the last came from *Alexandria* and other parts of *Syria*.

The Place.

The first sowen and seeded plentifully both in the naturall places, and whether it is transplanted in the Summer moneths, as the second, as is said was not knowne: the last as comming out of an hotter climate is somewhat more tender, and hard to be kept a Winter, for it beareth not the first yeare, and hardly the next but very late.

The Names.

The first is called by *Lobel Thlaspi Italorum*, and so doth *Lugdunensis*, and others that have made mention thereof: *Gesnerus* calleth it *Thlaspi vetera herbarij folio*: the second is called by *Lobel Lunaria Magorum Arabo*, as he saith in *Volumine* doe call it: *Bauhinus* calleth the last *Thlaspi Alexandrinum* being so called by *Cornutus* who first set the same.

The Vertues.

There hath not as yet beene made of any of these sorts by any that I know, and therefore thus much shall suffice to have spoken of first of those and the others before, for I intended not to invent receipts of those things I mention, but to shew what I have reade or knowne to be practised.

Chap. XVIII.

Draba sive Arabis. Arabian Mustard.

Is nearest both in forme and qualitie unto the *Thlaspi* is this herbe *Draba* which I have Englished *Arabian* Mustard for want of a fitter name, for although the Latine or Greeke name (whether ye will, or neither if ye will) may seeme to argue an *Arabian* originall, yet we find that it was an adulterate a Greek name new Latine, and not thought to be of *Dioscorides* his own setting downe, but intruded by others into some copies of his, because others that are more authentick have not it all: the ancients have mentioned but one sort, but these later times have produced divers others, which have beene so called of the likenesse in some parts, although unlike knowne and common.

1. *Draba vulgaris.*

The more common or knowne *Arabian Mustard.*

This *Arabian* Mustard hath a creeping white roote, shooting in divers places many straight straked stalkes set with greyish, greene leaves, somewhat broad and woolly long, a little pointed at the end, and broad at the bottome compassing them, but those that grow at the toppe of them have every one a short foote stalke and deepely cut, about the edges: the toppes of the stalkes are parted into many branches, all of them riling to an equall height, whereon grow small white flowers set thereon of foure leaves apiece, forming a large tuft or umbell, where after come small round seede vessells, divided into two cells like those of the former *Thlaspies* with a little pricke at the ende, containing in each part one seede somewhat long, as the leaves are little and long: the whole plant maintaineth it selfe in the Winter and perisheth not.

2. *Draba minor Arabica vel Arabis Arabica.*

The lesser *Arabian* Mustard.

This smaller sort hath divers hairy leaves rising from the roote somewhat deepely cut about the edges, and standing upon long foote stalkes, from among which spring up a few stalkes of about an hand breadth high, having a few such lesser and narrower set thereon, and at the toppe and middle thereof plentifully stored with small white and yellowish beades on them (for the flowers have

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

not beene obserued) parted by a thinne skinne containing one seede in each part: the roote is small and for the smallnesse of the plant, with small fibres annexed thereunto and liuing many yeares.

3. *Draba tenuifolia.* Thinne leafed *Arabian* Mullard.

From a small long white roote rise brittle short stalkes about a foote long, with small branches towards the toppes, set with a few pale greene leaues of two inches long and one broad, dented about the edges and somewhat resembling them at the bottome, of a fierie hot and sharpe taste: the flowers stand at the toppes as it were spike-fashion, small and white, which afterwards giue small round heads every one set upon a long foote stalke.

4. *Draba alba siliquosa repens.* The more creeping codded *Arabian* Mullard.

This more creeping square codded *Arabian* Mullard sendeth forth many heads of leaues compassing one another circlewise, thicke full of joyce somewhat broad, dented about the edges and of a darke greene colour, sharpe and pricking upon the tongue, and from the midst of them seuerall weake stalkes a foote or more long, vpon whom grow smaller leaues and broader at the bottomes where they compasse them, set at seuerall distances, at the toppes whereof come forth diuers white flowers in a small tuft standing one aboue another, more liuely when they flower, making a long spike, and giue small long and round coddes, which parting into two parts, keepe the small reddish seede within them cleauing to each side: the roote is small and creepeth spreading and running.

5. *Draba alba siliquosa minor.* The lesser codded *Arabian* Mullard.

This smaller sort hath diuers branches of leaues rising from the roote which lying on the ground or a little couered with earth shoote forth small fibres whereby it creepeth farre about: the leaues are broad at the point, smaller at the bottome, dented into some deepe dents or notches, the greatest whereof are ouerst, of a darke greene colour which so abide the full Winter, and then somewhat easely before the beginning of Summer appearing, from among them rise sundry upright slender hairy stalkes halfe a foote high, set with lesser leaues which compasse the stalkes at the bottome, after which come slender long and round coddes, like to those of the greater Mullard, containing within them in a double row small reddish seedes: the roote is small and white, sending forth such like branches of leaues yearely abiding all the Winter after.

6. *Draba Cretica flore & siliqua.* Ballard *Arabian* Mullard.

This small plant hath diuers such like branches of hairy whitish leaues lying about the roote, slightly snagged about the edges, every one on a small foote stalke, from among which rise up weake and slender stalkes set with the like leaues and sundry small yellowish flowers at the toppes, whom small long coddes doe follow, containing small sharpe seede: the roote is of the bignesse of a finger, white and long, set without with very few fibres.

7. *Draba lutea.* Yellow *Arabian* Mullard.

The last plant is not so small as this is great, shooting forth square, but weake stalkes, foure or five foote long or more, not able to stand upright, but lie on the ground oftentimes, set orderly with long and somewhat broad greene leaues, a little hairy and dented about the edges, spreading many long branches, all of the whole

4 *Draba alba siliquosa repens.*
The more creeping codded *Arabian* Mullard.

5 *Draba alba siliquosa minor.*
The lesser codded *Arabian* Mullard.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

2. *Draba flore luteo.* Yellow Arabian Mouſe-ear.

with very ſmall yellow flowers growing ſcatteringly at the toppes with ſome ſmall leaves among them, which turne into very ſlender and limber long pods, with very ſmall yellowiſh ſeede in them very ſharpe and biting upon the tongue: the roote groweth to be very great and long, woody, very ſtrong and fierce both in ſmell and taſte, abiding under ground many yeares, but loſing all ſtalkes and leaves above ground every yeare.

8. *Draba flore cæruleo galeato.*

Hooded *Arabian* Muſtard with blew flowers.

For ſome like unto *Draba* is this plant referred hereunto, although in many things much differing: the roote conſiſteth of many long white ſtrings and fibres like unto the *Aſclepias* Swallowwort, of an hot but aromaticall and fragrant taſte, which uſually ſendeth forth but one ſtalke, yet ſometimes two, ſtraight, unooth and ſtraked, about halfe a foot high, ſpred into ſome few branches, bearing hoodded blew flowers like thoſe of Orchis or Dogs ſtones, in a thick long ſtanding on each ſide of them to the toppes: the lower greene leaves are about two inches long and ſcarſe one broad, ſmooth and dented about the edges, but thoſe that grow up higher and but few upon the ſtalkes are narrower and more pointed.

The Place.

The firſt *Cluſius* ſaith he found it very plentifully about the borders of the fields at *Vienna*, as others have done in *Hungaria*, and ſo likewiſe the fourth and fift, the ſecond being not mentioned where it grew, the third was found about *Rome*: the firſt *Lobel* ſaith groweth not farre from *Montpelier*: the ſeventh at *Tubing* neare unto the *Neccar* along *Heidelberg* and *Bornia* in *Rhætia* among the *Switzers*: the laſt is naturall in certaine places of *Italy* and *France*.

The Time.

They bee all flower in the moneths of *June* and *July* and their ſeed ripeneth in the meane time.

The Names.

They are called in Engliſh *Arabian* and ſome in Latine *Arabis* and *Draba*, but from whence deduced it is not yet knowne, although *Lobel* and *Pena* doe gheſſe much thereabouts: for divers writers have obſerved, that this herbe was never knowne to *Dioſcorides* nor mentioned by him, but thruſt into the text as I ſaid before by ſome unlearned: neither *Galen* nor *Oribaſius* who both followed *Dioſcorides* method and wrote moſt of the ſame things, make any mention thereof at all, no more doe *Ætius* nor *Paulus Ægineta* who in the ſame manner and ſucceſſion of the ſame herbes with *Dioſcorides*, no nor *Pliny* neither who wrote out of *Dioſcorides* the moſt of any, yet I finde thirteene that *Pliny* meaneth this plant under the name of *Dryophonon*: beſides it is twiſe found in ſome Greeke copies that are manuſcripts, firſt in the Chapter next unto *Thlaſpi* in his ſecond booke, where it is called *Draba*, the ſame booke betweene *Glaſtum* and *Telephium*, yet howſoever it is the herbe ſo named is now received, and accepted by that name among all the moderne writers of herbes, and although *Dodonæus* and ſhoughe the *Thlaſpi creticum* to be it, yet others ſhowe found hiſtories to be ſolide it. *Scorpio* the firſt is generally called *Draba* and *Draba vulgaris* by all Authors, and *Matthiolus* called it *Draba ſylveſtris*, *Lobel Draba ambellana*, *vel Draba major capitulis ſeminis*, the ſecond is called by *Lobel*, *Ranbonius* and by *Cluſius Draba minor capitulis orbiculatis*: the third is called by *Ranbonius* the fourth is called by *Lobel Draba vel Arabis altera* and ſo by *Lugdenſibus*, by *Cluſius Draba tertia ſuccuſento folio*, and by *Ranbonius Draba alba ſilueſtris*, which ſhewes it may be the *Planta ſiliquoſa Thlaſpeos generibus conjuncta* of *Thalius*, but *Thalius* doth not agree with *Lobel* his *Sinapi* and *Thlaſpi media planta*: the fift is *Cluſius* his *Draba ſolio ſerrato* called *Draba alba ſiliquoſa*: the firſt is that *Sinapi* and *Thlaſpi media planta* of *Lugdenſes*, followeth *Ranbonius* called *Draba Eryſimi flore & ſiliqua*: the ſeventh is mentioned in his Epitome under *Matthiolus* & in his *Hortus medicus* alſo by the name of *Arabis quorundam* and I ſhall eaſy more fully agree thereunto then unto the *Selinagines*, by which name he received it in *England*, which moveth me much to ſuſpect that this *Draba lutea* is the ſame herbe that was doe ſtudy

here

here in England call *Sedge. Sarasenica* and *Graminea filiquosa*, it doth so nearely answer it in every part, that it was also well knowne to *Bauhin* in his time, although mentioned by him in a contrary place from the *Sarasenica*, namely in the Chapter of *Erysimum* Barren-wort, where hee compareth the seeds of *Sarasenica* to the seeds of *Sarasina* continued, meaning this plant and not that which he had described before for *Sarasenica*, whose seede he saith is blowne away with the winde. *Bauhinus* in his *Matthiolus* calleth it *Draba* [illegible] in his *Pinax* *Draba latifolia siliquis*; the last *Bauhinus* hath onely mentioned by the name of *Draba* [illegible] which as I say doth hardly or very little agree unto any *Draba*.

The Vertues.

The seed of Mustard being as sharpe in taste as any *Thlaspi*, is accounted to be hot and dry, and thereby with as effectuall to all the purposes that Thlaspi or Cresses serve unto, and as it is in *Dioscorides* if the Pepper, or is used instead of Pepper to put among broths and meats, and also being boyled with Prisane, is available to rough fleame that lieth in the breast and lungs, causing it to be easely expectorate and spit forth.

Chap. XIX.

Turritis sive Turrita. Towers Mustard.

Of this herbe there are two or three sorts mentioned by some writers, whereof some of them as *Bauhinus* doth unto the kinds of wilde Colesworts, to whose nature I cannot accord in every point, in that the herbe is in part but the seede chiefly is as hot and sharpe in taste as the *Thlaspi* is, and therefore ought to be joyned next thereunto as containing neerest unto their family.

1. *Turritis vulgaris.* The more common Towers Mustard.

This more common sort of Towers Mustard hath many rough hairy leaves full of sappe or juice, of a dark green colour about two inches long and more then one broad, pointed at the ends and brondell'd or dented about the edges, lying round about the head of the roote upon the ground, from among which rise up divers rough and hairy stalkes neare two foote high, set orderly with such like leaves but lesser one on all sides thereof, but imbracing them at the bottome which are narrower & longer pointed then the rest, at the toppes of the stalkes which are seldome branched, grow many very small white flowers as it were in a tuft together, but flower by degrees the lowest first, and bring forth long slender cods presently after, which being upright round about the stalkes before the highest flowers are blowne, the whole stalkes seeme like Pyramis, Steeples or Towers from whence it tooke the name, in which cods are contained small browne cod shaped seed, the roote is compoted of many white fibres or strings seldome abiding after it hath given forth seed.

1. *Turritis vulgaris.* Common Towers Mustard.

2. *Turritis altera.* The greater Towers Mustard.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

...ed, there doth spring up divers plants before winter, and so abide to flowre and seede the next Sommer.

2. *Turritis maior*. The greater Towres-Mullard.

The greater sort spreadeth many leaves upon the ground somewhat greater & longer and not so rough or hairy as the former, somewhat crumpled and waved about the edges, and not a paler or whiter greene colour, almost of the colour of the wilde Colewoorts (which onely thing in my opinion caused *Bauhinus* and others to reserre these into the kinds of wilde Colewoorts) the stalkes rise higher and more branched, the leaves on them compassing them at the setting on, much more than the former, bearing small whitish yellow flowres at the toppes, and long slender cods (as unto the other after them) but somewhat longer more crooked, and not growing up so straight about the stalke, but more loosely or sparsedly, containing within them somewhat larger seede and not altogether so fierce or hote. The roote is white and thicke with fibres growing about it, which perisheth and is raised againe in the same manner.

3. *Turritis Alpina*. Mountaine Towres-Mullard.

The small mountaine Towres-Mullard groweth up with a small smooth round stalke little above a spanne high, having many small leaves at the foote thereof slightly waved about the edges, and of a pale greene colour, somewhat like those that grow upon the stalke which are not many, and they smaller and shorter and without foote stalkes at the toppes whereof stand many small white flowers to clusterling that they forme a short spike, every one standing on a long foote stalke: the codds have not beene well obserued: the roote is small and white.

The Place.

This delighteth to grow more on the open Sunnie hills, and the second more in the woodes and shadowye places, and both of *Austria* is truthfully as *Clusius* saith where the last was found also.

The Time.

These flower early for the most part sometime in *April* but usuall in *May*, and the seede is ripe in *June*.

The Names.

These herbes have not as yet beene knowne to any of the ancient Herbarists either Greeke or Latines, neither yet to many of our moderne Writers, for I finde none of them to make mention thereof by the name of *Turritis* or *Turritis* but onely in the *Dutch* Herball, *Clusius*, *Tabernamontanus*, and *Gesner* from him whose figures were cut for his Herball, and *Bauhinus* last of all, who yet, as I said in the beginning of the Chapter referreth them rather to the kinds of *Brassica sylvestris* wilde Colewortes. The first is called by *Clusius Turritis vulgatior*, and *Turritis* by *Tabernamontanus* who calleth it also *Lactaria* and *Bauhinus Brassica sylvestris foliis supernè & hirsuta*: the second is called *Turritis magna* by *Clusius*, but *Thalius Brassica sylvestris procera*, and *Bauhinus* following *Thalius* rather than *Clusius* calleth it *Brassica sylvestris ramosa foliis supernè glabra*: *Bauhinus* calleth the last *Brassica sylvestris Alpina*, although he had it was sent him by a skilfull Herbarist by the name of *Turritis Alpina*.

The Vertues.

Where sharpenesse of these herbes, and especially the seedes doe plainely declare them to bee *temperate* to the kinds Cresses, *Thlaspi*, and the like, and no doubt will worke the same effects, although I have no author hitherto that might declare any speciall properties in them, and therefore I leave them to every ones practise to try their vertues.

Chap. XX.

Iberis Cardamantica. Sciatica Cresses.

Sciatica Cresses are of two sorts, of both which *Matthiolus* entreateth but in several places, the one in the end of the first booke under the title of *Iberis*, the other under *Lepidium* in the second booke.

1. *Iberis Nasturtij folio*. Sciatica Cresses.

The *Iberis* riseth up with a round stalke about two foote high spread into divers branches, whose lower leaves are somewhat larger than the upper, yet all of them cut or some on the edges, somewhat like unto garden Cresses but smaller: the flowers are small and white growing at the toppes of the branches, which afterwards grow huskes like unto Cresses, with smaller brownish seede therein than in the other, very hote and sharpe as the more than the Cresses: the roote is long, white and woodily.

2. *Iberis latifolia*, Sciatica Cresses with larger leaves.

This hath the lower leaves whole, somewhat long and broad not rent or torne at all, but onely somewhat snipped about the edges towards the ends very like unto those of *Thlaspi Creticum* set forth here before in the first booke: those that grow up higher are lesser: the flowers and seede are like the former, and so is the whole herbe, and both roote and seede as sharpe as it.

The Place.

These grow by the waysides in untilled places, and by the sides of old walles, &c.

The Time.

They flower in the end of *June*, and their seede is ripe in *July*.

The Names.

[illegible] *Iberis sive Cardamantica quæ Cordum, id est, Nasturtium sylvestre.* If the text in *Dioscorides* his owne, which is plainely corrupted, as I have before noted, from the authority of *Hermolaus Barbarus*, see saith thus: *Iberis, quam Iberidem quidam alij Lepidium vocant, aut Nasturtium*, &c. and *Tragus* hath a Chapter in his second booke entituled for *Lepidium*, to which he referreth one herbe in two places, besides this *Iberis* is thrust into the end of his first Booke, [illegible] with the rest of the herbes there set downe before. *Gesner* also in his booke [illegible] doth never intreate of them severally as of two herbes, but still as of one. *Ruellius* likewise saith, that *Lepidium* was called *Iberis*, being hot in the fourth degree and neare unto

1. Iberis Cordifolia latifolia Scotica Cressa.

2. Iberis Cordifolia tenuifolia sylvestris Scotica Cressa.

Cressa in the properties: and in his third Booke and 77. Chapter, speaking *De Iasione*, he saith, *Iasonem ipsum Chironis fuisse discipulum, Iberide herba eius quem Lepidium quidam vocant*: they therefore that reprehend and make them different herbs are in an error, but the said *Paulus Ægineta* in the same Booke and place sheweth that there is another *Iberis* saying, *Iberis frutescit quæ aquatica nascitur Lauri folio simplici & crispo, sed minore, & spongiæ multos similes ramulos habente, non solum in cæsarum sed & aliis quoque Siciliæ agellis*; which *Iberis* or *Iberis altera* is very likely to be the *Lepidium* of *Pliny* in his 19. Booke and 8. Chapter, where he saith that *Eam Lepidium in subjectum sit condimentum simile Laurino*, which *Lepidium*, by the judgement of the best of the late Writers is that herbe which some call *Piperitis*, and some *Nasturtium Aquaticum*; as *Dioscorides* shall speake in the next Chapter. *Dioscorides*, as *Galen* the wel skilfull, called it *Iberis*, because he cured a friend his in *Iberia* with this herbe, which he learned of another who knew not the name thereof, and therefore *Dioscorides* in a Booke of his called *Cleinus* setteth downe in *Iambicke* Verses both the name of the herbe, and the place of growing, that others might know it, and the manner of the cure also for others to follow, which last recite were too tedious. *Pliny* calleth it *Iberis* mistaking the accent over the *Iota*, as it is likely. It is named also by some that is in the *Greeke Anthologie*. *Matthiolus* giveth the figure of the first in his great Volume, and the other in his leaser: *Angularis* calleth the first *Lepidium sempervirens*, *Fabernamontanus Iberis sativa*, *Dodonæus* and *Gerard Thlaspi Creticum*, and *Raulinus Iberis Nasturtij folio*: the other is called *Iberis* by *Lobel*, *Dodonæus*, *Lacuna*, *Gesner* in *Lucia* and *Cæsalpinus*, who yet saith it is *Lepidium sylvestre*, by *Dodonæus Lepidium hortense*; by *Lobel Iberis Cardamantica Lepidium Iberis Paulli*, and by *Raulinus Thlaspi*. The *Arabians* call it *Sataratz* and *Hanfah*: the *Italians Iberride* and *Lepidio*: the *Spaniards* [illegible] the *French Passerage sauvage* and *Nasiort*: the *Germanes Wilderkerss*, the *Dutch Sciatica Kerss*: and we in like wise Sciatica Cresses.

The Vertues.

The leaves, but especially the roote while they are fresh, taken in the Summer time, bruised and wrung out in juice with old *Hony* or *Sugar*, and applied to the place pained with the [illegible] thereon for foure houres in men, and two houres in women, the place also where it is applied being first well rubbed, and then wrapped with wooll or linnen: after they have [illegible] saith *Galen* from *Dioscorides*, not only the said disease in the fingers and joints of the hands, but also such as is the gout in the hands or feete, but all other old griefes of the head, as inveterate [illegible] ther part of the body that is hard to be cured, and saith also that *Dioscorides* cured [illegible] wherunto were *Sesamoides* used or *Thlaspi* applied. *Pliny* writeth the same method and manner as doth in his Verses, and saith that if any part of the sciatic remaine, the same medicine [illegible] plied againe: the same also is effectuall in the diseases of the joints, and applied to the same [illegible] blemishes thereof, whether they be scarres, or leprosie, or scabbes, or scurfe, &c. which although [illegible] part, yet that is to be helped afterwards with a salve made of oyle and wax. *Dioscorides* and *Pliny* say, that if the roote be hung about the necke, or tied to the arme it will ease the paines of the [illegible]

Cap.

Chap. XXI.

Lepidium sive Piperitis. Pepperwort or Dittander.

Having shewed you in the last Chapter that there is another *Lepidium* differing from these, I thinke it meete to shew you which it is, and place it next thereunto, and together with it expresse some others, that for their likenesse and properties have obtained the same name.

1. *Piperitis sive Lepidium vulgare.*
Dittander or Pepperwort.

Our common Pepperwort called Dittander, sendeth forth somewhat long and broad leaves, of a light blewish green colour finely dented about the edges and pointed at the ends, standing upon round hard stalkes three or foure foot high, spreading many branches on all sides, and having many small white flowers at the toppes of them, after which follow small seede in small heads: the roote is tender running much under ground, & shooting up againe in many places, and both leaves and roote are very hot and sharpe in taste like unto Pepper, for which cause it tooke the name.

2. *Lepidium Monspeliacum Dentellaria dictum.*
French Dittander or Scarre-wort.

This little weede is usually called *Dentellaria Rondeletij sive Narbonensis*, sendeth forth a number of long and slender stalkes, reddish at the bottome, and lying downe upon the ground, and not standing upright by reason of the length, which in my Garden became five or six foote long set with leaves on all sides of them, being somewhat narrow, long, and smooth, of a sadde greene colour smaller at the lower end, and compassing the stalkes about, but

1. *Piperitis sive Lepidium vulgare.*
Pepperwort or Dittander.

2. *Lepidium Monspeliacum Dentellaria dictum.*
French Dittander or Scarre-wort.

3. *Lepidium annuum.*
Annuall Dittander or Scarre-wort.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

lesser still up higher to the toppes, where they are a little branched, and doe breake forth into divers darke reddish flowers set together, consisting of five small pointed leaves a pece standing in rough brownish husks, wherein afterwards is contained small round and blackish seede very sharpe in taste, exulcerating the skinne and lippes if being layd thereon as the leaves doe also; the roote is composed of many great strings with a woodie substance in the middle, running downe deepe into the ground and abiding many yeares, although both stalkes and leaves perish every yeare gaining strength in the Spring.

3. *Lepidium annuum.* Annuall Dittander or Scarrewort.

This Dittander or Scarrewort hath stalkes more upright then the last, three or foure foote high, set with such like leaves as the last but somewhat larger and compassing them at the bottomes: the flowers are white, and doe grow upon small branches spike fashion one above another, which afterwards give small round and scanted flat cases like unto those of the *Thlaspies*, wherein the seede is contained no lesse hot and fierce in taste, and exulcerating the lippes, then in the former: the roote is small and fibrous perishing yearely.

The Place.

The first is found naturally growing in many places of this Land, as at *Chert* in *Essex*, neare *Enfield* also not far from *Redriffe* Common in *Kent*, at *Sawley Abbey* neare *Clitheroe* in *Lancashire*, and in other places, but usually kept in Gardens: the other two are found about *Montpelier* in *France*.

The Time.

The first flowreth in the end of *June* and in *July*, but the second very late with us in *August*, and never giveth seede in *England* that ever I knew: the last flowreth in *July* and the seede is ripe in *August*.

The Names.

Besides *Lepidium* in Greeke is so called as it is thought *quod squamulas seu maculas e squamarum interventu*, or as others thinke *quod vesicas seu quasi arrenones ulceres*. *Lepidium* also in Latine, yet this is not the *Lepidium* of *Dioscorides* and *Galen* which is a smaller herbe even the same I shewed you in the last Chapter, but it is *Lepidium sativum* of *Pauline Aegineta*, and *Plinie* his *Lepidium solis lautoris* also, as I shewed you before: *Dentaria* also of *Pliny* by *Fuchsius* and *Lonicerus*, by *Tragus*, *Matthiolus* and *Camerarius* *Lepidium sive Piperitis* by *Fuchsius* and *Lonicerus*, by *Tragus*, *Matthiolus* and *Camerarius* *Lepidium sive Piperitis magnum* by *Fuchsius*, *Turner* and *Cordus in Historia*, & *quorundam* rookes in rote *Lepidium Dioscoridis* & *Creticum Plinij* by *Lobel* and *Dodonaus*, and *Lepidium Pauli & Plinij* by *Matthiolus*, *Lugdunenses* and *Caesalpinus*: *Lepidium Raphanus sylvestris officinarum*, and by *Tabernus* *Lepidium latifolium*: the second is called *Dentaria Plinij* by *Gesner in horto* and *Eleomola*, who saith it is called at *Rome* *Herba sanctae Apollonie*, by *Lobel* and *Lugdunenses* *Dentellaria* and *Dentaria Rondeletij* and *Barbarea*, *Matthiolus* *Plinij* by *Angularia* and *Camerarius*, who also saith it is called *Crepanella* by the *Italians*, *Clusius*, *Durantes* and *Tabernemontanus* called it *Pentaphyllum Plinij*, *Pentaphyllo Plinij*, *Bellonius* saith that they of *Candy* call it *Saxifrage* they of *Lemnos* *Persicaria*, and they of *Lobe*, *Romania*, *Calopanus* calleth it *Glastum sylvestre* and *Bauhinus* *Lepidium Dentellaria dictum*, the last is called by *Lobel* *Lepidium omnium*, and so also by *Lugdunenses*, but by *Bauhinus* *Lepidium glastifolium*. We usually call the last in *English* Dittander and Pepperwort, but the other two may be called in *English* after the Greeke *synonyma* Scarrewort, eyther because it will make a marke in the hand of them that shall hold it a while, or else it will take away markes and scarres of wounds, sores, or burnings in the flesh.

The Vertues.

All these herbes are as hot and fiery sharpe as the last, and worke the same effects, for both *Paulus Aegineta* and *Plinie* say, that they are as effectuall for the Sciatica or Hip-goute or any other goute or paine in the joints, or for other inveterate greefs, the leaves hereof to bee bruised and mixed with old *Axungia*, and spread in the same manner, and used in the same order that the Sciatica Cresses are appointed before: the last also mundifieth the deformities or discolourings of the skinne, and helpeth to take away markes, scarres, and staines of the sowre markes of burnings with fire or *Iron*. The women of *Bury* in *Suffolke* doe usually give the juice thereof in Ale to drinke to women with child to procure them a speedy delivery in travaile. The others are judged by the learned men at *Montpelier* to be also of the same effect, for some of them take that of *Bauhinus* to be the right *Lepidium* of *Dioscorides*, wherefore such vertues are attributed by *Bauhinus*, who saith it is good against the toothach as the oyl of Pellitory of *Spaine* and moreover by holding some of the leaves in their hands that had the toothach did give them ease, and withall raise a marke or staine discolouring in the gaine of the tooth, and leave it so after it was cast away.

Chap. XXII.

Hydropiper sive Persicaria. Arsmart.

BEcause the last herbe was called *Piperitis* I thought good to joyne these, and although in truth there were onely two sorts of Arsmart knowne to all Herbarists, yet since *Bauhinus* hath added a third, a small one, *Fuchsius* a fourth, and we to increase their number are to joyne a fifth, which we

1. *Persicaria vulgaris acris sive mitis.* Ordinary quicke or sharpe Arsmart.

The quicke or sharpe Arsmart groweth not so high or great as the mild but hath more store of branches and leaves, some what like unto Peach leaves, and are long and sharpe at the ends one other, and most usually without any spot at all upon them, yet sometimes it hath beene found with markes upon the leaves at the greater joynts as well towards the toppes of the stalkes as in the middle, forth small spike heads of pale coloured, and sometimes coloured or white flowers, which falling away, blackish flat seede come in their places: the roote is somewhat long with many strings thereat, which as well as the rest of the plant is of a very sharpe and quicke taste, farre more then Pepper.

2. *Persicaria vulgaris mitis sive maculosa.* Ordinary spotted Arsmart.

This other Arsmart hath somewhat broader leaves set at the greater joynts of the stalkes with blackish markes on them usually yet sometimes without: the flowers grow in somewhat longer spike heads

whitish with such like seede following, the whole taste is of the same fashion and both perishing quickly. This hath no sharpe taste at all, but rather sower like sorrell, or else a little drying or without taste.

Parthenium Angustifolia. Narrow leafed Arsemart.

The small Arsmart hath reddish stalkes of a cubits height, with much narrower leaves at the joynts then the former, and at their toppes such cluster-like heads of seede as there but lesse by a great deale: the roote is blackish and thready.

Parthenium pusillum repens. Small creeping Arsmart.

The other small Arsmart standeth not upright at all as the former doe but leaneth downewards with the weake branches, which together with the small long narrow leaves are not by the halfe so great as either of the two first, and differeth not but in the smallnesse from them with sometimes white and sometimes purplish flowers.

5. Parthenium acre Virginianum.
Sharpe Arsmart of *Virginia.*

This Arsmart of *Virginia* is in most things like the first, yielding narrow leaves, but the flowers grow on more slender and lesse stalkes and wholly white.

6. Parthenium latifolium maculosa Virginianum, flore albo, Small spotted Arsmart of *Virginia* with white flowers.

This sort of *Virginia* Arsmart riseth up with sundry hard and greene stalkes with the like great joynts on them as the others have, and three large broad darke blewish greene leaves with small long points on them, spotted oftentimes like the common sort, and often also without markes, in some five inches long or better, and three and a halfe broad, with sundry compassing veines from the middle ribbe, and certain leiger and transverse at the toppes of the stalkes and on the joynts with the leaves likewise, spring branches bearing white flowers, like lose graines as in the

4. Parthenium pusillum repens. Small creeping Arsmart.

1. a. Parthenium vulgare minus & minus frequentatum.
Ordinary sorte of lesser Arsmart, and lesse spotted or mild sort.

6. Parthenium latifolium maculosa Virginianum flore albo, sive alterum Virginianum.
Small spotted Arsmart of *Virginia*, with white and with blush flowers.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

other but greater, succeeded by the like blacke and flat shining seede: the roote consisteth of a great bush of blacke stringes and threads which perish not yearely as the former doe, but abide from yeare to yeare, yet sometimes the stalkes with leaves above ground dye downe and rise afresh in the Spring.

7. *Persicaria alter a frutescens longifolia maculata Virginiana flore comoso.*

This other *Virginia* Arsmart groweth up with straight round stalkes, much higher than the last, with much longer and narrower leaves, marked also oftentimes in the like manner, and often also without: this is more specifull in branches of flowers, which are shorter spikes but thicker set, with fine bluish coloured flowers, much longer than in any of the former, but gave no seede with the Gentleman Mr. *John Morrice* of *Ilfarnam*, that had it risen from the seede that was sent him from a friend in *Virginia*: the roote is greater and more woody than the last, and perished with the extremitie of the hard winter frost.

The Place and Time.

The former two sorts grow almost every where with us in watery plashes, ditches, and the like, that be almost part arte drie in Summer: the third in *Germany*: the fourth in the like places about *Antwerpe*, as *Lobel* saith: the three last sorts came from *Virginia*, the former sorts flowering in *June*, and their seede being ripe in August, but the other sorts flower much later with us, and scarce perfect their seede except the last.

The Names.

It is called in Greeke ὑδροπέπερις id est, *Piper aquaticum*, many doe call it also *Hydropiper* in Latine, and generally *Persicaria a folioram forma*, yet some distinguish them, calling the milde or gentle sort *Persicaria* simply, and the other *Hydropiper* or *Persicaria acuta*, as *Lobel* doth, or *mordax* as *Thalius* doth: some as *Lugdunensis* only would make the spotted sort to be *Plumbago Plinij*, because of the leaden like spots on the leaves: but they are much deceived: some also call it *Britannica Plinij*, but they are as farre wide as the other: *Lacuna* calleth it *Chondrogonum*, and *Anguillara* calleth the sharpe sort by that name of *Cratogonon*, and by some *Zingiber sylvestre*: the third is onely remembred by *Bauhinus*, the fourth by *Lobel*, and the three last by no other before: the *Italians* call it *Persicaria*, the *Spaniards Mustiola*, the *French Culrage*, the *Germans Wasser pfeffer*, and *Wilde pfeffer*, the *Dutch Water peper*, and we in *English* Water pepper and Arsmart, and in some countries Red Arse.

The Vertues.

The milde Arsmart is of a cooling and drying qualitie, and the other contrarie is hot and drie: the hotter very effectuall for putrid ulcers, either in man or beast to kill the wormes, and cleanse the putrified place: the juice thereof dropped in, or otherwise applied, it likewise consumeth all cold swellings, and dissolveth the congealed blood of bruises by strokes, falls, &c. a peece of the roote, or some of the seede bruised and held to an aking tooth taketh away the paine: the leaves bruised and laid to the joint that hath a felon thereon taketh it away: the juyce dropped into their eares that have wormes in them destroyeth them quickly: if the herbe be strewed in a chamber it will soone kill all the Flies therein: and if the herbe or juyce thereof be put to horses or other beasts sores, it will drive away the Flyes that will flicke thereto, even in the hottest time of Summer: a good handfull of the herbe put under a horses saddle, will make him travell better, although hee were galled before. The milde Arsmart is held to be good against hot impostumes and inflammations at the beginning, and to heale greene wounds.

Chap. XXIII.

Thlaspi vulgare. Common field Pelletory or Sneeseworte.

NExt unto Dittander should follow Tarragon called *Tarchon* and *Dracunculus hortensis*, *Estragon*, being of the like hot and sharpe biting taste, but that I have entreated thereof in my former Booke, as also of the garden Dragons, whose figure I herewith shew you, & must in this Chapter shew you of *Pyrethrum vulgare*, ordinarily called wilde Pelletory and Sneeseworte, of which kinde also I have set forth one with double flowers in my former Booke. *Pyrethrum alterum vulgare*, called by us Pelletory of *Spaine*, although set forth in my former Booke. Vnto this I must adde an other stronger scarce known to much as by name to our Nation. This common Pelletory shooteth forth diverse tender stalkes a span high or more spread into tender branches, whereon are set narrow long leaves pointed at the ends, and finely dented about the edges standing one above another up to the toppes, where grow many white flowers in a round tuffe together, somewhat like unto those of Yarrow or Millfoyle, with a very small yellowish thrumme in the middle bordered about with very short whitish leaves dented in at the broad ends, which falling away leave behind them small heades with chaffie seede therein: the roote is long and whitish joynted at several distances, growing fast about under ground: both leafe and roote are of an hot sharpe biting taste, like unto the true Pelletory of *Spaine* whereof it tooke the name.

2. *Pyrethrum vulgare efficacius.* Pelletory of *Spaine*.

This is a small low plant bearing many finely cut long leaves upon the stalkes lying on the ground, much like unto Camomill, bearing at the toppes of each one single large flower having a pale or border of many leaves white on the upper side, and reddish underneath set about the middle yellow thrumme, but not standing so thicke joyned as the bottome as the Camomill flowers doe, but more severed one from another: it beareth small whitish seede which is hardly found and discerned from the chaffe: the roote is long growing downeright but of the bignesse of a mans finger or thumbe in our country, but not halfe so great where it groweth naturally, with many fibres from the sides, of a very hot, sharpe, and biting taste, drawing much water into the mouth being chewed after it hath been dried, but nothing so much while it is fresh and greene: the plant is very tender, as not enduring our Winter, unlesse it be very carefully preserved.

3. *Pyrethrum Alpinum sive Ptarmica montana Alpina Scabiosæ folio.* Wilde Pelletory with Scabious leaves.

This mountaine Pelletory hath round stalkes about a foote high, spreading some branches towards the toppes whereon are set divers long pale greene leaves on both sides one above another as in the former, but more deepely cut in on both sides, somewhat like unto a Scabious leafe: at the toppes of the stalkes and branches &c.

Pyrethrum sylvestre. Wilde Feltwort or Spanish Camomile.

Pyrethrum majus vulgare. Ordinary Dragons.

sometimes somewhat larger than the other, else not much unlike having a border of pale or white leaves, set about a middle thrum: the roote hereof is more stringy and fibrous than the other.

The Place.

The first groweth in fields and medowes by the hedge sides and path wayes almost every where, and in lanes also and waste grounds, the other in *Spaine* and divers other countries: the last was found in the mountainous fields of *Helvetia* or *Switzerland* and other parts there abouts.

The Time.

The first and last flower in the end of *June* and in *July*, and the seed not untill *August* with us, and seldome giveth ripe seede unlesse carefully preserved in the Winter.

The Names.

It is called in Greeke Πυρεθρον Ρωμαϊκον, quasi Ignis Romanica, quasi Sternutatoria, or Sternutamentaria, as it is also in Latine from the effect of procuring sneezing. The first is diversly called by divers. *Tragus* calleth it *Pyrethrum album sive acutum*, & *Millefolium primum*, *Gesner* calleth it *Pyrethrum sylvestre vel aquaticum*, & *incultum*, *Fuchsius* *Pyrethrum*, *Dioscorides* *Pyrethrum*, *Cordus* on *Dioscorides* *Pyrethrum sylvestre*, *Octavius Horatius* *Draco sylvestris sive Pyrenica*, *Lobel* stretcheth it to that plant which *Lugdunensis* calleth *Cotula fœtida sperati alterius Alyconii*, and yet maketh it also a kinde of *Chamæmelum*, *Thalius* *Pyrenica sylvestris Germanica*, *Clusius* *Pyrenica quarundam*, *Lobel* *Pyrenica folio Paracoms vel Stervo*, *Matthiolus* *Sideritis*, *Gesner*, and others *Pyrenica*, and *Matthiolus* *Pyrenica altera sive Salvia*: the second is called by *Matthiolus*, *Lugdunensis* and *Dodonæus* *Pyrethrum sive Britannica*, and of some *Salivaria*, but *Gesner* in horto *Matthiolus*, *Lugdunensis* and *Dodonæus* *Pyrethrum sive Britannica*, the *Spaniards* *Pelitre*, by *Matthiolus*, *Lugdunensis* and *Dodonæus* *Pyrethrum sive Britannica*, the *Spaniards* *Pelitre*, by *Lobel* *Pyrenica sive Britannica*, the *Spaniards* *Pelitre*, by *Dodonæus* who calleth it *Pyrethrum vulgare Alexandrinum*, by the *Arabians* *Akarcarha*, by the *Italians* *Radix Matricaria*, or *Matricaria*, by the *Italians* *Pelitre*, by the *Spaniards* *Pelitre*, by *Lobel* *Pyrenica sive Britannica*, the *Spaniards* *Pelitre*, by *Dodonæus* who calleth it *Pyrethrum vulgare Alexandrinum*, by the *Arabians* *Akarcarha*, by the *Italians* *Radix Matricaria*, or *Matricaria*, by the *Italians* *Pelitre*, by the *Spaniards* *Pelitre*, by the *Germans* and *Dutch* *Bertram*; in English wilde Pellitory, or wilde Pellitory of *Spaine*, the second is called the true Pellitory of *Spaine*.

2. Pyrethrum vulgare officinarum. Pellitory of Spaine.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

The Vertues.

Wilde Pellitory is hot and dry in the second degree while it is fresh and greene, but in the third degree when it is dry. An ounce of the juice thereof taken in a draught of Muscadine an houre or two before the fit of an Ague and presently layd to sweat, will assuredly drive away the Ague at the second or third fit: and taken in the fartherest: the herbe dryed or the roote chiefly chewed in the mouth draweth downe from the head much fleame, and is thereby available to ease the paines in the head and teeth, and to draw forth cold rheume, cate the ague & fluxions upon the Lungs or distillations into the eyes, it mightily also purgeth the braine from those humours that are the cause of the Appoplexie and Epilepsie or falling sicknesse: it helpeth also to consume the superfluous moysture of the head and braines, that falling into other parts of the body is the cause of many diseases, and much trouble thereunto: the powder of the dryed herbe or roote put up into the Nostrills purgeth fleegme, which oftentimes doth ease the head-ach, the leaves or flowers bruised and made into a salve or pomatum with old Hogs grease, being applyed taketh away blacke and blew spots that come by throakes or falls or bruises, as also all sore sores or blemishes in the skinne, and is also good for the Goute and Sciatica. The true Pellitory of Spaine is not commonly used for the toothach, by the root it selfe or with other things to bee chewed in the mouth, for which it is to be used with oyle, and rubbed on the parts that have shaking fits of Agues.

CHAP. XXIIII.

Raphanus Rusticanus. Horse Reddish.

THe kinds of Garden Reddish I have declared in my former Booke, & therefore need not to describe the againe, but onely to shew you their Figures and with them the Horse Reddish, whose first leaves that rise up before Winter are about a foote and a halfe long, narrower and very much cut in or torne on the edges into many parts, of a darke greene colour with a great rib in the middle, but after these have beene up a while others follow which are greener, rougher, broader and longer, whole and not divided as the first, but onely somewhat roundly dented about the edges: the stalke when it doth beare flowers as it doth but seldome is great, rising up with some few lesser leaves thereon to the height of three or foure foote, spreading at the toppe into many small branches of whitish flowers made of foure leaves a peece, after which come small pods like those of the lesser Shepherds purse, but seldome with any seede in them: the roote is great, long, white and rugged, shooting up divers heads of leaves which may be parted for increase, but it doth not creepe within the ground, nor runne above ground, and is of a strong sharpe and unctuous taste almost as Mustard.

Raphanus rusticanus. Horse Reddish.

The Place.

It is found wilde in some places of this Land, but is chiefly planted in Gardens where it loveth in a moyst and shadowy place.

The Time.

It flowreth as I sayd but seldome, but when it doth it is in *May*.

The Names.

It hath no Greeke name that I can finde for it *Dioscorides* his Copies beeing true it cannot bee his *Raphanus sylvestris*, called by the *Romans Armoracia*, for hee maketh the roote thereof to bee small, and the leaves tender and fit to bee eaten which cannot agree hereunto, yet *Lobel* is confident that it is the *Armoracia* of *Pliny*, and thinketh that it is the *Thlaspi arvense* and *Lonchitis* of *Theophrastus lib. 7. cap. 4.* which *Pliny* reciteth under *Thlaspi*. It is called *Raphanus Rusticanus* by *Lobel*, and *Raphanus vulgaris* and *Rusticanus* by *Matthiolus*, *Raphanus Pharus major* and *Radicula magna*, *Armoracia* and *Raphanus major* by *Brunfelsius*, *Raphanus major* by *Tragus*, *Gesner*, *Cordus* upon *Dioscorides* and *Lonicerus* call it *Thlaspi majus* and *maximum*, and *Lobel* doth also judge of it also, for he calleth it *Raphanus Rusticanus Thlaspi alterum Dioscoridis lib. 2. cap. 172.* But [illegible] booke and 15. Chap. hath faulted much, in reciting the kinds of Reddish with the Greekes to make [illegible] he taketh out of *Theophrastus lib. 7. c. 4.* where he by the word *Lepidion* doth not understand Reddish as the learned doe well know that reade him, and that agreeth with him is as it is thought *Scandix* Reddish, whereof in the same Chapter he mentioneth five sorts, *Corinthia, Cleonea, Lonchitis, Bacris* and *Pelopponesia* wild sort with Rocket-like leaves which *Athenæus* calleth *Anarrhea*, and *Pliny* inverting the word *Lepidion*

Original from UNIVERSITY OF MICHIGAN

Raphanus sativus. Garden Reddish.

Raphanus niger rotundo oblongus radice.
The round or crooked blacke Reddish.

Nigra, called *viridis*; the *Corinthia* saith *Theophrastus* is the greatest, whose roote is bare above ground, growing upwards and not downewards as the rest doe. *Lunbolasia* called of some *Thracia*, doth best indure the cold; *Nostra* is sweetest, the forme being small and round, when as the *Clonaea* is somewhat long. Now let any one observe all these sorts rightly, to the kinds of Reddishes knowne to us. *Et erit mihi magnus Apollo.* The *Italians* call it *Ramorazzo*, the *French Grand raphanon* and *grand raifort*, the *Germans Merrettich*, (and thereupon *Tragus* calleth it in Latine *Raphanus marinus*) and some *Kren* or *Kren*, the *Dutch Metteradys* and wee in English Horse Reddish, Mountaine Reddish, and in the North greene Reddish, but better I thinke Clownes Mustard for it is too strong for any tender stomacke.

The Vertues.

Horse Reddish is hot and drie in the third degree: with the roote salt and vinegar is made a Mustard, much used with country people and strong labouring men in some countries of *Germany*, &c. and in our owne land also, but I find it is too strong for tender and gentle stomackes, for as *Oribasius* saith, to those that use it, it burteth the head, and causeth sharpe and soure belchings, but it is of much good use to the paines of the raines, bladder, and loines, provoking much urine and helping to separate the gravell from the stone and to expell it, being boyled with honey and vinegar into an Electuary: it is also a good remedy in strong bodies, both for the Cough, the Tisike and other diseases of the lunges, as also to procure womens courses that are stopped; the same also provoketh vomiting and sweating, is often given before the fit of the *quartane* ague to alter the course: the juyce given in drinke is held to be very effectuall for the scurvey: it killeth the wormes in children being drunke, and being laid upon the belly, the roote bruised and laid to the place grieved with the Sciatica-gout, joynt-ach, and paines and swellings of the spleene and liver, doth wonderfully helpe them all: the distilled water of the herbe and roote is more familiar to be taken with a little Sugar for all the purposes aforesaid.

Chap. XXV.

Rapistrum. Wilde Rape or Charlocke.

What *Dioscorides* shall shew you the sorte of wild Rape called Chadlocke or Charlocke with us, whereas there are more sorts knowne at these times then formerly were to the ancient writers.

1. *Rapum sylvestre non bulbosum.* The wild Rape or Turnep.

The leaves hereof are very like the garden long Turnep, but growing thicker and more plentifully upon the stem, crumpled and tough in handling, the roote is long and slender, in the rest it differeth

2. *Rapistrum*

2. *Rapifrum alterum sylvestre non bulbosum.*
Another wilde Parsnep.

This other sort hath smaller leaves at the bottome not jagged, but those that follow are larger and somewhat jagged and waved, the flowers are yellow and the seede flat, and of a whitish yellow colour in small long pods somewhat sharpe.

3. *Rapum sylvestre sive Rapistrum anglorum.*
Wilde Charlocke.

This wilde Rape hath many long and broad rough leaves hairy and greene, lying upon the ground round about the roote, somewhat deeply gashed in on the edges and round pointed; from among which riseth up one slender and hairy stalke seldome many, branched from the middle upwards into many parts, with diver. lesser leaves on them up to the toppes where stand divers yellow flowers of 4. or 5. leaves a peece after which follow some what long and rough pods, not very slender with divers round small reddish browne seede therein like unto Mustard seede but larger, as quicke and sharpe in taste but more bitter then it: the roote is long and white, and growing woodily when it runneth up to stalke and perisheth after seedetime.

4. *Rapistrum alterum anglorum.*
Another wilde Charlocke.

This other wilde Charlock hath large leaves waved in but not cut or jagged as the former, the upper leaves being whole and smaller, the flowers hereof are pale yellow and the pods following are not more smooth with a shew of divisions in them, and is annuall also.

5. *Rapistrum album dentatum.*
White wilde Charlocke.

This Charlocke groweth up with fewer, smaller and rougher leaves in some little or nothing jagged in others more: the stalks are rougher and lower then the others, the flowers likewise grow not so many together, neither are so great or yel-

4. *Rapum sylvestre non bulbosum.*
The wilde Rape or Turnep.

2. *Rapistrum aliud sylvestre non bulbosum.*
Another wilde Turnep.

5. *Rapistrum album.*
White Carlocke.

yellow, but either pale yellow or more white, after which come smaller rough pods with sundry divisions in them, with smaller browniſh ſeede nothing ſo fiery hot as the other: the roote is ſmall and long ſo have others ſomewhat thick and rounder neare unto a ſmall long rooted Turnep. Of this kinde alſo ſome are found with a purpliſh flower.

Flore purpureo.

6. Raphanus album nigris lineis. Charlocke of *Naples*.

The Neapolitane Charlocke hath the greene leaves next the ground like unto thoſe of the Garden Radiſh cut in or rotne on the edges in the ſame manner but harder and rougher, the ribs on the under ſide leaves ſtalkes rough, but thoſe that grow upwards on the ſtalkes which are two foote high and are divided, and ſhorter lower and next the flowers long and narrow, without any inciſure at all: the flowers are white with long blacke veines in them and the pods that follow are ſmall and long with ſmall ſeede in them, nothing ſo hot or ſharpe as the former: the roote is white and long, ſharper in taſte then the leaves which are in a manner herby without ſharpneſſe.

7. Raphanus parvus Maſſilienſis. Charlocke of *Marſelles*.

This ſmall Charlocke groweth not above foure or five inches high, with ſmall rough leaves with few diviſions in them of an inch long, and dented about the edges, the flowers are ſmall and of a pale yellow colour like unto the Sea Stocke gilliflower, the pods that follow are ſmall and long containing ſmall ſeede within them, the roote is ſmall and white.

8. Raphanus monoſpermus. One grained Charlocke.

The lower leaves of this Charlocke are ſomewhat large thicke and hairy, of a very freſh greene colour cut on both edges at the bottome, but broader at the ends where they are finely waved, the ſtalkes alſo are ſomewhat hairy about a foote high or more, ſet with a few ſuch leaves as the loweſt but ſmaller and branching forth at the top long ſpikes of gold yellow flowers the length of ones hand, in whoſe places come ſmall rounde ſhaped ſeede huskes with a ſmall point at the end, containing in every one of them but one ſeede from whence it hath the name: the roote is long, and white, and ſomewhat fibrous.

9. Raphaſtrum maximum reticulatum monoſpermon Hiſpanicum. *Spaniſh* one grained Charlocke.

This *Spaniſh* kinde differeth from the former *French* or *Dutch* ſort ſet forth by *Bauhine*, in that it groweth higher, with larger leaves divided into parts, the end peece great, round, and more hairy: the branches many, the flowers large and white in yelloweſh huskes without any threde in the middle: the ſeede alſo rounder and not pointed at the ends.

The Place.

The firſt is found wilde in ſundry places, but for the profit of the ſeede is ſowen in fields in divers countries of this Land: the ſecond I found going from *Shordich* by *Bednall Greene* to *Hackney*, the third, fourth and fifth are found as well in Corne fields as in the fallowes, and in the borders and hedges of them, as alſo on dunghilles and untilled and waſte grounds: the laſt is of *Naples*, the ſeventh of *Marſelles* in *France*, the eighth in divers places of *Germany* as well as at *Montpelier*, and the laſt in *Spaine*.

The Time.

They doe flower and ſeede the one or the other all the Sommer long.

The Names.

They are diverſly named by divers, for ſome would make them to be ſorts of *Eruſimum*, others of *Sinapi*, and others referre them to the *Lampſana* of *Dioſcorides*, but they tooke their name *Raphaſtrum ſpuriorum Raphanorum* for the moſt part, and therefore ſome would name them all wilde Turneps. The firſt is the *Lampſana* of *Matthiolus*, *Lugdunenſis* and *Tabernamontanus*, and *Raphanus ruſticanus* of *Lobel*, the ſecond not ſet out in any author before, the third and fourth are called *Raphaſtrum* by *Bruneſelſius*, *Dodonæus* and *Gefnerus*, and *Raphaſtrum arvenſium* by *Lobel*, *Matthiolus* calleth it *Lampſana*, and ſo doth *Augustanus*, *Gefnerus* alſo, *Lobelius*, *Lugdunenſis* and *Gerard* their figures declaring it, *Lugdunenſis* maketh it to be *Lampſana altera*, and *Tragus* to ſtretch in the fourth *Sinapi agreſtis*, *Fuchſius* and *Turner* call it *Erion*, *Camerarius* and *Coſter Durantes Eruſimum*, and *Raphanus Raphaſtrum ſpecies*: the fifth is the third *Sinapi agreſtis* of *Tragus*, *Lampſana* of *Turner* and *Coſter* who ſo calleth it *Radix ſylveſtris*, *Raphaſtrum flore albo Erucæ folijs* of *Lobel*, of *Gerard Raphaſtrum arvenſe*, and yet the figure of *Raphanus ſylveſtris* is agreeable unto this rather then unto *Dioſcorides*, for which he ſeemeth it, the roote chiefly declaring it which are not made to be ſmall and creeping, of *Tabernamontanus* *Armoracia ſpuriorum Raphaſtrum album* and *Raphaſtrum purpureum*: and of *Bauhinus Raphaſtrum flore albo ſiliqua articulata*: the ſixt is called by *Columna Lampſana Apula Plinij & Dioſcoridis*, and by *Bauhinus Raphaſtrum flore albo maximo*: the ſeventh in my table is *Raphaſtrum album nigris lineis*: the ſeventh *Bauhinus* onely hath ſet forth by the name of *Raphanus ſilvis Lavendulæ marinæ*, but I have entituled it *Raphaſtrum parvum Maſſilienſe*: the eighth *Bauhinus* hath mentioned in his *Matthiolus*, *Phytopinax*, *Pinax* and *Prodromus* by the name of *Raphaſtrum monoſpermon*: the laſt is entituled in *Carolus* hiſtory of *Canada* plants: the *Germans* call it *Gurtheare* and *Hederick*, the *Dutch* *Hederick*, and in *English* Charlocke, Chadlocke and Kedlocke.

The Vertues.

The ſeede of the Rape that groweth naturally wilde is hotter then that which is manured and ſweeter and leſſe bitter alſo, whereof ſome doe make uſe inſtead of Muſtard ſeede, or mingle it therewith, but the oile that is got out of the ſeedes is that Rape oyle that is uſed in Lampes, and therefore called Lampe oyle, and is much uſed for that purpoſe then the Traine oyle which is made of the Whale, which Rape oyle in divers Countries is in many, and ours ſerveth to make ſope withall in the head of Oyle Ollive, as alſo to fry their fiſh, but it is not uſed in Phyſicke, but is in a manner wholly ſpent for the uſes before ſayd, or to feede ſmall birds. The other ſhall have as little uſe in medicines as the former, and therefore untill I can learne ſome properties I ſhall not ſet downe any unto you.

Chap. XXVI.

Bunias sive Napus sylvestris. The wilde Navew.

The Navew differeth little from the Turnep either in leafe flower or seed that they are hardly known asunder, of both which being garden herbes, whose rootes are to be eaten and therein chiefly to be distinguished, I have spoken in my former bookes; but the wilde kinde hereof I am to speake in this Chapter, which differeth almost as little from his owne kinde of the Garden, as the Garden kinds themselves doe one from whom I must adde one stranger not well knowne to many.

1. *Bunias sive Napus sylvestris & noſtras.* Our wilde Navew.

Whereto saith *Lobel* hath seene and knowne the manured Navew, may soone upon the sight hereof say it is the same of it, because it is so like thereunto in the long and not hairy leaves, more or deepelier jagged then in other kinde, the flowers also are yellow, and the small pods like it but more sharpe but and biting: the root is somewhat ruberous, round and long of the bignesse of ones thumbe or thereabouts, with many strings thereto.

2. *Bunias sylvestris Cretica.* Candy wilde Navew.

The Candy wilde Navew hath divers rough leaves of the one side next hand somewhat like unto the leaves of the manured Charlocke, or the wilde hedge Mustard, dividing into divers gashes on both sides, and each of them ending in a point: the stalk is white round & rough, diuiding into many branches each of them ending in a sharpe pod: the flowers stand not at the toppes but on the sides, with the rest with the uppermost leaves whose colour is not described, but the cods that follow them are very slender and small, about two inches long.

The place.

The first is often found wilde by the hedges and wayes sides upon ditch bankes likewise, and in clay grounds readily, and is found in any other: the other was sent from Candy.

The Time.

They flowre about the same time that the Charlocks do.

The Names.

The manured Navew is called *Bunias* in Greeke of Apuleius, to this wilde kinde is called *Napus sylvestris* in Latine, *significantibus veteribus Graecis, sed vapidi, hoc nomine, quam ſylvestres*; but *Galen* putteth no difference betweene *Bunias* and *Gongylides*, as indeede there is not in the forme and greatnesse of the roote and leaves. *Fuchsius* hath much erred herein, for in the second and fourth Chap. he saith, that the Greekes call the one they called *Bunium* which I have referred to the manured, and *Bunias* to the wilde, which by the judgement of the learned cannot hold true, for that *Bunium* is a farre differing plant. *Theophrastus* and *Dioscorides* also declareth it plainely, entreating of *Bunias* in one place, and of *Bunium* in another. *Plinie* in lib. 19. cap. 5. maketh *quinque genera Naporum*, five kinds of Navewes mistaking the one for the other, mistaking it to be *Napus*, for it is evident that he taketh this division from *Theophrastus*, who speaketh of foure sorts *non ſatorum, Raphanorum* and not *Naporum*. There is a great controversie betweene learned men, whether of the sorts of *Bunias* or *Napus ſativus* or *ſylvestris*, the seede should be taken to be put into the *Theriaca Andromachi*, some following the Greeke verses of the Father, others the Latine verses reformed and translated into Latine verses, extant in *Galen* Latine workes, who mentioning the seedes, which all doe understand to be the manured kind, and which *Dioscorides* commendeth not white (and therefore) to bee good against venome and poison; and some following the same, who in a continued stile or profe in setting downe the said receipt, saith, the seede which many of our moderne Physitions doe better allow of, because they have more acrimonie, and they are thought to be more vigorous then the same kinde, which is more sweete, even as the more acrimonie in it is taken for that composition, and for Mithridate also, before that *de Andria*, examining the ingredients into *Andromachus* Treakle saith the seed commeth from *Candy* is to be taken in that place. The first is called by *Tragus Rapum* and the other *Napum*, but that by his description seemeth to be taken for the same kinde hereof, that the manured Turnep did bear no appearance unto the first wilde Turnep, but that by his description seemeth to be taken for the same kinde hereof, that the manured Turnep, and used to be eaten of the poore wilde they are that the roote is ruberous which this rape is not. *Turner* calleth it *Napus agrestis*, *Leyserus* and *Napus ſylvestris* and to both *Ruellius*, *Lobel* calleth it *Bunias ſylvestris*, and *Napus*, and *Lobelius* *Napus ſylvestris*. The other *Ruellius* had it sent him from *Honorius Belon* in *Candy*, yeelding the name of *Bunias ſylvestris*

1. *Bunias sive Napus sylvestris.*
Our wilde Navew.

sylvestris and called by the *Cretanes* Seibobrenbes, the *Italians* call it *Navone salvatico* and *Napo selvatico*, the *French* Navette, the *Germans* wilde *Steckruben*, the *Dutch* wilde *Steckrape*, and we in *English* wilde Navew.

The Vertues.

This wilde Navewe as it is horter and drier, especially the seede than the tame, so it is more effectuall to provoke urine and womens courses, helpeth the crudities of the stomacke and torments of the bowells, and (as we) the decoction wherein Horehound is boyled and taken it helpeth the yellow jaundise: the same effect [illegible] *Cordus* and others give unto the seede of the manured Navewe, which is to expell venome and poyson, not hurting them to doe any harme; the same *Galen* it seemeth giveth to the wilde sort brought from Candy, and whereas *Matthiolus* saith, that the seede of the garden sort taken in a decoction of Maiden hare or Lenticles, doth not onely drive forth the venoms and infection of the small pockes, but of all other spotted or infectious fevers and diseases, and also defendeth the heart and spirits from being infected with those contagious and malignous vapours, so the seede of this wilde sort is found to be as effectuall if not more forcible.

CHAP. XXVII.

Pastoria bursa. Shepheardes purse.

I Have yet two kindes of herbes to entreate of, that some referre to this Classis, which I therefore bring in the end, because that in not pleasing my selfe in so doing, I know not how I shall please others that are judicious, for I doe not finde either of them to have that acrimony in them that the rest have, but else this might be referred to the kindes of *Thlaspi*, it is in many other things so like them. Howsoever there are many more sorts knowne now than formerly have been, of which I shall speake in this Chapter, and of the other in the next.

1. *Bursa Pastoris major vulgaris.* The greater common Shepheards purse.

The common Shepheards purse hath divers small and long leaves, somewhat deeply cut in on both sides and severall parts of a pale greene colour, among which riseth up a small round stalke parted into some branches, having smaller and lesse divided leaves on them to the toppes, where grow many white flowers one above another, after which follow flat whitish powches or seede vessels, small at the bottomes, broad at the heads and cleft like the *Thlaspi*, in each side whereof lieth a small brownish yellow seede: the roote is small and white, and perisheth after seede time, there is no sharpenesse, and but a very little heate either in herbe or seede of this, although some attribute thereunto a little acrimony, but is drying and astringent.

2. *Bursa pastoris major folijs non finuatis.* Great Shepheards purse with whole leaves.

This other great Shepheards purse hath a small root with some fibres thereat, from whence riseth usually but one small stalke a span long, branched into two or three parts, whose lower leaves are whole without divition, having long footstalkes to them, and those upon the stalke compasse them at the bottomes, the flowers are white, and the seede vessels flat like the former.

1. *Bursa pastoris major vulgaris.*
Common Shepheards purse.

3. *Bursa pastoris minor.*
The smaller Shepheards purse.

4. *Bursa pastoris minor.* Small Shepheards purse.

This small one is in all things like the last, but that it is lesse in every part thereof. And there is also another small one that is in all things like the second, having no division on the leaves. *Minor flore integro.*

4. *Bursa pastoris Alpina hirsuta.* Hairy Mountaines Shepheards purse.

This small Shepheards purse hath many small leaves lying in a round compasse upon the ground soft and hairy, of the colour of Lentilles, slightly dented, and sometimes not at all, matching or spreading many heads of leaves, and from thence many slender naked stalkes, bearing white flowers, and small long and yellow with pointels greener than the common, with small reddish seede within them: the roote is small and thready.

The Place.

The common and little sorts that have cut leaves are frequent in every place with us, but the other two with whole leaves seeme to grow wilde, but in *Germany*, *Montpelier*, and *Italy*, as *Bauhinus* and *Thalius* say.

The Time.

They flower and seede all the Summer long, yea in some of them are, that they flower and seede twice every yeare.

The Names.

Almost *Herbarists* name, and all that have written hereof do call it in *Latine Bursa* or *pera pastoris*, except *Gesner*, who nameth it *Thlaspi fœnum & Calfor Dorantes Herba Cancri*, *Bauhinus* maketh particular relation both of the leaves of the last, and *Thalius* of that small one with whole leaves: the *Italians* call it after the *Latine* name *Borsa pastore*, the *French Tabouret & bourse de berger*, the *Germanes Sickefraut*, and *Teschelkraut*, the *Dutch* sommetime and we in *English* Shepheards purse or pouch, and in the North, Picke purse and Caleweede.

The Vertues.

Some doe hold that Shepheards purse is cold and binding, others finding a little heate upon the taste of the leaves and seede, doe judge it not to be cold at all but drying and astringent, and by this onely quality worketh effectually in staying all fluxes of blood, either in inward or outward wounds, as also the fluxes or lacks of the belly, the bloody flixe, and the abundance of womens courses, or the pissing of blood, the juyce or the decoction of the herbe with some Plantane being drunke, or any other way taken: some doe hold that the greene herbe bruised and bound to the wrists of the hands, and soles of the feete will helpe the yellow jaundise: the herbe boyled and laid pultis wise upon inflammations, Saint *Anthonies* fire, or the like represseth them: the juyce dropped into matering or running eares helpeth them: it closeth the lippes of greene wounds, and is of great effect, being made into a salve for wounds in the head.

Chap. XXVIII.

Myagrum. Gold of pleasure.

Remember that that I entend here to set forth, and therein also not pleasing my selfe to bring them into any other Classis or *Myagrum*, Gold of pleasure, whereof there are more sorts come to our knowledge in these our dayes than formerly hath beene,

1. *Myagrum satiuum.* Garden gold of pleasure.

This sowen seeded plant riseth up with one or more upright round stalkes about two foote high, set with sundry leaves somewhat narrow leaves, of a whitish greene colour, somewhat deeply dented about the edges, or else very little waved, compasse them at the bottome, spread from the middle upwards into sundry branches, bearing at the toppes very small yellow flowers, where when they are fallen, come small flat seede vessells, with gold yellow coloured seede within them, somewhat long and small, the roote is small and long, perishing stil after seede time.

2. *Myagrum syluestre siue Pseudomyagrum.* Wild gold of pleasure.

This plant is much found among the fields of flaxe, springeth up but with one round stalke, almost a yard high, set with long and somewhat narrow leaves, resembling those of Woade, but longer and smaller pointed, at the bottome where they compasse the stalkes about with a point end sticking out on each side, stood the stalke in branches from the very bottome almost, at whose toppes come forth divers whitish flowers very like those of flaxe, after which rise round small heades, with a small point at the toppe, very like in fashion to the *Myagrum* with one seede therein, but these are full of small yellow wilt seedes like unto Cresses, but lesser, the taste without any acrimony when it is dry, and exceeding bitter when it is fresh as the herbe being bruised.

3. *Camelina siue Myagrum alterum amarum. English* Wormeseede.

The small Wormeseede groweth very like the last, with a taller upright stalke, branching toward the top, set with long and narrow greene leaves, somewhat like unto those of the single Wall-flowers, but smaller, and of a whitish greene colour, and very like unto the leaves of *Clusius* his *Leucoium syluestre*, that it is almost taken for it, but that the leaves of this are somewhat smaller and not of so fresh a greene colour, at the tops of the stalkes and branches come forth many very small pale yellow flowers made of foure leaves apeece, like the cruciated flowers of that *Leucoium*, but much smaller, even more than halfe, which afterwards give small round heades, containing within them very pale coloured seede, bitter in taste, the roote is small and woodily, perishing every yeare after seede, but rising againe of the shed seede.

4. *Myagrum fœtidum.* Stinking gold of pleasure.

The stalkes of this *Myagrum* use to be about two foote high being rough, round, and greene, bearing rough leaves set here and there one above another, being foure or five inches long, and one and a halfe broad about the edges at the tops of the branched stalkes stand divers small pale yellow flowers in a thicke tuft together, where unto succeede small round husks containing small seede like unto those of, commonly bruised but growing, have somewhat a grievous or evill scent.

5. *Myagrum fœtidum maius.* The greater one grained gold of pleasure.

The leaves that lie upon the ground are long and narrow, round pointed, and cut in on the edges with a white line in the middle of every one, and of a pale greene colour, but those that

Original from UNIVERSITY OF MICHIGAN

grow upon the whitish bending hard stalke, which groweth to be a yard high or more, spreading branches from the bottome are little or nothing waved about, but compassing it at the joynts where they stand, the toppes whereof is stored with small yellowish flowers on a long branch one above another, after which come round hard and white heads, small at the bottome, and broader at the toppes with three corners and a small middle point sticking up in each, whereof is contained but one seede which is long and reddish whereof it tooke the name; the roote is white, long and wooddy perishing after the seede is ripe.

6. *Myagrum monospermum minus.* The lesser one grained *Myagrum*,

The lesse *Myagrum* hath much smaller leaves, the lowest whereof are two inches long and one broad, waved about the edges, standing upon foote stalkes, and of a pale greene colour, from whence rise one or two slender stalkes about a foote high, with a few very narrow leaves set on them, compassing them at the joynts; the flowers are small and white, standing at the toppes in a round tuft together, where afterwards grow small round heades with one kernell apeece within them; the roote is white and thready but perisheth in the like manner.

7. *Myagro similis filiqua rotunda.* Round podded like *Myagrum*.

This plant hath a stalke a cubit high, hairy, brittle, and spread into branches, whose bottome leaves are about six inches long, and one and a halfe broad, rough, hairy, and sappy, not dented at all about the edges, a little like in taste with some clammineese also, but those that are set at the joynts of the branches, and compasse them about are nothing so great, and the higher they grow, smaller and narrower, the flowers stand spike fashion at small branches, being small and of a white colour, after which come small round cornered heads with a pricke at the toppe, every one on a small long foote stalke, greene at the first, and blacke when it is ripe, with an oylie yellow kernell within them.

The Place.

The first groweth in some places of *Italy* wild, but yet both they and we doe sow it in gardens for pleasure, and in the fields for the seedes sake, whereout is pressed an oyle that serveth the poore for meate, and the rich for their Lampes: the second is frequent in *Germany* most usually in all their flaxe grounds, which being in stalke like it, but not of that bignesse is accounted a weede and cast away, except of such as will save the seede to give to small birds, whereon they will feede when it is ripe, and growing upon the stalke most greedily: the third groweth in many places of our owne country, and being once brought into the gardens, and there suffered to shed the seede, it will come up yearely against of it selfe: the fourth groweth in the sandy grounds about *Basill*: the fift on the *Pagus* hills by *Turin*: the fixt not farre from *Mompelier*: and the last neare *Lunell* that is also hard by *Mompelier*.

The Time.

All these flower in the Summer moneths, and their seede is ripe about *August*.

The Names.

This called in Greeke [illegible] yet *Myagrum* and [illegible] also *Melampyrum* as *Dioscorides* saith, and some *Myagrum* [illegible] *Paulus Aegineta* hath two sorts of plants of an oily substance, [illegible] *Melampyrum*, & [illegible] *Myagrum*, *quae infundunt sive praeter vomitum solos gignunt sine simplicat.* Some (saith *Matthiolus*) take the first sort here set downe to be the true *Myagrum* of *Dioscorides*, which he saith, it cannot be because this hath the leaves of Rocket, but *Dioscorides* his should have the leaves of Madder. Others againe as he saith would have the second sort to be it, which he disalloweth also, because the leaves are like Woade than Madder, and therefore calleth it *Pseudomyagrum*, yet by the judgement of the first is the true one. Some there be also that take them both to be but one plant: but *Bauhinus* misliketh of their judgement, because they are described to be so different both in leaves and flowers, and therefore like enough them to be two distinct plants as they are indeede. *Dodonaeus* seemeth cosens this first *Myagrum* to be that plant which the Germanes call *Flachsdotteren*, and *Leyndotteren*, which *Tragus* saith is proper to the second. *Dodonaeus* also taketh this to be that kinde of graine which both *Galen* in *primo de alimen. facultat.* and *Theophrastus* lib. 8. cap. 8. call *Erysimum*, which *Gaza* translateth *Tricoum*, and is like unto *Sesamum*, as both he and *Pliny* write: but not the *Erysimum* of *Dioscorides*, although *Pliny* confoundeth them both together, as you may reade here a little before, in the 3 chapter of *Erysimum*, whereunto I refer you, but not that the *Erysimum* of *Theophrastus* is our *Treacle Buckwheate*, as some would have it, for thereunto it is utterly unlike, in that the seede of *Theophrastus* and that their *Erysimum* is oily, which that of Buckwheate is not, nor is fit to be used for Lampes, as you shall heare of them, when I come to speake of Buckwheate. *Tragus* taketh it to be, although not the true *Sesamum* of *Galen*, to be very like it as *Pliny* & *Theophrastus* before him did, and calleth it *Sesamum Germanicum*, the oyle of which seede is not only like the true oyle of *Sesamum*, but is of [illegible], and may safely be used in the seede thereof for the meate and medecine, and therefore some have called it *Sesamum minus*. The first is that *Myagrum* that is so much misliked in *Ruellius* and others, that they should so call it, and saith his country people did call it *Drode*, *Dodde*, and *Dorele*, having leaves like Rocket as he saith, and therefore calleth it *Pseudomyagrum*; *Lobel* in *Adversar.* calleth it *Myagrum Germanicum sive Camelina Gesneri*, and in his *Icones Camelina Myagrum*, the *French* as *Ruellius* and *Tragus* doe call it *Camelina* and *Camelinum*, *Bauhinus* in his *Matthiolus* and *Pinax* calleth it *Myagrum foliis Cardui Lanati sive Theophrasti Erysimum & Myagrum Dioscoridis*, and to it is indeede the second is the *Sesamum Germanicum* of *Tragus*, which he also calleth *Selama*, and of the *Germanes Flachsdotteren*. *Cordus* upon *Dioscorides* saith, that it was unadvisedly called that it was the true *Sesamum* of *Dioscorides*, but he there disproveth them, and calleth it *Selinusia* (which *Gesner* in his note thereupon saith, that some did interpret to be *Apium*) whose toppe branches with the seede resembled the *Tuba* of *Milium*. *Gesner* in *horto Germaniae* calleth it *Myagrum Dioscoridis* (thereby judging them to be two severall plants) and *Lobel* in *Stirpium Adversar.* calleth it *Pseudomyagrum* with the leaves of Woade, and *Bauhinus* in his *Matthiolus* [illegible] *Myagrum & Erysimum* and his third *Erysimum* also. *Gerard* hath two figures hereof which *Bauhinus* calleth the one by the name of *Camelina*, and the other of *Erucae sylvestris*: *Tragus* calleth it *Dioscoridis* [illegible] as I said in the description, it is very like to the *Leucoium* [illegible] of *Clusius*, and in my judgement is the

Thlaspi unto them of *Lugdunensis*, as who so will well compare them shall finde: the fourth is *Bauhinus* his *Myagrum tenuifolium*: the fifte *Bauhinus* saith was sent by the name of *Brassica*, and that *Alpinus* called it *Pinaster*, but calleth it in miche *Myagrum monospermon latifolium*: the sixte he also calleth *Myagrum* [illegible], the last *Bauhinus* saith grew with his brother *John Bauhinus* at Mount *Brigsade* by the name of a *Nasturtium*, and therefore he calleth it *Myagro similis siliqua rotunda*, but saith it was called a *Lepidium* at *Montpelier*, and the Doctor *Daldus* sent it him from *Norimberge* by the name of *Thlaspi*.

The Vertues.

The oyliocile of the seede of *Myagrum* serveth as *Dioscorides* saith, to make the skinne smooth that is roughe in any part of the body. And *Galen* saith that the seede being oyly hath an emplastricke or clensing qualitie cursing. *Pliny* saith and *Ruellius* as it should seeme from him, that the oyle thereof helpeth the VIcers of the mouth if he therewith annointed: the oyle of the seede is of much use in *Germany* and other places where they sow many fields therewith, and is used as I said both for the poore mens table and rich mens Lampes, and serveth also with lye made of ashes to make Sope, for which purpose it is most used: the oyle thereof being as I said to like unto the true oyle of *Sisymbrium* being hot and cauling, doubt not but the same as the true oyle of *Sisymbrium* may safely be used in the head thereof, and no doubt will performe the like effects or very neere the same oyle will. The second sort is in qualitie very neare the former, and although the seede as the seede are while it is greene, is so bitter that no creature will taste thereof, yet when they are dry they loose their bitternesse, and the seede especially becommeth so sweete as no other can be more acceptable to small birds as *Linnets*, *Bullfinches* and the like to feede upon: the third being called in many places Worme seede, and I thereupon calling it in my *Herbe* Worme seede, but by *Gerard* Treakle Worme seede is much used by the country people where it groweth to kill the wormes in children, the seede being a little bruised and given in drinke or any other way. The other sorts I have not knowne to be used in any purpose, either inward or outward for meate or medicine, and therefore let this suffice untill we can understand with what vertues they are endued to be cleared.

Chap. XXIX.

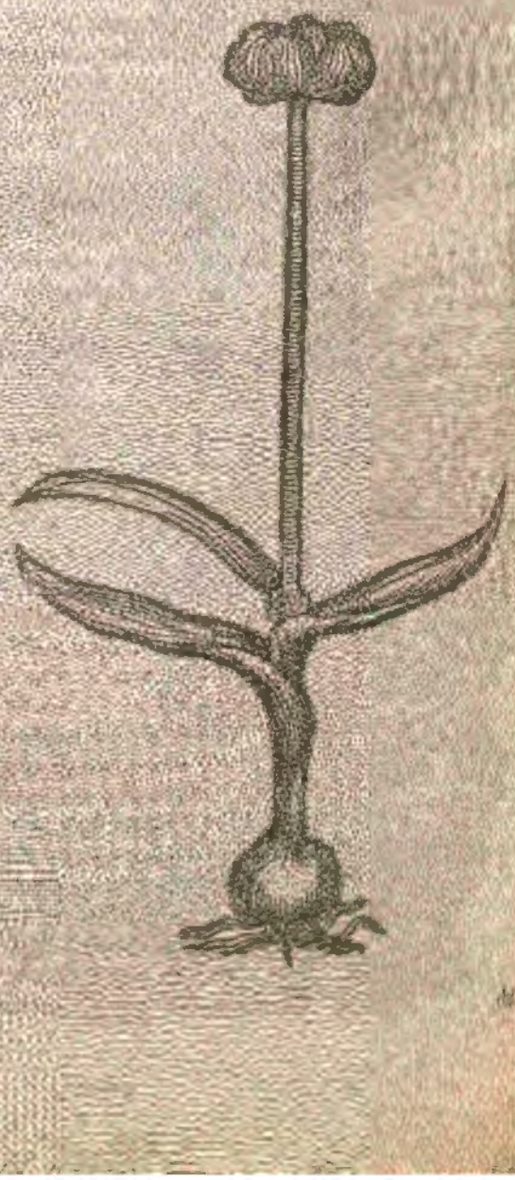
Cepaceum genus. The sharpe Onion rooted kindes.

Of *Leek*, *Porrum*, *Allium*, Onions, Leekes and Garlicke as under one kinde, are to be reherced unto this Chapter, of many wherein I have amply entreated in my former booke, of which I shall lay little here, and some of the names there specified, namely of other sundry sorts of Garlicke, yet I thinke good to make some of the names of the other, and give you some of their figures.

Of Onions (accounting very likely of the Latine *Cepa*, because the roote is single, not giving offsets or increase as other bulbous rooted doe) there is the ordinary round white one, the flat and the long both sharpe and sweete, and the greater and lesser red sort, some onely on the outside, others red quite through; the Squill or Sea Onion, I have three sorts described in my former booke. Of the ordinary sort of Leeke there is a greater and a lesser, called *Ampelo-prasum* which are the broadest, and *Scallonia accipenser* they some, to be of the kinde of Onions rather then Leekes, because they are called *Cepe Ascalonie*, or *Scallonish*, and not *Porri Ascalonici*, and not the *Cepe* or *Porrum* of *Theophrastus*, which some call *Gethyon*. *Lobel* saith it is to be *Bulbus Serotinus* of *Theophrastus* and *Plinie*. Besides these *Lobel* mentioneth a wilde Leeke without leafe or stalke, which is like the Garden kinde but smaller.

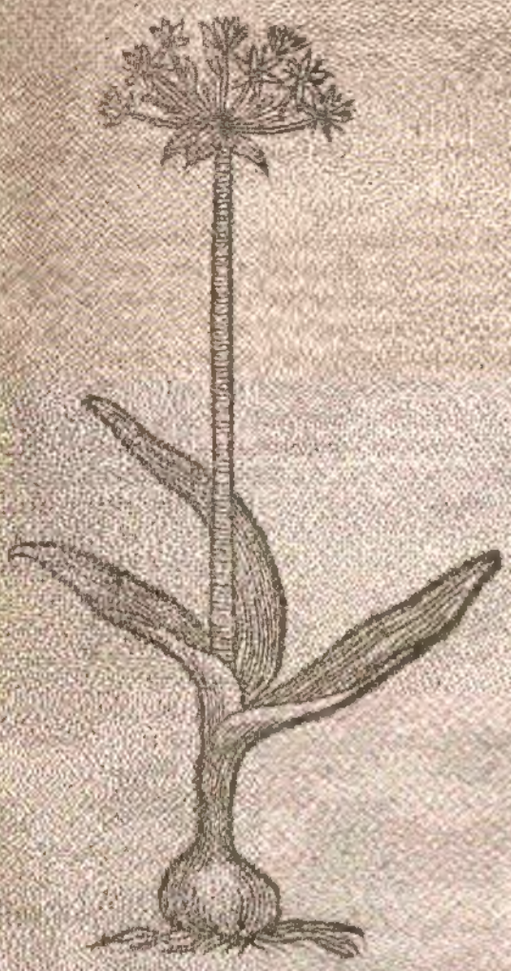
Porrum agreste.

And *Porrum ampeloprasum* one of Spaine with large leaves.



Of the tame or Garden Garlick, as well as of the wilde, I have given the descriptions of three kinds, *Allium Ophioscorodon*, *Allium*, and *Moly* of sundry sorts, as *Moly Indicum*, *Moly latifolium non floridum*, *Moly Pannonicum vel Thracium*, *Moly Pyrenaicum humile*, of two sorts *Moly Creticum*, *Moly vel Nerine Indicum*, *Moly Narcissum luteum*, *Moly Pannonicum purpureum*, *Moly Lusitanicum purpureum*, *Moly Hispanicum*, *Moly purpureum Neapolitanum*, *Moly [illegible] Hispanicum*, *Moly [illegible] Hispanicum*, and *Moly Monspelliense*. The rest are here to follow.

Allium Sylvestre.



Wilde Garlicke.

The Crow or wilde Garlicke is of two sorts, each of them hath sundry narrow long leaves like grasse, the one softer, and the other thicke and harder, from among which rise up one or two slender bare stalkes, bearing a tuft of purplish flowers, and blackish seede after them: the roote is long and round with three coates, or severall peelings.

Allium Sylvestre Latifol. Indicum Moly.

Allium Theophrasti sive Cepa.
The Great Onion of Theophrastus or Common.

Allium scorodoprasum
Serpentine Leek.

Ascalonicum
Scallion.

Allium sylvestre & Allium angulosum
Crow Garlick, and Spotted or Snake-top Ramsons.

the outermost whereof is whitish in the one, with sundry fibres under it, and reddish in the other and inuested by the offers, but is not parted into cloves as the garden Garlicke is, so strong smelling of Garlicke, that the milke of Kine that feede thereon will taste thereof.

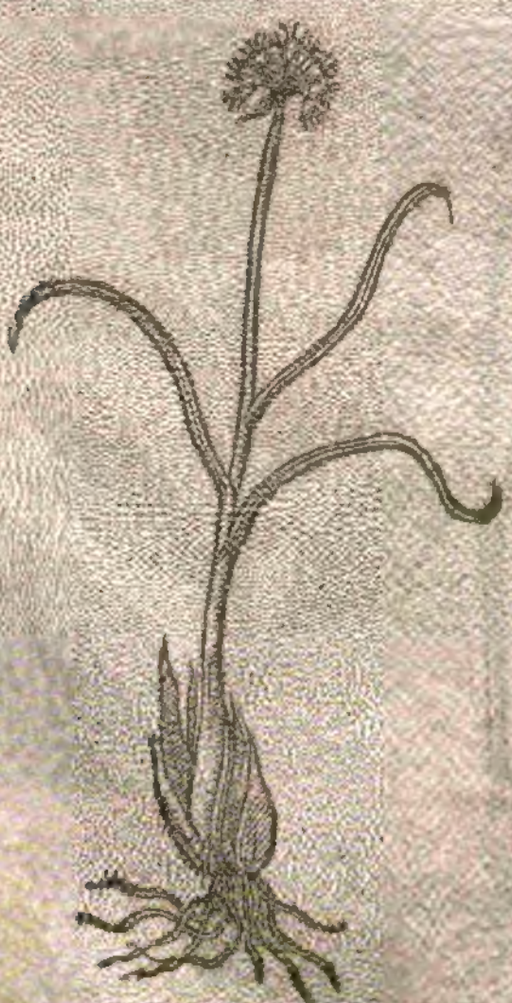
2. *Allium anguinum.* Spotted or Snakelike Ramsons.

This kinde of Ramson hath some what broader leaves then the other Ramson, somewhat like to Lilly Conuall leaues but spotted oftentimes with blacke spots as the slender stalkes, are which beare many small white flowers on the head: the roote is bulbous but longer then the other, couered with a browniſh outward skinne or coate somewhat netted as it were like *Gladiolus*, with a tuft of fibres thereto; it is called by Herbarists as *Clusius* saith, *Victorialis longa* because the *Gladiolus* is called *rotunda*.

3. *Scordoprasum.* Great Turkey Garlicke.

This great Garlicke shooteth forth sundry great long leaues much bigger then the ordinary Garlicke, and after diuers yeares abiding a great long stalke three or foure foote high with some lesser leaues thereon naked from the middle up to the toppe, where it beareth a large tuft of flowers enclosed at the first in a thinne skinne of a paler colour then those of *Homers Moly* or rather whitish, with three square huskes and blacke seede like the rest: the roote is great white and almost transparent at least shining, and seldome giueth offers for encrease. There is another with looser scaly and yellower rootes, and narrower leaues. *Allium.*

4. *Scordoprasum alterum bulboso & convoluto capite.*



Great Turkie Garlick with a bulbed and twining head.

This other great Garlicke groweth after the same manner but larger in each part: the stalke riseth sometimes halfe a yard higher, having at the toppe a large head of bulbes like to the *Indian Moly*, wrapped in a thinne skin with a long point growing above it being smaller to the end, which bulbes in time breake that outer skinne and shew the bulbes to be at the first purplish, but growing whiter afterwards, having also some flowers among them: the head with the toppe of the stalke at the first doth winde or twine it selfe like a Snake or Serpent, which when the bulbes grow to ripenesse standeth upright: the roote is as great and white as the last, and more ready to part into Cloues like the ordinary sort of Garlicke: both of these doe smell somewhat ielle strong then Garlicke, partaking of Leekes, from whence rose the Greeke name as *Dioscorides* saith.

5. *Moly Pannonicum latifolium primum Clusij.* *Clusius* his first leafed *Hungarian Moly*.

This *Hungarian Moly* hath diuers long and some what broad leaues rising from a white round roote that hath sundry small bulbes growing thereto: the stalke riseth two or three foote high with those leaues thereon, but naked or bare from the middle to the top, where it beareth a round tuft of purplish flowers after which commeth blackish seede in three square huskes.

2. *Scordoprasum.*
Great Turkey Garlicke.

3. *Scordoprasum alterum Tabern.*
Another sort of great Turkey Garlicke with a browne roote.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Moly montanum latifolium Pannonicum Clusij.* Broad leaved Pannonian Moly.

6. *Moly Pannonicum odoratis flore.* Sweete smelling *Hungarian Moly.*

The sweete kinde is very like unto the last, but with lesser leaves and fewer stalkes bearing at the toppe a long tuft of pale coloured flowers upon longer footestalkes hanging downe their heads, of a pretty fine fresh sent which abideth not long, but quickly vanisheth, the three square heads that do bring forth blackish seede somewhat like to those of Pinkes or Gilloflowers, the round roote hath some bulbes growing thereto.

7. *Moly mont anum capite rotundo purpureo.* Purple round headed mountaine Moly.

The purple mountaine Moly hath a few long narrow greene leaves set on the stalke one unto the other, and a long tuft of delicate purple flowers on short footestalkes, never fully opening themselves, and smelling somewhat strong of Garlicke: the round white roote hath some bulbes thereto.

8. *Moly Africum umbella purpurascente.* Purplish headed Moly of *Affrica.*

This *African* Moly hath sometimes but one stalke of halfe a yard high or thereabout, and sometimes two or three, with a few somewhat broad and long leaves, pointed at the ends, and a little hairy about the edges: the tuftes of small flowers at the toppe consist of five leaves set on long footestalkes.

9. *Moly Italicum album caule triangulo.* The small *Italian* white Moly.

The little *Italian* Moly hath one or two long hollow leaves, somewhat broad likewise, and ending in a point: the stalke is square, growing to be halfe a foote high, with sundry small white flowers at the toppe: the roote is small and round, of a shining purplish colour smelling like the rest of Garlicke: *Pona* in his *Italian* Booke mentioneth this.

The Place and Time.

These kinds of bulbous are peculiar to divers countries as *Germany, Hungary, France, Spaine, Italy, Turkey* and other hote Countries, flowring in summer and seeding after.

The Names.

The names of them all are sufficiently expressed in their titles, all authors that have written of them not much disagreeing from those here set downe, and therefore I shall not needs further to insist upon them.

The Vertues.

These are lenitive or mixed, yet doe they somewhat provoke the appetite encrease thirst and ease the belly and bowells, prevaile much against the venomous qualities of Serpents, Scorpions, Spiders, Toades, and such like, to be taken in Wine, Garlicke, Honey and Rue, and encrease Sperme, especially the seede: they also kill the Worms in Children if they drinke the water fitting wherein they have beene steeped all night, being roasted under the Embers, and eaten with Honey or Sugar and Oyle, they much conduce to help an inveterate Cough, by causing the tough flegme and rankling to be the easier to be expectorate: the juice being snuffed up into the

the Nettrills, purgeth the Head, and helpeth the Lethargie, yet the often eating of them is said to cause paines in the Head: it hath beene held with divers country people a good preservative against infection. Onions boiling with bread and milk, as also to make a great Onion hollow, filling the place with good Triacle, and after to roast it well under Embers, which after taking away of the most outmost skinne rubbed, and beaten together is a soveraigne salve for eyther Plague sore, or any other putred Ulcer: the juice of Onions is good for scalding or burning by fire, water or Gunpouther, and used with Vinegar taketh away all blemishes, spots, and markes in the skinne, and dropped into the eares easeth the paines and noyse in them: applyed also with Figges beaten together helpeth to ripen and breake Impostumes and other sores. Leekes are much of the same propertie that Onions be, yet not altogether so effectuall; they are a remedy against a Surfet of Mushrums, being baked under the Embers and eaten, and helpeth the Piles boyled and applyed warme, to avoyde emulgons I referre you to what hath beene said before of Onions. Garlicke the garden kinds as the bell, and the other a meaner sie hotter then Onions or Leekes, and is more effectuall to all the purposes aforesaid, being generally accounted the poore mans Treakle, for that it is a remedy for all diseases or hurts, for besides the properties whereunto Onions are conducible, it hath a speciall qualitie to discusse the inconveniences coming of agues or mineralll vapours, or by drinking corrupt and stinking waters as also by taking all Wormes and Henbane, Hemlocke, or other poisonfull or dangerous herbes: it is held good also in hydropick diseases, the Jaundise, Falling sickenesse, Crampes, Convulsions, the Piles or hemorrhoides and other cold diseases: but to alter the strong sent thereof and cause it to be lesse offensive, divers have set downe divers things, as some to eate Rue, or herbe Grace, some to eate a raw Beane after it, others to take of a Beete roote roasted under the Embers and others lay by eating a few Parsley leaves.

VMBEL-

VMBELLIFERÆ.

VMBELLIFEROVS PLANTS.

CLASSIS OCTAVA,

THE EIGHT TRIBE.

CHAP. I.

Ferula. Fennell giant.

IN this Classis I am to intreate of all the kindes and sorts of umbelliferous herbes, such I meane as are generally so called, for there are many other herbes that beare their flowers and seede or berries on the toppes of their stalkes in manner of an umbell as those doe, as you may observe through the whole passage of the Booke, which cannot properly belong hereunto. Now because there be many sorts of these herbes, I thinke it fit to distribute them into three Rankes or Orders: the first shall be of those which beare fine leaves like *Ferula*: the next shall be of such as have fine and thinne cut leaves like Carrots or Parsley: and the last shall be of such as have broad leaves like *Panax* or *Angelica*, that so under these three rankes, I may comprehend the whole Family or Tribe, of these umbelliferes; yet I must entreate you to beare with the passages of some of these, if for names sake I infert sometimes into one forme, such as ought be placed in an other, the vicinitie of the names constraining that effect.

Of the *Ferulas* there are two or three sorts plainely to be discerned to be differing one from another as shall be shewed.

1. *Ferula tenuifolia.* Fine leafed Fennell giant.

This fine leafed Fennell giant bringeth forth sundry large hollow fungous thicke branched stalkes, of very light fine stuffe (for substance but thicke set) leaves together, and bushing more than the next, both greener, finer, and thinner than it also, placed out of order, sometimes two or three or foure leaves together, the bottome of the stalkes being as thicke as ones finger, but compassing one another with broad thinne hollowish skinnes, at the bottome, from among which riseth up a strong upright stalke eight or ten foote high, sometimes as bigge as a great cudgell, set with divers such fine leaves thereon, one above another, compassing the stalke at the bottomes one of the joints whereof come forth severall small branches towards the toppes, the toppe also being divided into sundry parts, forming a large umbell of small yellow flowers, which turne into blackish flat seedes, but yellowish, as may have beene observed in the gumme, two alwayes joyned together by the little foote stalke, whereon they grow, as is usuall in all these umbelliferous plants; the two inner sides being somewhat hollow, and the outsides round with the longnesse: the roote groweth very great and never decaieth, branching forth many wayes of a blackish browne on the outside, and somewhat white within, yeelding a thicke juyce being broken in any part, which doth quickly condensate and grow into a yellowish gummie substance, not smelling any thing strong in our country, as I have often proved, and nothing so much as the Gum *Sagapenum*, which is supposed to be gathered from the roote of this plant.

2. *Ferula latiore folio.* The broader leafed Fennell giant.

This other Fennell giant groweth in the like manner in all things, and as high, or rather higher, whose branches and leaves are more spatled or thinner set than the former, and the leaves themselves of a darker greene colour also and longer: the flowers are yellow, and the seede somewhat larger: the gummie juyce that issueth from them all, of this smelleth a little more, even with us, than the former, although nothing so strong as we have seene, which we have in our shops, and said to be taken from this plant in the hot countries and climates of the East.

3. *Ferulago seu Ferula minor.* Small Fennell giant.

This small kind groweth nothing so high as the former, but abideth much lower than the ordinary Fennell, having also nothing so great or branched, yet larger than those of Fennell, as the tufts at the toppes, which give seede like either of the two former, but somewhat like them and blackish: the roote is much smaller and lesse than either of them, with but few fibres thereat.

The Place and *Time.*

They all found growing as well in *Norfolke* as *France* among the rockes that are torrified with the Sunne all

1. *Ferula tenuior folio.*
Fine leaved Fennell giant.

2. *Ferula latiore folio.*
The broader leaved Fennell giant.

all day, as in divers places of *Italy*, *Apulia* and *Florence*, and divers other places, but with little gumme in *Europe* that I can learne of: they flower in *June* and *July*, and the seede is ripe in the beginning or end of *August*.

The Names.

The Greeke call it Νάρθηξ, and the leafe ταινιώδες which *Gaza* translateth *Ferula* and *Ferulago*, the Greeke name signifying the *Thirsus*, or *gallant*, or *bullion*, as the *Latine* name declareth. *Ferula quasi ferire ea solebant pueri dum ferebant thyrsos festis diebus & festos duces & proceres luserant.* *Marcellus* calleth them *Ferulas virgeas*, because they were *virgis pueriles cæsi*, wherewith he (more the barbarous) beates his schollers. The leafe is the *Feniculum heracleum*, or *Dioscoridis*, *Lobels*, *Dodonæus*, and others, which *Cesalpinus* calleth *Ferulaceum*, so he doth the other *Ferulam* for he would be called of *Lobel*, and others from him *Ferulæ galbaniferæ*; but *Bauhinus Ferulaceas*, who thinketh it to be the same that *Gesner* and *Camerarius* calleth *Ferulago*; but I am in doubt he was therein deceived, for (as those herbes I said, are every yeare the one as high as the other with me, but *Ferulago* which is my last, imported the diversity as *Dioscorides*, *Theophrastus* and all others have called it, *hoc nomine Ferula*, and to dot *Lugdunensis* and *Tournefortius* call it *Ferulago*, *Narthecium Theophrasti*.

The Vertues.

At the first springing up every yeare of the *Ferula* before the leaves breake forth, there riseth up from the roote a great cole with head like to the yolke of an egge, which the Shepheards there gather and roast under the Embers, being first wrapped in double wet papers or cloathes, and after eate them with Vinegar and Salt, for this is a meate not onely pleasant and delightfull unto them, but mightily provoketh Venery. *Aetius* writeth that the inner pith of the stalkes while they are green, being drunke with wine helpeth those that spit blood, or bleede at the nose, and are stung by the Vipers: the seede being drunke doth ease the griping passions of the belly and the chollicke. *Pliny* saith that the stalkes being boiled are pleasing to be handled, and taken with new wine or with honey, but if any doe eate many of them, they will cause the hard bitter loathsomenesse of *Ferula* being taken to the quantitie of a beane looseneth the belly, it doth helpe the paine of the sides being taken at severall times of the Moone: the iuice of the roote dropped into the eyes doth helpe the sight. *Pliny* setteth downe this observation, that as *Ferula* is most deadly to Lampreys, so it is most acceptable foode to Asses, but a present poison to other cattell. *Galen* briefly sheweth the properties of it in this manner: the seede, saith he, doth heate, and rarifie, the pith of the stalke hath a binding quality, it helpeth the spitting of blood, and those that are troubled with the chollicke. The gummes that issue from plants are much better than the rest of the herbe: for *Sagapenum* is hot and drie in the third degree, and being dissolved into the juyce of rue and taken, doth wonderfully helpe to breake the stone in the kidnies, bladder, urine and womens courses, expelleth the dead child, and strengtheneth the weake sighted eyes being annointed in some and taken doth much helpe the cough, and the difficulties of thinner brethe called Catarrhes, being dissolved in oyle and applied, doth strengthen the members that are out of joynt, or the overthrowne [illegible]

against the obstructions of the Mother: *Mesues* saith it purgeth tough flegme, and other clammy humours, and is helpfull to all the cold diseases of the braine, breast, and lunge, the joynts, aches also be they never so inveterate, in what manner soever, it doth wonderfully expell the water of the dropsie taken with yellow Saffron, it abateth the hardnesse of the spleene, and expelleth the windinesse thereof being drunke, and all crudities, nodes, knots, and hard tumours being dissolved in Vinegar and the juyce of Capers, *Galbanum* doth more draw, and diffuse humours than *Sagapen*, and is more powerfull and availeable for the breast and lungs against hardnesse in breathing, for burstings, cramps, and convulsions: it is more powerfull to resist poysons taken in wine with *Myrrha*, and easeth the pittings of the mother, the giddinesse in the head, the paines of the eares, and the falling sickenesse: a little of the gumme spread like a plaister will breake and draw any bile or sore being laid thereon, especially if a little Turpentine be put to it: it is also of great good use in many plasters and likes, to helpe to warme those places or joynts that are cold, to diffuse the humours gathered to the places, and to heale up manifold consumations sores, and to heale them afterwards. Because I have said that *Galbanum* and *Sagapenum* are gathered from the roottes of these *Ferula's*, and that I shall shew you in divers places hereafter, that other gummes are taken in like manner from other plants. I thinke it fittest to shew you the manner of drawing out, and gathering the gummes from the roottes of all sorts of herbes which is to this manner. After you have digged an hole on one side of the roote of any plant in manner of a small trench, and the bottome of the same cleared from loose earth and stones, that they be not mixed with the gumme; wound or cut the roote on that side is open, or make an hole therein, that so the gumme falling out, be not stopped by a small orifice or cut, and so let the juyce or gumme distill forth of it owne accord, but this must be done in the hottest and driest time of the yeare, that no raine or moisture take it for spoiling it, and to have the place or trench the clearer, it were necessary to lay some flat smooth stones, or the like in the bottome to keepe it the clearer: if the juyce or gumme come out in droppes and doe not runne together of it selfe it is accounted the better. Some also wound the lower part of the stalke, and take the juyce that commeth from thence, but that is nothing comparable to the other, this being called *Lacrymæ*, and the former *Radicarium succus*.

Chap. II.

Thapsia. Scorching Fennell.

Although there is but one true *Thapsia*, yet for the resemblance of other plants so neere thereunto, *Clusius* hath referred some unto it, and entitled them *Thapsia*, which *Lobel* and others have called by other names.

1. *Thapsia feniculi folio*, The true Thapsia or scorching Fennell.

The true Thapsia hath a smaller and lower stalke than *Ferula*, with somewhat broader and shorter leaves then it also, and nothing so much winged or branched, the flowers are yellow that

1. *Thapsia feniculi folio.*
The true Thapsia or scorching Fennell.

2. *Thapsia latifolia Hispanica.*
Spanish broad leafed Thapsia.

Original from UNIVERSITY OF MICHIGAN

stand as the toppes be umbells, and the leede more like unto *Dille* or *Fennell* than *Fennell* or *Thapsia*, but much greater than it, and fatte than *Fennell* or *Thapsia*, the roote is of the thickneſſe of ones thumbe, brownish on the outside, and much whiter than *Fennell* within, with a thicke barke, and a ſlender tough pith, yeelding forth a yellowish milkie juyce, being broken, which being rondeliſed is somewhat gummie but hot and dric: at the toppe of the roote there groweth a tuft or buſh of thoſe haires, whereby this plant is knowne from *Fennell*, which the world learne be diſcerned: the taſte of the herbe is somewhat sharpe and unpleaſant, but the roote much hotter and offenſiue to the taſte and throate, procuring vomite, and in the greene more than dry.

2. *Thapſia latifolia Hiſpanica.*
Spaniſh or broad leafed Thapſia.

The leaves of this Thapſia are found like unto Fennell plant, greene but couered ouer with a little woolly haire like, ſpread round about on the ground, of an unpleaſant taſte: the ſtalke that riſeth up among them, groweth into a cubite, and sometimes to be two cubits high of 2 fingers thicknes, with a few ioynts and leaues at them like the lower but leſſe, at the top whereof ſtand somewhat broad umbells of yellow flowers, which while the ſeed is in ripening changeth the forme into the round as a ball: the ſeeds broad & winged as it were the middle part whereof which ſproteth out the leaues is long and narrow: the roote is some what like the former, thicke, long, and broader at the toppe, with a blackiſh thicke barke full of a milkie juyce which is moſt bitter and sharpe in taſte, prouoking vomiting and vrine within.

3. *Thapſia maxima Hiſpanica.*
The greater *Spaniſh* Thapſia.

This Thapſia ſhooteth forth ſtalkes three or foure fingers thicke, like to a *Ferula*, and exceeding any mans height, having branched winged leaues like the laſt, but larger, and ſpread on the ground like it: the flowers and ſeeds are like it alſo: the roote is greater.

4. *Thapſia Caroti folia.* Carrot Leafed Thapſia.

This was the moſt vnuſuall Thapſia that the ſhoppes of thoſe

know, and tooke to be right, untill learned and iudicious men ſcanning it better, found it to be farre differing, having large winged leaves lying upon the ground, more like unto the wilde or tame Carrot, then unto *Ferula*, whereunto the true is compared: the umbell of flowers is yellow, but ſmaller, as is both ſeede and roote than the *Ferula*: *Matthiolus* ſet this forth firſt for *Thapſia*, but is diſproved by all: it ſmelleth rather ranke then ſtrong.

3. *Thapſia fœtidiſſima*, Stinking Thapſia.

In the country of *Salamanca* in *Spaine*, ſaith *Cluſius*, groweth a certaine *Ferulum* plant with leaves like *Lobus* with a hore circumference ſpread upon the ground, bedewed alwayes with a clammie moiſture, of a deepe greene colour and ſhining: the ſtalke is ſaid to be ſmall and ſtraight, bearing an umbell of flower almoſt as round as a ball.

We have had the ſeedes of a *Thapſia* brought us out of *Spaine* by *Bael*, whoſe rootes were ſhort and tuberous, ſo the ſame ſpringing, and ſmall time of the abiding of them in my garden, by the early frоſtes comming there- *Thapſia tuberoſa dicta.*
after tooke them away ſo quickly, that I can give you no further relation of them: but he called it *Thapſia tuberoſa*, which whether it were a ſpeciall kinde, or but the youngneſſe of the rootes I cannot tell, never having had opportunity to get of the ſeede againe.

The Place and Time.

The firſt, as *Dioſcorides* ſaith, groweth in *Thapſia* one of the Iles of the *Sporades*, and in the countrie about *Apollonia*: *Theophraſtus* ſaith, and as *Lobel* ſaith about *Montpelier*, and the way to *Frontignacke*; all the reſt grow plentifully in ſundry parts of *Spaine*, and doe flower there, as he ſaith ſomewhat late.

The Names.

It is called *Thapſia* of the Iſle, and *Thapſia* alſo in Latine, from the Iland of that name, as *Dioſcorides* ſaith; but as *Lobel* ſaith, it may as well be ſo called from the fierie heate, wherewith it ſcorcheth or burneth the bare parts of the body, even a farre off, if they ſtand in the winde or breath of it that gather it; and therefore *Dioſcorides* admoniſheth not to gather it, but in a quiet day free from winde, and to be on the leeſide thereof for feare of exulcerating the face and hands, &c. The firſt is the true *Thapſia* of *Lobel* and *Tragus*, and *Imperatus* ſo to call it; and the ſecond *Thapſia* of *Cluſius*: the ſecond is the firſt *Thapſia* of *Cluſius* which *Lobel* and others ſetting forth for *Seſeli* *Peloponenſe* is found by *Cluſius* for ſo doing, ſaying, that their ſo eaſie falling to errour, ariſeth from their want of due conſideration of all the parts thereof, and the ſight of the true plant, and onely led by weake conjecture to the ſight of the figure, and as he ſaith, is called *Cumiſia* by thoſe of *Murcia* in *Spaine*: the third is *Thapſia* of *Lobel*, which ſome, as he ſaith, would call *Cicutaria maxima Lobelij*, for which he blameth them worthily both: *Cluſius* his fourth alſo, which as he ſaith the *Spaniards* call *Turbo*: the laſt is that *Thapſia* that *Matthiolus* ſet forth and *Coſa Colonna*, becauſe it is moſt frequent in *Italy* tooke to be the right, but is ſince knowne as before noted from it: *Lobel* in his Obſervations, *pag.* 452. in the title over it, maketh ſome doubt whether this plant ſhould be not the *Sagapenum Ferulæ*, for all do account theſe *Thapſias* to be kinds of *Ferula*, & ſo the *Italian* name of the *Ferula* it doth import as much; but as I ſhewed you in the Chapter before, that I have gathered ſome gum from the *Ferula* in my garden, that hath bin in ſhew as pure and good gumme *Sagapenum* as any we have in our ſhoppes, and therefore I doe not thinke any gumme *Sagapen* was ever taken from this or any other *Thapſia*: the *Arabians* call it *Lamuron* and *Drya*: the *Italians Thaſſia*, and thoſe of *Naples Sicilia*, and other parts *Ferulaſtro* the *Apennyne*, as *Cluſius* ſaith, call this *Canabeja* promiſcuouſly with *Ferula* and *Libanotis*, making no diſtinction betweene them: the *French* call it *Turbit blanc*, and *gris* by others: the *High* and *Low Dutch* little knowing them, have ſcarſe given them any name, but as the Latine doth: *Gerarde* calleth them ſtinking and deadly *Ferula*, which how fully it agreeth with any of them, but that of *Matthiolus*, let others upon due conſideration iudge: I have called the true *Thapſia* according to the nature, burning and ſcorching Fennell, which if any can alter for a better, I ſhall be well content: the rootes of the firſt *Spaniſh* kinde are accounted for *Turbith* with them, but they differ much from the right, and therefore are called *Thapſia turbith*.

The Vertues.

Thapſia, or the ſcorching Fennell as *Dioſcorides* ſaith purgeth choller ſtrongly both upwards & downwards, two ſcruples of the barke of the roote as well as halfe a ſcruple of the juyce thereof drunke with mede or honied water, and ſo to be taken it is dangerous; this manner of purging is fit for thoſe that are almoſt dead, or ſhort winded, or are troubled with paines in their ſides and ſpitting of blood, but ſaith *Lobel* this manner of purging thereby ſo much heateth and drieth, worthily in reſpect of the danger to the inward parts, for more harme oftentimes came thereof then helpe, by the grievous torments it uſed to ſtirre up: *Galen* briefely ſetteth downe the properties of it in theſe words: *Thapſia* hath a ſharpe and ſtrong heating facultie joyned with ſome moiſture, and therefore ſtrongly drawes from farre, and digeſteth what it draweth: but much time is required to effect this, for the fatneſſe of ſuch moiſture, it is the fault thereof to be quickly corrupted. Outwardly applied it hath moſt nobly wrought, for as *Pliny* reporteth, *Nero* by annointing his beaten face with the juyce hereof, and very ſquill mingled and ſome mixed together at night, ſhewed the next day his face to be free and cleare, contrary to that which by ſo harſh beating it ſhould have: and to take away all blacke and blew ſpots, bruiſes, markes, and blemiſhes in the face whatſoever, as the morphew, leprye, ſcabbes, ſcurfes, wheales, pimples, or the like, ſet caution in the uſe thereof, ſuffer it to lie not long on the place, that is not much longer than two houres, and then to be waſhed off with warme water ſeaſoned: it is uſed likewiſe being diſſolved into an ointment with good effect to anoint withall for the griefes thereon, or for the paines in the knees or joynes: it ſeaſeth alſo to gather againe in ſuch as to whom it is ſcarce all to want it, by rayſing a rumour, and after mollified and ſupplied with fat matter, ſeaſeth the part as a preſſure: it ſeaſeth likewiſe to cauſe haire to grow ſpace where the places have been depriued thereof. The rootes of the ſecond and third, but of the laſt eſpecially in former times have been uſed by impoſtors in *Italy* and *France*, and dreſſed like *Turbith* that is pared and pilled, and ſo ſold for it, untill diligence add experience to know the right, and refute the folie, had prevented the future miſchiefe that was like enſue, exclaiming againſt *Fuchſius*, who tooke theſe rootes to be the true *Turbith* ſheweth it ſelfe in *Germany*, but I have ſhewed you before in the Chapter of *Alipum*, the many errors of forreine writers in ſetting forth *Tithymalls Scamony* for the true *Turbith*: the old women Leeches of *Salamanca* in *Spaine*, uſe the rootes of the third or greateſt *Spaniſh* kinde of *Thapſia* to procure womens courſes,

and to purge the body which it doth with that violence both upward and downeward that may seeme brought into great danger that take it.

Chap. III.

Peucedanum, Sow-Fennell.

We have three sorts of Sow-Fennell to offer to your consideration in this Chapter.

1. *Peucedanum majus Italicum.* Great Sow-Fennell of *Italy*.

The great Sow-Fennell hath divers long branched stalkes of thicke and somewhat tough hearbe from for the most part joyned together at a place, among which riseth a crested straight stalke, more tall then as Fennell with some joynts thereon, and leaves growing thereat, and towards the toppe some branches shoot from thence, like wise on the toppes of the stalke and branches stand divers tufts of yellow flowers which doe grow somewhat flat thinne and yellowish seede twise as bigge as Fennell seede: the roote groweth very deepe with many other parts and fibres about them, of a strong sent like hot brimstone, and yeilding forth a yellowish milke or clammy juyce almost like a Gum.

2. *Peucedanum vulgare.* Common Sow-Fennell.

The common Sow-Fennell groweth in the same manner that the former and hath no other difference but this is lower and smaller by a fourth part, and the smell thereof as strong as the former.

3. *Peucedanum minus.* Small Sow-Fennell.

As the first Sow-Fennell was larger then the second, so this is lesse then it, having smaller and shorter leaves of a blewish greene colour, of a little bitter taste but almost no smell, the stalke is slender and round, seldome a yard high, parted into divers branches, whereon stand small tufts of white flowers in an umbell, which are succeeded by thicke short seede almost like to Parsley, but of an ash colour, and bitter taste: the roots of the bignesse of ones thumbe, sometimes greater or lesser, with a tuft of haires at the toppe, blackish or brownish on the outside, with a thicke barke of a pleasant sweet taste at the first and afterward sharpe.

The Place and Time.

The first groweth naturally in *Italy* in divers places: the second in good plentie in the fat low Marshes about Feversham in *Kent*: the last was found on Saint *Vincents* Rocke by *Bristow*, by *Lobel* as hee writeth is done in his *Adversaria pag.* 331. and in *Hungarie* and *Austria* by *Clusius*. They all flower and seede in the end of Summer that is in *July* and *August*.

The Names.

It is called in Greeke [illegible] & and in Latine *Peucedanum* and *Peucedanum*, some take it of the filthy sent

1. *Peucedanum majus Italicum familiæ.*
The toppes of the *Italian* Sow-Fennell.

2. *Peucedanum vulgare.*
Common Sow-Fennell.

...others of the Pine tree whose leaves are like it. *Apuleius* calleth it *Panifolium*: the hill is the *Pennel* ... *Matthiolus*, *Imperatoria* and others, and *Peucedanum vulgo Italicum* by *Lobel* and *Lugdunenses*: the ... called by *Bauhinus Peucedanum Germanicum* and *Peucedanum* simply without any other addition by *Tra...* *Tabernæmontanus* and others: it is called also *Fœniculum porcinum* but by *Tabernæmontanus Cauda porcina*: the ... called by *Lobel Peucedani folio perpusilla planta*: it is called by *Clusius Peucedanum Pannonicum* and is proba... *Apuleius* and *Bauhinus* say to be the second Saxifrage of *Matthiolus*: the *Arabians* call it *Harbanum*, the *Ita...* *Finocchio porcino* and vulgarly *Finocchio porcino*, and by some also *Pionselle*, by the *Spaniards Fenicho de puerco*: by the ... *Peucedanis*, by the *Germans* of some *Harstrang*, but commonly *Sowfenchel* or *Schweinsfenchel*, of ... *Ferculum* *Fennell* and we in *English* Sow-Fennell, Hog-Fennell, Sulphurwort and Hoglrange.

The Vertues.

The seed of Sow-Fennell say *Dioscorides* and *Galen* used with Vinegar and Rose water, or the juice with a little Opobalsamum put to the nose, helpeth those that are troubled with the Lethargie, the Phrentie, the turning of the sense or dulnesse in the head, the Falling sickenesse, long and inveterate Headach, the Palsie, the Sciatica or Ischiadicke passion, and generally all the diseases of the Nerves and sinewes used with oyle and Vinegar: the juice received in wine or put into an Egge is good for the Cough or shortnesse of breath, and for those that are troubled with winde and excreating paines in the body: it purgeth the belly gently and dissolveth the winde and swelling of the spleene, it giveth ease to those women that have bin travaile in child birth, and easeth the paines both of the bladder and reines, and woombe also: a little of the juice dissolved in wine and dropped into the eares easeth much of the paines in them, and put into an hollow tooth easeth the paines thereof. The roote worketh to the like effect, but more slowly and lesse, and is to be boyled in water and the decoction thereof drunke: the dryed powder of the roote being put into foule Vlcers of hard curation cleanseth them thoroughly, removeth any splinters of broken bones or other things in the flesh, & healeth them up perfectly, & likewise bringeth on and inveterate sores to sear or skinne: it is also put into such salves as serve to heate and warme any place. The roote is hot in the second degree and dry in the third, but the juice is stronger. *Pliny* recordeth the vertues before in the leaves: the roote being drunke in wine with the seede of the Cypresse tree in powder easeth the ... the seede: the smoke, but some use to burne it and by the smell thereof give ease thereunto: the juice helpeth the ... of children and their Navells when they sticke forth: the roote is of so great force in greene wounds ... that it drawes out the quiture from the very bones.

Chap. IIII.

Libanotis, Herbe Francumsence.

There be divers sorts of *Libanotides* as both the old and new Authors have recorded, some whereof have broad leaves, others fine and like Fennell, of which I meane to entreat in this Chapter, and to referre the other to the last order of these Umbelliferous plants, which containe those with broad leaves.

1. *Libanotis Ferulæ folio sive Cachrys sive Cachrys vera,*
Fennell leafed herbe Francumsence.

This herbe Francumsence is a worthy, goodly, and rare plant, shooting forth divers bushy great reddish stalkes ... leaves of a fresh greene colour, being somewhat thicker and longer then those of the *Ferula*, but shorter then ... *Peucedanum* Sow Fennell, set often and in many places set three together, of a quicke aromaticke sent and ... tasting somewhat neare a Lemmon: from among these leaves ariseth up sometimes but not every yeare ... a good bigge stalke, but neither so great nor halfe so high as the *Ferula*, and not much above a yard high, ... with higher then the stalkes with leaves, branched into very many sundry parts, bearing yellow flowers ... are succeeded by pretty good big whitish yellow seede, round and a little long withall, some what crested ... the outside two joyned together as is usuall in most fenulous plants, which maketh one side flat, the smell ... fragrant running between sweete, and is said to be cauliicke or burning, which caused the name *Cachrys* to be gi... This stalke or roote groweth deepe and spreadeth much and with many branches in the ground, bigger then a great ... Parsnep or the topps, and white on the outside as well as inside, with a pith in the middle, but to observe that ... one may handle it very tenderly if he doe not breake it, and yeeldeth forth a clammy pale juice, of so fine a fragrant ... smell, as I compare it to the Lemmon, and endureth many yeares.

2. *Libanotis ferulæ folio & semine, sive Panax Asclepium Ferulæ facie Lobelii,*
Lobel his Esculapius, Woundwort or Allheale.

Learned men have set forth each almost a sundry herbe, for the *Panax Asclepium* of *Dioscorides* and ... and every one supposing his to be the right, and because they all seemed to be worthy plants for to be ... taken heede to shew you them all with their differences, and wherein they come neareth or are further ... off from the true and fruit to begynne with that of *Lobel*, which groweth nothing so high or great as the ... and hath ... like unto it and yellow flowers also: but the seede that followeth is broad not so small ... more like unto *Ferula* of a little quicke taste or sent: the roote is small and not growing deepe, ... after a yeare groweth woody, the sent and taste being not much resinous or sharpe.

3. *Panax Asclepium Matthioli*, *Matthiolus* his Esculapius Allheale,

Most learned men very specially against *Matthiolus* in many things doth thinke and so doth *Columna* ... this opinion is no other herbe then a *Ferula*, yet surely I thinke they are much mistaken ... for that *Matthiolus* had set forth the *Ferula* before and described it at large, and although he had ... called this *Panax* as we doe the *Ferula*, I presume the cheefe cause was that hee had onely the dryed ... stalke without a description and therefore so let it passe, not intending to coyne a description of that ... I have now growing, as also because *Bauhinus* doth number it among the other sorts as a differing ... the Germans giveth his Figure also which is divers from the *Ferula* in my opinion having finer, small-

1. *Libanotis sativa sive Cachrys vera.*
Fennell leafed true Francumsence.

2. *Panax Asclepium Pinnis*
Libel his Æsculapius Wounderwort

ler and shorter leaves then *Ferula*, and a smaller umbell of flowers, the roote likewise is small and no way answerable to a *Ferula*.

4. *Panax Asclepium Apulum Columnæ.*
Columna his Æsculapius Allheale of *Naples*.

Fabius Columna saith that this his *Panax Asclepius* is the truest of any other, hath bin described by any other author, growing frequently in *Apulia*, answering it in every part according to the descriptions thereof in *Dioscorides* and *Theophrastus*. For it hath a small slender roote with a bush of haires at the toppe of the bignesse of ones thumbe, with a thicke rugged barke of a whitish yellow colour on the outside, and spungie white and wooddy pith within, full of a clammy white milke hardening quickly into a Gum which is bitter and sharpe in taste and unpleasant but yet aromaticall; the stalkes or leaves which are spread next the ground, in a round forme at the head of the roote, are cut into severall long haires as it were thicke set together, some what like unto common Yarrow and hairy withall, which is not seene in the other sorts, or rather like unto Fennell leaves but bigger, having seven winged leaves set on a pretty long stalke, five bigger and two smaller which are next the hairy stalke, being greene at the first but changing yellow when it groweth toward flowring, which with the leaves is halfe a yard long: from among these doth rise up but one maine of stalke, which is slender two or three foote high sometimes, having some joynts but no leaves thereon to the toppe, whereat usually stand but one or two small tufts or umbells of yellow flowers and seldome three, but spread a little largely and growing closer and rounder as it forneth to seede which are flat and winged on both sides two growing together as is usuall in all other umbelliferous plants, whereon as also on the stalke is often found a sweete smelling Gum as cleare as Turpentine or Gum Arabecke, which is hardly dissolved in water without heate, the like also is taken from the roote cut in peeces, but that it is yellower because it must be forced by the fire.

4. *Panax Asclepium Apulum Columnæ.*
Columna his Æsculapius Allheale of *Naples*

5. *Panax Æsculapium Dalechampij.* The French Esculapius Allheale.

The fourth kind *Dalechampius* found about *Montpelier* having a white roote like Parsly, slender, sharpe and well smelling, and leaves also like Parsly, or rather like Coriander then Fennell and somewhat hairy with many yellow flowers of an absolute roundnesse.

6. *Panax Æsculapium Anguillara & Camerarij.* Esculapius Allheale of *Candy*.

The *Panax* which *Anguillara* and *Camerarius* have remembred, saying that in *Candy* it is usually called *Sefeli* and *Ferula Pastinacea* though both falsely, riseth up with a round Fennell-like stalke foure or five cubits high, with sweet joynts thereon divided into branches of leaves, larger then Fennell and smaller then *Ferula*, of a pale greene colour on the upper side and of a blewish greene underneath, with large umbells of yellow flowers, the coppes turning into broad flat winged seede of a resinous taste and taste, the leaves being much more edible and yeelding a whitish milke nothing so hot or strong in smell as *Ferula*.

7. *Libanotis minor umbella candida.* Small herbe Francumsence.

This small herbe Francumsence hath sundry leaves lying upon the ground, much cut and divided into longer peeces then *Pimpinella saxifraga*, and narrower than the greene *English* Saxifrage, the stalke hath but few joynts and leaves on them, bearing small umbells of white flowers like *Meum*, and small seede after them, almost like the seed of *Ammi*, Bishops weede: the roote is great and white, divided into sundry branches, and with a bush of haires above.

8. *Libanotis pratensis Germanica.* *Germane* herbe Francumsence.

The herbe Francumsence of *Germany* hath a blackish long roote, as thicke as ones finger, full of a resinous juice, sharpe and well smelling, set with a bush of haires at the coppe, from whence spring stalkes of fine Fennell-like leaves, but shorter than they: the stalke riseth to halfe a yard height, on the coppes whereof stand bowing umbells of white flowers smelling sweete. There is of this kinde a lesser sort also, not differing from the former in any thing, but in the smallnesse.

The Place and Time.

All these kindes of *Libanotides* have beene found growing in sundry places of *Italy* and *France*, except the first, which is all that seeme found in *Sicily* and *Candy*, and the last in *Germany*, and doe all flower and seede, in the yeare ordinarily, in the end of summer.

The Names.

The name in Greeke is derived from λίβανος, which is *Thus* or *Olibanum* Francumsence, because the smell of the herbes is compared to the smell thereof, and *Libanotis* likewise in Latine: but because this later age hath found out divers sorts, which may be referred for the forme, or for the smell, unto some of the ancients; *Theophrastus*, *Dioscorides*, and *Galen* (who yet in their writings, acknowledged that there are many more sorts than they have mentioned) I have here onely shewed you those kindes that have fine leaves, whereof the *Libanotis Matthioli*, or *Libanotis pratensis*, may well be accounted as one of them, both for forme and smell, taking the name from *Æsculapius*, who saved his life by a fall from of a ladder, as it is set downe by *Pliny*. The first is called *Libanotis sexta officinarum* of *Matthiolus* and others (and indeede many Writers have interpreted the *Libanotis* to be *Rosmarinum*, and thereby confound the two names together, for the *Libanotis pratensis*, *Libanotis Stephanomarinus*, and *Libanotis Germanica* onely is the fourth sort of *Libanotis* with the ancients, which is properly the *Rosmarinum* of the *Latines*, and was, and is usually put into Garlands, &c. and therefore so called *Coronarium*, when as none of the five last mentioned, being terrestrious plants can fitly be called *Rosmarinum* in that sence, or serve for that use; and is the last kinde of *Dioscorides*, *Theophrastus*, and *Galen*, whose seede is called *Cachrys* or *Cauchrys*, as it is in some Greeke copies, but falsely it is here in stile. *Camerarius* calleth it *Libanotis cachryfera*, *Libel Cachrys verior Libanotis Galeni*, *Seseli Germanicum*, *Libanotis Candida*. This word *Cauchrys* or *Cachrys*, is of divers significations, and it is the pill or skin wherewith they use to burne the skin to make an escarre, from whence also the seed had the same having some qualities: and *Cachrys* is understood to be a scaly rush (which some also take to be the cattkins of sundry trees) yet leaves growing in Winter, and falling away by some, in the Spring; but others thinke that it is but the young buds which spreadeth into branches with leaves after Winter, when the Spring is come: the second hath the same in his title, as *Lobel* and *Bauhine* call it, and is the *Panax Æsculapium* of *Dodonæus* and others: which is called *Panax Æsculapium* by *Matthiolus*, *Lugdunensis* and others, and by *Bauhine Libanotis secunda sive Panax Æsculapium primum*: the fourth is so called by *Camerius*, as it is in the title, and by *Bauhine Panax Æsculapium alterum*: the fifth is the *Panax Æsculapium alterum* of *Dalechampius in Lugdunensi*, which *Bauhine* calleth *Panax Æsculapium exotica latifolia*: the sixt is the *Rosmarinum alterum sceptracum Dioscoridis* by *Lobel*, and by *Bauhine Libanotis secunda Lobelij*, *Panax Æsculapium*, for so it was entituled unto them by *Dodonæus*, and *Tabernæmontanus*: *Lobel*, and by *Cæsalpinus Libanotis nigra*: the seventh is the *Libanotis Septentrionalium herbarorum* of *Lobel*, and by *Lugdunensis*: the last is called by *Thalius* in his *Hercynia sylva Libanotis*, and by some he maketh it *Mas* and *Semina*, and I have thereupon called it *Libanotis pratensis Germanica*. The *Arabians*, the *Libanotis*, *Thuris*, *Thuraia*, *Alibanfach*, and *Alchala*, or *Cachala*; other Nations doe follow the *Greeke* name of *Rosmarinum*, and thereafter call this as well as the *Latines Rosmarinum*, which is out of dinary *Rosemary* one and the same name: but wee have more fitly distinguished them, by calling this kinde, herbe Francumsence from the Greeke appellation.

The Vertues.

The seede doth with that the leaves of all the sorts of herbe Francumsence doe usually stay the bleedings of the *hemorrhoides*, and easeth the heate, inflammations, and swelling of the fundament, if they be bruised and applied thereto, and doe digest the kernells and emptimations of the body, wheresoever they are hard to be digested: the juice mixed with honey cleanse foule ulcers, and ease the paines and torments of the body of a man that hath taken in what helpeth the biting of venemous Serpents, and provoketh both urine and women's courses: the same also helpeth to discusse ancient tumours or swellings being laid on them: the juyce of the leaves as well as the seede mixed with honey and annointed on the eyes quickneth the sight, the seede being drunke with the juice, helpeth those that have the falling sicknesse, or have old paines in their breasts: it stoppeth also the bloody evill, if it be taken with pepper in wine; it provoketh sweat being put into a hot bath, it helpeth those that are burtten, that have cramps or convulsions or the gout, if it be beaten

with

with the meale of fitches, and mixed with vinegar, and laid to the places: the same also mixed with fresh gat, cleanseth the leprey, morphewes, and the like deformities in the skinne: that seede that is larger (*Candy*) cannot be used inwardly, for it is too sharpe, and will exulcerate the throat: the greene wood is a present salve of all wounds being bruised and laid thereto, but saith *Dioscorides*, the seede called *Candy* is most effectuall and mightie drying, nutritive, and therefore is good to be put into washing balls, or such things as cleanse the skinne, being annointed on the head helpeth the defluxions and rheumes of the eyes, but it must be cutting of the third day. *Agathyrsus Penus* or Allheale, as the said *Dioscorides* saith, hath in the flowers and seede an helping power to scale ulcers, fretting or running cankers, and likewise yeheales, pusles, or the like breaking out in the skinne, being stamped with honey and applied to them; the same also is profitably both drunke in wine against venemous Serpents, as also to have the places annointed with it, and oyle mixed together.

Chap. V.

Fœniculum, Fennell.

Although I have in my former booke given you the knowledge of two or three sorts of Fennell, yet for sole there are some others not there spoken of, I thinke it not amisse to shew them all in this place together, and the rather, because therein I did not so amply intreate thereof, as they did require.

1. *Fœniculum vulgare*, Common Fennell.

Common Fennell is well knowne to rise up with sundry round little stalkes, somewhat more high, bearing at severall joynts long stalkes, of fine small long leaves, smelling somewhat strong, but not unpleasant, and at the toppes on severall branches, tufts, or umbells, of yellow flowers, which turne into small round bitterish greenish seede, two always together, as in the other umbelliferous, withering ripe and drie become somewhat sad coloured, the roote is long and white, running downe deepe into the ground with divers branches thereat: some doe make two sorts, one with greene leaves wholly, and the other with reddish greene leaves not differing in ought else.

2. *Fœniculum dulce*. Sweete Fennell.

Sweete Fennell groweth no otherwise than the former doth, having both rootes, leaves, stalkes, and seede, after the same manner, saving that this, neither beyond sea, nor in our country doth rise to high, and endureth the sharpenesse of our Winters; the seede is larger, yellower, and sweeter in taste, more unlike then the former, which is continueth in the hot countries, but will not hold either colour, largenesse, or sweetnesse, long in our country, but each of them decay yearely, so that the third yeares sowing, yeelded a more small, and sad coloured seede as any in any other garden or country of this land, so that you may hereby easily know that it is the climate only that changeth it to be either larger or smaller, longer or shorter, yellower or paler than others; it also giveth the seede to be sweeter or bitterer, which divers have thought to be differing sorts: some also thinke that the *Garden Fennell*, as the *Italians* call it, is a diversion of Fennell from the other sweet sort, when as it is onely the art in ordering it, by transplanting and whitening it that maketh his leaves grow so thicke bushing together more than the ordinary, and the whiting giveth it a sweeter smell, and shorter stalke to eating.

3. *Fœniculum sylvestre vernale minus*.

Small round Fennell.

There is a small kinde of Fennell which differeth not from the common sort, either in taste or smell, but in being lower and smaller than it, and that the umbells at the heads of the stalkes are white, and the seede that followeth is lesse than the ordinary sort, being somewhat more like unto *Cornes* Caraway seede.

4. *Fœniculum sylvestre*, Wild Fennell.

The wild Fennell groweth up with great, but lower stalkes than the common of the garden, having also but few leaves, and those very thinly set thereon, but somewhat softer or harder in handling, and flowers also: the seede is small and somewhat round, which followeth after the small umbells of yellow flowers.

5. *Hippomarathrum vulgare*, Great Fennell of *Candy*.

This great Fennell hath lace, but shorter leaves than the the ordinary sort, the stalke is stalked and round, two or three cubits high, of the bignesse of ones finger, divided into sundry branches, bearing yellow flowers at the toppes, and great large almost round seede afterwards, the roote is great and whitish.

6. *Hippomarathrum sphærocephalum*,

Great round headed Fennell.

The stalkes of this Fennell are three cubits high, with large Fennell-like leaves, and round globe-like umbells,

1. *Fœniculum vulgare*. Common Fennell.

whole flowers are of a purplish violet colour and large seedes like Fennell, but of a strong sent almost stinking: the rootes long and white endureing long; this is not the last called *Hippomarathrum Creticum* and *Cachryfermum* for that hath yellow flowers and seede like *Cachrys*.

The Place and Time.

The kindes of Fennell grow in hot countries as in their titles and descriptions is declared, for the coldnesse of our climate affordeth even the best and sweetest to grow with us: the wilde sort was brought mee out of *Spaine* among other seeds by *Boel*: they all flower and seede in the end of Autumne if the yeare be kindly, I meane the former sorts.

The Names.

It is called in *Greeke* μάραθον, and *Fœniculum* in Latine, and both from one signification, *quod quasi fœnum in pulcritudinem & tenuitatem reponatur, vel quod magno cum fœnore semen reddat, & cum incredibili celeritate multa germina producat*. The first is the most common both in our Land and both the *Germanies*, which they call *ordinarie* as well as we. *Ceſalpino* calleth it *ſylveſtre*, and *Camerarius in horto* saith some tooke it to be *Hippomarathrum*: the second is the *Fœniculum dulce* of *Matthiolus* and divers others, and called *anetgrec* by *Lugdunenſes*, which all *Germane* authors lay doth as well alter in their countries as in ours, but holdeth more sweetnesse still as doth the country it is wherein it groweth: the third *Bauhinus* onely hath made mention of in his *Pinax*: *Lobel* calleth *ſpontè virens in agris Narbonenſium* and I may say as well *Hiſpanorum*, *Matthiolus* calleth it *Italicum*, and *Augerius* doubteth whether it may not bee *Hippomarathrum*: the fift is very probable to bee the *Hippomarathrum* of *Honorius Bellus* of *Candy* whereof he maketh mention in his first Epistle to *Clusius* which is set in the end of *Clusius* his history of plants, who saith the *Candiotes* call it *Platycaulos*, whose seede as he there saith was as great as those of *Cachrys*. *Bauhinus* in his *Prodromus* seemeth to aime at this having but a branch thereof sent him out of *Signior Contarini* his Garden at *Venice*, but could not demonstrate the whole plant: the last is remembred by *Alpinus libro de exoticis*. The *Arabians* call it *Kerenja*, the *Italians Finocchio*, the *Spaniards Hinojo* and *Fincho*, the *French Fenouil*, the *Germane Fenchel*, the *Dutch Venkel*, and we Fennell.

The Vertues.

Fennell as *Galen* saith is hot in the third degree, and dry but in the first, and put to many uses, the leaves seedes and rootes being both for meate and medicine, the *Italians* especially doe much delight in the use of the root, and therefore as I have before transplant it and whiten it, to make it the more tender to please the taste, which being sweete and somewhat hot and comforting the stomacke, helpeth to digest the crude flegmatieke qualitie of fish, and other viscous meats which they much inure themselves unto. We use it to lay upon fish or to boyle it therewith and with divers other things, as also the seede in bread or other things: the physicall use thereof is to make winde to provoke Urine and to ease the paines of the Stone and helpe to breake it: the leaves or seede boyled in Barley water and drunk is good for Nurses to encrease their milke, and to make it the more wholsome for her Nurse Children to take: the leaves being boyled in water but much more the seede stayeth the hickocke, and take away that loathing which often happeneth to the stomackes of sicke or feaverish persons, and slayeth the heate thereof, the seede boyled in wine is good for them that are bitten by Serpents or have eaten poysonfull herbes or mushromes, the seede and the rootes much more helpeth to open the obstructions of the Liver, Spleene and Gall and thereby much conduceth to all the diseases arising from them as the painfull and windie swellings of the Spleene and the yellow Iaundies: as also the Goute and Crampes, the seede is of good use in cathartik medicines, and those that helpe the shortnesse of breath, and wheesing by obstructions of the Lungs: it helpeth also to bring downe the courses and to cleanse the partes after delivery: the rootes are of most use in Physicke drinkes and brothes that are taken to cleanse the blood, to open obstructions of the Liver, and to provoke Urine and to amend the evill colour or complexion in the face after long sicknesse, and to cause a good colour and a good habit through the whole body: Fennell both leaves and seedes or rootes are much and often used in drinkes or brothes, for those that are growen fat to abate their unweildinesse and make them more gaunt and leane: the distilled water of the whole herbe is likewise commended for the same purposes, as also to be dropped into the eyes to cleanse them from all enormities risen therein, but the condensate juice dissolved or as some take it, the naturall juice or Gum that issueth out thereof of it owne accord in hot countries, doth cleanse the eyes from mists and filmes that hinder the eye sight: some for this purpose take the greene stalkes of Fennell, and holding them to the fire in Autumne while they are greene, cause a certaine juice or liquor to drop from them, which they apply to the eyes, as holding it to bee more effectuall then either condensate juice or the naturall Gum. And those yet more neerely make a water to cleare the eye sight in this manner: they powther some fine white Sugar Candy very finely, and put that powder into the hollow greene stalke of Fennell while it groweth a foote above the ground, so that it be betweene two joynts, which after it hath remained therein a day two or three, and the hole covered and bound close over that no raine get in in the meane time, they open it at the lower joynt, having first placed a good peece of soft wax made a little hollow gutture wise under the hole, which may serve as a gutter or conduit to carry the liquor (from falling downe by the stalke) into a vessell or thing set or purpose thereto to receive it. The sweete Fennell by reason of the sweetnesse is much weaker then the ordinary, which is better to all the medicinall purposes aforesayd, and therefore they doe but deceive themselves and others, that use the sweete Fennell seede in compositions as thinking it the better when as it is much the weaker, by want of the bitternesse wherein the vertue operative: the juice of Fennell dropped into their eares that have wormes breeding in them, killeth the worme: The wilde Fennell is stronger and hotter then the tame, and is therefore most powerfull against the Stone, but not effectuall to encrease milke, for it is dryer: *Honorius Bellus* saith that the women at *Candy* use to boyle the great seede of the *Hippomarathrum* of *Candy* in Lye to dye their haire withall.

Chap. VI.

Anethum. Dill.

Although formerly we have beene acquainted but with one sort of Dill, and that *Theophrastus* saith there are many sorts but expresseth none of them, yet in these later times two other sorts more have beene found out, which we will shew you together here.

1. *Anethum hortense sive vulgare.* Common garden Dill.

The common Dill groweth up with seldome more then one stalke, neither so high nor so great unto the top as Fennell being round and with fewer joynts thereon, whose leaves are sadder and somewhat long, and so like to Fennell that it deceiveth many, but harder in handling and somewhat thicker, of a stronger sent also and more sharper, the toppes of the stalkes have fewer branches and smaller umbells of yellow flowers, which yeeld small seede somewhat flatter and thinner then Fennell seede, and of a stronger and more unpleasant taste: the roote is small and woodily perishing every yeare after it hath borne seede, and is unprofitable, and put to no use.

2. *Anethum sylvestre magna.* Great wilde Dill.

This great kinde differeth not from the former in any notable part but in the greatnesse both of stalkes, leaves, flowers and seede and that it is found growing naturally wilde in *Saxonia* as *Caesalpinus* saith.

2. *Anethum hortense sive vulgare.* Common garden Dill.

3. *Anethum sylvestre minus.* Small wilde Dill.

As the last was greater in all parts then the first so this is much lesse then it growing but a foot high, the leaves are fine and small on the stalke, and the flowers yellow like it, and the seede small and long: this in roote as well as the rest being smaller maketh the difference, for both these last are but annuall as the first.

The Place and Time.

The first is most usually sowen in Gardens and grounds for the purpose, yet it is found wilde with us in some places: the second as is sayd hath beene found in *Saxonia* as the last, and sent by *Columna* to *Bauhinus*, and by *Bael* from *Lusitania* to us.

The Names.

It is called Σωβον in Greeke ἀπὸ τοῦ σβεννύειν quod eius cremor sopit by some, or as others thinke ἀπὸ τοῦ ἄνω θεῖν, id est, ἄνω τείνειν quòd eius appetentia sursum tendat: so also ἄνηθον quod est sanguinem & cocta venerem sedet, quam facultatem Antheus filius antiqui probabrant, tametsi plerique alia genitalium remedia tribuerint. The first is simply called *Anethum* by all authors, or *Anethum hortense* as *Bauhinus* doth: the second is onely mentioned by *Caesalpinus* and *Bauhinus* out of him, and the last by *Bauhinus* from *Columna*, and we from *Bael*: the *Arabians* call it *Zebet* or *Sebet*, the *Italians Aneto* the *Spaniards Eneldo*, the *French Anet*, the *Germans Tyllen* and *Hoobkruyt*, the *Dutch* also *Tille* and we Dill.

The Vertues.

Dill is hot in the third and dry in the second degree, especially being greene, but when it is dryed it is hot and dry in the third, digesting more then before: it is good to breede milke saith *Dioscorides*, but *Galen* in the Fennell before seemeth to gainesay it, for being dry it stayeth milke and engendreth it not, and to ease swellings and paines being boyled and drunke; the same also stayeth both the belly and the stomacke from casting: the decoction thereof helpeth women that are troubled with the paines and windinesse of the mother, if they sit therein: it provoketh Vrine, it stayeth the hickock, being boyled in wine and but smelled unto, tyed in a cloth, and dryed dulleth the eye sight, and being much taken extinguisheth venery, for it mightily expelleth winde, and dryeth naturall sperme: the seede is of more use then the leaves, although they bee much used to mitigate continuous and is more effectuall to digest raw and viscous humors, yet more inferiour then Fennell, and is put into medicines that serve to expell winde, and ease torments and paines thereof: the same seede stamped and used in oyles or plaisters, discusseth the impostumes in the fundament and dryeth up all moysture especially in the secret parts: the oyle made of Dill is effectuall to warme, to resolve humours and to ease paines of the sinewes, either sore or hard tumors, to ease paines and to procure rest.

Chap. VII.

Cuminum. Cumin.

The Cumin is not knowne to most of our best latter writers and Herbarists to be of any more sorts then one, but wee have had the relation of other sorts, but not those of the ancients, as either *Syriacum*, *Æthiopicum* or *Africum* which are but one and the same as many good Authors thinke, and has onely differed by the soyle and climate where they grew as shall be shewed.

1. *Cuminum vulgare.* Ordinary Cumin.

1. *Cuminum vulgare.*
Ordinary Cumin.

Ordinary Cumin groweth up with slender and low stalkes scarce halfe a yard high, growing white at the last and branching out more, having store of leaves which are small and thrid like unto Fennell, the flowers are somewhat reddish at the top of the stalkes, which turne into small whitish yellow seed somewhat long and almost round, crested or straked on the outside and smelling strong, the roote is small long and perishing yearely.

2. *Cuminum Melitense dulce.* Small sweete Cumin of *Malta*.

The small Cumin whose seede is small and like unto Annesseede, but sweete as sweete Fennell, is usually sowen in the Low Countries put into their bread or other meates, as also to season other parts, for exchange of other commodities. It is given to understand as small and low a plant as the Dutch and much like it in leaves and growing, the seede only differing.

3. *Cuminum sativum sive Melitense.*
Great sweete Cumin of *Malta*.

This other Italy eater seedes then the ordinary Cumin longer also and pointed at both ends, crested likewise on the outside and of a deader colour smelling more unsavourily and sharpe not quicke and sharpe almost like Cubebes or Pepper: which is probable (for we never saw it greene) groweth greater then the ordinary, although like it in all other parts.

The Place and *Time.*

All these sorts grow familiarly in the hot countries as *Spaine*, the Iles in the Mediterranean Sea, wherein *Malta* is one, and in *Syria*, and the other East countries where it is sowen in dry land it yeeldeth no good, unlesse in a hot soyle, and sowed in the middle of the Spring, so that it come not with us (though nothing so with them) before it be ripe.

The Names.

It is called in Greeke κύμινον, and in Latine also *Cuminum* and so generally of all other authors as *Dioscorides*, *Theophrastus*, &c. and of many kind, calling them by the sundry countries where they grew, as *Syrium vel Italicum*, *Syriacum*, &c. when as it is confidently held they were not differing in any thing but greatnesse for although one sort of seede was rough or hairy and white and called *Cuminum Æthiopicum* which *Pliny* also called *Ægyptium* as the best, another more rough and hairy called *Cuminum Æthiopicum*, yet they were both sorts one time in a place then another according as the countries proved good unto or evill: Also *Dioscorides* hath wilde kinds of Cumin, I have corrected of them before in the third Booke of this Worke it is called by most writers *Cuminum Satiuum* or *Cyminum*, yet *Salmasius* called it to be *Cyminum Romanum* and *Dioscorides Confectus* calleth it *Cuminum Sylvestre* and *Cervinum* in *Dioscor. Cyrenaicum*. The two last are onely touched by *Bauhinus* in his *Pinax* and called by those of *Mala Cuminum* the wilde Cumin and the seconde kinde *Cuminastrum dulce*. The *Arabians* call it *Cumun* or *Kemun*, the *Italians*, the *Spaniards Comino*, the *French Cumin*, the *Germans Kummel*, the *Dutch Cayen*, and we call the seede Cumin seede.

The Vertues.

The seede of Cumin is not onely most used with us who have little or none of the herbe growing, but every where else for it is as and yet is in sundry places used both in bread and meate to season it withall as we doe Pepper, and was pleasing as well to the stomach as the taste: *Galen* saith it is in the third degree of heate and the same dryenesse almost of dryenesse, and as *Dioscorides* saith, it heateth, bindeth and dryeth, but *Dioscorides* the elder saith, drawing that Cumin seede by attenuating and digesting doth dissolve humors and by drying or attraction, as in the swellings of the gods by winde or a watrish humor, and by the same doth quickly take it away, and so it doth all other paines and swellings, being boyled with Nettle roote and drunke or used: it also dissolveth winde in the body and easeth the paines and torments of the belly, being boyled in wine and drunke, and is is used as a corrector of any windy meate: it is also taken it helpeth those that are bitten by Serpents: the seede also taken in broth or drunke, is good for those that are short winded, or are otherwise troubled with an old cough, and the ease of the breast to boyle the seede with Figges in wine: the same seede beaten and mixed with vinegar and applyed to the nose that bleedeth doth stay the bleeding, and boyled in water and the lower parts bathed

that

doth therewith stayeth the abounding courses of women: Cumin seede broiled and fryed with an hard egge and bound to the backe part of the head easeth an old head-ach, and stayeth the rheume that falleth into the eyes: or are blood shotten, or else the powder mixed with wax into the forme of a plaister and applyed to the eyes will soone helpe it, and take it away. Cumin seede is sayd to make any one looke pale that often is bathed, or applyeth it outwardly.

Chap. VIII.

Meum. Spignell.

MEUM *Meum* the ancients likewise knew and described but one kind, although it was entituled by divers names of the places where the best grew: but we have in these latter times lesse acquainted with three or foure other plants which may not unfitly be referred also thereunto, as by their descriptions you shall soone understand.

1. *Meum vulgatius.* Common or ordinary Spignell.

The rootes of common Spignell doe spread much and deepe in the ground, many strings or branches growing from one head which is hairy at the top of a blackish browne colour on the outside and white within, tender, well, and of an aromaticke taste, from whence rise sundry long stalkes of most fine cut leaves like those of tender then Dill, set thicke on both sides of the stalke and of a good scent: among these leaves rise up round stiffe stalkes with few joynts and leaves at them, and at the toppes an umbell of fine pure white flowers at the edges, whereof sometimes will be seene a shew of reddish or bluish colour especially before they bee full blowne and are succeeded by small somewhat round seede bigger then the ordinary Fennell, and of a browne colour, divided into two parts and creeked on the backe as most of the umbelliferous seedes are.

2. *Meum Alsaticum minus.* Small Spignell.

The small Spignell hath a good big roote a foote long into the ground blacke on the outside and white within without any branches downewards, but parted into severall heads upwards, each whereof sendeth forth sundry short slender stalkes of most fine short leaves set by small nifts together: among which rise up a few such stalkes not above a foote high, bearing white umbells of flowers and very small seede after them as small as Parley, of blacker of colour, the scent whereof is most quicke sharpe and very piercing as is the rest of the plant.

3. *Meum Alsaticum Creticum.* The preservative Candy Spignell.

The stalke hereof is about two foote high, as thicke as that of Dill and greene, with many long winged leaves thereon as finely cut as the former Spignell: the umbells of flowers are white and small, and very small long

1. *Meum vulgatius.*
Common or ordinary Spignell.

2. *Meum Alsaticum Creticum.*
The preservative Spignell of Candy.

4. *Ammi sparium Italicum.* Italian ballard Spignell.

7. *Ammi Alpinum Germanicum tho Montelinadictum.* Mountaine Spignell of Germany.

threed smelling seede follow them: the roote is slender long and white of a fingers thicknesse, smelling well and of a sharpe taste: Our author *Alpinus* saith hee had another sort from the *Rhetian* hills, but this hee holdeth to the best.

4. *Ammi sparium Italicum.* Italian ballard Spignell.

This ballard Spignell is somewhat like unto the true, yet more like unto Dill with longer and thicker leaves: the stalke rises as high as the first with white umbells of flowers, and larger seede on them: the whole plant and every part thereof is of more strong and unpleasant sent and taste then the former, but the roote especially which groweth in inches like the true Spignell, but smaller somewhat like Sow or Hogge-Fennell.

7. *Ammi Alpinum Germanicum tho Montelinadictum.* Mountaine Spignell of *Germany*.

This Spignell hath but few stalkes of winged leaves rising from the roote, somewhat broader then the leaves of the ordinary Spignell and thereof, and are betweene *Carum* and *Ammi*, among which riseth a slender fluted stalke a foote high bare of leaves for the most part to the toppe, where are two or three small umbells of purple flowers, each consisting of five small leaves a peece, bearing seede afterwards that is somewhat long and reasonably great, the roote is of a fingers length covered with a rugged blackish barke, and but few fibres adjoyning thereunto, and a bush of haire at the toppe, of a smell somewhat like the ordinary Spignell but much weaker.

The Place and Time.

The first groweth in many places wilde in the North countries of this Land, as in *Lancashire* and *Yorkshire* where it is plentifully found: it is also planted in Gardens, the second in *Sussex*, the third in *Candy*, the fourth in *Italy*, the last in *Austria*, and on the bottome of Saint *Vincents* Rocke by *Bristow*, right against the hot water which is not to bee seene but at low water as it hath become informed to me by some: but I doubt it will prove *Lobel* his *Tenuedam facie pusilla* at least, when it is better growne up with me I shall the better judge of it.

The Names.

It is called in Greeke πλατυφυλλος, in Latine also *Ammi*, and by some of the ancient authors *Athamanticum*, either from *Athamas* the son of *Aeolus* who is thought first to have found it, or from the mountaine *Athamantes* in Thessaly where the best grew: *Pliny* calleth it *Macedonicum* and *Hispanicum*, not as though they were not found here but as was usuall with them in many other plants, they noted the places where the best was to be had at the present time: for the same *Pliny* saith that in his time *Ammi* was onely sowen in *Italy* by some few [illegible] Matthiolus it is now knowne to grow wilde in many places of *Italy*. The first is generally taken for the true *Ammi* of the ancients, & so called by most of the moderne authors, yet *Tragus* and *Fuchsius* took it to be *Daucus Cretensis* or *Dioscoridis* and *Matthiolus* to be *Tordylium*, some also called it *Anethum sylvestre*, & as *Ruellius* the French *Anethum vulgatius*, and *Dodonæus* saith some tooke it to be *Libanotidis genus* and others *Fœniculum montanum*, some also called it *Seseli Creticum*, and *Bauhinus* calleth it *Ammi folijs Anethi*, because he called the *Seseli Creticum*, which *Lugdunensis* calleth *Ammi aliud*: the third is only remembred by *Alpinus*, & not described by *Matthiolus* that it is more like Dill then the first but not described, and therefore *Lobel* in his Obser-

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

vations giveth a very briefe touch thereof, and the figure withall, calling it *Meum Bauhini* and *Tabernæmontani* call it *Meum adulterinum*; the laſt is firſt remembred by *Geſner* in *Lonicerus*, the other *Matthiolus*, who call it *Matthiola*, from the name *Matty* or *Matthew*, whereby the *Germans*, *Bohemians* and others did call it. *Bauhinus* in his *Matthiolus* and *Pinax*, calleth it *Meum Alpinum angelicæ folio*, and maketh a doubt if it be not the *Panax Montanum* of *Cluſius*, which in my ſimple opinion it cannot be, for that *Cluſius* ſaith, the leaves of that *Panax* is like *Seſeli pratenſis*, and the ſeede is as ſmall as Parſley, in both which *Matthiolus* differeth from it, although it ſeeme to agree in the purplish huskell, and ſomewhat in the roote. *Arabians* call it *Adz*, the *Italians Meu* and *Imperatrix* or *Maſtrantia* ſatly, but that name is given of the *Italians* to *Angelica*, and many other plants that are of any eſpeciall vertue, as *Lobel* ſaith: the *Spaniards Yeros* and *Siſtre* of ſome, the *French Athum*, the *Germans Bærwurtz*.

The Vertues.

Galen ſaith that the rootes of Spignell are hot in the third degree, and dry in the ſecond, whereby it is verie able to provoke urine and womens courſes, and the paines in the kidnies and bladder; but if more thereof be taken then is fit and convenient it cauſeth head-ach, for by ſending the hot vapours to the head, it is thereby moved and hurt: the rootes of *Meum* or Spignell (for no part elſe of the plant is of uſe here to us, and yet the ſeede is very medicinall) boyled in wine or water and drunke, helpeth the ſtrangury, and ſtopping of the urine, the winde ſwellings and paines in the ſtomacke, the paines of the mother, and all joynt-aches: if the powder of the roote mixed with honey, and the ſame taken as a Lohoc or licking medicine it breaketh tough groſſe and filthie theume that falleth on the lungs: the rootes are accounted very effectuall againſt the ſting or biting of venemous creature, and is one of the ingredients into *Mithridatum* and *Theriaca Andromachi*, which are ſpeciall antidotes for the ſame, and many other effectuall purpoſes.

CHAP. IX.

Gingidium. Strange Chervill.

I Have two ſorts of this Chervill that properly belong to this Diviſion or Order, and there are two more which might be referred to the other Diviſions of thoſe umbelliferous plants which I diſtinguiſhed in the beginning, yet for the names ſake, I would not willingly exclude them the family, but let them keepe company with the reſt at this time.

1. *Gingidium verum ſive Syriacum.* The true *Gingidium* or ſtrange Chervill.

The true *Gingidium* that *Raunolfius* ſaw in *Syria* groweth up with an upright ſtalke ſomewhat rough, branching forth from the very ground almoſt, whereon are many ſtalkes of fine cut leaves, ſmaller then Fennell, eſpecially thoſe on the ſtalkes and branches, for the loweſt are a little more

1. *Gingidium verum ſpecioſum.*

4. *Gingidium Hiſpanicum Syriacum.* Broad leafed Chervill of Spain.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

...where of grow great broad umbells of white flowers, a little purple in the middle, which ...ere they flower hang downe their heads, and after the flowers are past, the umbells doe contract or ...themselves rounder, the outer part being higher than the middle, which then is hollow, that it represen...with a ball, somewhat like to the umbell of seede in the wilde Carrot, and beareth plenty of very small seed, ...roote great, but long, white, and woolly, perishing every yeare that it beareth seede, which is usually ...the next yeare it is sowen, or else springing late and not shooting up in stalkes but seede, it will abide a Winter, ...whole plant hath a little resinous taste and smell to my senses.

2. *Gingidium Hispanicum. Spanish* Toothpicke Chervill.

The second Toothpicke Chervill groweth rather greater than the former, but with smaller and slenderer ...leaves as the joynts, thicker and more finely cut at the tippes, whereat stand large umbells ...white flowers, divided into many parts, and standing upon long stalkes, which when the seede groweth ripe ...are rough, being long and slender, and serve well for tooth pickes: the roote is long and white: the whole plant ...of lesser taste.

3. *Gingidium Cherefolij folijs.* Another strange Chervill.

This other strange Chervill hath divers stalkes of winged leaves, very like unto the ordinary Chervill, but not ...so much cut into many parts, the stalke is round, straked, and blackish, halfe a yard high, with joynts and leaves ...like the other: the umbells of white flowers are compassed about with smaller and finer cut leaves, which when ...the flowers are past are contracted together somewhat like the first, and are somewhat clammy, wherein lie small ...seede like the former: the roote is long, white, and bitterish.

4. *Gingidium latifolium Syriacum.* Broad leafed Chervill of *Syria*.

The Syrian Chervill beareth but few stalkes of winged leaves, somewhat like to Parsneps, but that every divided ...part is broad and round, but lesser: the stalke is somewhat hairy, crested, small, low and naked of leaves to the ...top, where grow diverse long stalkes with small umbells of white flowers, and two or three small long leaves ...with them: the seede small and like unto the first.

The Place and Time.

All these herbes rooted, are said to be brought out of *Syria*, but the second groweth also plentifully in *Spaine*, ...from whence it hath beene brought and sent to friendes: they all flower late, and therefore the seede is much la...ter, so that if the yeare be not hot and kindly, the seede will hardly ripen with us.

The Names.

It is called in Greeke *πύρεθρον*, and *Gingidium* in Latine: *Dioscorides* saith it was also called in his time *Lepidi*...*um*, but that name doth more fitly agree to another plant, as is shewed before: the old *Romanes* were wont to call ...it *Biberia*, of the *Syrian Diospolis*. The first, as I said, *Leonhartus* in the later times first made knowne to the ...Christian world, having gathered it in *Syria*, giving it the name of *Gingidium Dioscoridis*, which it doth most ...rightly represent, but *Dodonæus* coupleth *Gingidio* to *Pastinaca sylvestris*, which as it is lesser in leafe, so is it most like ...in the head of seede, and *Lobelius de Insertis* thereupon calleth it *Syriacum*: the second is the *Diptamus* of *Mat*...*thiolus*, *Lobel*, and others; yet *Matthiolus* would faine have it to be *Pastinaca sylvestris major*, because it groweth ...larger: *Tragus* calleth it *Nefeli*, and *Fuchsius Nefeli Massiliensis*, *Cæsalpinus Cunilis sativæ alterum genus*: the third ...is the true *Dictamnus* of *Matthiolus*, *Lobelius*, and *Tabernæmontanus*: the last is called by *Lobel Gingidium latio Ban*...*ij Persici*, and is the last *Gingidium* by *Dodonæus*; yet as he sheweth in the Chapter of *Pastinaca latifolia*, *Lacu*...*sius* thinketh *Banius* to be the *Pastinaca tenuifolia* of *Dioscorides*.

The Vertues.

These herbes are more used as nutriment than medicine, both in former times and now also where they grow, ...for *Dioscorides* and *Galen* speake more of the edible propertie, that they are by their taste or else welcome and a...greable to the stomacke, being eaten raw or boyled, or divers other wayes ordered, as the time and mens ...willes doe require to take them: but in that *Galen* saith in one place, that they are rather medicinable than nourish...ing, it is because he sheweth that they have a temperate qualitie betweene heat and cold, but have a manifest bit...ter and binding property by both which they are so commodious to the stomacke, that they are of the nature of a ...medicine, to cleanse and dry up the moist humours that by their abounding doe much offend the stomacke, ...and by the liver and other parts: the other medicinable qualities also therein arising from thence, are to be pro...fitable for the diseases of the bladder, and to provoke urine being boiled in wine and drunke.

Chap. X.

Pyrethrum vulgare. The true Pellitory of Spaine.

There are in mine opinion two sorts of this *Pyrethrum*, the formes of their leaves being different, indu...ced me to thinke, although there be nothing else as shall be shewed.

1. *Pyrethrum umbelliferum primum.* The first Pellitory of *Spaine*.

This *Pyrethrum* hath divers stalkes of fine cut leaves, the forme and divisions whereof doe some...what resemble the leaves of Mayweede, being short, and not long like Fennell, or like wilde Carrots, ...wherewith it groweth, from among which rise up some stalkes, with few or no leaves on them, bran...ching in three parts, bearing a round umbell of white flowers, after which follow somewhat round ...seede bigger than Annise seede: the roote groweth sometimes as great as two thumbes together, ...of a reasonable long forme, and a foote or more deepe, of a brownish yellow colour on the out side, and whi...te within, of a very sharpe and heating taste, drawing forth water into the mouth, more plentifully and quickly ...than the common Pellitory of *Spaine*, which hath a Daisie-like flower (as my taste if it deceive mee not, hath ...not) Notwithstanding some authors have set downe the contrary, and endured after seede time, if it be some...what carefully defended in the Winter time.

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Pyrethrum umbelliferum alterum.*
The other Pellitory of *Spaine.*

This other Pellitory groweth somewhat lower, the leaves are somewhat longer and finer, resembling Dill; the stalkes are slenderer and full of leaves, the umbells of flowers are white, but not so great; the roote is slenderer and single, and herein consisteth the chiefest difference.

The Place and Time.

The first groweth most usually in the hotter countries, of *Italy, Spaine,* &c. the other on some mountaines in *Germany,* and often among the rockes whereon there is but a crust of earth, so that the rootes grow in the chinkes: they flower and seede toward the end of Summer.

The Names.

It is called in Greeke πυρεθρον ἀπὸ ῥιζῆς ἰγνεον ἔχουσα, and *Pyrethrum* in Latine, & also *Salivaris*, from the quality to draw spittle into the mouth: the first is the *Pyrethrum verum* of *Matthiolus*, and *alterum* of *Lobel* and others. *Camerarius* calleth it *Pyrethrum Dioscoridis*, *Cæsalpinus* doubted to call it *Pyrethrum*, for until it was well examined by the learned, they were loath to admit it as *Dodonæus*, who would rather find a fault in the description of *Dioscorides*, and suppose it to be a kinde of Saxifrage, than admit it for true *Pyrethrum*. The other is called by *Lugdunensis Pyrethrum Germanicum*, because *Gesner* first set it to *Dalechampius*, and as I said, it must probable to be a different sort from the former; for I rather thinke this to be it that *Tragus* found on the mountaines, and called *Ptarmicam montanam*, than the former, as *Lobelius* doth who also noteth it in his *Pinax* that the *Pyrethrum*, that hee saw in the *Padua* garden, varied in having yellow flowers from this, which hath growne with us and is white.

The Vertues.

This Pellitory is hot and dry in the third degree: the roote taken with honey is all-thwart against all cold diseases of the braine, as the Apoplexie, falling sicknesse, the palsie, or shaking of the braine, and others of the like nature: it helpeth also the defluxions of rheume from the head to the teeth, being brused and layed to some vaines, and the mouth gargled therewith, or the roote it selfe chewed in the mouth, doth much ease the paine of the tooth-ach if it proceede from rheume: it is also good against all the evils aforesaid that are used to warme and heate any part of the body, as the flowers doe are beruimmed with cold, or the dead in shaking palsies: for which purpose, some doe commend it to be drawne from the greene rootes, to be eaten: yea though the parts be drawing to a gangrene, it speedily & much helpeth all cold griefes, either inward or outward.

4. *Pyrethrum umbelliferum primum.*
The first Pellitory of *Spaine.*

CHAP. XI.

Nucula terrestris sive Bulbocastanum. Earth Chesnut.

OF the Earth Chesnut there is two sorts, a greater and a lesser in each part.

1. *Nucula terrestris major.* The greater Earth Chesnut.

The great plant bringeth forth divers long stalkes of leaves immediatly from the roote which are finely cut in and divided, somewhat like unto the leaves of Parsly, that grow on the middle or top of the stalke, as *Dodonæus* compareth them, yet larger than the next or small Earth nut, among which riseth up a slender stalke about a foote high, bearing at the toppes many small white flowers in an umbell, which turne into blackish small long seede, smelling somewhat sweet: the roote is not fully round or smooth, but bunching out in one place or other, and somewhat rough, of a blackish browne colour on the outside, and white within, of a pleasant taste, between a Chesnut and a Parsnippe, which is often eaten by women and children when they have roasted them by the fire or under the embers.

2. *Nucula terrestris minor.* The lesser Earth-nut or Chesnut.

This smaller Earth-nut hath a small round thicke or rather like the former, but lesser, from which ariseth a tender slender whitish string or stalke, whether soever you will call it, within the ground, not thicker than a packthred, which groweth straight up from the roote, in which growth it is four or five inches deepe in the earth, not bearing or shooting any leafe to and from the stalke of the ground, from whence it riseth a little bigger naked or bare of leaves for an inch or two, and then sendeth forth from the sides of the same stalke, sundry small stalkes of very fine cut leaves little bigger than haires, of a fad greene colour, and at the toppe whereof sundry small white flowers in umbells, and such like small long seede as in the former, but lesser, and somewhat sharpe in taste.

The Place and Time.

The first is as frequent in the higher and lower *Germany*, and in *France* and *Italy*, and the lesser more plentifully in our country than theirs, although, as *Camerarius* saith, it groweth by the *Rhyne* also, and flowereth in the beginning of Summer, seeding quickly after.

Original from UNIVERSITY OF MICHIGAN

The Names.

It hath no Greeke name, but what is acquired from the Latine, which is *ἀγριοκάστανον*, when as the Latines by a corrupt word doe call it *Bulbocastanum*, or *Bulbocastanum*, but they better *Nucula terrestris*, as *Lobel* doth, but *Gesnerus* & *Gesner* thinke that the word should be rather, *Balanocastanum*, which but as strange as the other, and but formed together to shape it a coat fitteable to the wearing: *Dodonæus* in his former workes tooke it to be *Bunium* of *Dioscorides*; but recalleth upon better advice, he changed his opinion, and maketh no mention thereof in his later, or *Pemptades*: which *Lobel* also seemeth to stumble at, not knowing, as he saith in *Adversaria*, *fol.* 71. any other plant that may represent *Dioscorides* his *Bunium* if this be not it: but the description of *Bunium* in *Dioscorides* doth so much vary from this, and hath so little resemblance, that I wonder judicious and learned men should so erre. for if one or two words here doe correspond unto the *Bulbocastanum*, all the rest contradicteth it quite, for besides that *Dioscorides* maketh no mention of the roote to be bulbous, or otherwise, which was not to be omitted, and giveth an especiall knowledge of the plant; there is in this Earth-nut no square stalke, nor of a fingers thicknesse, nor in the true coppes, as *Lugdunensis* saith, is there any mention of Parsley-like leaves neare the rootes, but on the stalkes, nor are the flowers like Dill, which are yellow, nor is the seede smaller then Henbane, the properties also of each, being different, Thus have I shewed you that *Bulbocastanum* cannot be *Bunium*, but what *Bunium* is, by the judgement of *Dalechampius*, I shall shew you a little hereafter among the wild Carrots. *Matthiolus* maketh the first here, to be his first *Oenanthe* in *fol.* 617. of *Venice* edition; Doctor *Turner* tooke it to be *Apios*; and *Cesalpinus* calleth it *Pastinaca*, and as *Camerarius* saith, *Geranium primum Dioscoridis* but he saith that the *Italians* call it so, because the vulgar eate it in stead of bread and cheese. *Lugdunensis* calleth it *Bulbocastanum grandius*, as *Camerarius* in part also acknowledgeth it, and doth call it *Bulbocastanum Italicum*, but *Lugdunensis* by that name understandeth the lesser sort calling it *mas*, because he would make a *fœmina*, which is a quite differing plant from this, as I shall shew you among the *Oenanthes*. *Gesner*, *Dodonæus*, *Tabernæmontanus* and others, doe generally call it *Bulbocastanum*. The other is, as I said even now, called by *Lugdunensis* *Bulbocastanum mas Italicum*, and *Bulbocastanum alterum minoribus foliis & bulbis* by *Camerarius*, *Lonicerus* understandeth this plant, which he calleth a species of *Ornithogalum*. The *French Savoyards* call it *Faverottes*, the *Germans Erdkerstlen*, and *Erdnuss*, the *Dutch Erdtnoten*, and wee Earth-nuts, Earth Chesnuts, Ground nuts, and Kipper nuts.

Nucula terrestris major alba vel nigra.
Earth-nut or Chesnut.

The Vertues.

The roote is hot and drie, and somewhat binding, yet all moderately, but the seede is more in both, yet hath an opening propertie to provoke urine: the roote is said to be good for those that either spit or pisse bloud: they that use to eate of them doe finde them nourishing as Chesnuts, and no otherwise profitable in any especiall respect.

Chap. XII.

Oenanthe recepta herbariorum. Dropwort.

Although I know that none of these plants described in this Chapter, is the right *Oenanthe* of *Dioscorides*, yet because the common vote of these times passeth so upon them, and that I could not so well joyne them to the *Filipendulas* here before set forth, unto whom they are in some sort like in that they were *umbelliferæ*, let me place them here to beginne this second division of the umbelliferous plants, which are of such as beare thinne cut leaves, like Carrots or Parsley, and that in the last Chapter it was shewed you, that some did call the *Nucula terrestris*, *Oenanthe*, as well as the ordinary *Filipendula*.

1. *Oenanthe Apii folio major.* The most ordinary great Droppewort.

This great Dropwort hath for rootes many round white and somewhat long Asphodill like clogs joyned together at the toppes, and ending in small fibres, from whence rise many greene winged leaves, made of many parts, set in the manner almost of smallage leaves, but much smaller, and from among them two or three little round couert, hairie stalkes, of sometimes two foote high, beset with some such leaves as grow below, and at the toppes finished up with an umbell of white flowers, converted afterwards into Fennell-like seede, but smaller, and of a greyish colour.

2. *Oenanthe Apii folio minor duorum specierum.* Two smaller sorts of the former Droppewort.

These two sorts of small Dropwort have four winged leaves very like in the divisions unto the former, but both smaller

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. Oenanthe Cretica stellata.
Candy Droppewort with starre like heads.

4. Oenanthe Cretica prolifera.
Candy Droppewort with fruitfull heads.

smaller by much & more green, yet the one of them also smaller than the other, and the lesser a little finer jagged, which plainely sheweth the difference as well as the seede, which is smaller almost by the halfe, and rounder than the greater of these, which is somewhat like unto Dill seede, but somewhat smaller and white, the flowers in either being white, but differing in greatnesse: the rootes likewise are much alike; yet still greater or lesser the one than the other, and each consisting of sundry small tubers, with many strings or fibres among them.

3 *Oenanthe Cretica stellata.*

Candy Droppewort with starre-like heads.

After many yeares standing, this sendeth forth an upright stalke, scarce a foote high, without any leafe thereon, and with foure and five heads or tufts of white flowers, upon long foote stalkes, encompassed with eight or nine somewhat long and pointed leaves like a starre, after which follow small seede somewhat like to the *Indian* Scabious: the leaves that grow below are winged, that is many small ones set at distances upon a long foote stalke, very like, both for forme and bignesse, unto the finger of the last two recited here which fall away in the Winter, and springing a fresh in the Spring from the roote, which consisteth of sundry Asphodill like cloues, but lesser, somewhat hard and blackish.

4 *Oenanthe Cretica prolifera.*

Candy Droppewort with fruitfull heads.

Very like unto the last is this Candian, yet differing first in the leaves, which are larger and not cut into so many parts, then in the heads of flowers, which though white and clustering together like it, yet in stead of the long pointed leaves set thereabout, this hath sundry small heads of the like white flowers, after the manner that many other plants have, namely Marigolds, Daysies, &c. which we call childing or fruitfull, or as some doe, Jacke-Anapes a horse backe, and againe in the seede, which is like to the water or Marsh kinde, and lastly, and most especially in the rootes, which are not glandulous like the other, but wholely compoled of a number of white fibres

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

and stands this also upon the first springing thereof from the seede hath but three leaves upon divers stalkes, and those not farre more.

5. *Oenanthe angustifolia Lobelij.* *Lobels* narrow leafed Enanthe or Dropwort.

This Enanthe of *Lobel* is sayd to be like the last, but with much narrower and finer cut leaves, and not to differ greatly in any other particular.

6. *Oenanthe Cicutæ facie Lobelij.* *Lobels* Hemlocke like Enanthe or Dropwort.

The leaves hereof are more like the medow Rue then Smallage having many small ones set together of a darke shining greene colour, and somewhat like Hemlocke in colour as also in the flowers but more in effect, troublesome and overturning the braine and senses being eaten as *Lobel* saith, the roores are whits and glandulous, or kernelled like Scite and tender but sharpe and unpleasant in taste, yeelding a whitish milke at the first, and turning yellow after, which is poisonous, virulent and exulcerating.

7. *Oenanthe palustris sive aquatica.* Marsh Dropwort.

The lower leave hereof are much divided into many smaller parts then the former sorts, but those that grow upon the hollow stalkes are much finer and smaller: the spikie umbells of flowers are white as the other, and the seede like Hemlocke: the rootes are many small tubers fastned by strings and other fibres among them.

8. *Oenanthe Monthellacæ major & minor.* French Dropwort a greater and a smaller.

The greater of these two French plants of *Dalechampius* as *Lugdunensis* remembreth them, hath a thicke crested hollow stalke about a foote high and leaves thereon like unto Carrots, the umbells of flowers are white, and somewhat long seede succeeding: the roores have many somewhat long and blackish tubers with other fibres among: The lesser sort hath a thicke hollow stalke, and the like Carrot-like leaves: but the seede thereof is flat like *Anise*, wherein hee saith, as also in that it groweth in stony places, it commeth nearer then the other unto the true *Oenanthe* of *Dioscorides* although the other in all other things is neerest thereunto: the rootes hereof also are small and tuberous like the other.

9. *Oenanthe Juncoides minima.* Small Rushlike Enanthe or Dropwort.

Although I have given you the lesser figure of *Lobels Oenanthe aquatica* in want of the right, whereunto this doth come very neere yet the description shall amende that defect: For it hath sundry very fine and small divided green leaves lying on the ground all the Winter and some as small and fine as *Meum Spignell*: but those upon the hollow greene Rush-like stalkes which are about halfe a yard high are finer by much, yet very few, and at the upper joynt with the leafe and not at the top of the stalke come forth a few very small white flowers which turne into very small seede: the heads or tubers that bee dispersed among the small haire like fibres, are as small as reasonable big pins heads, which abide and perish not encreasing yearely, but best in a moist and shadowie place.

10. *Oenanthe tenuifolia altera Africana.* Fine small Dropwort of *Africa*.

I have yet one other of these *Oenanthes* to shew you which *Bodi* gathered on the *Barbary* coasts and brought to me having small slender broad stalke with very fine cut leaves thereon as fine as either Dill or Spignell, set at distances with divers branches of umbel-like white flowers at the toppes, changing into very fine white seede: the roote being small and tuberous like the last.

The Place and Time.

All these the second two sorts, and those particularly enticuled grow in our owne Land, which second and last have not been remembred by any other before, flowring and seeding in the end of Summer.

The Names.

Dioscorides hath by *Matthiolus* judgement recorded three sorts of *simplex Oenanthe*, derived *ἀπὸ τοῦ οἰνάνθης τοῦ Οἴνου ἄνθος* that is *flos vinosus, quod floribus decore, odore et quadantenus colore non sint viti dissimiles: vel etiam quod circa vindemiam appareat, & fructum vindemiæ ferat*, yet *Theophrastus* in the last Chapter of his first Booke maketh mention of one sort not to be excluded from the number of flowers yet sowen of seede, which all doe interpret to be the blossomes of the wilde Vine, and as *Matthiolus* saith *Dioscorides* implyeth that wilde Vine that beareth Grapes which doe not which is barren. Divers authors have diversly judged of *Dioscorides* his *Oenanthe*, *Matthiolus* reprooving *Fuchsius*, who first and *Lobel* after him that strove to maintaine his opinion, that the common *Filipendula* was it: yet notwithstanding *Lobel* his opinion, *Matthiolus* his reasons stand for good arguments therewithall although as I sayd in the beginning of this Chapter, I here shew you many diversities of *Oenanthe* as they are accounted, yet we cannot be assured that any one is the genuine and right plant: and howsoever as *Fuchsius* and *Lobel* would maintaine *Filipendula*; *Lugdunensis* his smaller *Monspelien Oenanthe*, *Alpinus* also doth maintaine that his is the right, yet still there is somewhat defective in each of all these, namely either in the flowers or stalkes, or seedes: but because I cannot absolutely determine this controversie, I must leave every one to his owne judgement, onely them that are found most vertuous. For the names the first doe most truly deserve the name of *Apiifolia*, which our countrey women herbe gatherers, and sellers most fitly call white Peony roots, because the roores are white and slogny, somewhat like unto the female Peony rootes: the rest have other names as the titles their authors give them, yet except the first, the third and the last they have all roots like unto *Pimpinella*: *Bauhinus* in my opinion hath much mistaken himselfe in quoting *Columnæ* his *Cynapium Apii folio* to bee *Oenanthe Apii folio* which may plainely bee seene to bee the *Nucula terrestris* or *Bulbocastanum* which is *Matthiolus* his first *Oenanthe* after *Filipendula*, and not *Oenanthe Apii folio* which is his second.

The Vertues.

Dodonæus writeth in his *Oenanthe Cicutæfacie* to be virulent and venemous, from the relations of the North countries, whereas the first is chiefly groweth, and commeth against *Matthiolus* that approved it beneficiall for the Splene, Epileptical, Antipticall and Cephalicall diseases, as also the Strangury or hard making of water, beholden the other to be by some singular prerogative available in the same cases. *Alpinus* also commendeth his *Cauly Oenanthe Stellaris* to be good for them that have the Strangurie.

CHAP. XIII.

Daucus, Dauke or wilde Carrots.

ALthough there be many sorts of these Daukes or wilde Carrots, yet because I cannot well tell how to separate them, I must packe them all into this one Chapter.

1. *Daucus Creticus verus Dioscoridis.* The true Dauke of *Candy*.

The true *Candy* Dauke hath sundry stalkes of winged leaves, as finely cut as Fennell but thicker, set at distances one against another, of a whitish or hoary colour smelling somewhat sweete, from among which rise divers slender branched stalkes a foote high, bearing at their tops small umbells of white flowers, and after them small hoary grayish seede, somewhat long and round of a quicke sent and taste: the roote is small, long and white, almost as quicke and sharpe both in sent and taste as the seede, but will not abide our Winters where the care we can use.

2. *Daucus Alpinus Creticæ similis.* Mountaine leafed Dauke.

This fine Dauke differeth little from the former which is in that it groweth in colder places, the leaves being somewhat longer and greener then the former, nothing so hoary or white, and grow not so many or thicke together. the umbells of flowers are white and the seede like also, but a little longer and not so hoary, but somewhat neare both in taste and smell: the roote also is quicke and sharpe as the other.

3. *Daucus montanus Pannonicus.* Mountaine Dauke of *Hungary*.

This Dauke of *Hungary* which *Clusius* calleth *Saxifraga Pannonica*, and *Bauhinus Daucus montanus foliolis brevique folio*, hath sundry long stalkes of fine cut leaves and short, some what like unto the leave of Pimpernell, of a strong sent and taste, and somewhat sharpe withall; among which rise up joynted stalkes about a foote high with the like leaves on them, and at their tops umbells of white flowers: the roote is but short and blackish colour quicke and sharpe, drawing water into the mouth upon the chewing, and hath a bush of haires at the toppe.

4. *Daucus montanus pumilus.* Low or dwarfe mountaine Dauke.
